end of the spectrum, while if the star is receding from us, the lines are shifted toward the red end of the spectrum. The possibility of the use of this principle in determining end-on motions was first suggested by Fizeau in 1848, but it was not until 1868 that Huggins actually applied it and succeeded in measuring the radial velocities of Sirius and other stars. This epoch-making achievement was followed, three years later, by Vogel's determination of the period of rotation of the sun from observations of the relative shifting of the solar lines due to light from the eastern and western limbs of the sun. So long, however, as the shifting of the lines was observed by visual methods alone, the results obtained were unsatisfactory, for the displacements are minute and difficult to estimate, and the lines, being often somewhat hazy, do not lend themselves well to accurate measurement, while the human eye itself adds a further uncertainty from its tendency to exaggerate the effects observed. These difficulties were obviated by Vogel's introduction of the spectrograph in 1888. In this instrument the camera takes the place of the eye, and the displaced lines are recorded on the photographic plate along with standard lines of reference from terrestrial sources, so that far greater accuracy of measurement is now possible.

The vast field of research opened up by Kirchhoff and Huggins has attracted a host of workers whose labors have been rewarded with such an abundant harvest of results that only a few of the most important can be mentioned here. Stars are now classified according to the character of their spectra; the first classification of this kind, since considerably extended by Pickering of Harvard, was made by Father Secchi in 1863, while other schemes of classification have since been proposed by Lockyer and Vogel. Nebular astronomy has been revolutionized; Huggins, in 1864, established the gaseous nature of the nebulae by means of the spectroscope, and Keeler, in 1890, succeeded in obtaining the first reliable evidence of the existence of nebular radial motions. Stellar photometry has been prosecuted assiduously by Pritchard and Pickering, who have published photometric catalogues of the stars; and the latter has contributed a new and valuable method of research by his introduction of photographic photometry. By means of the spectroscope double stars are resolved into their components even when those components are too close to be separated by the telescope. In solar physics striking results, some of which have already been referred to, have been obtained, and the field has grown to be so extensive that observatories, like those at Mount Wilson (California), Mendon (France), Kodai-kanal (Madras), and South Kensington, have been established, the work of which is restricted almost entirely to the prosecution of this important branch of astrophysics. See DOUBLE STARS; NEBULAE; STARS; SUN; SUN-SPOTS; VARIABLE STARS.

ASTRUC, as'truk'; JEAN (1684-1766). A distinguished physician. He was born at Sauves,

in Languedoc, March 19, 1684. He studied at Montpellier, where he took his degree as doctor in 1703, and where he lectured (1707-09). In 1711 he was appointed to a professorship at Toulouse, and in 1716 he was called to a chair in medicine at Montpellier. In 1729 he became physician to the King of Poland, but the next year accepted a chair at Paris, where he died on May 5, 1766. His most important works are his dissertations on the epidemic diseases, published at the time of the plague (1722-25); his great work on venereal diseases (*De Morbis Venereis*), that appeared at Paris in 1736; his *Tractatus Therapeuticus et Pathologicus* (Venice, 1748); and his epoch-making *Conjectures sur les mémoires originaux dont il paraît que Moïse s'est servi pour composer le livre de la Genèse* (Brussels, 1753). The last book was written in the apologetic interest of curing what the author called "the malady of the century"—the doubt as to the Mosaic authorship of the Pentateuch. It furnished the clue to the documentary analysis of this work, which has occupied scholars ever since (see PENTATEUCH), by calling attention to the fact that in the Hebrew text of Genesis the name for God is sometimes Elohim and sometimes Yahwe, and that the passages employing the first of these names seem to differ in fundamental conceptions from those in which the second is used. Astruc inferred from this that Moses had used different sources in compiling Genesis.

ASTRUP, äs'trup, EIVIND (1870-96). A Norwegian explorer, born at Christiania. He came to America in 1891 and in the same year joined the Peary expedition to Greenland. In 1893-94 he was a member of the second Peary expedition to Greenland and made the first survey of the northern and northeastern coast of Melville Bay. He lost his life during a snowshoe expedition from Dovre, Norway. His body was found Jan. 21, 1896, at Lille Elvedälen. His published works include *Blandt Nordpolens Naboer* (1895).

ASTURIAS, äs-tōō'ri-äs (from Basque *asta*, rock + *ura*, river; literally, 'the country of the dwellers by the rocky river'). A former division of Spain, now included in the province of Oviedo, bounded on the north by the Bay of Biscay, east by Santander, south by León, and west by Galicia. The low hills of León and Old Castile rise gradually to the mountain chain which forms the southern boundary, towering to a height of nearly 9000 feet in the summit of Torre de Cerredo. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The climate is damp, as the clouds and fogs of the Atlantic hang continually about the snow-capped mountains. The principal kinds of wood are oak, chestnut, and silver and Scotch firs; in the more remote districts the forests are superb. Pasturage is found along the slopes in the narrow valleys, supporting an excellent breed of horses and cattle. In the wider valleys, barley, wheat, maize, figs, olives, grapes, and oranges are cultivated; along the coast are excellent fisheries. Copper, iron, lead, cobalt, arsenic, antimony, and coal are found in the province.

Asturias became a place of refuge for the Goths in the eighth century. Here the famous Pelayo was made King in 718, and his successors, continuing the fight against the Arabs, became kings of León in the tenth century. Because of this long struggle against the Moors

and the consequent exclusive sentiments of the Asturians which kept them free from foreign domination other than that of the Romans and the Goths, they are probably to be regarded as the purest representatives of the original Iberian race; and their language (*language bable*) furnishes much light upon general problems of Castilian linguistics. (See recent studies by Ramón Menéndez Pidal.) The Asturians still boast of their independence as free *Hidalgos* and are simple in manners and brave, but less industrious and sociable than their neighbors in Biscay and Galicia. They have been termed the *Swiss* of Spain, and they are equally faithful and fond of money. The *Vaqueros* form a distinct caste in the province, intermarrying among themselves and leading a nomadic life, wintering on the seacoast and summering on the hills of *Leytariegos*. Oviedo, the capital, has, since 1833, given its name to the whole province. The other important towns are the ports of Gijón and Avilés. The area of the province of Oviedo is 4207 square miles, with a population in 1900 of 627,069.

Since 1388 the heir-apparent, whether male or female, to the crown of Castile, and later to the crowns of the Spains, has been known as Prince, or Princess, of Asturias.

ASTYAGES, äs-ti'ä-jéz (Gk. Ἀστύαγης, in the Babylonian inscriptions called *Istuvēg*, 'the good warrior'). The last King of Media, son and successor of Cyaxares, reigned c.584-550 B.C. According to the story told by Herodotus, Astyages, on account of a dream, gave his daughter Mandane in marriage to Cambyzes, a Persian of eminence; but later, being influenced by an alarming dream, he sent Harpagus to destroy the child which was the fruit of the marriage. But the child Cyrus (q.v.) was hidden away by a shepherd, and was after many years brought to the notice of Astyages, who easily discovered the boy's parentage. Astyages punished Harpagus for deceiving him, and Harpagus instigated the bold and ambitious Cyrus to lead a revolt of the Persians, through which Astyages was made prisoner, and Cyrus took the sceptre. Astyages was treated mildly, but kept a prisoner until his death. According to the more reliable account given in the Babylonian inscriptions of Nabonidus, Cyrus, the King of Anzan, revolted against his lord, Astyages. The troops of Astyages deserted him and delivered him to Cyrus, who captured Ecbatana in 552 B.C.

ASTY'ANAX (Gk. lord of the city, from ἄστυ, *asty*, city + ἀναξ, *anax*, ruler, lord). The son of Hector and Andromache, deported, according to the story, with his mother from the ruins of Troy by Pyrrhus. Upon the fortunes of these two Trojans Æacine has founded his admirable tragedy, *Andromaque*. At the death of Pyrrhus, Astyanax became King of Epirus. According to another legend, he was hurled from the walls of Troy, in fulfillment of an oracle.

ASUNCIÓN, ä-sūōn'syōn', NUESTRA SEÑORA DE LA, nwä'-strä sä-nyō'-rà dā lä. The capital of Paraguay, an episcopal city, situated on the east bank of the Paraguay River (Map: Paraguay, F 9). It was founded in 1536, on the feast day of the Assumption of the Virgin (August 15), and for more than a century was the capital of all the Spanish territory in the valley of the Río de la Plata. Among the notable buildings are a cathedral, several churches, a government palace, a public library, and a national college, and there is an agricultural

school. The regularity of its streets and its fine situation on the river bank make it notable among South American cities. A railway connects Asunción with Eucarnacion, on the Paraná, a distance of nearly 250 miles, and in 1913 through train service to Buenos Ayres was established. There is a line of river steamers connecting Asunción with Buenos Ayres and Montevideo. There are distilleries, mills, foundries, and shipyards, and manufacturing is carried on to a large extent. This city is the chief centre of trade for the country and has a considerable commerce, the principal articles of export being leather, tobacco, sugar, and *yerba maté*, or Paraguayan tea. Pop., 1895, 45,000; 1900, 51,700; 1905, 60,259; 1912 (est.), 84,000.

ASUR, ā'sūr. See ASSYRIA.

ASURBANIPAL, ā'sūr-bā'nē-pāl. See SARBANAPALUS; ASSYRIA.

ĀSVAGHŌSHA, āsh'vā-g'hō'shā, or **ĀQVA-GHOSA**. A Buddhist monk, author of a life of the Buddha, written in Sanskrit, and entitled *Buddha-carita*, or "Acts of the Buddha." He lived in the second or the fourth century A.D., and his poetical work on the legend of Buddha follows the manner of a classical Sanskrit epic, but is written with the elaboration and artificiality of the later court poetry. It was translated into Chinese between 414 and 421 A.D. For the Sanskrit edition consult Cowell, *Āsvaghosha's Buddha-carita* Oxford, 1893), and *Sacred Books of the East*, vol. xlix; and on the Chinese version consult Asvaghosha, *Discourse on the Awakening of Faith*, translated by Suzuki (Chicago, 1900).

ĀSVĀLAYANA, or **ĀQVALYANA**, āsh'vā-lā'yā-nā. The name of an ancient Sanskrit author, familiar in connection with Vedic literature, because of the *Srauta-Sūtra* and the *Grhya-Sūtra*, which bear his name. See VEDA.

ASVAMEDHA, ās'vā-mād'hā (horse-sacrifice). A Vedic and later Hindu rite, believed to be efficacious in insuring progeny.

ASVINS, ās'vinz. Two Vedic divinities of the heaven, the Aryan Dioscuri, later called Dasra and Nasatya. They are the first bringers of light in the morning sky, and the husbands of Surya, daughter of the sun god. The Asvins are the divine physicians and are frequently implored in the Rigveda, where they are always addressed together for release from ills of all kinds. Consult Bergaigne, *La religion védique*, vol. ii (Paris, 1878-83), and Macdonnell, *Vedic Mythology* (Strassburg, 1897).

ASWAIL, ās'wāl. See BEAR.

ASWAN, ā-swān'. See ASSUAN.

ASYLUM (Lat. Gk. *ἀσυλον*, *asylon*, right of sanctuary, refuge, a place safe from violence, from *ἀ*, a, priv. + *σῦλη*, *sylē*, right of seizure). A place of refuge. 1. In ancient times sacred places, especially the temples and altars of the gods, were appointed as asylums to which criminals as well as persecuted individuals might flee for refuge, and to molest them in such places was regarded as an impiety. An analogous institution is the "cities of refuge" (Num. xxxv. 9-34). Among the Greeks in early times these asylums might be sometimes useful in preventing hasty retribution; but in the course of time they were so much abused that their sanctity was in a great measure disregarded. Thus Pausanias, who fled to the altar of Athene, was taken and slain there by the Lacedæmonians, and in other cases the refugee was compelled to leave the asylum by fire or starvation. In Rome the Emperor Tiberius abolished all such places

of refuge from law, excepting those in the temples of Juno and Æsculapius. The custom of allowing to real or supposed criminals a place of safety in temples was also adopted by the Christian church. In the time of Constantine the Great the churches were made asylums; and Theodosius II extended the privilege to all courts, alleys, gardens, and houses belonging to the Church. In 681 A.D. the Synod of Toledo extended the privilege of asylum to a space of 30 paces around every church. In the lawless periods of the Middle Ages the influence of the Church often prevented deeds of gross injustice and violence; but the sanctity of churches was abused by criminals, and this led to several modifications which gradually destroyed the privilege of sanctuary (q.v.). In England it was abolished by acts passed in 1534 and 1697. 2. The word "asylum" is now applied to places of shelter for unfortunate or destitute persons and to hospitals for the insane. See LUNACY.

ASYLUM, RIGHT OF. In international law, a privilege accorded by the law of nations or by custom to foreign legations to shelter within their precincts persons subject to the jurisdiction of the state in which such legation is maintained. As this definition indicates, the right, so far as it exists at all, is a right to *extend* protection, not to *claim* it; and this circumstance differentiates it strikingly from the institution of asylum or sanctuary (q.v.) as practiced in primitive society. See ASYLUM, above; and also AVENGER OF BLOOD; CITY OF REFUGE.

The right of asylum originated in the fiction of extra-territoriality (q.v.), or the extension by a state of its territorial jurisdiction by its legations into the territory of another state, to the exclusion, so far as the precincts of the legation were concerned, of the domestic jurisdiction. The person taking refuge within the legation was deemed to have come under the protection of its flag, and, so long as he remained there, to be as completely exempt from the legal or executive process of the country as if he had escaped to the foreign territory represented by the legation. He might be surrendered by the government under whose flag he had taken refuge, at its pleasure, or as the subject of extradition (q.v.) proceedings; but any attempt to take him by force was an invasion of the territory of the state in whose legation he was sheltered. This is the theory upon which the alleged right of asylum rests, but it is a theory so clearly at variance with the real basis of international relations of independent states, and it has been so discredited by the abuses to which its application has led, that it has completely broken down. The fiction of extra-territoriality having been abandoned, attempts have been made to justify the right of asylum by the doctrine of the inviolability (q.v.) of diplomatic agents (q.v.), the members of their families, their official houses and property. But, in practice as well as in theory, this doctrine, which is intended only to guarantee the perfect freedom and fearlessness of the minister in the discharge of his functions as the representative of a foreign government, is strictly applicable only to the bona fide members of his household, not to visitors, and still less to strangers temporarily residing with him.

Notwithstanding the absence in international law of any justification of the right of asylum, it has been frequently granted in modern times, but only in countries whose civil institutions

fail to command the respect of foreign states, and in times of civil tumult. It was repeatedly practiced by the representatives of the Powers in Greece during the Revolution of 1862, and in Spain in the periods of anarchy between 1840 and 1850 and from 1865 to 1875. In the Spanish-American states it has been a common and recognized practice to protect in the legations the successive victims of the frequent revolutions by which changes in administration are commonly effected, and the legitimacy of the practice has not infrequently been acquiesced in by the state in which it occurred. This condition of affairs has given a certain legal sanction to the right of asylum in those countries, though it is usually justified by the states exercising it, not on legal grounds, but upon grounds of humanity. It is, however, universally conceded that it has no application to ordinary criminals, but only, as a measure of temporary protection, to political offenders. Even in this restricted form the practice has been generally discouraged and forbidden by the United States government, though the grant of asylum by our ministers in Central and South America has in exceptional cases been condoned or approved by the Department of State.

The following rules may be taken to represent the official, if not the consistent, attitude of our government:

1. In no case is a minister to offer his dwelling as a resort for refugees.

2. If a fugitive, uninvited, applies for protection, it is to be accorded only when his life is in imminent danger from mob violence and only for so long as such imminent danger continues.

3. A minister is bound to refuse asylum to persons fleeing from the pursuit of the legitimate agents of the government, and, in case such persons have been admitted, he must either surrender or dismiss them.

4. A minister is obliged strictly to abstain, except under the conditions and limitations prescribed by rule 2, from receiving or retaining persons who are engaged in political agitation, or who, though not formally accused, inspire the government with distrust.

As ships of war are generally conceded to be exempt from the local jurisdiction of the foreign ports visited by them, it is clearly within the power of commanders of such ships to grant asylum to refugees from that jurisdiction; but it is well settled that "considerations of propriety and good faith require" them "to abstain from abusing the hospitality of the port in which they may be by making their vessels an asylum for offenders against the law." Neither consuls (who are not diplomatic agents) nor merchant vessels, as a rule, enjoy any exemption from the local jurisdiction, and consequently they can assert no claim to grant asylum. Certain immunities which have been conceded to them from time to time have been exceptional in character, and more in the nature of courtesies extended than of rights admitted. The subject of asylum has been fully and learnedly treated by Prof. John B. Moore in his *Asylum in Legations and Consulates* (New York, 1892); and more briefly in Snow's *International Law* (Washington, 1898). Consult also Moore on *Extradition* (Boston, 1891); Wharton's *International Law Digest* (Washington, 1896); and Woolsey's *International Law* (New York, 1899).

ASYMPTOTE, ás'im-tót (Gk. ἀσύμπτωτος,

asymptōtos, not falling together, from *ἀ*, priv. + *σύν*, syn, with + *πίπτειν*, *piptein*, to fall). A straight line which a curve approaches nearer and nearer, but does not reach within any finite distance; or, in other words, a tangent to a curve, having the point of tangency at infinity. A clear idea of how a curve may have such a tangent can be procured from one of the well-known laws in physics. According to that law, the greater the pressure exerted upon a gas the smaller the volume it occupies. This law may be presented in geometrical form by drawing two lines, *OX* and *OY* (see figure), perpendicular to each other, and then representing pressures by perpendicular distances from the line *OX* and the corresponding volumes by perpendicular distances from the line *OY*. By joining the series of points, *P*, *P*, etc., thus obtained, the relation existing between the various pressures and volumes may be graphically shown by a curve called an equilateral hyperbola. The greater the pressure the smaller the volume, and hence the smaller the distance between the curve and the line *OY*. But where will the curve and the line *OY* be tangent? In other words, where will the distance between them, and hence the volume of gas, become naught? Evidently, at a point infinitely distant from the line *OX*, i.e.,

at a point representing an infinitely great pressure. For under any finite pressure, no matter how great, a gas still occupies a certain definite volume. The line *OY* is therefore, according to the definition, an asymptote of our curve, and so is, for analogous reasons, the line *OX*.

AS YOU LIKE IT. A comedy by Shakespeare, founded entirely on Lodge's romance, *Rosalynde*, save for the introduction of Touchstone, Audrey, and Jaques. It was written in 1600, but did not exist in folio until 1623.

ATA, á-tä'. A mixed Malay and Negrito people of Davao district, Mindanao. They do not form a distinct tribe, nor are they of uniform culture. Their language is broken up into many dialects not mutually intelligible. They are not to be confounded with the Aeta. See PHILIPPINES.

ATACAMA, á'tä-kä'mä. A northern province of Chile, bounded by the province of Antofagasta on the north, the Argentine province of Catamarca on the east, Coquimbo on the south, and the Pacific Ocean on the west. Its area, excluding the desert portion, is 30,728 square miles. The surface is stony, scantily watered, and mostly barren, but it is especially rich in minerals. Of these, copper and silver are mined on a large scale and are the most important, commercially, but there are also found considerable quantities of gold, nickel, cobalt, and iron. The salt and saltpetre deposits of the province are almost inexhaustible. Owing to its

important mineral production, Atacama is well supplied with railway lines, which connect the more important mining centres. The first railway built in Chile connects the capital with Caldera, the best ocean port of the country. Pop., 1895, 59,713; 1907, 64,000; 1910 (est.), 65,000. Capital, Copiapó.

ATACAMA. That part of the long coast desert of South America extending between the Pacific and the Andes, from the river Loa to Copiapó (23°-27° S. lat.) and embracing the larger part of the Chilean province of Antofagasta and the smaller part of the province of Atacama (Map: Chile, C 9). It rises abruptly from the coast to about 3500 feet, then more gradually to over 13,000 feet, with groups of mountains rising above the high plain, on whose surface are also interspersed small salt lakes and swamps. The surface is strewn with stones and is seldom sandy. The only river from the Cordilleras reaching the sea is the Rio Loa. The region is very rich in minerals, especially in copper and silver and nitrate deposits. The scanty rainfall and the scarcity of fresh water make it almost uninhabitable. No vegetation is found between the elevations of 2000 and 8000 feet except where mountain streams debouch upon the plateau.

AT'ACA'MAN, or AT'ACAME'ÑAN. The territory of this South American linguistic stock, now represented by a few hundred individuals, of whom hardly any still speak their mother tongue, included the region around Atacama (19°-24° S. lat.) except that portion in the southwest occupied by another stock, the Changoan. This part of the continent is archaeologically and ethnologically important as the seat of the ancient "Atacaman culture," recently studied by de Créqui-Montfort, Boman, etc. The surviving Atacamans are to be found at San Pedro de Atacama, etc. Consult Chamberlain in the *American Anthropologist*, vol. xiii, pp. 465-467 (N. S., 1911).

ATACAMITE. A copper hydroxylchloride that crystallizes in the orthorhombic system. It is usually found in confused crystalline aggregates and fibrous or granular massive forms. The lustre is vitreous and the color bright to dark green. As sand it was originally discovered in the Atacama province in northern Chile, whence its name; and it also occurs in Peru, Bolivia, and Australia. It has been found as a crust on the lavas of Vesuvius and Etna in Italy; also in Saxony and in Arizona. The deposits in South America, which contain from 50 to 60 per cent of copper, are regarded as valuable sources of copper, and have been sent to England to be smelted. Atacamite has been ground up in Chile and sold under the name of *arsenillo* as sand for letters. The greenish incrustation found on antique bronze utensils, weapons, and other articles, and commonly known as *arugo nobilis*, is composed of this mineral.

ATAHUALPA, ñ'tá-wál'pá (†-1533). Inca of Peru. He was the favorite son of Huayna Capac, who, upon his death-bed made Atahualpa King of Quito, while Huascar, his eldest son, received Peru (1525). In the spring of 1530 Atahualpa, incensed at Huascar's demand for homage, declared war against him and completely defeated Huascar on the plains of Quipaypan, in the neighborhood of Cuzco, the native Peruvian capital, in 1532, a few months before

the arrival of the Spaniards. Huascar was taken prisoner and confined in the strong fortress of Xauxa. Then followed, according to Garcilasso de la Vega, a series of atrocious massacres of all the royal family of the Incas. The extent of these massacres was undoubtedly grossly exaggerated by the surviving relatives of the victims, from whom Garcilasso derived his information; but there seems to be no sufficient reason for doubting that Atahualpa killed all whom he had reason to fear as future rivals. In the meantime the Spaniards had disembarked at Tumbez, and after a perilous march through the unknown country, Pizarro, at the head of his 200 cavaliers, approached the victorious camp of Atahualpa, where he found some 50,000 men assembled. By a stratagem Pizarro obtained possession of the person of the King. Atahualpa was treated with a great show of kindness at first, and more especially when he offered, as a ransom, to fill the room in which he stood with gold as high as he could reach. When Atahualpa's brother, Huascar, who was still a prisoner, heard of this, he offered still more advantageous terms for himself. To prevent this Atahualpa had him secretly assassinated. The golden treasure which was to constitute the ransom of Atahualpa now began to pour in, and at length Atahualpa demanded his freedom. This Pizarro refused to grant and accused Atahualpa of plotting against him. Atahualpa was placed on trial and formally condemned to death upon evidence furnished by an interpreter, who was desirous of possessing one of the wives of the King. He was threatened with burning at the stake as a heretic, but, as he submitted to baptism according to the rites of the Church, he was garroted, Aug. 29, 1533. The principal authority is Garcilasso de la Vega's *Royal Commentaries of the Incas*, trans. by C. R. Markham for the Hakluyt Society (London, 1869-81). Garcilasso's mother was of the Inca blood, or, according to more probable authority, one of the royal concubines.

ATAKAPA, á'tá-ká'pá, or ATTACAPA (Choctaw, man-eater). A tribe, now extinct, formerly occupying the western part of Louisiana. They are believed to have constituted a distinct linguistic stock, the Attacapan family, although the language shows some slight correspondence with both Carankawa and Tonkawa.

ATALA, á'tá'lá'. A romance of Chateaubriand, published in the Paris newspaper *Le Mercure de France* in 1801. Atala is the daughter of a North American Indian chief. She falls in love with a prisoner, who is the chief of another tribe, releases him, and flees with him. Having been brought up as a Christian, and sworn by her mother to a single life, she remains faithful to the vow and finally commits suicide in a fit of religious scrupulosity.

AT'ALAN'TA (Gk. Ἀτаланτή, *Atalantē*). A heroine in Greek mythology. The tradition recognizes two persons of this name, the Boeotian Atalanta and the Arcadian Atalanta, who are often confounded in the ancient accounts and whom it is not easy to keep apart. 1. The Boeotian Atalanta, daughter of Schœneus, was the most swift-footed of mortals. Being reluctant to marry any one of her many suitors, she imposed upon all who sought her hand the test of a foot-race with herself. If successful, the suitor was to receive her hand, but, if defeated, he was to be put to death. Hippomenes, son of Megareus, came to the contest with three golden

apples, which he had received from Aphrodite. By dropping these successively as he ran along he retarded the course of Atalanta—who stopped to pick them up—and thus won the race and the maiden. Since husband and wife failed to thank Aphrodite, the goddess led them, on their way home, to profane by their love a sanctuary of Cybele. Cybele, angered in her turn, changed them both into lions and yoked them to her chariot. For this version of the story see Ovid, *Metamorphoses*, x, 560-707. 2. The Arcadian Atalanta, daughter of Jasius and Clymene, was, when an infant, exposed on Mount Parthenius by her father, who desired a son. She was suckled by a she-wolf, and afterward rescued and brought up by shepherds. She lived apart from men, the companion of Artemis, skilled with the bow. Many achievements are ascribed to her. She slew the centaurs, Rhæcus and Hylæus, wounded the Calydonian boar, took part in the funeral games of Pelias, and sailed with the Argonauts to Colchis. She finally gave her hand to her suitor Meilanion, by whom she had a son, Parthenopæus, one of the Seven against Thebes.

ATALANTA IN CALYDON. A play by Swinburne. It is a quaint dramatic experiment, uniting Greek classic form with modern romantic treatment; a poem rather than a play. It appeared in 1864. It is founded on the famous boar hunt of Greek legend, and its choruses are among the author's highest achievements.

ATTALA. A city in Etowah Co., Ala., 56 miles northeast of Birmingham, on the Alabama Great Southern, the Louisville and Nashville, the Nashville, Chattanooga, and St. Louis, and the Southern railroads (Map: Alabama, C 1). It is the seat of the Etowah County high school, and has foundry and machine shops, iron mines, compress and storage plant, lumber yards, cooperage, and manufactories of cotton-mill castings, sink brackets, grates, etc. The water works are owned by the city. Pop., 1900, 1560; 1910, 2625.

ATAMAN (Russ. *ataman*, Little Russ. *otamen*, *hetman*, Polish *hetman*, chief of any band or gang. By some explained as an adaptation *via* Poland, of the AS. *heafodman*, Ger. *Hauptmann*, Eng. *headman*, or *hetman*). The title borne by the chief of the Cossack tribes. Formerly the ataman was elected by an assembly of the people and held the power of life and death. Even as subjects of the Czar the atamans held their power until in 1708; after the part played by Mazeppa in the war with Charles XII Peter the Great reduced them to little more than provisional governors. The head of each Cossack army is still called ataman, and an ataman presides over the government of the territory of the Don Cossacks. Since 1835 the title of Chief Ataman has been vested in the Russian heir-apparent. Hetman was also the title given by the Poles to the commander-in-chief of their armies, who was absolute in power during time of war, except when the King took command of the army.

ATAMAS/CO LILY. See Plate of **AMARYLLIDACEÆ**.

ATAULFUS, AT'AULF, or ADOLE, a'dôlf (?-415). The brother-in-law of Alaric, and his successor as King of the Visigoths (410-415). He assisted Alaric in the sieges of Rome, and after the latter's death went to Gaul, taking as a captive Galla Placidia, sister of the Emperor Honorius, who became his wife in June, 414.

He wished to ally himself with Rome, but Honorius was unwilling to form such an alliance. Late in 414 he entered Spain, and in 415 he was assassinated at Barcelona. His last words are said to have been: "If possible live in friendship with Rome, and restore Placidia to the Emperor." Consult Hodgkin, *Italy and her Invaders* (Oxford, 1880-85).

AT'AVISM (from Lat. *atarus*, the father of a great-grandfather, an ancestor). A term used in biology to signify the temporary appearance in an individual—plant or animal—of a peculiar character which is not typical of the immediate race or genus, but which is found in allied ancestral races. The term "atavism" is sometimes incorrectly used as a synonym for reversion. Reversion, as employed by paleontologists and students of evolution, refers to the gradual resumption by a race, during the later stages of its existence, of the general form of its ancestors, generally the form of the earliest ancestral members of the race. Abnormal developments are often examples of atavism, as are occasional modern many-toed horses, which recall the foot structure of the extinct three-toed horses of Tertiary time. Good illustrations of atavism are often also furnished by hybrids. See **EVOLUTION**; **HEREDITY**.

In sociological literature the term "atavism" is frequently used, in the sense of reversion to more primitive types, to explain criminal instincts and other social-pathological phenomena. In this sense the term is continually used by Lombroso, and by other authors of both the Italian and French schools of criminologists. See **CRIMINOLOGY**.

ATAXIA, LOCOMOTOR. See **LOCOMOTOR ATAXIA**.

ATBARA, át-bû'rá, or BAHR-EL-ASWAD. The most northerly tributary of the Nile, rising at the northern end of Lake Tsana, in Abyssinia (Map: Africa, H 3). It flows 800 miles northwest through the Nubian Desert and enters the Nile in lat. 17° N., above Berber. Its most important tributaries are the Bahr-Setit and Mareb. The Atbara is unavailable for navigation, but it is important on account of the large quantity of water it contributes to the Nile during the rainy season. It contributes to the Nile a large proportion of the silt which fertilizes the fields of Egypt. In the dry season the Atbara is almost waterless, except for a few stagnant pools, unfit for drinking.

ATCHAFALAYA, ách'a-fá-lí'yá. A river of Louisiana, having its source near the mouth of the Red River in Avoyelles Parish, and serving as an outlet for the Red and the Mississippi rivers during high water (Map: Louisiana, D 3). It flows south, and passing through Grand Lake, empties into Atchafalaya Bay, Gulf of Mexico. It is about 225 miles long and navigable for small boats for 218 miles.

ATCHEEN'. See **ACHIN**.

ATCHIEVEMENT. See **HATCHMENT**.

ATCHINSK, á-chênsk', or ACHINSK. The chief town of a district in the Yeniseisk government, southern Siberia, on the Chulym River. It is on the road to Tomsk and on the Trans-Siberian Railway, 108 miles west of Krasnoyarsk. Pop., 1897, 6714; 1910, 7000.

ATCH'ISON. A city, and the county-seat of Atchison Co., Kans., 49 miles northwest of Kansas City, Mo., on the Missouri Pacific, the Chicago, Rock Island, and Pacific, the Atchison, Topeka, and Santa Fe, and the Chicago, Burlington, and Quincy railroads, and on the Missouri

River (Map: Kansas, G 3). It is finely situated on the "Great Bend" of the Missouri; is the seat of a State soldiers' orphans' home and of Midland College (Lutheran), St. Benedict's College (Roman Catholic), and Mount St. Scholastica's Academy (Roman Catholic). It contains a public library; fine county courthouse and government buildings; Forest, City, and Central parks; a hospital; and a noteworthy bridge across the river, some 1200 feet long. The union station, erected at a cost of about \$140,000, is among the prominent buildings of the city. The city's exceptional facilities for transportation by rail and water have made Atchison one of the principal commercial cities of the State; it has an extensive trade in grain, lumber, live stock, fruit, and general agricultural produce, and large wholesale interests in groceries, drugs, and hardware. Manufactures also are of importance, the industrial establishments including large grain elevators, flour, corn, and oatmeal mills, railroad shops, foundries, lumber mills, furniture, broom, and harness factories, carriage works, and brickyards. The government, under a charter of 1881, is vested in a mayor, elected every two years; a municipal council; and administrative officials, appointed by the mayor. The school board is independently chosen by popular vote. Atchison was settled by the pro-slavery party in 1854, during the conflict between that party and the anti-slavery party for the control of Kansas, and was named in honor of Senator D. R. Atchison. It was incorporated in 1858. Pop., 1890, 13,963; 1900, 15,722; 1910, 16,429.

ATCHISON, DAVID RICE (1807-86). An American politician. He was born in Kentucky, removed to Missouri in 1830, and practiced law. In 1834, and again in 1838, he was a member of the State Legislature, and from 1843 to 1855 sat in the United States Senate, being president pro tempore in 1846-49 and in 1852-54. By virtue of this office Senator Atchison was for one day legal President of the United States, since General Taylor was not sworn in until Monday, March 5, 1849. A slave-holder himself, he soon became conspicuous as a pro-slavery leader in the debates over the organization of Kansas and Nebraska, and in 1854 fought with Douglas for the passage of the Kansas-Nebraska Act, which involved the repeal of the Missouri Compromise of 1820. Returning to western Missouri in 1855, he there took an active part in the struggle (1856-57) between the pro-slavery and "free state" parties for the control of Kansas, though for the most part he discountenanced violence and bloodshed.

ATE, á'té (Gk. Ἀτῆ, *Atē*, bewilderment, infatuation, from ἀείν, *aacín*, to hurt, damage, infatuate). The personification, in Greek mythology, of the blindness which leads men to ruin, called sometimes daughter of Zeus and Eris (Strife). She tricked Zeus into the oath which made Hercules subject to Eurystheus, and was in consequence cast forth from heaven; on earth thenceforth she led men into evil. Ate is seldom clearly personified. Even in the legend of her deception of Zeus we have scarcely more than allegory, and even in Greek tragedy Ate is rarely more than a quality.

ATELIERS NATIONAUX, á'te-lyá' ná'-syó'nó'. See NATIONAL WORKSHOPS.

ATELLA. See ATELLANÆ.

ATELLANÆ (Lat. *Fabulæ Atellanæ*, the Atellan fables, farces; also styled *Ludi Osci*,

the Oscan plays). A kind of popular drama in Rome, introduced, tradition said, from Atella, a town in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabulæ Atellanæ* were still retained as interludes and after-pieces. The Maccus (Fool) and the Bucco (Fat-Chaps) of the *Fabulæ Atellanæ* may be considered the origin of the modern Italian *arlecchino* (harlequin), and other characters of the same stamp. They were the favorite characters and, in the view of some, spoke the Oscan dialect, exciting laughter by its quaint, old-fashioned words and phrases. It is, however, not likely that the Oscan speech was used in them, at least to any extent; rather the *Atellanæ* ridiculed country life and manners. Other stock characters in the *Atellanæ* were Pappus (Papa, Daddy) and Dossennus (Sharper, Trickster). The *Atellanæ* were neither so dignified as the *comædia palliata*, nor so low as the *comædia tabernaria*, but indulged in a kind of genial and decent drollery. The caricature was at first always pleasant, and, though quizzical, did not lapse into the obscenity which characterized the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing caste, were allowed to take part in the *Atellanæ*. In Sulla's time the *Atellanæ* made an approach to literary form, in the writings of Pomponius and Novius. A few fragments of these popular farces have been collected by Ribbeck in his *Comicorum Romanorum Fragmenta* (Leipzig, 1898). Consult also Munk, *De Fabulis Atellanis* (Leipzig, 1840).

A TEMPO, á tēm'pó (It. to, or in time). A term used in music to denote that, after some short change in the time, the performer must return to the original tempo.

ATEUCHEUS SACER, á-tū'kūs sūs'sēr. See SCARABÆUS.

ATH, át, or **AATH**. A town in the province of Hainault, Belgium, situated on the navigable Dender, 14 miles northwest of Mons (Map: Belgium, B 4). It has a hospital and college, and important manufactures of linen, calico, lace, gloves, cutlery, etc., and carries on a brisk general trade. There are many lime kilns in the vicinity. Pop., 1890, 9900; 1900, 11,100; 1910, 11,108.

ATHABASCA, áth'á-bás'ká (N. Amer. Indian, place of hay or reeds). Formerly a district in Canada, formed in 1882 out of the Northwest Territories, and enlarged in 1895, so as to contain 251,300 square miles, including 11,800 square miles of water area. The district lay between lat. 55° and 60° N. and long. 100° and 120° W. It was bounded on the north by the former district of Mackenzie, on the east by the former district of Keewatin, on the south by the former districts of Saskatchewan and Alberta, and on the west by the province of British Columbia. It is a part of the great American Plain, and only in the southwest corner, where it approaches the mountains of British Columbia, does it attain any considerable elevation. Much of its surface, however, is decidedly broken and hilly. The greater portion drains northward into the Mackenzie River system. The western half is crossed by the Athabasca and Peace rivers. There are numerous lakes, of which Reindeer Lake, in the east, and Athabasca, in the north, are very large; the former is included in the province of Saskatchewan, while the latter is divided between Saskatchewan

and Alberta. The climate is subject to great extremes of heat and cold, but is clear and bracing. There is little rain or snow, but the rainfall is greatest when most needed, during the growing summer months. In the west the soil is highly fertile, and wheat, potatoes, and other of the hardier varieties of cereals and vegetables can be successfully raised. In the east the soil is rocky and sandy and less fertile. Salt and gypsum are found in the Slave River region. The inhabitants are mostly Indians and half-breeds, who live by hunting, the product of the chase constituting almost the only revenue-producing resource of the district. Dunvegan, in the southwest, is the principal settlement. In 1905 Athabasca ceased to exist as a political division, the western part falling to the new province of Alberta, the central part to the new province of Saskatchewan, and the extreme east to the Northwest Territories; the latter part in 1912 was included in Manitoba. For a further description, see ALBERTA; SASKATCHEWAN.

ATHABASCA, or ELK, RIVER. A river in the northwest of Canada, included in the great basin of the Mackenzie (Map: Canada, H 5). It rises near Yellowhead Pass in the Rocky Mountains. Its general course is east and then north to Athabasca Lake, from which it emerges and unites with the Peace River to form the Slave River. Its length is 765 miles, its drainage area 58,910 square miles, and its most important tributaries are the McLeod, Pembina, and Lesser Slave rivers.

ATHABASCA LAKE. A Canadian lake in the northern part of Alberta and Saskatchewan (Map: Canada, J 5). It is traversed by the parallel of 59° N. and by the meridian of 110° W.; length, 195 miles; average width, 20 miles; area, 3085 square miles. Its principal feeder is the Athabasca River.

ATHABASCA PASS. A defile of the Canadian Rocky Mountains between Mounts Brown and Hooker, which crosses the boundary between Alberta and British Columbia (Map: Northwest Territories, F 4).

ATHAL'ARIC (516-534). King of the Ostrogoths. He was selected by his grandfather, Theodoric the Great, as his successor, and upon the death of Theodoric was recognized as such by the Goths and Romans. In consequence of dissipation, however, he died at an early age.

ATHAL'IAH (Heb. Yahwe is powerful). The daughter of Ahab (2 Kings viii. 18), King of Israel, and Jezebel, who married Jehoram, King of Judah (ib. viii. 26). After the murder of her son, Ahaziah (2 Kings ix. 27), who succeeded Jehoram, but reigned for only one year, she paved her own way to the throne by a general slaughter of her grandchildren, Joash alone escaping through the intervention of Jehosheba, the daughter of Jehoram. This occurred c.842 B.C. The young prince thus rescued was privately educated in the temple, and, after Athaliah had reigned six years, the high priest, Jehoida, succeeded by a carefully contrived plan in placing Joash on the throne (c.836 B.C.). Athaliah, hearing the noise attending the coronation, hastened to the temple, where the people were shouting "God Save the King!" As she looked around in astonishment on the young King, whom she had supposed to be dead, surrounded by priests, Levites, rulers, captains, and a rejoicing multitude, she "rent her clothes, and cried, 'Treason! treason!'" By the command of the high priest she was led out of the temple and slain in the gateway of

the palace. The house of Baal, with its altars and images, was broken down. This narrative (2 Kings, xi.; 2 Chron. xxii. and xxiii.) is the subject of Racine's drama *Athalie*.

ATHALIE, a'ta'le' (Fr. Athaliah). The title of a tragedy by Racine, and his last play (1691). Founded upon the story of Athaliah in 2 Kings, it was written at the suggestion of Madame de Maintenon, who desired for her protégées, the girls of her school at Saint Cyr, a play in which there should be no word of sexual love. The dramatic quality of the play is no less striking than its religious fervor, and the tragedy may well have given a fit opportunity to Rachel's emotional gifts. If not the poet's masterpiece, it is perhaps inferior only to his dramas *Andromaque* and *Phèdre*.

ATH'AMAS. The son of Æolus, and ruler of Orchomenus in Boeotia. At first he married the cloud goddess Nephele, who bore him Phrixos and Helle, but he was abandoned by her on account of his love for the mortal Ino, daughter of Cadmus. By Ino he was the father of Melicertes and Learchus, the latter of whom he slew in a fit of madness. Thereupon Ino cast herself into the sea with Melicertes and was changed into the sea goddess Leucothea, while Melicertes became Palæmon, a divinity of sailors. Athamas fled to Thessaly, where, presently purged of his guilt, he married Themisto. The story of Athamas was much used by the Greek tragic writers.

ATHAN'AGILD (?-567). King of the Visigoths of Spain. In 554 he led the uprising against King Agila (549-554) and called the Byzantines of North Africa to his aid. The Emperor Justinian also lent his aid to Athanagild by sending to Spain an army under Patricius Liberius, which conquered the principal seaports on the southeastern coast of the peninsula. Agila was defeated at Seville and murdered by his followers, and Athanagild succeeded to the throne. He built the churches of St. Justa and St. Rufina at Toledo.

ATHAN'ARIC (?-381 A.D.). A ruler, with the title of judge, of the Western Goths (Visigoths), whose settlements lay on the north bank of the lower Danube. Since he took advantage of the weakness of the Roman Empire when the imperial armies were engaged in suppressing the rebellion of Procopius, war was declared against him by the Emperor Valens. Athanaric acted strictly on the defensive during two campaigns, in which the Romans gained no advantage over him; but in the third year of the war (369 A.D.) he hazarded a general battle, and was defeated, whereupon he sued for peace, and, with that object, had a conference with Valens in a boat on the Danube. After peace was concluded Athanaric was occupied in settling dissensions arising out of the Arian controversy, which then agitated his people; he was a relentless foe of all Christians. When the first advance of the Huns on Europe alarmed the Gothic nation, Athanaric attempted to secure the eastern borders of his kingdom; but the Huns forced the passages of the Dnieper, defeated the Goths, and advanced in great force into the plains of Dacia. When, in 376, the Western Goths were received by the Romans as allies, and had settlements granted them on the south of the Danube, Athanaric, with a part of his people, refused to accompany them, removing to the west and fortifying himself against the new enemy. In 380, however, banished by his followers, he accepted the hospitality of the Empire, and re-

moved to Constantinople, where he was cordially and honorably received by the Emperor Theodosius. Fourteen days later he died. Consult Hodgkin, *Italy and her Invaders*, vol. i (Oxford, 1880), and *The Cambridge Mediæval History*, vol. i (New York, 1911).

ATHANASIAN (āth'ā-nā'zhan) **CREED**, THE. Often called the Quicumque, from its first Latin word. The longest of the three so-called ecumenical creeds and the latest in time of composition. (See CREEDS AND CONFESSIONS and NICENE CREED.) It was long supposed that the Athanasian Creed was the work of the saint whose name it bears. Mediæval legend said that Athanasius wrote it while in exile in Rome, during the episcopate of Julius I (337-352), but since the seventeenth century this theory has been shown to be untenable. Among the arguments against it are these: The creed was written in Latin, whereas Athanasius spoke and wrote Greek; it is nowhere mentioned by Athanasius, or by any of the other Greek fathers of the century after his death; it omits certain forms of statement which Athanasius was specially interested in maintaining, and includes others which were not formulated until a later time; and it appears first in the West, and never received the sanction of the Eastern church at all. On the other hand, a study of the contents of this so-called creed, and a careful comparison of other documents, make it appear probable that what we have is in fact not a creed at all, but rather an explication, or setting forth, first, of the Catholic doctrine of the Trinity, and, secondly, of the person and work of Christ. The creed thus falls into two main divisions, the former clearly depending upon the teaching of St. Augustine, the latter upon the Christology of Chalcedon (q.v.). It may have been, wholly or in part, a sermon on the creed, such discourses being very common at that age of the Church. And indeed Hincmar of Rheims (ninth century) expressly calls this creed *sermonem Athanasii de fide*. Or it may have been regarded as a sort of hymn or chant, to be used in public worship, like the Te Deum. We know that in the Middle Ages the Quicumque was actually recited at Prime by the monks in the monasteries of southern Gaul. This liturgical use of our symbol can be traced as far back as the Carolingian period, and the formula itself is doubtless still older. It is apparently referred to in the acts of the Synod of Autun (c.670 A.D.), and most modern scholars are inclined to place its composition, or compilation, in the sixth century.

Striking parallels, amounting sometimes to verbal identity, are found to the Athanasian Creed in a sermon falsely attributed to Augustine, but really perhaps by Cæsarius of Arles (ps. Augustine, *Sermo* 244), in the *Commonitory* of Vincent, of Lerins (434 A.D.), and in Augustine's treatises on *The Trinity* and *Christian Doctrine*, which are still older. At least one of the characteristic phrases of this creed was current in the West early in the third century (Tertullian, *Adv. Prax.*, 13, "The Father is God, and the Son is God, and the Holy Ghost is God, and each is God"). It would appear, therefore, that we have to do, not with the work of any single writer, but with a document which was produced gradually, perhaps from various sources, but worked into a unity under Augustinian influence, and reaching its present form by the sixth century, probably in southern Gaul or north Africa.

At the beginning of the Athanasian Creed, and

also at the end of each of its two divisions, occur damnatory clauses, pronouncing eternal doom upon all who do not accept the Catholic faith as here set forth. So far as doctrine is concerned, the creed agrees with the theology of western Christendom, including Protestantism. But objection has often been made to the way in which the faith is here expressed, especially to its rigid form, its highly artificial refinements, its mathematical precision, the minute detail arising from its great length, and the damnatory clauses. Most Protestant churches do not make use of this creed, although it is retained in the English Book of Common Prayer and is appointed to be read in that church on thirteen special days of the year. The American Episcopal church has dropped it entirely.

For the text of the Athanasian Creed, consult the English Prayer Book, and Philip Schaff, *Creeds of Christendom*, vols. i, ii (New York, 1884). Consult also: A. E. Burn, *The Athanasian Creed and its Early Commentators* (Cambridge, 1896); G. D. W. Ommanney, *Critical Dissertation on the Athanasian Creed* (Oxford, 1897).

ATHANASIUS, āth'ā-nā'zhī-ūs, SAINT (Gk. Ἀθανάσιος, *Athanasios*) (c.293-373). The father of Greek orthodoxy, Bishop of Alexandria, and the most eminent theologian of the fourth century. He was probably born in Alexandria, and died there. His parents are said to have been Christians. We know little about his youth, except that he was well educated and brought up for the service of the Church. Rufinus tells us that in early boyhood Athanasius played at being bishop and baptized some of his mates according to the rules of the Church, and that the bishop afterward recognized their baptism as valid; but this story rests upon no sufficient evidence. Athanasius began to serve the Church as reader, and was advanced to the office of deacon before the beginning of the great theological struggle which led up to the Council of Nicæa (325), where he appears as an opponent of the presbyter Arius, who also lived in Alexandria. His life is intimately connected with the progress of the Arian controversy, and he was by far the most formidable antagonist whom that heresy encountered. For many years it was "Athanasius contra mundum," but his great ability and perseverance gained the victory in the end. (For particulars respecting this struggle, see NICÆA, COUNCIL OF; ARIUS.) Athanasius advocated the famous *homoousion* doctrine, which was that the Son of God is of the same essence or substance with the Father, whereas Arius maintained that the Son was of like substance with the Father, but the first of creation, and more than man. All the Trinitarian and Christological speculations of the fourth and fifth centuries have their roots in this controversy.

Athanasius became Bishop of Alexandria, probably in 326, and his episcopate lasted until his death, 47 years afterward. At this time Alexandria was not only one of the leading cities of the Empire, but also one of the most important in the Church. For more than a century the greatest theologians had worked and taught here, and here, too, divergences from Catholic orthodoxy were by no means rare. During the progress of the Arian controversy politics mingled with theology, and each side labored to win Imperial favor. The Arian party was influential at court and very active. Five times

Athanasius was sent into exile, and more than one-third of his long episcopate was spent away from his see. Almost from the first, charges of immorality, sacrilege, sorcery, treason, and even murder were brought against him by his enemies; but in every case the verdict of history has pronounced him innocent. A grossly partisan synod at Tyre (335) condemned him, and the outcome was his first banishment, lasting two years, which he spent at Treves. He was pardoned after the death of Arius, and returned to Alexandria amid the acclamations of the people (337). The Emperor Constantius banished him again in 339, and this second exile extended over seven years. Athanasius sought refuge with Julius, Bishop of Rome, where he was well received, and where, according to an unreliable tradition, he is said to have written the Athanasian creed (q.v.). Leaving Rome, he visited Gaul, Dacia, Aquileia, and Antioch. In 346 he was permitted to return to his see, and the joyful people streamed forth to meet him "like another Nile." By favor of the Emperor Constans Athanasius now enjoyed 10 years of comparative quiet; but in 356, owing to the renewed ascendancy of the Arian party, who had gained control of all the churches in Alexandria, he was once more compelled to seek safety in flight. For six years he dwelt among the Egyptian hermits, or concealed himself in the neighborhood of the capital, where he could secretly watch the fortunes of his church. These years were fruitful in literary labor, and at the same time they gave him a more intimate knowledge of the monastic life. Athanasius was the first episcopal patron of the monks, and it is largely through him that the Western church came to know of the Egyptian hermits. After Julian's accession a policy of religious toleration was inaugurated, and Athanasius was recalled. But the Emperor had a personal falling out with the Bishop the same year (362) and issued a special edict against him, so that he fled to Thebais, where he remained about 18 months. His fifth and last exile lasted only four months and brings us down to the year 366. Seven years of life remained to the aged Bishop, and these were spent in quiet labor at his post, and in enjoyment of the honors his fidelity had earned. The theological battle was practically over, and the victory rested with the cause of Nicene orthodoxy. Athanasius's disciples, especially Basil the Great and the two Gregories, were instrumental in securing the final verdict in its favor at the second Ecumenical Council at Constantinople (381).

Athanasius was a voluminous writer. His works are chiefly controversial and dogmatic, though some are exegetical and pastoral. Highly valuable to the historian are such works as the *Discourses against the Arians*, the *History of the Arians*, the *Apology against the Arians*, and *On the Decrees of the Nicene Synod*. The *Life of St. Anthony* purports to describe that famous hermit, but it is full of legendary material. A series of *Festal Epistles*, relating to the celebration of Easter, contains much valuable material of various kinds; e.g., the Thirty-ninth Epistle, for the year 367, gives a very important list of the canonical books of the Bible.

The Benedictine edition of Athanasius's works appeared in Paris (3 vols., 1698). Migne's *Patrologia Græca*, vols. xxv-xxviii (Paris, 1857), is more nearly complete, but has the usual faults of that collection. The *Festal Epistles* were edited by Cureton (London, 1848). An Eng-

lish translation of the "Historical Tracts" and "Treatises in Controversy with the Arians" may be found in *The Library of the Fathers* (Oxford, 1843). Selections from his writings, including all the most important, and also his letters, are translated by Archibald Robertson, who furnishes elaborate prolegomena discussing "The Life and Theology of Athanasius," in the *Nicene and Post-Nicene Fathers*, 2d series, vol. iv, ed. by Schaff and Wace (New York, 1892). Consult also William Bright, *Lessons from the Lives of Three Great Fathers* (London, 1890); F. W. Farrar, *Lives of the Fathers*, vol. i (New York, 1889); W. Cave, *Lives of the Fathers*, vol. ii, ed. by Cary (Oxford, 1840); and the article on Athanasius in Smith and Wace's *Dictionary of Christian Biography*. For the teaching of Athanasius, consult: Harnack, *History of Dogma*, vol. iv (Boston, 1898), and Fisher, *History of Christian Doctrine* (New York, 1896); Bishop, *Development of the Trinitarian Doctrine in the Nicene and Athanasian Creed* (New York, 1911); Simpson, *Athanasian Warning* (New York, 1911); Taylor, *Athanasian Creed in the Twentieth Century* (New York, 1911); Burn, *The Athanasian Creed* (London, 1912).

ATHAPASCAN STOCK. One of the most important and most widely extended linguistic stocks of North America, having its territorial and tribal nucleus along the Yukon and Mackenzie rivers of Alaska and British America, but extending in detached tribes on both sides of the great divide southward almost to central Mexico. The line of migration has evidently been by successive conquests from north to south, the original tribes everywhere giving way before the more warlike Athapascans. Tribal characteristics and habits are as various as might be expected in a race scattered from the Arctic zone to the tropics. Among the more important tribes may be named the Chippewayan, Kuchin, Taculli, Sarsi, Hupa, Navajo, Apache, Jicarilla, Mescalero, and Lipan. See these tribal names for detailed information.

ATHARVA, ā-t'hār'vā, or **ATHARVAN**, ā-t'hār'van, or **ATHARVAVEDA**, ā-t'hār'vā-vā'dā. The name of the fourth Veda.

ATHEISM (Gk. *á, a*, priv. + *theós*, *theos*, god). The doctrine that there is no God. It is to be clearly distinguished from agnosticism (q.v.), which is a profession of ignorance about God, not a denial of His existence. Many of those charged with atheism have merely rejected some particular form of popular belief in the gods. The early Christians were called atheists because they denied the gods of the Greeks and Romans, and Christians themselves have sometimes used the term with little more justification. Voltaire and Thomas Paine are instances of men widely denounced as atheists, who were not atheists, but deists (see **DEISM**). Real atheism, however, has appeared in almost every highly developed civilization. Its cause is usually new philosophical or moral ideas, which seem, at least for a time, to be incompatible with current theistic belief. Often it voices a protest against an unworthy conception of God. In India the Sankya philosophy, which is one of the great systems of Hindu thought, Buddhism, and Jainism are atheistic, each arguing against an eternal Creator on the ground that the conception is both needless and illogical. Atheism appeared occasionally in Greek and Roman thought, though some of those charged with it, as Protagoras, were really agnostics. In the

modern world it arises from a belief that the arguments to prove a God are not sufficient to compel acceptance; from materialism, the belief that no power except that of physical forces is needed to explain the universe; and from sensationalism, the belief that all ideas are the result of sensations, and that we can know nothing about the Absolute or Infinite. The last position leads more logically to agnosticism. In the eighteenth century atheism gained some followers in France, and later, in Germany. The most famous exponents of it were La Mettrie, Holbach, Feuerbach, and Carl Vogt. In modern thought Comte, from the philosophical side, and Haeckel, from the scientific, have put forward systems of thought essentially atheistic, in that they account for the universe without the hypothesis of a self-existent and self-conscious God. Atheism is not necessarily irreligious. On the contrary, Buddhism, Jainism, and the Positivism of Comte are organized religions. For modern atheism, consult Flint, *Anti-theistic Theories* (Edinburgh, 1879); Otto, *Naturalism and Religion* (London, 1907).

ATHEIST, THE. Otway's last play, being a continuation of *The Soldier's Fortune*, produced at Dorset Gardens in 1684, with Betterton as Beaugard and Mrs. Barry as Porcia. Its plot, which is extremely involved, is drawn from a French novel, *The Invisible Mistress*, by Scarron. It was dedicated to Lord Eland, son of the Marquis of Halifax.

ATHEIST'S TRAGEDY, THE. One of Cyril Tourneur's best-known plays. It bears the subtitle of *The Honest Man's Revenge*, and, when published in 1611, also bore the note, "As in divers places it hath often beene acted." It was probably written in 1600. The plot, grotesque and crude, is drawn from the *Decameron*. As poetry, it contains several passages of no little imaginative power.

ATH'ELARD. See ADELARD.

ATH'ELING (AS. *Ætheling*; Ger. *Adel*, nobility). Among the Anglo-Saxons a general designation for a noble. In the ninth and tenth centuries it was often restricted to members of the royal family and sometimes to the heir to the throne.

ATHELNEY, æth'el-nī, ISLE OF (AS. *Æthelinga*, prince's + *ig*, island). An island in the midst of a marsh, at the junction of the rivers Tone and Parret, in the middle of Somersetshire, England. Here Alfred established his camp as a rallying point against the Danes, and later (in 888) founded a Benedictine abbey, now entirely gone. Athelney is the scene of Alfred's reputed adventure with the cakes. The "Alfred Jewel" was found there in 1693. See ALFRED.

ATH'ELSTAN (AS. *Æthele*, noble + *stān*, stone), or **ÆTHELSTAN** (c.894-940). The grandson of Alfred the Great and the first monarch who took the title of King of England. He was crowned at Kingston, in Surrey, in 924 or 925, and seems to have possessed both great ambition and high talent. It is supposed that his design was to unite in subjection to his single sway the entire island of Britain. On the death of Sihtric, King of Northumbria, who had married one of his sisters, Athelstan took possession of his dominions. The other kings of the island submitted to him, and he styled himself *Rex totius Britanniae*. A league, composed of Welsh, Scotch, and English, was formed against him. A fierce and decisive battle was fought at Brun-

anburh, in 937, in which the allies were utterly defeated and which became famous in Saxon song. After this the reputation of Athelstan spread to the Continent. Five of his half-sisters married continental nobles, viz., Otho the Great, Charles the Simple, Hugh the Great, Louis, King of Arles, and a German noble. At home he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and encouraged the translation of the Bible into the vernacular. He died at Gloucester, Oct. 27, 940. Consult Freeman, *Old English History* (London, 1869) and *The Norman Conquest* (London, 1885).

ATH'ELSTANE. A character in Scott's *Ivanhoe*. Although of gigantic strength, he is nicknamed "The Unready," because of his phlegmatic temperament. He is a suitor for the hand of Rowena, but in the end renounces his pretensions in favor of Ivanhoe. His title is "Thane of Coningsburgh."

ATHENA. See MINERVA.

ATH'ENÆUM (Lat. *Athenæum*, from Gk. *Ἀθῆναιον*, *Athēnaion*, temple of Athene). The name applied in general to temples dedicated to the tutelary goddess of Athens, though more particularly used to designate one of these temples in Athens where poets and men of letters were accustomed to meet and read their productions. (See ATHENE, TEMPLE OF.) At Rome the Athenæum was a celebrated institution of learning, founded by Hadrian about 135 A.D., and developed by those of his successors who were interested in literature and education. The building was in the form of a theatre, in which poets and rhetoricians read their productions, delivered lectures, and held recitations. In time salaried professorial chairs were attached to the Athenæum, which thus became a university like that at Alexandria. In this form it survived until the fifth century. Similar institutions, bearing the same name, were established in Lyons, Marseilles, and other provincial centres. The term is applied also in Belgium and Holland to schools of a grade below the universities. In modern times the term has become a very general designation for literary or scientific clubs and societies, or for the buildings in which they meet, and has been adopted as the title of a number of important literary journals, notably of one in Paris and of one in London. The best-known club is that founded in London in 1824. Its members are elected from among men "of distinguished eminence in sciences, literature, or the arts, or for public service." The club is situated at 107 Pall Mall.

ATH'ENÆUS (Gk. *Ἀθῆναίος*, *Athēnaios*). A Greek writer who flourished in the latter half of the second and the early third century A.D., born at Naucratis, in Egypt. He lived first at Alexandria and afterward in Rome; but we possess no further details of his life. His great work was the *Deipnosophistæ* ('The Dinner of the Learned'), in 15 books. Of this the first two and parts of the third, eleventh, and fifteenth have come down to us only in an abridged form; the remaining books are complete. After the model of Plato's Symposium, Athenæus relates to his friend Timocrates the table talk at a dinner given by one Larcensius, to which 29 guests were invited. Among them were jurists, poets, grammarians, philosophers, orators, physicians, and musicians: The work, as a matter of fact, consisted of extracts from an enormous

number of books (2500, by 800 writers) which are introduced into the imaginary conversation. Almost every possible subject, from cookery to grammar and literary criticism, is discussed, but the author is especially fond of scandal and of cookery. The work has not a single gleam of genius, the dialogue is prolix and lumbering; but as a storehouse of miscellaneous information the book is invaluable. The date of composition is after 192 A.D., for the Emperor Commodus, who was murdered in that year, is ridiculed in it: according to Kaibel, after 228. The best edition is by Kaibel (1887-90). The work was also edited by Schweighäuser (1801-07), Dindorf (1827), Meineke (1858-67), and was translated by Yonge in Bohn's Classical Library (1854).

ATH'ENAG'ORAS (Gk. 'Αθηνάγορας). An early Christian philosopher, who taught first at Athens and afterward at Alexandria. He is one of the oldest of the apologetical writers, and is favorably known by his *Legatio pro Christianis*, which he addressed to the Emperor Marcus Aurelius, about the year 177 A.D. He therein defended the Christians against the monstrous accusations of the heathens—viz., that they were guilty of atheism, incest, and cannibalism. His work is written in a philosophical spirit and is marked by great clearness and cogency of style. We likewise possess a valuable treatise of his on the resurrection of the dead. Consult the English translation in *Ante-Nicene Christian Library*, vol. ii, pp. 129-162 (New York, 1867).

ATH'ENAI'S. See EUBOICIA.

ATHENE, á-thē'ná. See MINERVA.

ATHENE, TEMPLE OF. 1. The name long given to a famous Doric temple at Ægina, of which 22 columns remain. The sculptures of the pediment, representing a contest of Trojans and Greeks, are among the Æginetan Marbles at Munich. In recent years scholars have inclined to believe that the temple was built rather in honor of Aphaea. (See ÆGINETAN SCULPTURES.) 2. An old temple at Athens, situated between the Parthenon and the Erechtheum, the foundations of which were identified in 1885 by Dörpfeld, who has based on them a reconstruction of the temple. (See ATHENS.) 3. An archaic Doric temple dating from the sixth century B.C., at Syracuse, now a cathedral. 4. See PARTHENON.

ATHENE NI'KE, TEMPLE OF. See NIKE APTEROS, TEMPLE OF.

ATHENE PAR'THENOS (Gk. 'Αθήνη παρθένος, Athene, the Virgin). A small, inferior copy of the great chryselephantine statue of Athene. It is in the possession of the National Museum at Athens. The original was the work of Phidias for the Parthenon.

ATHE'NIS. See BUPALUS.

ATHEN'ODO'RUS (Gk. 'Αθηνόδοτος, Athēnōdōtos). 1. The Rhodian sculptor of the first century B.C., who, with two others, produced the famous "Laocoön." (See LAOCOÖN; GREEK ART.) 2. Surnamed *Cananites*, from *Cana*, near Tarsus, his birthplace, son of Sandon (c.74 B.C.-8 A.D.). A Stoic philosopher, the instructor of Augustus when the latter was a boy at Apollonia; he came afterward to Rome, where the Emperor favored him highly, and made him tutor of the young Tiberius. His influence was great at court, and he was very free-spoken; he is said to have advised Augustus to repeat the alphabet whenever he felt himself giving way to anger. He was on friendly terms, too, with Cicero and Strabo; the latter declares that he

was a learned scientist. In his old age Athenodorus returned to his native town, Tarsus, where he died. 3. A Stoic philosopher, of Tarsus, surnamed Cordylion (c.110-40 B.C.). As director of the library at Pergamum, he sought to purify Stoic writings by cutting out of them passages which did not meet his views. From 70 B.C. he lived at Rome in the house of Cato Uticensis.

ATH'ENS (Gk. 'Αθήναι, Athēnai, usually derived from the name of the goddess Athene). The capital of the kingdom of Greece and of the nome of Attica; situated in lat. 37° 58' N., and long. 23° 44' E., on the southwest coast of Attica, less than 3 miles from the Saronic Gulf at the nearest point, and about 4½ miles from the harbor of Piræus, in the plain bounded on the northwest and north by Mount Parnes, on the northwest by Mount Pentelicon, on the east by Mount Hymettus, on the south by the sea, and on the west by Mount Ægaleos (Map: Greece, E 4). It is 350 feet above sea level and has a moderate climate, the mean temperature ranging from 46° F. in January to 81° in July. The cluster of houses at the foot of the Acropolis on the site of ancient Athens forms the inner city, with narrow, crooked streets; and outside of this the Neapolis, or new city, extends in a semicircular arc, which is regularly laid out and divided into six districts. It is connected with the older portion by Hermes and Æolus streets, the main business thoroughfares, which intersect at Constitution Square, the site of the royal palace and gardens. In the modern section the Square of Harmony (Place de la Concorde) forms a centre from which wide boulevards radiate in various directions, the most important of which are Piræus Street, Athens Street, Stadion Street, and University Street, the last two ending in Constitution Square. On the two avenues last mentioned stand the government offices and the buildings of the archaeological colleges, of the Academy of Sciences, of the National Library, and of the National University. Other important modern structures are the Royal Palace, erected from 1834 to 1838, situated amid magnificent gardens, the House of Parliament, Palace of Justice, the Polytechnic Institute, National Archaeological Museum with its priceless collections, the Metropolitan, Roman, and Anglican churches, and extensive cavalry barracks. For illustrations of the architectural features of Athens, see ARCHITECTURE.

The government of the city is administered by a mayor, or *demarchos*, chosen by popular vote every four years, together with a council of 18 members, which has jurisdiction over the suburbs of the parish. There is a municipal fire department, but the police is under the control of the central government. The city owns its gas and electric plants as well as the water works, which include the ancient aqueduct of Hadrian, but the water supply is so scanty that the inhabitants are obliged to supplement it by purchase from water-carriers. Street cars traverse the city in every direction, and railroads from all parts of Greece converge here. A suburban line runs to the bathing resort of Phaleron, close to the port of Piræus. Athens is the seat of several foreign consulates, including one of the United States. It is the financial centre of Greece, although it does little manufacturing and trades only in imports for its own consumption. It is the seat of a Greek Metropolitan. The population has been steadily increasing in

the last quarter of a century. It numbered 66,834 in 1879, 107,251 in 1889, 111,486 in 1896, exclusive of the suburbs, 167,479 in 1907.

Education. There are primary, secondary, normal, technical, and industrial schools. The National University, founded in 1837 and named in honor of King Otho, received its present title after his abdication. Its income is about \$80,000, the number of students about 2500. The faculties comprise theology, law, medicine, philosophy, and mathematics and physics. The university has a number of museums, laboratories, and a library, which is also the National Library, of 250,000 volumes, 2300 MSS., and 200,000 historical documents. Besides this there are the library of Parliament, with 160,000 volumes, the National Museum, and that of the Acropolis.

But to foreigners the chief educational importance of Athens centres not in the university, but in the various schools established there by other nations, for study of Greek archaeology. Of these the American School of Classical Studies is of especial importance. It was founded by the Archaeological Institute of America and opened in 1882. It is supported by regular contributions from American universities and colleges and by gifts, and has a permanent director and secretary and a professor of Greek language and literature chosen annually from among the institutions which support it. It has three scholarships, two for men and one for women. Its students are in the main drawn from American colleges and universities. Besides instruction it devotes much time to investigation. Its organ is the *American Journal of Archaeology*. Like this in many respects is the French School at Athens, founded in 1846, which is supported by the State and controlled by it, with the assistance of the Academy of Inscriptions and Belles-Lettres. It is managed by a director and associates. The British School at Athens was founded in 1886, is supported partly by the government and partly by contributions from the universities of Oxford and Cambridge, the Society for the Promotion of Hellenic Studies, and private subscription. It is under the control of a managing committee in London and a director, assistant director, and secretary in Athens. Like the American School, it devotes itself to both teaching and excavation. Of equal importance is the Royal German Archaeological Institute, founded in 1874, supported by the government and under the control of a directorate in Berlin, represented by secretaries both in Athens and in Rome. The work of this institute has been of an unusually high character. All these organizations issue monographs and proceedings.

History. The early history of Athens is involved in obscurity. The Athenians themselves claimed to be *autochthones*, and there can be no doubt that Attica was outside of the great waves of migration that swept over northern Greece and the Peloponnesus. In all probability the early inhabitants of Athens were a people made up of an original stock which occupied the place from Minoan times at least and an admixture of incomers from Ionia. These newcomers seem to have been responsible for many of the important changes which subsequently took place in Attica. In the earliest times Athens, or Cecropia, was only one of a number of petty states, but tradition said that it became the capital under Theseus, who united the whole of Attica under his rule. Theseus may be mythical, but it is certain that Athens

early became so thoroughly the capital of the country that only Eleusis preserved the memory of independence. Like all the early states, Athens is said to have been ruled by kings, of whom the last was Codrus. The rule of archons, chosen for life, seems to represent the limitation of the royal power by the nobles, Eupatridæ; and when, in 753 B.C. (according to tradition), the term of office was made 10 years, and in 683 B.C. reduced to one, it is clear that the government had become an aristocracy. The name of king was indeed always retained as a title for that one of the archons to whom were intrusted the old priestly functions of royalty. Another archon was called Polemarchus, as the commander in war; while the first, who seems to have been charged with the civil government, was called simply "the archon," and gave his name to the year. See ARCHON.

During this early time the citizens were divided into four tribes, and each tribe into three brotherhoods, though these associations seem to have been older than the tribes. At first only the members of the noble clans belonged to the brotherhoods; but some time in the seventh century B.C. the peasants and craftsmen, who were organized like the nobles, seem to have been admitted, and later enrollment in a brotherhood was required of all legitimate children. The aristocratic government of the three archons and the Council of Elders was forced by the changes common to the Greek world after 700 B.C. to give increasing recognition to wealth apart from birth. The exact course of this revolution cannot be traced, but one step was the institution of the six Thesmothetæ, or junior archons, who took charge of the judicial system. The commercial development of Athens was rapid during this period and led early to the creation of a fleet, though of the details of its organization we are not informed. This prosperity and the introduction of a metallic currency do not seem to have helped the small landowners or the peasants, and, though they loyally supported the government against the conspiracy of Cylon (about 630 B.C.), their condition seems to have grown worse rapidly, perhaps in consequence of a war with Megara. To help them against the oppression under which they suffered, it was decided to form a written code of laws, and about 621 B.C. this work was intrusted to Draco. His labors did not give sufficient relief. The small farmers were driven to borrow money, mortgaging their land, and thus rapidly falling into the power of the rich, while the tenants, who rented land, were often reduced to slavery and even sold out of the country, from inability to pay their debts. A revolution seemed imminent, but was averted by the wise legislation of Solon, in 594-593 or 592-591 B.C. By cancellation of all debts involving the freedom of the debtor, and by freeing all in slavery for debt, he relieved the freeman, while, by the substitution of the Eubæic for the Æginetan standard in coinage, he brought Athens in alliance with Chalcis, and opened the way to the development of the western trade. His great service was the reform of the constitution on a really democratic basis, though outwardly it was still a timocracy. Four classes were now recognized, according to the wealth of the individual citizens, and, though the archonship was open only to the first class, and no offices were granted to those in the fourth, yet as all citizens could vote in the Ecclesia, and sit in the courts, now

established, the election and judgment of the magistrates were in the hands of all and not a privileged few.

The old Council of the Areopagus, composed henceforth of ex-archons, was made the supreme guardian of the laws, and a new senate of 400, chosen equally from the four tribes, was instituted to prepare the business for the Ecclesia. Though the situation was much alleviated by the reforms of Solon, the political parties still continued their struggles. The party of the nobles, living chiefly in the city and the Attic plain, was known as that of the Plain; the moderate party, which was satisfied with the new order, was largely composed of the middle class, and, from the residence of many of them, was called that of the Coast; a third party of a more radical type was that of the Hills, for most of its members seem to have come from the mountain regions. Aided by the Hillmen, Pisistratus made himself tyrant (561 B.C.), and, though twice driven out, finally handed down his power to his sons, who ruled till the murder of Hipparchus (514 B.C.), and expulsion of Hippias (510 B.C.). During this time the forms of the constitution had been observed, though all offices had been filled by the friends of the tyrants. The period was one of growth in foreign influence and internal prosperity. The tyrants beautified the city with new temples, introduced a better supply of water, and inaugurated more splendid festivals, thus producing greater contentment with their rule.

After the overthrow of this tyranny by Cleisthenes, party strife broke out afresh; but Cleisthenes finally succeeded in securing a revision of the constitution which removed entirely the danger of local parties. As a basis for his division of the people, he took the villages or small districts scattered through Attica. These were divided into 30 groups, so arranged that 10 groups were along the coast, 10 in the inland, and 10 about the city. By combining one group from each of these three regions, he formed 10 tribes, which he named after ancient Attic heroes (Erechtheis, Aigeis, Pandionis, Leontis, Acamanthis, Oineis, Cecropis, Hippothontis, Aiantis, Antiochis). These tribes were the chief divisions of the people, and from this time the number 10 regularly recurs among the various governing boards of Athens. The old Senate of 400 was replaced by a new one of 500, which became the executive organ of the government, supervising all officials and the finances and even the military management. For convenience in the transaction of routine business the year was divided into 10 periods, and during each period the 50 senators of a tribe, the so-called Prytanes, acted as a standing committee, though the whole body met daily. Along with the new constitution an increase in the citizenship took place, and, though the old property classes and their privileges were undisturbed, the increase of wealth had largely increased the number who could hold office. With Cleisthenes the Athenian democracy was fairly established, though other changes in the direction of equalization of privileges, such as the election of archons by lot, the establishment of pay for service in the courts and at the assembly, and a reduction of the power and influence of the Areopagus, were carried out in the course of the fifth and fourth centuries, not always to the advantage of the State. The new government at once proved its value by the rapid advance of Athenian power, which was raised to

an undreamed-of height by the repulse of the Persians, and the establishment of the Delian League, which made Athens mistress of the Aegean and its islands. This period (480-430 B.C.), which culminated in the age of Pericles, is the Golden Age of Athenian greatness, and to it belong the greatest triumphs of Athenian genius, the poetry of Aeschylus and Sophocles, and the sculpture of Phidias. From this time the history of Athens is merged in the general history of Greece. Though the Peloponnesian War deprived Athens of much of her power, her place as the centre of Hellenic culture remained unshaken, and even when the battle of Chæronea (338 B.C.) deprived her of political position, the philosophic schools and the traditions of the past continued to attract foreigners. The democratic constitution was overthrown by Antipater (322 B.C.), but its forms were afterward restored, and many of the official titles continued to exist long after the incorporation of the city in the Roman Empire.

Under Roman rule Athens prospered, and became the great centre of education for the youth of aristocratic Rome. (See Capes, *University Life in Ancient Athens*, London, 1877.) The Emperor Hadrian, in particular, enlarged the city to the northeast, where a new quarter was named Hadrianapolis in his honor, and built a gymnasium and library. It was about this time that Herodes Atticus erected his Odeum as a memorial of his wife Regilla and repaired the Stadium. The fame of the philosophic schools continued to attract students, though with the spread of Christianity they lost influence and were finally closed by Justinian in 529 A.D. During the following centuries many of the temples were converted into churches; but from the sixth to the eleventh century Athens almost disappears from history. Basil II visited it in 1018 to celebrate a victory over the Bulgarians, and in 1175 Michael Acominatos became Metropolitan of Athens. His letters and orations give a valuable picture of the wretchedness and desolation into which the city had fallen. In 1204 the capture of Constantinople by the Crusaders enabled Boniface of Montferrat to establish himself as King at Thessalonica, while Athens and Thebes fell to his feudal vassal, Otho de la Roche, and in 1260 the Frankish rulers assumed the title of Dukes of Athens, their dominion also including Thebes, Megara, and Argos. A succession of Frankish dukes ruled until the disastrous battle of Lake Copais threw the real power into the hands of the great Catalan company of mercenaries, and they seem to have held the real control, though recognizing the suzerainty of non-resident dukes, until 1387, when Nerio Acciajuoli, a Florentine who at the time ruled Corinth, made himself master of the city, and he and his successors maintained control over it until 1458, though after 1392 they were tributary to the Sultan, who was the real ruler of Athens.

For a long while after its capture by the Turks Athens almost disappeared from the view of the Western world, but a letter written in 1578 gives the population at the time as 12,000. The Venetians captured the city in 1687, and during the siege a bomb partially destroyed the Parthenon, which had been used as a powder magazine by the Turks. In 1690 the Turkish rule was reestablished, and continued until the achievement of Greek independence, though it was not till 1833 that the Turkish garrison was

withdrawn. In 1835 the capital of the new kingdom was established at Athens, and with this period begins the history of the modern city.

Archæology. The central point of the ancient city was the Acropolis, but the modern city lies almost entirely to the north and east between the Acropolis and Mount Lycabettus, and along the west slope of the latter, though a modern quarter is growing up on the banks of the Ilissus. On the east and south of the city flows the Ilissus, and on the west the Cephissus, whose scanty supply of water is now largely diverted for the irrigation of the extensive olive groves in that quarter. Though the city itself is some distance from the sea, it is well supplied with harbors. The first harbor was the open bay of Phalerum, with its sloping sandy beach, well suited for the light boats of the early time, but not easy of defense. Somewhat farther from the city is the rocky peninsula of the Piræus, with two small harbors, Munichia and Zea, on the east; and on the west a much larger basin, all nearly landlocked, and easily defended from the rugged hill of Munichia. The advantages of Piræus were first seen by Themistocles; and the fortification of the peninsula was completed soon after the Persian wars. The harbors were connected with the city by the "long walls," at first so built as to include Phalerum, though later the southern wall was abandoned and a new one built close to the northern, furnishing connection with Piræus alone, which had become the only important harbor.

The earliest city was undoubtedly on the Acropolis, where excavations have shown a "cyclopean" wall like those of Tiryns and Mycenæ, and remains of a palace and dwellings of the Mycenaean Period. The town seems also to have extended down the west slope into the valley at the foot of the Pnyx and probably along the south side for some distance; and this lower city was also inclosed by a strong wall in whose circuit there were nine gates. The most remarkable of these gates was the Dipylon, so called, within and without which was located the famous Ceramicus, or Potters' quarter. This gate, the principal one of Ancient Athens, consisted of inner and outer double gates separated by a rectangular court. The structure was flanked by towers. It is outside this gate that the great cemetery of Athens was discovered. A part of the ancient settlement embraced within this wall, including various sanctuaries, was regarded in later times as sacred ground, the so-called Pelargicon. There were also ancient settlements along the Ilissus, where later were some of the most revered sanctuaries, and apparently also on the hills to the west of the Acropolis, where there are many foundations for small houses, cisterns, and steps cut in the rock. These dwellings were outside the later walls and were abandoned before the fourth century B.C., as graves of that period have been found inside the earlier houses. Close to the Acropolis on the northwest is the bare rock of the Areopagus, and, farther to the west and southwest, across a valley runs a long ridge, crowned at the south by the Hill of the Muses, with the monument of Philipappus, erected at the beginning of the second century A.D., and at the north by the Hill of the Nymphs, the site of the modern astronomical observatory. Between the two is the Pnyx Hill, where was the ancient place of assembly. In the earliest times the Acropolis and its neighboring walls formed the only forti-

fication, and it is still a disputed point whether there were any other defenses at the time of the Persian wars. The evidence renders it not improbable that there was an outer wall at that time, but the extent inclosed by it cannot be determined. We only know that it was much less than the space inclosed by the wall of Themistocles, built in great haste immediately after the Persian wars (479 B.C.). The course of this wall seems to have been preserved in later times and can be traced in places by remains of the foundations, by the nature of the ground, and by the presence of graves, which in later times were always outside the walls. Its exact line, however, cannot be determined. Under the Emperor Hadrian the limits of the city seem to have been extended on the east so as to include the Olympieum (see below), and that portion of the city now occupied by the palace and its gardens. The line of the ancient wall in this region is probably marked by the Gate of Hadrian.

The Acropolis was the religious centre of the city, and before the time of Pericles was given up to temples and shrines. The site of the old royal palace seems early to have been marked by a temple of Athena, the patron goddess of the city, which was adorned by the Pisistratidæ with a colonnade, the gables of which were filled with sculptures representing the battle of the gods and giants. A part of these sculptures, valuable as illustrating the art of the close of the sixth century B.C., have been pieced together from fragments discovered during the excavations. Probably to the same time as this temple belong the foundations of an ancient gateway, set at an angle to the present line of ascent. The temple and all the other buildings on the Acropolis were destroyed by the Persians (480-479 B.C.) and were certainly never entirely rebuilt, though it is believed by some that the cella (q.v.) of the old temple was reërected and remained standing even into Roman times. Under Themistocles, Cimon, and Pericles the work

ACROPOLIS OF ATHENS.

of reconstructing the Acropolis was carried forward. On the south side a lofty retaining wall was built, and the ground filled in so as to form a terrace at the level of the old summit, and on this terrace was erected the Parthenon (q.v.), the chief glory of Athens and even in its ruins the most perfect specimen of Greek architectural genius. The present building was erected on the site of a temple begun by Themistocles or Cimon, and seems to have been completed about 437 B.C. North of the Parthenon, close to the

ATHENS—RESTORATIONS

1. THE ACROPOLIS.

2. THE AGORA.

site of the old temple was built the Erechtheum, containing probably the ancient statue of Athena Polias, said to have fallen from heaven, the sacred olive of Athena, and the salt spring where Poseidon smote the rock with his trident. The building is now partially restored. (Consult B. H. Hill, "Structural Notes on the Erechtheum," *American Journal of Archaeology*, pp. 291-297 (1910); G. P. Stevens, "The East Wall of the Erechtheum," op. cit.; and G. W. Elderkin, *Problems in Periclean Buildings* (Princeton, 1912).) Near the west end stood the colossal bronze statue of Athena Promachos, erected by the Athenians as a memorial of the victories over Persia.

Northeast of the Parthenon was the great altar of Athena, and near by was erected later a temple of Augustus and Rome. On the south side of the Acropolis, west of the Parthenon, were sacred precincts, dedicated to Athena Ergane (the worker) and Artemis Brauronia. At the west end of the Acropolis, where alone the rock permits an easy ascent, stood the great gateway, the Propylæa, begun in 437 B.C. and never completed according to the original plan. (See W. B. Dinsmoor, "The Gables of the Propylæa," *American Journal of Archaeology*, 1910, pp. 143-184.) Just outside the Propylæa, on a high platform, reached now from the upper part of the Acropolis, but in ancient times also accessible by a staircase outside the gate, stood the little Ionic temple of Athena Nike, less correctly called that of "Wingless Victory." All these buildings were of white Pentelic marble and richly decorated with gilding and color. At the foot of the steep precipice on the northeast side of the Areopagus is a cave with a pool of dark water, which is believed to have been the site of the shrine of the Eumenides, and the region west of the Acropolis and south of the Areopagus probably contained other temples, of which all traces have disappeared. Farther down the slope toward the west, in the valley between the Pnyx and the Areopagus, has been discovered an ancient street, which evidently led from the market place to the Acropolis. It was lined with private houses and shrines. On the slope of the Areopagus was a large sacred inclosure, containing wine vats, and apparently dedicated to Dionysus, as it contained a long inscription with various regulations of the Iobachea, a society of worshippers of that god. At the foot of the Pnyx were many wells and chambers for collecting water, and there are traces of a large fountain, to which water was brought by an underground channel from the upper Ilissus along the south side of the Acropolis. This is held by many archaeologists to be the work of Pisistratus and to mark the site of the Enneacrunos, or fountain with nine streams, erected by him over an open spring, Callirrhœ. Others, however, maintain that the evidence favors placing Callirrhœ and the Enneacrunos at a point in the bed of the Ilissus, where abundant springs are still found.

Passing from the gate down to the south side of the Acropolis, we find at the west end the Odeum of Herodes Atticus (see ATTICUS HERODES), which is still well preserved. Adjoining this was the long stoa, or portico built for the Athenians by Eumenes II, King of Pergamum (197-159 B.C.). Back of the stoa on a terrace at the foot of the steep cliff of the Acropolis lay the sanctuary of Asclepius, containing his temple and altar, and colonnades and other build-

ings for the sick, who came thither for healing. In a cave inside the sacred ground was a spring, still supposed to possess curative powers and dedicated to the Virgin. East of the Asclepieum and the Stoa of Eumenes was the great theatre of Dionysus, with its seats partly cut in the solid rock, and back of its stage buildings the temple and precinct of the god in whose honor the plays were performed. This theatre was erected on the site of an older building in the last half of the fourth century during the administration of the orator Lycurgus. On the north side of the Acropolis lay many public buildings, but this region is still thickly populated, and only the caves of Pan and Apollo high in the northwest corner of the Acropolis have been thoroughly excavated. North of the Areopagus lay the great market place, surrounded with colonnades and public buildings, and near by Hadrian built a large gymnasium and baths, considerable remains of which can still be traced.

The most notable building of ancient times in this portion of the city is the so-called Theseum, perhaps better designated as the Hephaestum, a hexastyle peripteral temple in the Doric style (104 feet by 45½ feet), situated on a slight eminence north of the Areopagus and west of the market place. This is the best-preserved Greek temple left to us. The name Theseum is certainly wrong, as the sanctuary of Theseus was in another part of Athens and was a large inclosure; but the true name of the building is still uncertain, though modern archaeological opinion tends in favor of the temple of Hephaestus, which must have stood in this quarter of the city. The temple was built about the same time as the Parthenon, or, more probably, somewhat earlier, though on this point authority is divided. Of the pediment sculptures no trace remains, but at the east end of the portico are sculptured metopes, and across each end of the cella is a frieze in relief. The metopes represent the labors of Heracles and Theseus; the subject of the west frieze is the battle between the Centaurs and Lapithæ, and that of the east a battle in the presence of six seated gods. During the Middle Ages the building was changed into a church, but with little change of the exterior. Outside the Themistoclean Wall to the southeast of the Acropolis was the great temple of Olympian Zeus, begun by Pisistratus, but long left unfinished. About 174 B.C. Antiochus Epiphanes of Syria completed, or rather rebuilt, the temple, on a scale of magnificence which led Livy to say that, though unfinished, it was the only one on earth corresponding to the greatness of the god. The great platform measures 676 feet by 426 feet, and on this the architect Cossutius erected a temple 354 feet by 135 feet, measured on the upper step of the stylobate. It had three rows of eight Corinthian columns at each end, and two rows of 20 columns each at the sides, counting the corner columns twice. The magnificent scale of the work again delayed its completion, and it was not till the second visit of the Emperor Hadrian (129 A.D.) that it was finally dedicated. At present only 16 columns remain, one of which lies where it was prostrated by an earthquake. These columns are 56 feet 7 inches high and 5 feet 7 inches in diameter at the base, with 24 flutings. Excavations have brought to light the foundations of the earlier temple of Pisistratus.

Not far from the Olympieum, across the Ilis-

us, was the Stadium, laid out in a hollow between low parallel hills. The ground inclosed by the seats is 670 feet long by 109 feet wide. The Stadium seems to have been constructed by the orator Lyeurgus, about 330 B.C., was rebuilt in white marble by Herodes Atticus, about 140 A.D., and largely burned for lime during the Middle Ages; its restoration in marble (completed in 1902) was made possible by the liberality of a wealthy Greek of Alexandria, to whose initiative the establishment of the new Olympic games in 1896 was due. See ATHLETICS.

For the topography and monuments of ancient Athens, consult: Stuart and Revett, *Antiquities of Athens* (London, 1762-1816); Leake, *Topography of Athens* (London, 1841); Wachsmuth, *Die Stadt Athen im Alterthum* (Leipzig, 1874-90); Harrison and Verrall, *Mythology and Monuments of Ancient Athens* (London, 1890); Curtius, *Stadtgeschichte von Athen* (Berlin, 1891), which contains a very valuable classified collection of ancient passages relating to this subject, by Milchhöfer; Frazer, *Pausanias*, vols. i, ii (London, 1898). Pausanias (q.v.) gives an account of the monuments of Athens in his day, and the works of Frazer and Miss Harrison include a translation of his text and full commentary. Valuable also is the work of Lolling in Müller's *Handbuch der klassischen Altertumswissenschaft*, vol. iii (Nördlingen, 1889); and Milchhöfer in Baumeister's *Denkmäler des klassischen Altertums*, vol. i (Munich, 1885). For the Acropolis, consult: Bütticher, *Die Akropolis von Athen* (Berlin, 1888), and Miller, in *American Journal of Archaeology*, vol. viii (Baltimore, 1893); also, Curtius and Kiepert, *Atlas von Athen* (Berlin, 1878). Athenian history is treated in the general histories of Greece. Aristotle wrote on the Constitution of Athens, and his work, first published in 1891, has been translated by Kenyon (London, 1891). Other important works are: Botsford, *Development of the Athenian Constitution* (Boston, 1893); and Wilamowitz-Möllendorf, *Aristoteles und Athen* (Berlin, 1893). For Athens during the Roman period and later, consult: Finlay, *History of Greece* (Oxford, 1877); Hertzberg, *Athen* (Halle, 1885). Other works of special value are: Laborde, *Athènes aux XVème, XVIème, et XVIIème siècles* (Paris, 1855) for its collection of documents; Gregorovius, *Geschichte der Stadt Athen im Mittelalter* (Stuttgart, 1889). Consult also: Dyer, *Ancient Athens* (London, 1873); C. Wordsworth, *Athens and Attica* (London, 1869); Symonds, *Sketches in Italy and Greece* (London, 1882); Freeman, *Historical Essays*, series iii (London, 1892); Horton, *Modern Athens* (New York, 1901); Bikelas, "L'Athènes d'aujourd'hui," in *Revue d'études grecques*, no. xi (Paris, 1898); Ferguson "Bibliography of Works Referring to Athens," in *The Athenian Secretaries* (New York, 1898); F. Judeich, *Topographie Von Athen* (Munich, 1905: is second half of part ii, vol. iii of 3d ed. of Von Müller's *Handbuch der klassischen Altertumswissenschaft*); M. L. D'Ooge, *Acropolis of Athens* (1909); Michaelis, *Der Parthenon* (Leipzig, 1871); W. Miller, *Latins in the Levant* (London, 1908); C. H. Weller, *Athens and its Monuments* (New York, 1913).

ATHENS. A town and the county-seat of

Limestone Co., Ala., 100 miles north of Birmingham, on the Louisville and Nashville Railroad (Map: Alabama, C 1). It is the seat of Athens Female College (Methodist Episcopal South), opened in 1843, Greens University, the (colored) Trinity College, and of a State Agricultural School. The town has a cotton mill, a planing mill, and an ice plant, and owns its water works and electric light plant. Pop., 1900, 1010; 1910, 1715. On Sept. 23, 1864, Colonel Campbell, with 600 Federal troops, surrendered here to General Forrest, at the head of a large force of Confederate cavalry, who soon evacuated.

ATHENS. A city and the county-seat of Clarke Co., Ga., on the Oconee River, 69 miles by rail east by north of Atlanta, and on the Southern, the Central of Georgia, the Georgia, the Seaboard Air Line, and the Gainesville Midland railroads (Map: Georgia, C 2). The city is an important cotton market, and contains several cotton mills, fertilizer factories, etc. It is the seat of the University of Georgia (q.v.), opened in 1801, the Georgia State College of Agriculture, organized in 1872, the Lucy Cobb Institute for Girls, and a State normal school and has a public library and the celebrated "tree that owns itself," a tree protected by a deed to it of 16 feet of land made by Col. William H. Jackson. The city owns and operates its water works. The government is vested in a mayor, elected biennially, and a council. Athens was founded, as the seat of the State University, in 1801. Pop., 1900, 10,245; 1910, 14,913.

ATHENS. A city and the county-seat of Athens Co., Ohio, 75 miles southwest of Columbus, on the Hocking River, and on the Baltimore and Ohio Southwestern, the Toledo and Ohio Central, and the Hocking Valley railroads (Map: Ohio, F 7). Athens has manufactures of lumber and brick and is the centre of an extensive coal-mining region. It is the seat of the Ohio University (State) (q.v.), opened in 1804, and of a State hospital for the insane, and has a Carnegie library. Settled in 1797, and incorporated in 1811, Athens is governed by a mayor, elected biennially, and a city council. The water works and electric light plant are owned and operated by the municipality. Pop., 1900, 3066; 1910, 5463. Consult Walker, *History of Athens County* (Cincinnati, 1869).

ATHENS. A borough in Bradford Co., Pa., 2 miles south of N. Y. State Line, on the Lehigh Valley Railroad, and on the Susquehanna and Chemung rivers (Map: Pennsylvania, H 2). The principal industries include cigar, overall, tool, and furniture factories, foundries, silk and planing mills, boat, milling and produce companies. Pop., 1900, 3749; 1910, 3796.

ATHENS. A town and the county-seat of McMinn Co., Tenn., 56 miles northeast of Chattanooga, on the Southern Railway (Map: Tennessee, F 3). It is the seat of the U. S. Grant University (Methodist Episcopal), opened in 1867. The town has planing, cotton, knitting and woolen mills. Athens was laid out in 1823 and was incorporated in 1868. Pop., 1890, 2224; 1900, 1849; 1910, 2264.

ATHENS. A city and the county-seat of Henderson Co., Tex., 75 miles southeast of Dallas, on the St. Louis Southwestern and Texas and New Orleans railroads (Map: Texas, E 3). The region is adapted to cotton, fruit, and vegetable growing, has an abundance of hard and soft timber, and contains deposits of coal. The principal industries include the manufacture of

pottery, fire brick, and tile. The city has a fine courthouse, good schools, and owns its water works. Pop., 1910, 2261.

ATHENS OF AMERICA, THE, or THE MODERN ATHENS. A name given to Boston, Mass., in the day of her literary preëminence, and still hers by reason of her spirit of culture.

ATHENS OF THE NORTH, THE. A title sometimes applied to Edinburgh. Copenhagen is another European city so styled.

ATHENS OF THE WEST, THE. Cordova (q.v.).

ATH'ERO'MA (Gk. *ἀθήρωμα*, *athērōma*, a tumor full of gruel-like matter, from *ἀθήρη*, *athērē*, groats, meal). A yellow, cheesy material, composed of fat, cholesterolin, sebaceous matter, albumen, chalk, and detritus of epithelium, found in cysts (as of the scalp). The term is now more commonly applied to the fatty degeneration of the arterial walls. See ARTERIOSCLEROSIS; ARTERY.

ATHERTON. A manufacturing and mining town in Lancashire, England, 4½ miles southwest of Bolton. The civic spirit is exemplified by the municipalization of water, gas, and electric lighting and traffic plants, and the erection of a dust destructor and public offices. There are numerous collieries, and cotton and iron goods are the leading manufactures. Pop., 1891, 13,700; 1901, 16,200; 1911, 18,982.

ATHERTON, CHARLES GORDON (1804-53). An American politician, born in Amherst, N. H. He graduated at Harvard in 1822 and was a member of the State Legislature for five years and Speaker of the Lower House for three. In 1837 he was elected to Congress and served in the House in 1837-43, and in the Senate in 1843-49 and in 1852-53. In December, 1838, he introduced the notorious "Atherton-gag" resolution, prescribing that "all petitions relating to slavery, or to its abolition, be laid on the table without debate." The measure was stubbornly fought by John Quincy Adams, who insisted on the "right of petition"; but it was passed by a vote of 120 to 78 and remained in effect until 1844. See GAG RULES.

ATHERTON, GERTRUDE FRANKLIN (HORN) (1857-). An American novelist, the grandniece of Benjamin Franklin, born at San Francisco, Cal., educated in California and in Lexington, Ky. She became the wife of G. H. B. Atherton, now deceased. The background to a series of her novels (see below) is California, and of the life of her State to-day she has given memorable studies. In the East she is almost equally at home: witness *Patience Sparhawk* (1897), with its satirical study of life in New York and Westchester County; *Aristocrats* (1901), which has the Adirondacks for its setting; or *Senator North* (1900), with its intimate pictures of social and political life in Washington. Frequently she attempts subjects of an epic breadth, as in *The Conqueror* (1902), where the personal story of Alexander Hamilton stands out in relief against the national life of his time. The following list includes the more important of her books: The California series—*The Splendid Idle Forties*, a revised and enlarged edition of *Before the Gringo Came* (1892); *The Dooms-woman* (1892); *A Whirl Asunder* (1895); *The Californians* (1898); *American Wives and English Husbands* (1898); *A Daughter of the Vine* (1899); *Rezanov* (1906); *Ancestors* (1907). Other novels: *Patience Sparhawk* (1897); *Senator North* (1900); *Aristocrats* (1901); *The*

Conqueror (1902); *Tower of Ivory* (1910); *Julia France and Her Times* (1912).

ATHERTON RES'OLUTIONS. See GAG RULES.

ATHLETE, THE. A statue representing the typical proportions of the Greek athlete, a copy of the Doryphorus (spear-bearer) of Polyclethus. It was found in the so-called Curia Isiaca at Pompeii and is now at Naples in the Museo Nazionale.

ATHLETICS (from Gk. *ἀθλητής*, *athlētēs*, contestant). The term has of late been definitely applied to recognized contests of physical skill and endurance for pastime and for the development of bodily strength. These are commonly divided into two classes—track and field games and gymnastic performances. The former include the running or walking of various distances, hurdling, high and broad jumping, pole-vaulting, throwing the hammer and weight, and putting the shot. The latter comprise the use of Indian clubs, dumbbells, parallel and horizontal bars, weight-lifting, rope-climbing, tug of war, and various exercises in vaulting over fixed objects.

Athletic games were brought to a high development among the Greeks, and a class of professional athletes grew up, who began their training when scarcely out of boyhood. They were obliged to submit to a rigorous discipline, including careful avoidance of excesses, a special diet, regular exercise, and the cultivation of courage, self-control, and resourcefulness. There were at all times among the Greeks those who practiced athletic exercises from pure love of sport; but when these ancient amateurs competed in the games, they preferred running, jumping, and javelin-throwing, where natural vigor might take the place of long exercise. In later times the athlete was a huge mass of flesh and muscle, as may be seen in the mosaic from the Baths of Caracalla, or even in the fine realistic bronze statue of a pugilist in Rome, or the brutal head of a boxer from Olympia. Under the Roman Empire we find the professional athletes organized into corporations. See GAMES, ANCIENT.

Of the Britons before the Roman conquest we know that they were bold, active, and capable of bearing great fatigue. The Romans drafted the strongest of them into military service, and by the introduction of luxurious habits debilitated the weaker ones who were left at home. The later infusion of the new blood of the Teutonic tribes corrected this tendency and brought with it a new love of athletic contests. Wherever a Scandinavian leader has left a tradition at all, it is one relating to his feats of strength and agility. Thus Olaf Tryggesson, an early King of Norway, boasted that he could walk round the outside of his boat upon the oars as the men were rowing; that he could hurl two spears at once, one from either hand, and that he excelled all men in archery and swimming. In the later Saxon period such exercises as injured the body to hardship and fatigue constituted the chief part of the education of youth. With the introduction of the Norman influence and the tendencies of the age of chivalry, tournaments, jousts, and other contests of personal skill and prowess were the principal diversion of the upper classes. The sons of citizens and yeomen had their sports as well; they fought with clubs and bucklers and ran at the quintain on every village green, and contended with poles

on the ice in winter, "not always without hurt," as Fitzstephen says, "for some break their arms and some their legs, but youth, emulous of glory, seek these exercises." With the decay of chivalry a great change took place toward the end of the fifteenth century, and exercises requiring the exertion of muscular strength went out of fashion to such an extent that the government thought it necessary to interfere. A proclamation of Henry VII, after reciting that "it ever hath bene of old antiquitie used in this realme for all lustye gentlemen to pass the delectable season of summer after divers manner and sundry fashions of disport," establishes a series of exercises with prizes to be contested for in open competition. His successor, Henry VIII, added example to precept in his younger days, and daily amused himself in casting the bar, wrestling, fencing with sword or battle-axe, throwing the hammer, and similar recreations, in which few could excel him. Such pastimes, with broad jumping and running, were, according to the authority of Thomas Wilson in *The Arte of Rhetorique* (1551), "the necessary accomplishment of a man of fashion." James I formulated a set of rules for his son, with the very modern conclusion that "bodily exercises are very commendable, as well for the banishing of idleness as for the making the body able and durable"; adding in a passage of the true spirit, "the exercises I would have you to use, although but moderately, *not making a craft of them*, are running, leaping, wrestling, fencing, playing at the catch or tennise, archerie, palle-malle, and such like other fair and pleasant field games." The troublous times of the Rebellion, with the prejudice of the Puritans against all that had gone to make appropriate the title of "Merry England," and the dissoluteness of the court of Charles II, tended to destroy the athletic spirit, except in the country villages, where the old games lingered. Otherwise during the eighteenth century and the early part of the nineteenth athletics dwindled well-nigh to extinction, and the moral and physical condition of the youth of England suffered to a proportionate extent.

Fortunately, about the year 1850, an athletic revival occurred in England affecting all branches of sport, furthered not a little by the energetic deliverances of Charles Kingsley and his school in favor of "muscular Christianity." Athletic games of a sort had been established about the year 1812 at the Royal Military College, Sandhurst. In 1837 the Rugby Crick run began, and soon afterward regular games were held also at the Woolwich Military Academy and a number of the great public schools. Probably the first athletic sports held in modern fashion occurred at Exeter College, Oxford, in 1850; they included sprints and long-distance running, followed later by jumping, hurdling, and weight events. The movement rapidly spread, and athletic clubs began to be formed. The Cambridge University games were established in 1857, and the Oxford games three years later. The inter-university boat race dates from 1856 as an annual event; there had been a university boat club at Oxford since 1839. In 1864 the Oxford and Cambridge track and field games were established. The events of the first meeting were 100 yards, 440 yards, and one-mile runs; high and broad jumps; 120 yards and 200 yards hurdle races; and a steeplechase. Within the decade 1850-60 athletic meetings became a regular feature of school

and college life, and through their influence amateur athletic sport became general throughout the kingdom. The London Athletic Club dates from 1866 (though it really grew out of a smaller organization of three years earlier), and the national amateur championships were established in the same year. The latter were for some years managed by the Amateur Athletic Club, whose attempt to become the regulating amateur organization subsequently failed. In 1880 the Amateur Athletic Association was founded as the national governing body for England. It is allied with the Scottish and Irish Amateur Associations and with the British swimming and cycling associations. The national championships now consist of 100 yards; 440 yards, half-mile, mile, and four-mile and ten-mile runs; 120-yard hurdles; high and broad jumps; hammer-throwing and weight-putting; pole-vaulting; two-mile and seven-mile walks; and two-mile steeplechase. A 10-mile championship run is also held in the spring. The Oxford and Cambridge sports include the first 11 of the above events, substituting a three-mile for the two distance runs. Other important English events are the London Athletic Club and Putney Athletic Club games, the Civil Service, the United Hospitals, and the Railway Clearing-house sports. Cross-country running has made Englishmen the best of long-distance runners.

American and International Athletics. Athletics became popular in the United States in the early seventies. A movement soon arose to bring them under definite organization, and in 1879 the National Association of Amateur Athletes of America was formed, out of which grew the Amateur Athletic Union, which held its first annual meeting at Detroit, Mich., in 1888, and was reorganized in 1891. It controls all matters concerning amateur athletics and recognizes the following sports: basket ball, billiards, boxing, fencing, gymnastics, hand-ball, running, jumping, walking, weight-putting, hurdle-racing, lacrosse, pole-vaulting, swimming, tugs-of-war, and wrestling. Its authority is universally recognized.

In America, as in England, the colleges exert an important influence on amateur athletics. College training methods are, on the whole, more scientific than those of the majority of athletic clubs, and most of the leading athletes come from the colleges. Their governing bodies are the Intercollegiate Association of Amateur Athletes of America and the Western Intercollegiate Association. Allied with them is the national body, the Amateur Athletic Union, with its eight sectional groups. The first intercollegiate athletic meeting was held at Saratoga in 1873. Contests have been held between representative American and English athletes on both sides of the Atlantic for over half a century.

ATHLONE, áth-lón'. A town of Ireland, on both sides of the Shannon, 75 miles west of Dublin, in the counties of Westmeath and Roscommon (Map: Ireland, D 3). It is an agricultural centre, and has manufactures of felt hats, friezes, linens, and corsets. Improved transportation facilities by means of locks and canals enable large river steamers to navigate the Shannon for 116 miles from Killaloe to Carrick-on-Shannon, thus circumnavigating the river rapids. The Shannon is here crossed by a fine iron railroad bridge. Athlone is one of the chief military positions in Ireland. The fortifications once covered 15 acres and contained barracks for 1500 men, but are now dismantled. Pop., 1901, 10,701; 1911, 9,631. During the last attempt of James II to recover his throne in 1690 Athlone suffered two sieges and was finally taken by assault.

ATHOL, áth-ól. A town in Worcester Co., Mass., 82 miles west by north of Boston, on the Fitchburg Division of the Boston and Maine and a branch of the Boston and Albany railroads (Map: Massachusetts, C 2). It has a public library and manufactories of shoes, mechanical tools and machinery, silk, furniture, lumber products, toys, woolen goods, etc. The government is administered by town meetings. Athol was first settled in 1735 and was called Pequoig until 1762, when it was incorporated as a town under its present name. It owns its water works. Pop., 1890, 6319; 1900, 7061; 1910, 8536. Consult *History of Worcester County* (2 vols., Boston, 1879).

ATHOR, á'thór, **ATHYR**, á'thír, or **HATHOR**, há'thór (Egyptian *Hat-hor*). An Egyptian goddess. The original seat of her cult seems to have been Denderah in upper Egypt, where the ruins of her famous temple are still to be seen, but at a very early period her worship spread over the whole of Egypt. Her primitive fetish was, apparently, a buffalo's skull raised on a pole, and from this was developed the sacred Athor column, which plays an important part in Egyptian architecture, bearing, as capital, a female head with the ears of a cow. The same head forms the central ornament of the *sistrum*, or rattle for temple music, which appears among the insignia of this goddess. In later times Athor was regarded as the goddess of music and the dance, of joy and love. By the Greeks she was identified with Aphrodite (*Venus*). Earlier, however, she was conceived as a cosmical divinity, typifying the sky, and the traditional explanation of her name as meaning "the house of horns" (i.e., of the sun) is a result of this conception. The world is frequently represented in the form of her sacred animal, the cow, bearing between her horns the sun-god or his disk. In Egyptian mythological texts Athor is sometimes called the mother of the sun, which is daily born from the sky. As the nocturnal sky, she became the goddess of the dead, and, under the latest dynasties, deceased women were supposed to become Athor, just as deceased men became Osiris. The representations of Athor vary greatly. Usually she is depicted in the form of a woman with a cow's head. The third month of the Egyptian year (Athor) was named for this goddess. For illustration, see EGYPT.

ATHOS (Gk. *Ἄθος*, called in modern times

Ἅγιον Ὄρος, *Hagion Oros*, by the Greeks, and Monte Santo by the Italians, both names signifying Holy Mount) (Map: Greece, F 1). Properly the highest elevation on the easternmost of the three Chalcidian peninsulas. In a broader sense of the word the whole peninsula was called Athos. The peninsula is about 40 miles long and is connected with the mainland by an isthmus hardly a mile and a half broad. It contained in ancient times several towns. The mountain Athos (6349 feet), called in ancient times Acte, is at its southern extremity. The point was a perilous one for sailors, and Xerxes, when planning the invasion of Greece, ran a canal through the isthmus, traces of which are still to be seen. Mount Athos has been since the Middle Ages the seat of a monastic republic, which, at the present time, consists of 20 monasteries, about 3000 monks, and 3000 lay brethren. The origin of some of these religious houses is dated by legend as far back as the time of Constantine. In the thirteenth century they were pillaged by the Latin conquerors of Constantinople, but recovered under the succeeding emperors. In recent times they have through three centuries of Moslem rule preserved their independence and former privileges. In the Middle Ages they were the centre of Greek learning and they have furnished to scholars many valuable Greek manuscripts, but at the present day there is a universal lack of learning among the monks of these establishments. Consult: Curzon, *Visits to Monasteries in the Levant* (London, 1881); A. Neyrat, *L'Athos* (Paris, 1880); Athelstan Riley, *Athos* (London, 1887); Brockhaus, *Die Kunst in den Athosklosteren* (Leipzig, 1891); Gelzer, *Vom Heiligen Berge und aus Makedonien* (Leipzig, 1904); S. Lambros, *Catalogue of the Greek Manuscripts on Mount Athos* (1895, 1900). See BALKAN WAR.

ATHOS, á'tós'. The *nom-de-guerre* of a character in Dumas's *Musketeer* romances, whose real name in the story was the Comte de la Fère. He is one of the three guardsmen with whom D'Artagnan associates himself—the husband of the infamous "Miladi," and father of the Vicomte de Bragelonne, who gave his name to the last book of the trilogy.

ATHWART', **ATHWART'SHIP**. See BEARING.

ATHYR, á'thír. See **ATHOR**.

ATITLAN, á'té-tlän'. A lake situated in the department of Solola, Guatemala, 4700 feet above the sea level, over 24 miles long and 10 miles wide, with a circumference of 64 miles (Map: Central America, B 3). It has a depth of more than 1000 feet, is surrounded by steep declivities, and has no visible outlet, though many small streams flow into it. At its southern end is the large inactive volcano Atitlan, 11,849 feet high.

ATITLAN, or **SANTIAGO DE ATITLAN**, sän'té-á'gò dá á'té-tlän'. An Indian town situated on the south side of the mountain lake of Atitlan, in the department of Solola, Guatemala, 49 miles west of the city of Guatemala. It has mineral springs, and cotton spinning and fishing occupy the majority of the inhabitants. Pop., 9000.

ATKARSK, át-kársk'. The capital of a district, 50 miles northwest of Saratov, in the government of Saratov, southeast Russia; near the junction of the Medvieditzá with one of its feeders. It carries on a brisk trade in grain.

Pop., 1897, 9750. The settlement of Etkara was mentioned as early as the fourteenth century.

ATKINSON, EDWARD (1827-1905). An American economist. He was born in Brookline, Mass., and was educated in private schools. For many years he managed manufacturing companies and afterward conducted a fire insurance company for the mutual insurance of factories. He invented the "Aladdin oven," an improved cooking apparatus. He contributed extensively to the periodicals and published many pamphlets and books on economic subjects, banking, railways, cotton manufactures, the tariff, money, fire prevention, and the nutritive value of foods. During and after the presidential campaign of 1900 he was an active opponent of the administration's policy of expansion. Among his more extended works are: *The Distribution of Products* (1885); *The Industrial Progress of the Nation* (1889); *The Science of Nutrition* (10th ed., 1898); *The Prevention of Loss by Fire; Fifty Years Record of Factory Mutual Insurance* (1900); *Facts and Figures the Basis of Economic Science* (1904). Consult T. W. Higginson, biographical notice in *Proceedings of the American Academy of Arts and Sciences* (Boston, 1907).

ATKINSON, ELEANOR (STACKHOUSE). An American author, born at Rensselaer, Ind. She was educated at the Indianapolis Normal Training School, for several years taught in the schools of Indianapolis and Chicago, and from 1889 to 1891 was a special writer for the *Chicago Tribune* under the pen name of "Nora Marks." In the latter year she married Francis Blake Atkinson of Chicago. She edited *The Little Chronicle* in 1900-07. Her published books include: *Mamzelle Fiftine* (1903); *Boyhood of Lincoln* (1908); *Lincoln's Love Story* (1909); *The Story of Chicago* (1910); *The Students' Reference Work*, vol. v (1911); *Greyfriars Bobby* (1912); *Loyal Love* (1912); *How and Why Library* (1913).

ATKINSON, GEORGE FRANCIS (1854—). An American botanist. He was born at Raisinville, Monroe Co., Mich., received his education at Olivet College, Mich., and at Cornell University, and was made assistant professor of general zoölogy and entomology at the University of North Carolina in 1885 and associate professor of botany and zoölogy there in 1886. Two years later he became professor of the same subjects in the University of South Carolina, and botanist of the experiment station. In 1889 he was appointed professor of biology at the Alabama Polytechnic Institute and at the Agricultural and Mechanical College of Alabama, and in 1892 was appointed assistant professor, and afterward professor, of botany at Cornell, where he became head of the department in 1906. In 1896 he was elected vice president of the American Association for the Advancement of Science, and in 1907 president of the Botanical Society of America. For two years he was associate editor of the *Botanical Gazette*. His publications include several excellent text-books and treatises, such as *Studies of American Fungi* (2d ed., 1903); *College Text-Book of Botany* (1905); *Botany for High Schools* (1910; 2d ed., 1912); *Practice Key and Flora of the Eastern, Northern, and Central States* (1912).

ATKINSON, GEORGE WESLEY (1845—). An American writer and politician, born in Charleston, W. Va. He studied at Ohio Wesleyan, and

at Howard University (D. C.), and was admitted to the bar in 1875. From 1876 to 1880 he was United States internal revenue agent, and from 1881 to 1885 United States marshal in West Virginia. He was a member of the Fifty-first Congress (1889-91), and Governor of West Virginia from 1897 to 1901. After having served as United States Attorney for four years, he was appointed judge of the United States Court of Claims in 1905. He is author of *History of Kanawha* (1876); *After the Moonshiners* (1879); *Handbook for Revenue Officers* (1881); *ABC of the Tariff* (1882); *Prominent Men of West Virginia* (1895); *Psychology Simplified* (1897); *Public Addresses* (1901); *Chips and Whetstones* (1908).

ATKINSON, JOHN (1835-97). An American preacher. He was born at Deerfield, N. Y., and served in the ministry of the Methodist Episcopal church till his death at Haverstraw, N. Y. He wrote the familiar hymn, "We shall Meet beyond the River," and the historical works, *Memorials of Methodism* (1860); *The Centennial History of American Methodism* (1884); *The Beginnings of the Wesleyan Movement in America, and the Establishment therein of Methodism* (1896).

ATKINSON, JOHN CHRISTOPHER (1814-1900). An English clergyman and antiquary. He was born at Goldhanger, in Essex, where his father was curate. In 1838 he graduated B.A. from St. John's College, Cambridge, and three years later was ordained curate of Brockhampton in Herefordshire. In 1847 he became vicar of Danby, in the North Riding of Yorkshire, where he resided till his death. In 1887 he received from Durham University the degree of D.C.L., and in 1891 he became a prebendary in York Cathedral. A delightful antiquary somewhat after the type of Gilbert White (q.v.), he is best known for his *Forty Years in a Moorland Parish* (1891). Among his other popular books are: *The Walks, Talks, Travels, and Exploits of Two Schoolboys* (1859); *Play-Hours and Half-Holidays* (1880); *British Birds' Eggs and Nests* (1861); and *The Last of the Giant-Killers* (1891). Among his learned works are: "A Glossary of the Dialect of the Hundred of Lonsdale," in *Transactions of the Philological Society* (1867); *A Glossary of the Cleveland Dialect* (1868) with *Additions* (1876); *The History of Cleveland* (incomplete, 1872-77). He also edited for the Surtees Society *Cartularium Abbatia de Whiteby* (1879) and *Cartularium Abbatia Rievall* (1889).

ATKINSON, THOMAS WITLAM (1799-1861). An English artist and traveler. He first devoted himself to architecture, but afterward traveled extensively in western Siberia and published accounts of his travels in works beautifully illustrated by himself. The works are entitled *Explorations in Oriental and Western Siberia* (1858) and *Travels in the Regions of the Upper and Lower Amoor* (1860).

ATKYNs, Sir ROBERT (1621-1709). An English jurist and Lord Chief Baron of the Exchequer. He was descended from a family of distinguished lawyers, no less than four successive generations being represented in high judicial office. In 1659 he entered Richard Cromwell's Parliament as member for Evesham and was evidently of the King's party, as he was made Knight of the Bath at Charles's coronation (1661). He became judge of the Court of Common Pleas in 1672, but, owing to his

collision with the notorious Chief Justice Croggs and his sturdy independence in urging the right of petition, was forced to resign his office in 1680. During his retirement he continued his agitation against the arrogant pretensions of the Stuarts and acted as legal adviser to the lords after the flight of James II. When the case against Lord William Russell was instituted in 1683, Atkyns published two powerful pamphlets to establish the innocence of that nobleman. Upon the accession of William III he succeeded his brother Edward as Lord Chief Baron of the Exchequer, a position which he held until 1694. From 1689 to 1693 he was Speaker of the House of Lords. His *Parliamentary and Political Tracts* (1734) constitute a valuable contribution to the history of the time.

ATLAN'TA. The capital of Georgia, and the county-seat of Fulton County, 171 miles by rail west by north of Augusta and 294 miles by rail northwest of Savannah (Map: Georgia, B 2). It is popularly known as the "Gate City," is the largest city in the State, and one of the important railroad centres of the South. It lies at the base of the Blue Ridge, near the Chattahoochee River, and has an elevation of 1000 to 1100 feet above sea level and a healthful climate with a mean annual temperature of about 60° Fahrenheit. The city possesses a fine public library, the State Library with over 80,000 volumes, a valuable geological collection, and numerous educational institutions. It is the seat of the Georgia School of Technology (founded in 1888), a branch of the State University at Athens; Atlanta University, founded in 1869; (Clark University (Methodist Episcopal), established in 1870; Atlanta Baptist College, organized in 1867; and two medical schools. Among the more important buildings are the State Capitol, courthouse, city hall, custom house, opera house, Piedmont, Kimball, Georgian Terrace, Ansley, Winecoff, and Aragon hotels, and a Carnegie library. Other points of interest are Grant and Piedmont parks, the latter being the site of the Atlanta Exposition of 1895. In the vicinity of the city is Fort McPherson (q.v.), a government army post.

Atlanta carries on a large export trade in cotton, tobacco, grain, horses, and mules, its mule market being the second in importance in the United States. The products of its industrial establishments include cotton goods, cotton-seed oil, bags, furniture, machinery, fertilizers, patent medicines, flour, lumber, and planing mill products, and agricultural implements.

The government is administered under a charter of 1874, revised several times since. It provides for a mayor, who holds office for two years, and a bicameral municipal council; the board of aldermen, consisting of 10 members elected at large for three years, and the council of 20 members, chosen for two years to represent the whole city, but chosen respectively by the 10 wards—two from each. Of the administrative officials, only the license inspector and city warden are appointed by the executive, the municipal council controlling appointments to all other offices except the following, which are filled by popular election: attorney, commissioner of public works, engineer, tax collector, treasurer, and sexton. The annual income and expenditures of the city balance at about \$3,500,000; the principal items of expense being \$325,000 for the police department (including amounts for po-

lice courts, jails, etc.), \$250,000 for the fire department, \$450,000 for the health department (including amounts for street cleaning and sprinkling, and garbage removal), and \$550,000 for schools. Atlanta owns its water works which for the year 1913 yielded the city a revenue of \$485,000 against a total cost of \$262,000 for the year's maintenance.

Pop., 1850, 2572; 1870, 21,789; 1890, 65,533; 1900, 89,872, including 2500 persons of foreign birth and 35,900 of negro descent; 1910, 154,839. The first settlement was made here about 1839, and was called Terminus, from its being the intended terminus of the Georgia Railroad, completed in 1845. In 1843 it was incorporated as a town under the name Marthasville, and two years later the present name was adopted, while in 1847 a city charter was secured. Atlanta's growth was very rapid, its population being about 15,000 in 1861, and, from its admirable location, it became, at the outbreak of the Civil War, one of the most important cities in the Confederacy, being used as a depot for supplies and a rallying-place for recruits. In 1864 it was the objective point of General Sherman's campaign from Chattanooga. (See CIVIL WAR IN AMERICA.) The Federal army approached the city in July, and after fighting the battle of Peachtree Creek (q.v.), on July 20, closely invested the Confederate works. On July 22 the battle of Atlanta was fought southeast of the city, Hood, the Confederate general in command, making a bloody but unsuccessful attack on Sherman's extreme left under McPherson, who was killed early in the engagement. The Federal loss in killed, wounded, and prisoners in the battle in and around Atlanta was about 20,000; the Confederate, never accurately determined, was probably as great as 15,000. On the 28th another severe engagement, the battle of Ezra Church, was fought west of the city, Hood again attacking, and being again repulsed, the Federals losing about 600 and the Confederates about 4500. Meanwhile Sherman had kept up an almost continual bombardment, and on September 1, by a flank movement, compelled Hood to evacuate, the Federals taking possession on the following day. Here he stayed until November 15, when he started for Savannah, on his famous march to the sea. Atlanta was almost totally destroyed; but after the war it was quickly rebuilt and grew with great rapidity. In 1878 it became the capital of Georgia, and in 1895-96 the celebrated Cotton States and International Exposition was held here. For Atlanta during the Civil War, consult Jacob D. Cox, "Atlanta" (New York, 1882), in the *Campaigns of the Civil War Series*; and for the general history of the city, W. P. Reed (editor), *History of Atlanta* (Syracuse, 1889).

ATLANTA EXPOSITION, or COTTON STATES AND INDUSTRIAL EXPOSITION. An exhibition held in Atlanta, Ga., from Sept. 18 to Dec. 31, 1895, having for its chief purpose the presentation of the agricultural, manufacturing, and mineral resources of the southern States. The site selected was Piedmont Park, about 2 miles from the centre of the city, and covered an area of 189 acres, on which over 30 buildings, mostly in the Romanesque style of architecture, were erected. Numerous congresses were held during the Exposition, and to nearly every day was assigned some important feature that attracted special visitors. Among these were: Georgia Day, Confederate Day, Negro Day, etc.

A Department of Awards, presided over by Daniel C. Gilman, president of the Johns Hopkins University, viewed the exhibits during the two weeks between October 15 and November 1. The total attendance was 1,179,889, and the cost of the Exposition was \$960,930, while the receipts from the admissions were \$500,000, from concessions \$125,230, and from floor space \$79,000.

ATLANTA UNIVERSITY. A non-sectarian institution for the colored at Atlanta, Ga., opened in 1869. It was originally aided by the Freedmen's Bureau and the American Missionary Association, but soon became undenominational and independent. The university property, including buildings, is valued at about \$285,000, and there is an endowment of \$100,000. Collegiate, normal, and high school departments are maintained, and emphasis is also placed upon industrial training, the education of kindergarten teachers, and sociological work. In 1912-13 the officers and instructors numbered 34 and the students 404. The library had 15,000 volumes. President, Edward Twichell Ware, A.B.

ATLANTES, *āt-lān'tēz* (Gk. nom. pl. Ἀτλαντὶς; see *ATLAS*). Carved male figures used in architecture as supports to cornices, architraves, etc. They correspond to the female Caryatides, but were not so popular in Greek art. Examples are in the temple of Zeus at Girgenti, the theatre at Athens, in minor parts of mediæval decorative work, and especially, on a large scale, in late Renaissance buildings; sometimes called "Telamones."

ATLAN'TIC. A city and the county-seat of Cass Co., Iowa, 82 miles west-southwest of Des Moines, on

the Chicago, Rock Island and Pacific Railroad (Map: Iowa, B 3). It has a large corn-canning factory, machine shops, and other manufactures. Atlantic was incorporated in 1869; by the existing charter the mayor holds office for two years and the city council consists of six members. The electric light and water plant is owned by the city. Pop., 1890, 4351; 1900, 5046; 1910, 4560; 1913 (est.), 5600.

ATLANTIC CA'BLE. See **ATLANTIC TELEGRAPH, HISTORY OF.**

ATLANTIC CITY. The most popular seaside resort in the United States, situated on a long, narrow, sandy island, known as Absecon Beach, in Atlantic Co., N. J., 56 miles by rail southeast of Philadelphia, and about 95 miles (direct) southwest of New York; on the Pennsylvania and the Reading railroads (Map: New Jersey, D 5). The island, three-quarters of a mile wide, stretches for 10 miles along the coast and is separated from the mainland by four or five miles of meadows, partly covered with water at high tide, and by a narrow strait. Absecon Lighthouse, 167 feet high, is on the north end of the beach. The city's most distinctive feature is the unique "Board walk" (built of steel and concrete with board flooring), which skirts the ocean for 8 miles, and forms a charming promenade. It is the centre of the resort's activities. Along its land side are situated stores of almost every kind, a great many places of amuse-

ment, many playhouses, and a score of fine hotels. Extending seaward are six great ocean piers, devoted exclusively to recreation. The best known of these is Young's "Million Dollar Pier." The boating and bathing facilities are excellent. During the season about 90,000 persons enjoy the surf daily. Fishing and shooting are other popular amusements. The city has a fine country club and abounds in hotels, boarding houses, and private cottages for the accommodation of visitors. It also contains a Carnegie library, a hospital, the Mercer Memorial Home for Invalid Women, and the Children's Seashore Home. The government is administered by five commissioners, elected for four years, and restricted by the referendum and recall. The water works are owned and operated by the municipality.

A few settlers came to the site as early as 1780, but there were only seven houses standing in 1852, and the existence of the city and summer resort really dates from the completion of the Camden and Atlantic Railroad in 1854, when the name "Atlantic City" was first adopted. On April 3, 1902, the city suffered from a disastrous fire, which destroyed several hotels and smaller buildings, and part of Young's Pier, a loss estimated at \$500,000. Pop., 1900, 27,838; 1910, 46,150. During the summer the transient population varies, but it is estimated at between 300,000 and 400,000.

ATLANTIC HIGHLANDS. A borough and seaside resort, in Monmouth Co., N. J., 20 miles south of New York, on Sandy Hook Bay and the Central Railroad of New Jersey (Map: New Jersey, E 3). It has beautiful residences and drives, a casino, yacht and tennis clubs, and numerous resort amusements. The borough owns its water works and electric light plant. It was settled in 1880 and incorporated in 1887. Pop., 1900, 1383; 1910, 1645.

ATLANTIC OCEAN. An ocean so named from Atlas, probably because it was the sea beyond Mount Atlas in northwestern Africa. It lies to the west of the great land masses of the Old World, and extends from the Arctic to the Antarctic regions. It is bounded on the east by Europe and Africa and on the west by the two Americas. On the north it connects with the Arctic Ocean by a channel which is as broad as the narrower parts of the main body of the ocean, but which is itself obstructed by islands, of which Greenland is the largest. Greenland lies to the west of the main connecting channel, which is obstructed by Iceland. On the south the Atlantic extends as far as the Antarctic Continent, but no natural line of demarcation here separates it from the Pacific or the Indian oceans, with both of which it communicates freely. A line, 560 miles long, connecting Tierra del Fuego at the southern end of South America with the South Shetland Islands off the coast of West Antarctica, and the twentieth meridian east of Greenwich between Cape Agulhas at the southern end of Africa and the Antarctic Continent (length, about 2500 miles) are therefore generally taken to be the boundaries which separate the Atlantic from the Pacific and the Indian oceans, respectively. A Southern, or Antarctic, ocean is no longer recognized, since the existence of an Antarctic land mass has been established. The waters surrounding the Antarctic Continent are divided up among the three oceans along the lines just mentioned. The length of the Atlantic between these north and south

ATLANTA

ATLANTA, GEORGIA. VIEW OF THE BUSINESS PART OF THE CITY

boundaries is over 13,000 miles; the breadth averages perhaps something over 3000 miles, being less than 1800 miles in the narrowest place in the middle Atlantic between Sierra Leone, on the west coast of Africa, and Cape São Roque, on the east coast of South America. By the protrusion of the two continents in the equatorial zone the Atlantic is divided into two basins, the North and the South Atlantic.

The whole complex of waters constituting the Atlantic may be divided into two parts: (1) the main body of the ocean itself, and (2) the seas which are branches of it. To the latter belong the Arctic Ocean, the deep European Northern Sea (between Greenland and Norway on the one hand and Ireland-Faroe-Orkney and Spitzbergen-Bear Island on the other), the shallow Barents Sea, Hudson Bay, the Gulf of St. Lawrence, the North Sea, the Baltic, the American Mediterranean (Gulf of Mexico and Caribbean Sea), and, finally, the European Mediterranean (including the Black Sea). The area of the whole Atlantic basin is about 41,000,000 square miles—more than one-fifth of the earth's surface and three-tenths of the water surface of the globe—that of its main body 31,600,000 square miles (77 per cent) and that of its branches 9,400,000 square miles (23 per cent). The eastern and western borders are irregular in outline, but are peculiarly parallel, the embayment of the North Atlantic between Newfoundland and the Lesser Antilles corresponding to the northeastern projection of Africa, and the northwestern projection of South America to the wide expanse of the Gulf of Guinea in the South Atlantic. The main groups of islands in the Atlantic are the American Arctic Archipelago, Greenland, Iceland, and Spitzbergen at the north, the British Isles at the northeast, Newfoundland at the northwest, and the West Indies in the west-central part. The Atlantic, including all its connecting inland seas, receives most of the drainage of northeastern central, and southern North America, practically the whole of South America, most of Europe, except the eastern portion (Volga), and most of Africa except the southeastern part (Zambezi).

From the edge of the continental shelf, or platform, as that part of the continental land masses is termed which is submerged to a depth of 600 feet below the sea, the Atlantic basin generally deepens rapidly to depths of 10,000 to 13,000 feet. The main body of the Atlantic varies between 10,000 and 18,000 feet in depth; 13,000 feet may be considered the average depth of the ocean floor. The most conspicuous feature of the submarine relief of the Atlantic is a long, narrow ridge which extends throughout its whole length approximately midway between the eastern and western continents in the shape of the letter S. This coincidence with the general shape of the basin itself, together with the striking parallelism, mentioned above, of the western and eastern shores of the Atlantic, seems to indicate that these are major features in the structure of the earth's crust, although we are still ignorant of their details. In the North Atlantic this central ridge rises to within 13,000 feet of the surface, in the South Atlantic to within 10,000 feet; to the east and west of it lie depths of 16,000 to as much as 20,000 feet. The most marked depressions in the floor of the Atlantic are the Porto Rico Trough, north of Porto Rico, with a maximum known depth

of nearly 28,000 feet—the greatest yet recorded in the Atlantic—and the Romanche Deep, on the equator and in 18° W. long., with a maximum depth of over 24,000 feet.

The surface salinity of the main body of the Atlantic reaches its maximum in two elliptical areas—the one, in the North Atlantic, lying along the Tropic of Cancer with its nucleus nearer the African coast; the other, in the South Atlantic, lying north of the Tropic of Capricorn nearer the South American coast. The salinity here amounts to from 3.70 to 3.75 per cent. From these two areas the salinity decreases to about 3.40 per cent both toward the equator and the poles. The highest salinity within the confines of the Atlantic occurs in the eastern Mediterranean, where it exceeds 3.90 per cent.

The temperature on the ocean floors is about 35° F. in the North Atlantic, 35° to 37° in the equatorial regions, 32° to 34° in the western part of the South Atlantic, and 34° to 36° in the eastern part. The distribution of average surface temperatures shows a displacement to the north, inasmuch as the line of maximum temperature (81° F.) does not coincide with the equator, but extends from the Caribbean southeastward and eastward along 5° N. to the African coast. The 68° isotherm in the north lies in about 35° N. lat., in the south in 30° S. lat.; the 50° isotherm in the North Atlantic extends as far as 60° N. lat. on the European side, while in the South Atlantic it does not go beyond 46° S. lat. In the north the 32° isotherm extends from Denmark Strait, between Greenland and Iceland, northeast to beyond 80° N. lat., and then recurves around the western and southern coast of Spitzbergen until it reaches Barents Sea. In the south this isotherm lies in general as far north as 55° S. lat. The surface temperatures follow the changes in atmospheric temperature, but vary much less in amount. The decrease in temperature with the depth of the water is, in lower latitudes, very rapid for a short distance below the surface; but below a depth of from 1800 to 2400 feet the change in temperature is slight.

The surface waters of the North Atlantic and the South Atlantic have each independent circulatory systems. The Gulf Stream takes its origin from the offshoot of the South Equatorial Current, which flows northwest along the northern coast of Brazil and the Guianas. Reinforcing the westward-flowing North Equatorial Current, it enters the Caribbean through the Lesser Antilles (while a branch, the Antillean Current, flows along their outer side), is forced into the Gulf of Mexico through the narrow Yucatan Channel and out again through Florida Strait, whence it flows along the eastern coast of the United States and thence along the fortieth parallel. In about 40° W. long. it loses its individuality and is merged with the general eastern surface drift. This latter spreads and divides, one branch of it flowing northward along the western coast of northern Europe, there, above latitude 70°, to join the colder currents flowing to the west; the other branch of it flowing, as a relatively cold current, southward along the western coast of Portugal and that of northern Africa; here, below lat. 20° N., it joins, where it is known as the Canary Current, the warm westward North Equatorial Current, and forms, between lat. 10° and 45° N., a clockwise-moving circulatory system. Off the western shores of the Atlantic the cold Arctic

Current flows southward from the north (called the Greenland Current on the coast of Greenland and the Labrador Current farther south), part of it branching off toward the east about lat. 50°, and forming a return current, completing another counter-clockwise system of circulation between lat. 45° and 60° N.

In the South Atlantic there appears to be but a single great circulatory system, moving in a counter-clockwise direction. The South Equatorial Current flows westward across the Atlantic in the region of the equator, but on reaching the northeastern corner of South America in long. 34° W., it separates, the northern branch moving toward the northwest along the north Brazilian and Guiana coast toward the Gulf of Mexico, and the southern branch moving toward the southwest and forming the Brazilian Current along the eastern coast of Brazil. It turns eastward beyond lat. 40° S. and joins the cold West Wind Drift, whose northeastern-flowing waters probably emanate from the Weddell Sea. As the coast of Africa is approached, a part of this current turns northward and flows along the southern part of the western coast of Guinea, where it is known as the Benguela Current, to join again the westward current across the Atlantic near the equator. From it a current detaches itself to the right, which flows east along the Guinea coast and is known as the Guinea Current. In the southwest corner of the circulatory system of the South Atlantic the cold Falkland Current enters from the strait between Tierra del Fuego and West Antarctica and flows north between the Patagonian coast and the western side of the Brazil Current. These various oceanic currents range in velocity from 20 to 75 miles per day.

The northern Atlantic lies in the path of the great procession of cyclones and anti-cyclones of middle latitudes, and also in the path of the West Indian hurricanes over its lower latitudes; the counterparts of these atmospheric disturbances are found in the South Atlantic. The winds of the Atlantic are divided into two corresponding systems—one in the North and one in the South Atlantic. In January and February, in the North Atlantic, north of lat. 35°, the winds are chiefly from the west; they are northwest on the North American coast, west toward the middle, and southwest on the European coast; but between Iceland and Greenland they are from the northeast. South of about lat. 35° N. the winds are generally from the northeast (the northeast trade winds) almost to the equator. In the South Atlantic, north of lat. 20° S. in the western part, and north of lat. 35° S. in the eastern part, the winds are from the southeast (the southeast trade winds), becoming more distinctly from the south just at the equator. In lat. 30° S. the winds are from the south on the eastern side and from the north on the western side; but southward of lat. 40° S. they are in general from the west. In July and August the dividing lines between the wind systems of the North and South Atlantic are pushed farther northward by from 10° to 15°.

The mean annual rainfall over the Atlantic Ocean is dependent on the wind systems. The regions of the northeast and southeast trades—the former the westward extension of arid region of the Sahara, the latter projecting northwest from the west coast of South Africa across to the northeast corner of South America—are

extremely deficient in rainfall (10 to 30 inches). Between the two trade-wind zones lies the equatorial belt of high rainfall (40 to 80 inches and more). The region of the prevailing westerlies has moderate rainfall (40 inches) both in the North and the South Atlantic.

The vegetable and animal life of the Atlantic is treated under the subject OCEAN LIFE.

The distribution of algae is dependent on the light and temperature of the water, and so rapid is the decrease of the former that below a depth of from 800 to 1000 feet few algae are found; those in the surface waters belong mainly to the Fucaceæ, and those at greater depths are mainly Ceraminaceæ. The chief feature of the flora which can receive mention here is the great Sargasso region between lat. 24° and 30° N. and long. 40° and 80° W. on the west side of the circulatory system of the North Atlantic, where the seaweed *Sargassum bacciferum* is found in such great abundance as to interfere in some places with the progress of sailing vessels.

The distribution of mammalia, fishes, and floating mollusks is determined largely by the temperature of the surface waters. Of the Cetacea, some species of whales are distributed over various sections of the Atlantic Ocean, but those found in polar regions do not descend to lower latitudes, and vice versa.

The ocean bottom, near the coasts, is covered with a great variety of deposits of continental waste. The greater portion—that between depths of 3000 and 12,000 feet—is, however, covered with Foraminifera (*Globigerina*, *Orbulina*, *Pulvinulina*, *Spharorodina*). At these latter depths the calcareous bottom is replaced by gray clay, which forms a transition region between the foraminiferan ooze and the red clay of the greater depths below 14,000 feet, which consequently covers a large area. The flora and the fauna of the regions of the Atlantic visited by the *Challenger* are given in minute detail in the *Report of the Challenger Expedition*, prepared under the direction of C. Wyville Thomson and John Murray (London, 1880-95). See OCEAN; OCEANIC DEPOSITS; DISTRIBUTION OF ANIMALS.

Bibliography. The leading general work is *Geographie des Atlantischen Ozeans* by G. Schott (Hamburg, 1912), which discusses, besides the physical features, the discovery and exploration and the transportation and commerce of the Atlantic Ocean. It is accompanied by a bathymetrical map on the scale of 1:30,000,000. Similar representations are found on the *Carte générale bathymétrique des océans*, ed. by J. Thoulet, Inst. Océanogr. de Monaco, and the *Tiefenkarte des Atlantischen Ozeans*, 1:40,000,000, by M. Groll (Verst. Inst. Meereskunde, Berlin, Series A, No. 2, 1912). Current meteorological conditions are represented on the monthly Pilot Charts of the North and the South Atlantic Ocean published by the United States Hydrographic Office, Washington, D. C.

ATLANTIC TELEGRAPH, HISTORY OF THE. The first definite suggestion of telegraphic communication between England and America dates from 1845, when the Messrs. Brett, who a few years later were active in the construction of the first telegraph lines across the English Channel, registered a "General Oceanic Telegraph Company." Before proceeding with this enterprise they laid a cable across the English Channel (1851), the success of which and

other European cables led to the discussion of telegraphic communication between America and Europe by way of Newfoundland. The original plan was to carry the line across that island to St. John's and there intercept the incoming steamers and, by means of carrier-pigeons and a direct telegraph line to the United States, transmit messages. The cooperation of Cyrus W. Field was enlisted in 1854, and he became interested not only in this scheme, but also in a project of a transatlantic cable, which he pushed with vigor. The government of Newfoundland conferred on the company exclusive rights of landing a cable upon its coast, and privileges were also obtained from the governments of Prince Edward's Island, Canada, and the State of Maine. An unsuccessful attempt to lay a cable across the Gulf of St. Lawrence was made in 1855, but in the following year this work was accomplished satisfactorily and one link in the chain completed. The next question was that of the main cable from Newfoundland to Ireland along a route which had previously been surveyed by American and British war vessels, and which, on account of its comparatively shallow depth, was called the Telegraphic Plateau. Extensive tests meanwhile were made to determine the character of the cable, and the many problems involved were discussed with interest by eminent engineers and electricians, many of whom declared the laying and operation of the cable to be impossible.

Through the efforts of Mr. Field, and with the aid of Liverpool and London capitalists, the Atlantic Telegraph Company was formed, with a capital of £350,000, and assistance in the form of subsidies (£14,000 per annum during the operation of the cable was promised by Great Britain); and ships for laying the cable were secured from the governments of Great Britain and the United States. In the first board of directors were William Thomson, who was the electrical engineer of the company, and John Pender; the former, afterward Lord Kelvin, becoming widely known in the scientific world, while the latter was subsequently interested in the construction and laying of many ocean cables. The conductor, which was prepared under certain specifications, consisted of seven fine copper wires, each of No. 22 gauge, twisted together so as to form a cord which was one-twelfth inch in thickness, and weighed 107 pounds per nautical mile. This was covered with three layers of gutta-percha, over which was a coating of hempen yarn saturated with pitch, tar, beeswax, and boiled linseed oil. The sheathing consisted of 18 strands, each formed by seven No. 22 iron wires, making the entire cable about six-tenths inch in diameter, and its weight one ton to the mile.

This cable, when completed, was divided in two equal portions, and loaded on the U.S.S. *Niagara* and H.M.S. *Agamemnon*, which were loaned for this purpose by the respective governments and suitably equipped. A start was made from Valentia, a port on the west coast of Ireland, on Aug. 6, 1857, and the cable was paid out from the *Niagara* until a break occurred and the end was lost. The vessels returned to Plymouth, where the cable was stored and protected. Additional capital was raised by the company, 700 miles of new cable constructed, and another attempt was essayed in the following year. Instead of laying the cable directly from the Irish coast, the *Niagara* and *Agamem-*

non proceeded to mid-ocean, where they joined the ends of their respective cables and then steamed in opposite directions. Again misfortune attended the expedition, and owing to a double break 144 miles of cable were lost. Notwithstanding these mishaps, another start was made July 17, and on July 29, 1858, the two vessels separated. As a result of good fortune and careful management, they succeeded in landing safely the ends of the cable on the Irish and Newfoundland shores. On August 17 complete connections of the cable with the receiving instruments and land wires were made, and the following message was sent over the wire: "Europe and America are united by telegraph. Glory to God in the highest; on earth peace, and good-will toward men." Messages and replies from Queen to President, and between other officials followed, and the event was celebrated enthusiastically on both sides of the Atlantic. The station at Newfoundland was connected with the general telegraphic system of America, and that at Valentia with the British and European lines.

The commercial success of the Atlantic cable was early demonstrated, but, owing to the use of currents of too high potential, the cable soon became impaired, and after September 1 it was found impossible to transmit messages; while after October 20 no signals whatsoever passed over the cable. For several years there were no further attempts at laying an Atlantic cable; but Mr. Field was still active in furthering the enterprise and enlisting new capital. During this time a number of cables were laid in Europe and Asia, and improved methods of construction, testing, and operation were being developed. As a result of Mr. Field's efforts, more capital was subscribed, the company reorganized, and an improved cable, heavier and of greater conductivity, was manufactured. To lay this cable the steamer *Great Eastern* (q.v.), then and for many years the largest vessel afloat, was secured, and special cable-tanks and machinery fitted to it. On July 23, 1865, the *Great Eastern* sailed from Valentia and successfully laid over 1000 miles of the cable, which was under test for the entire trip. At this point, however, a break occurred, and the cable parted. Various attempts were made to pick up the cable with grappling appliances, which, though demonstrating the possibility of finding and raising to the surface a submerged cable, were not attended with success. For another attempt further capital was necessary, and the Atlantic Telegraph Company was practically amalgamated with the newly formed Anglo-American Telegraph Company. Again the *Great Eastern* set forth from Valentia, carrying not only a new cable of improved design, but also a sufficient length to complete the 1865 cable, which was to be recovered and a new length laid from the splice. In both attempts the engineers on the *Great Eastern* were successful, and on July 27 Heart's Content Harbor, Newfoundland, was entered, and the cable was soon landed and connected with the shore. The *Great Eastern* then returned to mid-ocean, and after a series of trials found the broken cable and completed the circuit to Newfoundland. With two working cables, the success of the enterprise was assured, and they were soon in steady use, the rate of transmission of messages improving with new apparatus and the increasing skill of the operators. In 1869 a French cable was laid from Brest to

Saint-Pierre, and four years later the Direct United States Cable Company was formed, and a cable laid across the Atlantic, landing at Torbay, Nova Scotia. This landing was subsequently abandoned, the cable lengthened and diverted to Halifax. This company was the first competitor of the Anglo-American Company, which in 1873 and 1874 laid new cables, again employing the *Great Eastern* for this purpose. In 1872 the 1866 cable broke down, and in 1877 the 1865 cable also, so that in 1880 another cable was laid, which was connected to the shore ends of the 1866 cable. In 1879 the Compagnie Française du Télégraphe de Paris à New-York laid a cable across the Atlantic, and in 1881 the American Telegraph and Cable Company, formed by Jay Gould, laid a cable, which was followed by a second in the following year. In 1884 the Commercial Cable Company, or Mackay-Bennett Company, as it was known from the names of its two chief owners, laid two cables, one of which was extended from Nova Scotia to New York. In 1894 another cable was laid for the Commercial Cable Company, and also a new one for the Anglo-American Company, giving the latter organization five working lines across the Atlantic Ocean. The longest telegraph cable to cross the Atlantic is that of the Compagnie Française des Cables Télégraphiques, which was laid in 1898 and extends from Brest to Cape Cod, Mass., being 3200 miles in length. It is one of the heaviest cables ever constructed, having 661 pounds of copper and 400 pounds of gutta-percha per nautical mile. In 1900 two cables were laid across the Atlantic, using the Azores as an intermediate station. One of these belonged to the Commercial Cable Company and extended from Fayal to New York, via Nova Scotia, making the fourth cable operated by this company. At Fayal direct connection is had with Europe by means of the Europe and Azores Telegraph Company's system. In the spring of 1900 the cable of the Deutsch-Atlantische Telegraphen-Gesellschaft was laid from Borkum to Fayal, and in the summer extended to New York, so that on August 31 Emperor William and President McKinley were able to exchange messages. Late in the year 1901 a cable from Waterville, Ireland, to Fayal, Azores, was laid by the Commercial Cable Company and successfully landed at the latter place on November 30. In 1904 the Deutsch-Atlantische Telegraphen-Gesellschaft completed a second cable from Borkum to New York; in 1905 a fifth cable, from Canso to Waterville, was completed by the Commercial Cable Company, at a cost of \$3,500,000, which very appropriately can be compared with the contract price of the first Atlantic cable, \$1,100,000. The difference is due to the greater conductivity, involving more weight in the core, and to the increased price of gutta-percha, the supply of which is stationary, if not diminishing.

In 1910 the Western Union Telegraph Company, which had previously extended from Nova Scotia to New York the two cables laid in 1881 and 1882 by the American Telegraph and Cable Company, laid a new cable of the heaviest and most improved type between New York and Bay Roberts in Newfoundland and between the last-mentioned point and Penzance in England. This cable was, in 1911, transferred to the Anglo-American Cable Company, and all the cables of the Anglo-American Company and the cable of the Direct United States Cable Company were leased by the Western Union Telegraph Company

for a term of 99 years from April 1, 1911, making, with the two cables laid by the American Telegraph and Cable Company, a total of eight transatlantic cables operated by the Western Union Telegraph Company under the title "The Western Union Cable System." By 1913 three of these eight cables landed at Bay Roberts, and one of the Commercial Cable Company's cables had been transferred to St. Johns, Newfoundland, making a total of eight cables landed at Newfoundland, which has supplanted Nova Scotia as a landing point for transatlantic cables. In 1913 the Gott method for the direct transmission of Morse signals—dots and dashes—was used by the Commercial Cable Company.

Until 1911 the tolls on transatlantic cable messages had invariably been computed upon a word basis, both addresses and signature counted and charged for, but in December of that year the Western Union Cable System, following the precedent established by the land line system of the Western Union Telegraph Company in inaugurating the "Night Letter" service, involving the use of facilities which otherwise would be idle at night for communications of a semi-urgent character and of considerable length, announced a "Cable Letter" and "Week-End Letter" service under which a specified charge is made for a given number of words with small added charges for additional words. These new services were adopted by other companies, and because of their low cost (as low as 5 cents per word) at once became very popular for social and other communications of a non-urgent character.

Consult Bright, *Submarine Telegraphs* (London, 1898), a thoroughly systematic and historical work; Judson, *Cyrus W. Field: His Life and Work* (New York, 1896). See TELEGRAPHY, SUBMARINE, for description of instruments and methods.

ATLANTIS (Gk. Ἀτλαντὶς, scil. νῆσος, *nēsos*, island). A large island, which, according to an ancient tradition, was situated in the Atlantic Ocean, over against the Pillars of Hercules. It is first mentioned by Plato, who, in the *Timæus*, represents an Egyptian priest as describing it to Solon. According to this account Atlantis was an island larger than Libya and Asia Minor combined. Nine thousand years before the time of Solon it had been a powerful nation and had been successfully resisted by the Athenians alone. It had finally been engulfed by the sea, which ever after remained unnavigable by reason of the shoal of mud which had been raised on the spot. In the *Critias* Plato gives a glowing description of the island and adds thereto its fabulous history. The account of Plato has been considered by some a pure invention of the author's imagination, while others have looked upon it as a real tradition. Various attempts have been made to identify the island. The Canary Islands, the Scandinavian Peninsula, and the American Continent have all been thought to be the land in question. The remains of a very ancient civilization in Crete, brought to light by recent archaeological excavations, have led some to identify Atlantis with Crete in the Minoan period. This view is discussed in the London *Times* of Feb. 19, 1909. Atlantis is also the name of a romance by Ignatius Donnelly (1882). Consult Volquardsen, *Ueber die Mythen bei Plato* (Schleswig, 1871), and Steiner, *Submerged Continents of Atlantis and Lemuria* (Chicago, 1911).

ATLAN'TOSAU'RUS. See TITANOSAURUS.

ATLAS (Ar. satin, smooth, from *talasa*, to make smooth). The name given to a silk satin manufactured in India and other eastern countries and at one time largely imported by European merchants. This material was wrought with threads of gold or silver, was either striped or flowered, and was woven in the most skillful manner, though it lacked the lustre of French silks.

ATLAS (so named from its sustaining the globe of the head, as the giant Atlas sustained the vault of heaven). The uppermost segment of the vertebral column; the first cervical vertebra. It differs from the other six in having no body or spinous process, being a mere irregular bony ring, partly divided into two unequal parts by a constriction; this division is completed by a ligament, the space in front being occupied by the tooth-like process of the second cervical vertebra (see **AXIS**) and that behind by the spinal marrow. On each side the ring is very thick; it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat and rest on the second cervical vertebra. The atlas, with the occipital bone, forms the joint on which the head moves in nodding, and turns on the pivot of the second cervical vertebra when we look from side to side.

ATLAS. A mountain system of northern Africa, extending about 1500 miles in a southwest and northeast direction from the western end of Morocco to the eastern coast of Tunis, in the main parallel with the coast of the Atlantic and the Mediterranean (Map: Africa, D 1). These mountains are a part of the orographic system that extends in ranges parallel with them through the Iberian Peninsula to the Pyrenees, and all belonged to the same physical area till separated by the creation of the Strait of Gibraltar. The ranges may be divided into two parts, the Moroccan, or Western, and the Algerian, or Eastern, Atlas. The former comprises three chains—the Great Atlas in the middle, the Little Atlas on the Mediterranean coast, and the Anti-Atlas south of the Great Atlas. The Great Atlas is the longest range and contains the highest summits of the entire system, as the Jebel Ayashi (14,600 feet) and Tamjurt (14,500 feet). Its average height is over 11,000 feet, while the highest summits in Algeria and Tunis do not exceed 8000 and 6000 feet, respectively. The Anti-Atlas is less elevated and shorter than the main chain. The Little Atlas begins in about long. 7° W. and finally joins the coast ridge of the Rif. In the Algerian, or Eastern, Atlas only two chains are distinguished, separated by an elevated plateau interspersed with numerous saline marshes, called Shotts. The northern chain, Tell Atlas, is cut up by coast streams and deep valleys into several separate groups. The valleys are very fertile, highly cultivated, and are among the most favored regions of the Mediterranean basin. The highest summits are more than 7000 feet. The southern range, or Great Atlas, is very wide and sends off numerous spurs into the desert. It reaches in its highest peak, Shelia, an altitude of 7611 feet. In Tunis the Atlas system spreads out into a number of separate mountains of inferior altitude. The rocks composing the Atlas system comprise igneous and sedimentary rocks, which belong chiefly to the Archæan and Paleozoic periods. Jurassic, as well as more recent

Tertiary formations, are also much in evidence. Copper, iron, salt, and several kinds of beautiful marble occur in the Atlas. Some of the summits are under snow for the larger part of the year, but even the highest peaks are usually without a snow cover in summer. Consult: P. Schnell, *L'Atlas marocain* (Paris, 1898); T. Fischer, "Ueber meine Reise im marokkanischen Atlas," in *Zeitschrift der Gesellschaft für Erdkunde*, vol. xxvi (Berlin, 1899); Louis Gentil, *Mission de Sagonzac* (Paris, 1906) and later writings; Joseph Thomson, *Travels in the Atlas and Southern Morocco* (London, 1889).

ATLAS (Gk. Ἀτλας). According to Hesiod's *Theogony*, one of the Titans, the son of Iapetus and Clymene, and brother of Menætiæus, Prometheus, and Epimetheus. Apollodorus, however, says he was a son of Asia; Hyginus makes him a son of Æther and Gæa. The Pleiades were daughters of Atlas and Pleione, the Hesperides of Atlas and Hesperis; and countless noble houses in Greek legend traced their origin to the union of a daughter of Atlas with a god. Through all antiquity, from Homer onward, Atlas bears the heavens on his shoulders, and this is early declared a punishment for rebellion against Zeus, which story was later elaborated until Atlas became the leader of the Titans in their war against the gods. Atlas was always located in the far west, beyond the horizon; finally, he was localized in northwestern Africa. There he was a king, rich in flocks, owner of the gardens of the Hesperides. Atlas, as bearer of the heavens, appears in early Greek art on vases and reliefs in connection with Hercules' search for the apples of the Hesperides. In statuary Atlas is first represented by the Pergamene school; he is portrayed as carrying the heavens or the terrestrial globe. The plural, Atlantes, is applied in architecture to male figures serving as columns. In consequence of the ancient views, which made the vault of heaven rest on solid pillars or other supports, the name "Atlas," originally mythological and cosmogonic, was introduced into geography; it was given to a hill in northwest Africa. Mercator, in the sixteenth century, applied the name "Atlas" to a collection of maps, probably because the figure of Atlas supporting the heavens had been given on the title-pages of such works.

ATLAS POWDER. A high explosive dynamite (of great strength and destructive potentiality), used for mining, quarrying, driving tunnels, sinking shafts and wells, submarine blasting, removing wrecks, clearing ice gorges, road building, excavating ditches, in farming for removing stumps and boulders from new land, and subsoiling. It also has been used with great success for planting fruit and other trees. It consists of nitroglycerin, sodium nitrate, wood pulp, and a small quantity of chalk or other anti-acid. The proportions are varied to fulfill the desired requirements as to strength and quickness. Like other varieties of dynamite, when not confined it will burn harmlessly; but when fired by a blasting cap it explodes with enormous force. It is put up in cartridges 6 and 8 inches in length and from $\frac{7}{8}$ of an inch to 2 inches in diameter, containing from 20 to 75 per cent of nitroglycerin, according to the special use for which it is desired. The 40 per cent strength, put up in cartridges $1\frac{1}{4}$ inches in diameter and 8 inches long, is the most popular in strength and size, as it fulfills the greatest number of requirements. See **EXPLOSIVES**.

ATMOGRAPH (*ἀτμός*, *atmos*, vapor + *γράφειν*, *graphein*, to write). A simple or self-recording instrument for measuring the amount of evaporation, usually of water, from water, from a vessel or other body. See **ATMOMETER**.

ATMOMETER, or **EVAPOROMETER** (Gk. *ἀτμός*, *atmos*, vapor + *μέτρον*, *metrion*, measure). An instrument used to measure the amount of evaporation in the open air from a surface of water. It consists of a round dish supplied with an inclined scale to give a magnified reading of the differences in level caused by the evaporation. This loss can also be obtained by weighing the dish and water at the beginning and end of the experiment. The evaporation pan and still well of Marvin consists of a surface of water fed from a supply tank where the amount lost by evaporation can be measured. In the Piche evaporimeter the evaporation is measured by the change in level of water in a vertical graduated glass tube closed at the upper end and open below. The tube is filled with water, and the open end is covered with a paper disk held in place by a metal clamp. The water is absorbed by the paper, from which it evaporates, and the amount is measured by taking the difference in readings on the scale. The paper surface gives off about one-third more water in a given time than an equal extent of surface of water in an open dish. The first instrument of this kind was constructed by Sir John Leslie, who employed a porous earthenware ball instead of the paper. Other modifications of this instrument have been employed by Livingston, and there is also the balance evaporimeter of Wild, when a pan of water is carried as the variable weight on a quadrant balance. The atmo-graph serves to produce an automatic record of the amount of evaporation. When the wind is blowing 5 miles an hour, the evaporation is 2.2 times as great as in a calm; at 10 miles, 3.8 times; 15 miles, 4.9 times; 20 miles, 5.7 times; 25 miles, 6.1 times; 30 miles, 6.3 times. Atmometers and other meteorological instruments will be found described in Russell, *Meteorology* (New York, 1899), a popular treatise; also by Marvin in *Monthly Weather Review* for 1909.

ATMOSPHERE (Gk. *ἀτμός*, *atmos*, vapor + *σφαῖρα*, *sphaîra*, sphere, globe). The name applied to the mixture of gases and vapors surrounding any climate or sun, but especially the envelope of our globe. Spectrum analysis tells us much about the constituent gases and vapors, and even the relative motion of these in the atmospheres of the earth, the sun, and the distant stars; we know, in general, that nearly all of the chemical elements that occur in those are also present either on our earth or in its own atmosphere. The principal constituents of the earth's atmosphere are oxygen and nitrogen, in the ratio of 21 to 78 respectively. The next most important constituent is aqueous vapor, the proportion of which varies from 5 per cent to nothing, depending upon the temperature and location of the sample of air that is analyzed. The other gases that are most commonly found are carbonic-acid gas, whose proportion varies slightly, but may be considered as being on an average 0.03 per cent and to this extent may be considered as a normal constituent; when this gas is in excess (as in many dwellings where the combustion of fuel or illuminating gas is not properly guarded, or when persons are gathered together without proper provision for ventilation)

it is to be considered as an undesirable impurity. Traces of ammonia, hydrocarbons, and possibly ozone, are frequently encountered. The most interesting recent additions to our knowledge have resulted from our ability to cool and condense the air into a liquid form. By the fractional distillation of this liquid air, Rayleigh, Ramsay, Dewar, and others have shown the presence of gases whose densities, calling that of hydrogen 1 and oxygen 16, are as follows: helium, 1.98; neon, 9.97; argon, 19.96; krypton, 40.88, and xenon, 64. These rare gases are exceedingly volatile, and their presence is held to indicate not that they belong to the earth's atmosphere, but that they are simply diffused through the whole interplanetary space, and are not held down to the earth's surface to any great extent by the attraction of gravitation. On the other hand, a larger body like our sun may have an attractive power sufficient to accumulate a larger proportion of some of these gases in its atmosphere. The accompanying figure and table recently calculated by Humphreys present the vertical change in composition of the atmosphere up to an altitude of 140 kilometers (87 miles). (Consult *Journal of the Franklin Institute*, March, 1913, pp. 212, 215.)

The chemical and physical properties of the earth's atmosphere are of vital importance to mankind. In a general way it is ordinarily stated that the stratified portion of the earth's crust, including the fossils, the coal beds, the oils, the gases, and all hydrocarbon compounds, as well as all the water contained in the rocks, the oceans, and lakes, represents an immense volume of oxygen, nitrogen, hydrogen, carbonic-acid gas, etc., that has been abstracted from the primitive atmosphere of the earth, which must therefore have at one time been very much greater than at present. It is supposed that at the present time the formation of new compounds and the disintegration of others on the earth's surface are going on at such a rate as to counterbalance each other, taking the earth as a whole, although there is probably no experimental or observational demonstration of this hypothesis. It is calculated that at the present time any excess of ammonia or carbonic-acid gas would be rapidly absorbed by the ocean water, resulting in the formation of precipitates that would accumulate at the bottom of the sea. In general, living plants absorb carbonic-acid gas from the air and give up oxygen to it, while ani-

mal life absorbs oxygen and gives up carbonic-acid gas. It cannot be shown that these two processes exactly counterbalance each other, but of course the tendency is in that direction. An appreciable portion of the atmospheric gases is held in solution by fresh and salt water, where it is utilized by plants and animals that live in the water.

A large part of the aqueous vapor in the atmosphere is retained for months on the earth's surface as solid snow or ice, while other por-

of a great mass of snow, and especially its periodical accumulations and evaporation, must disturb the earth's axis of rotation, producing periodic changes in latitude, such as are now going on even on a very small scale.

The physical properties of the atmosphere are as important as its chemical. The air becomes thinner as we ascend above sea level, owing to the fact that it is a compressible gas. The logarithm of the pressure due to the weight of the air above us diminishes in inverse proportion to

CHART SHOWING VARIATIONS IN CONSTITUENTS OF THE ATMOSPHERE AT DIFFERENT ELEVATIONS.

tions, forming as rain or dew, either evaporate quickly or accumulate in lakes and oceans and the superficial strata of soil. But so far as is known, there is at the present time no special tendency toward a steady increase of snow on land or rain water in lakes and oceans, except possibly over the interior of Greenland and in the central portion of the Antarctic Continent, both of which regions are in a glacial condition similar to what must have prevailed over large portions of North America and Europe during the Glacial Period. The steady accumulation

our altitude above sea level; this logarithmic law (erroneously called the law of Boyle and Mariotte), which obtains only so long as the air is dense enough to be considered as a gas that obeys the law of Boyle, gives us for the actual density of the atmosphere at an altitude of 50 kilometers, or 31 miles, something less than the 1-7000 part of the density at the earth's surface; i.e., if there is a pressure of 760 millimeters at sea level, there will be a pressure of only 0.1 millimeter at 50 kilometers. At some elevation not much greater than this it is neces-

sary to consider each particle of air as a separate satellite, moving rather freely with other particles around the earth in orbits controlled by the general law of gravity, but modified by an occasional impact of one particle on the other. At the earth's surface these impacts occur with great frequency and control the phenomena or determine the properties of the gas; but at great altitudes the impacts have less importance, and the gas behaves so differently that it is sometimes spoken of as the ultra-gaseous state, or a fourth condition of matter, or a Crookes's vacuum, since the phenomena peculiar to this condition were first illustrated by Crookes in his vacuum tube. That particles of matter in some form permanently attend the earth at 100 miles above sea level, seems to be demonstrated by the behavior of shooting stars or aërolites, which enter the atmosphere at a velocity of 20 miles per second and are at once heated up to the burning point by striking the air in front of them; it is only when they descend to the lower atmosphere that they can be said to be heated and burned up by the heat evolved by the compression of the gas immediately in front of them.

The density of the atmosphere at the earth's surface is about the 1-800 part of that of water, varying from the 750th to the 850th with the ordinary variations in pressure and temperature. This slight density offers no appreciable resistance to the ordinary motion of men and quadrupeds, but makes it possible for birds and insects to fly. On the other hand, when the air itself is in motion, the breeze produces a pressure that has been utilized by mankind from the earliest ages to propel sailboats and ships and drive windmills, so that the atmosphere must be recognized as affording a motive power that has played a most important part in the development of the human race. In fact, the winds set in motion by the solar heat constitute a great "hot-air" engine. The fact that the atmosphere has weight was first maintained by Galileo and demonstrated by the experiments of Otto von Guericke in his air pump, and Torricelli with his mercurial barometer, but more especially by Pascal, who, at the request of Descartes, carried his barometer to the summit of Puy-de-Dôme, a mountain in central France. It is by virtue of this pressure that water ascends the bore of a pump when the piston is raised. The total mass of the earth's atmosphere has been calculated to be about 1-1,000,000 or 1-1,125,000 of the mass of the earth. (Consult the *Monthly Weather Review* for January, 1899, p. 58.)

As the atmosphere is a fluid, subject at any place to the pressure of all the air above it, it is not only compressed by this weight, but by its elastic reaction it presses outward in all directions with an equal force; consequently every substance that is immersed in the atmosphere is buoyed up to an extent equal to the weight of the air that it displaces. This buoyancy must be allowed for in all delicate weighings. If the object is a bag or a balloon full of hydrogen, hot air, or other very light gas, the upward pressure or buoyancy may be greater than the weight of the balloon; consequently the latter rises. (See *ÆRONAUTICS*.) This principle gave rise, in the hands of Montgolfier, to the art of aerial navigation, the future of which now depends almost entirely upon our knowledge of the currents of air and our power to steer or guide the balloon.

The air is not a perfect gas, but has an internal friction called viscosity, by reason of which one layer of air sliding past another, experiences a drag, or retard, or resistance. Therefore any movement of one portion of the atmosphere over or through another portion soon ceases, unless an external force is continuously applied sufficient to overcome the viscosity. This viscous resistance increases with temperature, but is apparently independent of pressure; it is, therefore, greatest in the warmer portions of the globe and less at the poles, and may be zero at the outer boundary of the atmosphere.

The elastic pressure pervading a mass of quiet air is measured by the barometer; but if the air is in motion the barometer must move with the air, or else some device must be used in order to separate the elastic pressure from the pressure produced by the action of the wind on the barometer itself, considered as an obstacle to the wind. This matter will be found fully explained in Abbe, "Meteorological Apparatus and Methods," *Annual Report, Chief Signal Officer for 1887*, app. 46 (Washington, 1888). The observed pressure at any point on the earth's surface is subject to great changes from day to day, which are associated with the movements of the areas of high and low pressure attending fair weather and storms respectively; therefore the barometer can serve a useful purpose as an indicator of approaching changes of weather. The local pressure also goes through diurnal and annual periodic changes; formerly these were spoken of as waves of pressure, moving as such over the surface of the globe, but it is not necessary to commit ourselves to such an hypothesis before the true explanation of these variations has been discovered.

Another important physical property is the power of the air to absorb and radiate heat. The specific heat of the air when it is kept at a constant pressure is 0.2412, that of water being unity, and the specific heat, when kept at a constant volume, is 0.1721; the ratio of the two is 1.4011. This latter ratio affects the velocity of sound, and, in general, it determines the rate at which air will cool when it is allowed to expand without the addition of heat from extraneous sources. This so-called adiabatic expansion and cooling is the principle that is utilized in cooling the air to the liquid, or even solid state; it is also the principle that controls the cooling of ascending masses of air in the free atmosphere, by which the moisture contained therein condenses into cloud, rain, snow, or hail; this is, therefore, a property of great importance in meteorology.

The absorption of radiant heat by the atmosphere, especially the radiation from the sun and the earth, has been studied minutely, both with the spectroscope and the bolometer. Fraunhofer showed that the dark lines seen in the spectrum of a narrow beam of sunlight proceed mostly from absorption taking place in the sun's atmosphere, but that additional lines and bands seen when the sun is near the horizon must be due to absorption by the earth's atmosphere. The amount of absorption was assumed to be about 25 per cent when the sun is in the zenith, until Langley and Abbot showed that it must be 40 or 50 per cent of all the energy originally present in the sunbeam. The absorption is greater among the short waves than among the long waves, although there are specific wave lengths in all parts of the spectrum that are almost wholly

absorbed, and others that are very little affected. By virtue of this absorption the air retains a considerable body of heat, which it can lose only by the slow process of radiation; it therefore acts as a moderator of our extremes of temperature both by day and by night, both in summer and in winter. Without the atmosphere and especially without its moisture and its carbonic-acid gas, we should be subject to much greater vicissitudes of cold and heat than we are at present.

Bibliography. With reference to the chemical constitution of the atmosphere, general summaries of our knowledge will be found in Schmid, *Lehrbuch der Meteorologie* (Jena, 1861); Hann, *Lehrbuch der Meteorologie* (Leipzig, 1913); Ebermayer, *Die Beschaffenheit der Waldluft* (Munich, 1885); Spring and Roland, *Recherches sur l'acide carbonique de l'air* (Brussels, 1886); Letts and Blake, "On the Carbonic-Acid Gas in the Atmosphere," *Memoirs of the Royal Society of Dublin*, 1899. (Leipzig, 1913).

ATMOSPHERIC ELECTRICITY. Observation shows that the lower atmosphere, with its clouds and rain, or snow and dust, is generally in an electrified state. In November, 1749, Benjamin Franklin argued that lightning is but an immense electric flash, similar to the sparks obtained from electrical machines. On May 10, 1752, Buffon and d'Alibard experimentally confirmed this hypothesis by the use of a lightning-rod near Paris; and in June Franklin himself, by means of a kite raised during a thunderstorm at Philadelphia, was able to draw electric sparks from the clouds and the atmosphere. Since that day an immense number of observations have been made upon the various electric phenomena of the air. Regular observations of atmospheric electricity were originally made either by means of kites carrying insulated wire from the ground up toward the clouds, or more conveniently by means of metal rods insulated from the ground by resin or glass or silk; the upper end of the rod was sometimes pointed, but more properly ended in a sphere; the lower end was connected with a pair of gold-leaf strips, as in the earliest form of electroscope. This apparatus was improved by attaching a slow-burning match or flame at the upper end of the rod. The best of the early forms of apparatus was that of Dellman, in which a brass ball is electrified by induction and afterward its exact condition is determined by applying an electrometer. The modern method devised by Sir William Thomson (Lord Kelvin), about 1860, consists of a reservoir of water, supported on insulating glass pedestals; a small insulated tube leads from the reservoir to some point in the open air, at a distance from the building, and the water flowing through this tube forms a stream that is broken into drops within a few inches of the end of the tube. This constitutes the water-dropping collector. In freezing weather the water must be replaced by a vessel of oil, with wick and flame. The most modern apparatus was suggested by

Paulsen. A metal plate has one face coated, electrolytically, with some radio-active substance, preferably ionium. This plate is exposed with its radio-active face down, beneath a metal funnel. Such radio collectors become charged more slowly than good flame and water collectors, and they do not work as well as the latter in light winds. In the water-dropping collector, if the electric potential of the tube and the water at the point where the stream breaks into drops differs from that of the adjacent air, the drops will carry away the positive or negative excess, and soon bring the collector to the same potential as that of the air. The electric condition is observed by measuring, not sparks or currents, but the difference of potential that tends to cause such currents. For brevity, the word "potential" is used to signify difference of potential. The difference of potential between the air and the earth is measured by connecting the ground and the collector to the opposite poles of some form of electrometer, and for this purpose the quadrant electrometer of Kelvin has been most widely used, since it was first introduced at the Kew Observatory in 1861. A modification of all this apparatus has been used in France since 1875, known as Mascart's system, and this apparatus has also been used by the United States Weather Bureau. In 1884 that bureau inaugurated a systematic investigation of this subject by starting observations and studies under the guidance of Professors Rowland at Johns Hopkins and Trowbridge at Harvard University. This work was subsequently placed under the control of Prof. T. C. Mendenhall, whose report was published in the *Memoirs of the National Academy of Sciences*, vol. v (1889). The specific object of this investigation was to determine whether there was any apparent connection between the electrical condition of the atmosphere and the development and progress of storms, so that such observations could be utilized in the improvement of storm and weather predictions, or in drawing lines of equal electric potential on the Daily Weather Map. It was, however, demonstrated that the potential depends so much upon local conditions that observations made in the same neighborhood gave entirely different results, and that it was necessary to learn how to interpret the local record and its oscillations before combining it with records from another station. As it did not seem likely that results of any value in weather forecasting could be secured at present, the further prosecution of the subject was discontinued. The principal work that has been done since 1887 has been that of Elster and Geitel in Germany, Mascart and Chauveau in France, and J. J. Thomson and C. T. R. Wilson in England.

As regards the general phenomena of atmospheric electricity, observations throughout the globe harmonize in showing that, in general, in calm, clear weather a difference of potential exists such that the air is positive and the earth negative; this difference is larger during east and northeast winds in the northern hemisphere, and it oscillates violently during thunderstorms; there are also two daily maxima and two minima; the potential difference is much larger in winter than in summer, except during thunderstorms; the difference increases greatly during falling snow and during strong winds. Lord Kelvin suggests that there may be cloudless masses of air having different charges of electricity floating above and producing the ob-

served changes in potential as they pass by the observer.

As regards the origin of atmospheric electricity, a great number of hypotheses have been advanced and discussed; most of the older ones have been shown to be unsatisfactory, but the newest suggestions are still undergoing discussion, and our knowledge of the whole subject remains in an elementary condition. Perhaps the nearest approach to a plausible explanation is found in the work of J. J. Thomson and C. T. R. Wilson, who have been able to show that when aqueous vapor begins to condense from the air it settles by preference on the particles of dust that have a negative electrical charge, and that a considerable degree of supersaturation is required to make it condense upon those that are positively electrified. It follows that the first formed particles of fog or cloud are negative and are larger and, therefore, heavier; and that they, settling to the earth as rain, give the ground and the lower portion of the atmosphere a negative charge relative to the upper strata of air. This explanation is, perhaps, better than another which has had many adherents, viz., that the earth, being negatively electrified, induces a positive charge in the air. The action of ultra-violet radiations in discharging a negatively electrified body is the same as though they themselves were positively electrified; and this has led to the hypothesis that the radiation from the sun may give a positive charge to the upper layers of the atmosphere. The hypotheses that atmospheric electricity is due to the evaporation of water at the earth's surface, or to the friction of the wind, or to thermo-electric currents, or to the discharge of great volumes of steam through volcanic vents and geysers, must all be given up as insufficient. If it should be found that we must return to the original theory of Peltier that the earth has a negative charge, and that the atmosphere becomes positive by induction, then the most plausible suggestion—but as yet undemonstrated—is that of Clerk Maxwell, viz., that the tidal strains within the earth's crust and the slipping that cause faults and earthquakes give rise to a development of piezo-electricity that has gradually accumulated until the present condition has been attained. This hypothesis connects terrestrial electricity and terrestrial magnetism, and may be considered as a new example of the transformation of energy, since it is equivalent to the daily conversion of a small fraction of the force of gravitation into electricity. Elster and Geitel and Ebert prefer to explain the negative earth-charge by the fact that the solids of the earth's crust select out the negative charges from the highly conductive subterranean and soil air, passing over them as the earth breathes it out. This air is always more or less heavily charged by reason of the radio-active substances now known to abound in the earth's crust. As a result of the absorption the ground-air emerges with a preponderance of positive charges which keep the atmosphere positively charged toward the earth.

For a general summary of our knowledge of atmospheric electricity at the present time, consult Hann, *Lehrbuch der Meteorologie*, 2te Aufl., pp. 546–547 (Leipzig, 1906); H. Mache and E. von Schweidler, *Die atmosphärische Elektrizität* (Braunschweig, 1909); A. Gockel, *Die Luftelektrizität* (Leipzig, 1908). ATMOSPHERIC EN'GINE. See CALORIC ENGINE.

ATMOSPHERIC IN'FLUENCE. Air consists normally of oxygen, nitrogen, water vapor, and carbon dioxide; but owing to the continual decomposition of organic bodies that is taking place in nature, its constituents usually include many other gases, as hydrogen disulphide, sulphur trioxide, etc., which may act chemically on various bodies and thus gradually cause their destruction. The destructive effects of atmospheric electricity and changes of temperature may also be included among the influences that tend to destroy various materials.

Atmospheric influence is conspicuously shown on buildings and other structures that are exposed to the air. The atmosphere of large towns usually contains an excess of carbon-dioxide gas, and, where coal is burned, of sulphur. The resistance of many building materials to atmospheric influence is, however, very great. Granite is regarded as the most stable of building stones. Egyptian porphyry is also remarkably enduring. Basalt disintegrates unequally according to the amount of feldspar that it contains. The durability of slate is in proportion to its density. Sandstone, millstone grit, and conglomerates are affected through the decomposition of the material cementing their particles, or the mechanical effect of moisture, as by freezing. Limestone decays with varying degrees of rapidity. The application of melted paraffin to structures that tend to disintegrate has been found of value in protecting them from decay. A notable example of atmospheric influence is presented by the Egyptian obelisk in Central Park, New York, which had withstood the ravages of centuries in a dry atmosphere, but is rapidly disintegrating in the moist climate of New York. The power of brick, tile, and the like to resist the influence of the atmosphere is dependent on the chemical composition of the material and the amount of burning in their manufacture. If they contain lime, they tend to crack and crumble under moisture. Much care is usually exercised in the proper selection of materials in making cements, and those best adapted to resist atmospheric influence are naturally selected. Wood and timbers are easily influenced, and, when moist and exposed to currents, resulting in rapid evaporation, cracks ensue from shrinkage. The decay of wood is due to the action of micro-organisms which secrete the enzyme cytase. For the protection of wood, ordinary oil paint is the usual preservative. Treatment with special preparations, such as kyanizing, creosoting, and pickling in mineral salts, is also not infrequently resorted to. (See WOOD PRESERVING.) In the case of metals the influence is somewhat complicated by chemical and physical changes. Iron, when exposed to the influence of the atmosphere, absorbs oxygen from the air and becomes rusty or coated with iron

oxide. For its protection, as in the case of bridges, a suitable paint is the most satisfactory preservative. Zinc, when exposed, similarly becomes coated with oxide of zinc, which serves to prevent further oxidation. Copper likewise is soon coated with an oxide that serves as a protecting agent. Glass, which is deficient in silica, deteriorates in consequence of the decomposition of its potassium and sodium silicates. Paintings, statuary, and other works of art, as well as books and manuscripts, readily decay under the influence of the atmosphere. The bindings of books in libraries occasionally disintegrate in consequence of the sulphur that is often contained in illuminating gas.

ATMOSPHERIC RAILWAY. See PNEUMATIC DISPATCH.

ATOLL, a-tōl'. The name given by the Malays to a coral reef which forms an annular island, inclosing a lake of water. Some atolls are nearly 100 miles in circumference, and have from 15 to 60 fathoms of water. They make ex-

CROSS-SECTION AND BIRD'S-EYE VIEW OF AN ATOLL.

cellent harbors, with safe entrances, always on the windward side. Some of the reefs sustain considerable vegetation and are inhabited. See CORAL ISLAND AND CORAL REEF.

ATOM. See DIVISIBILITY; CHEMISTRY; MOLECULES—MOLECULAR WEIGHTS; ATOMIC WEIGHTS; MATTER.

ATOM, THE HISTORY AND ADVENTURES OF AN. A romance by, Smollett (1769), satirizing the English political parties of the day.

ATOMIC THEORY. See CHEMISTRY.

ATOMIC WEIGHTS. If one should weigh out a number of volatile oxygen compounds in such quantities that the volumes occupied by them (under some given pressure and temperature) should be equal to one another as well as to the volume occupied by 2 parts by weight of hydrogen gas, he would find, by analysis, that some of these compounds contain 16 parts of oxygen, others 32 parts of this element, still others 48 parts of it, etc. The number of parts of oxygen in any one of the compounds would be either 16 or some multiple of this number; but in no case less. A similar comparison of the compounds of chlorine would show that they contain either 35.5 parts of this element, or some multiple of 35.5, but in no case less. By extending investigations of this kind to volatile compounds in general, chemists have been able to demonstrate that for every element there is a characteristic number representing the smallest amount of that element capable of existing in a certain fixed quantity of a chemical compound, viz., in a quantity occupying, in the state of vapor, the same volume as 2 parts by weight of hydrogen gas under the same conditions of temperature and pressure. This characteristic number is called the *atomic weight* of the element, and is generally implied in its chemical symbol; thus the symbol Cl stands for 35.5 parts of chlorine,

and the symbol O for 16 parts of oxygen. The formula ClO_2 , representing an explosive compound of chlorine and oxygen, shows therefore that that compound contains once 35.5 parts of chlorine and twice 16 parts of oxygen; or, briefly, one "atom" of chlorine and two "atoms" of oxygen. The great advantage of using atomic weights as units of measurement for the several elements consists mainly in the fact that it permits of representing by integral numbers (usually small ones) the composition of any chemical compound, and that it therefore greatly simplifies inquiry concerning the similarities and dissimilarities in the chemical nature of material substances.

In analyzing equal volumes of compounds, it was seen above that the amounts of the elements found would represent either their atomic weights or multiples of these. Water would yield 2×1 parts of hydrogen and 16 parts of oxygen; hydrochloric acid, 1 part of hydrogen and 35.5 parts of chlorine; caustic soda, 23 parts of the metal sodium (Na), 16 parts of oxygen, and 1 part of hydrogen; common salt, 23 parts of the metal sodium and 35.5 parts of chlorine, etc. If, in studying these compounds, we analyzed, not equal volumes, but equal weights,—say, 100 parts by weight of each—we should find their composition in the form of percentages as follows: Water, 11.11 per cent of hydrogen and 88.89 per cent of oxygen; hydrochloric acid, 2.74 per cent of hydrogen and 97.26 per cent of chlorine; caustic soda, 57.5 per cent of sodium, 40 per cent of oxygen, and 2.5 per cent of hydrogen; common salt, 39.32 per cent of sodium and 60.68 per cent of chlorine, etc. Of course, to say that water contains 11.11 per cent of hydrogen and 88.89 per cent of oxygen is the same as to say that it contains 2 parts of hydrogen and 16 parts of oxygen. But by comparing the two sets of results just cited it is easy to see that, while the percentage figures have apparently nothing in common with one another, those derived from comparing equal volumes indicate plainly the simple laws according to which the chemical elements are distributed in their compounds.

The reason for choosing the volume occupied by two parts of hydrogen gas as the standard volume for the investigation of compounds is simply this, that by doing so no compound will be found to contain less than 1 part by weight of hydrogen; so that the atomic weight of hydrogen will be 1. If, instead of two, one part of hydrogen gas were chosen as the standard, the atomic weight of hydrogen in its compounds would be found to be one-half, the atomic weight of oxygen would be 8, that of chlorine 17.75, etc. The relative magnitude of the atomic weights would, of course, be the same, but the atomic weight of hydrogen would be one-half. Now, the atomic weight of hydrogen being less than that of any other element, chemists prefer to assign to it the value 1, thus making it the unit with which the atomic weights of the other elements are compared. That by doing so they do not render their results any less general may be readily seen from the fact that the "two parts by weight of hydrogen gas" taken may be 2 grains, 2 grams, 2 pounds, 2 anything.

But why should equal volumes of compounds form their comparable quantities? A plausible answer to this question is furnished by Avogadro's hypothesis, according to which equal volumes of all gases and vapors contain, under the

same conditions of temperature and pressure, equal numbers of molecules. Comparing the composition of equal volumes is consequently tantamount to comparing the composition of single molecules; and that a comparison of molecules should be expected to bring out the laws of chemical composition is clear. The smallest weights of the elements found in equal volumes of compounds represent, evidently, the relative weights of single atoms of the several elements, and this is why those weights are termed "atomic weights." It was the application of Avogadro's hypothesis that first led chemists to compare equal volumes of compounds. The first to demonstrate clearly the advantage of doing so was the French chemist Gerhardt, from whom the modern system of denoting the composition of substances is sometimes called Gerhardt's Notation.

In the above discussion, showing that Avogadro's rule is at the basis of the definition and determination of atomic weights, it was tacitly assumed, for simplicity's sake, that the rule is an equally reliable guide no matter what the equal temperatures and pressures, and no matter what the gas or vapor be. In reality the result of applying the rule to a given gas or vapor under a given set of physical conditions can be of no greater precision than the simple gas laws as applied to that substance under those conditions. From this it might be concluded that Avogadro's rule can only approximately indicate the magnitude of atomic weights, and that their precise values can only be obtained by purely chemical methods. In recent years, however, it has been shown that if the deviations from the simple gas laws are properly taken into account, Avogadro's rule leads to atomic weight values of no less precision than those obtained by the best chemical methods.

The rule directing us to compare equal volumes of compounds in the gaseous state, and thus leading to a knowledge of atomic weights, has been extended also to the state of bodies when dissolved in some solvent. (See MOLECULES—MOLECULAR WEIGHTS.) In case, however, compounds can be neither vaporized without decomposition nor dissolved in any suitable solvent, Avogadro's rule cannot be applied, and then some other principle has to be employed, if in the absence of better material the refractory compound must be used for determining the atomic weight of one of its elements.

Isomorphism. One such principle is based on the general fact that isomorphous compounds, i.e., substances which have about the same crystalline form, usually resemble one another also in their chemical composition. An example may serve to explain how this general fact is made use of for the purpose of determining atomic weights. Suppose the oxide known as alumina were the only compound available for determining the atomic weight of its metal, aluminum. Alumina is neither volatile nor soluble, and hence its molecular weight could not be determined by Avogadro's rule. But it is isomorphous with the oxide of iron, which is known to contain 2 atomic weights of iron to 3 atomic weights of oxygen. Alumina is therefore supposed to have a similar composition, i.e., to be made up of 2 atomic weights of aluminum and 3 atomic weights of oxygen. A chemical analysis would show that alumina contains 53.03 per cent of aluminum and 46.97 per cent of oxygen. Call-

ing the atomic weight of aluminum Al, and remembering that the atomic weight of oxygen is 16, we therefore have:

$$2 \text{ Al} : 3 \times 16 = 53.03 : 46.97.$$

This atomic weight is consequently found to be

$$\text{Al} = \frac{3 \times 16 \times 53.03}{2 \times 46.97} = 27.1 -.$$

The Discovery of Dulong and Petit. Dulong and Petit discovered a remarkable fact, which may be stated as follows: When the atomic weight of a solid element is multiplied by its specific heat (i.e., the amount of heat required to raise the temperature one degree), a number is obtained which is nearly the same whichever element is considered. Thus the atomic weight of iron being about 56, and its specific heat 0.1138, the product is about 6.37; again, the atomic weight of zinc being about 65.2, and its specific heat 0.0956, the product is about 6.24. The two products, while not absolutely the same, are nearly equal. Why the products of such different numbers should be about the same is not yet clearly understood. But the fact can nevertheless be used for practical purposes. The mean value of the products corresponding to the several elements is about 6.3. If, therefore, a new element were discovered, and it would be desirable to ascertain roughly its atomic weight, all a chemist would have to do would be to determine its specific heat and divide 6.3 by that quantity. This method of determining atomic weights is especially useful in cases in which there is doubt as to whether the number assigned to an element is its true atomic weight or a multiple of it. The fact discovered by Dulong and Petit can thus be used at least as a check on the atomic weights determined by other methods.

The Periodic Law. The celebrated Russian chemist Mendeléeff demonstrated a remarkable relation between the physical and chemical properties of the elements and their atomic weights. For an account of this relation see PERIODIC LAW. Suffice it to say here that the existence of this relation has definitely proved that the atomic weights at present used by chemists are in the truest sense of the term characteristic of the several elements known, and that it is hardly imaginable that future discovery should show them to be worthless and bring about their abolition. Once established, the Periodic Law has been employed as a check on the accepted atomic weights of the elements, but in a sense somewhat different from the law of Dulong and Petit. In several cases (e.g., in the case of platinum), accepted atomic weights were found to disagree with the general relation established by Mendeléeff. The periodic relation thus indicated that those atomic weights must be somewhat incorrect; and, as a matter of fact, careful re-determination showed them to be so and brought to light their true values.

Atomic Weights referred either to Hydrogen or to Oxygen. Being purely relative quantities, the atomic weights of the elements assume definite values only if referred to some fixed number chosen to represent one of them. Different sets of atomic weights may therefore be obtained by choosing different standards, and one such set is obtained by assigning to the atomic weight of hydrogen the value 1. This standard seemed at one time preferable to any

other, in the light of Prout's hypothesis, according to which the several chemical elements are not really different from one another in substance, but are condensation products of hydrogen. It was consequently expected that careful atomic weight determination would yield integral numbers, if the atomic weight of hydrogen were taken as the unit. Experi-

ment of the highest precision has, however, shown conclusively that while a really remarkable proportion of atomic weights are integral numbers, many of the exactly known atomic weights cannot possibly be represented by commensurable numbers; so that the common derivation of *all* the elements from one of them is extremely improbable, and choosing a "common unit of measurement" for the atomic weights is useless. Nevertheless the choice of a standard need not be altogether arbitrary. The actual determination of atomic weights involves analytical processes in which many of the elements are weighed as oxides, the required atomic weights being calculated from the weights of these and from the atomic weight of the oxygen contained in them. If hydrogen is taken as the standard, the figure for the atomic weight of oxygen, being determined by an analysis of water, cannot be absolutely exact. That error must then enter into all atomic weights calculated from that of oxygen; and every new determination of the atomic weight of oxygen must necessitate a recalculation of all atomic weights based on that of oxygen. To-day chemists obviate this by taking the atomic weight of oxygen itself as the standard. The atomic weights given in the accompanying table are those recommended in 1913 by an international committee representing the chemical societies of the world. Among the names connected with precise determinations of atomic weights, that of Stas is foremost. In recent years Prof. Theodore W. Richards, of Harvard, has carried out a number of determinations of great precision. See also CHEMISTRY; AVOGADRO'S RULE; MOLECULES—MOLECULAR WEIGHTS; PERIODIC LAW. Consult Richards, *Experimentelle Untersuchungen über Atomgewichte* (Hamburg and Leipzig, 1909).

ATOMICITY. See VALENCY.

ATOMISM (Gk. *άτομος*, *atomos*, uncut, indivisible, from *α*, priv. + *τέμνειν*, *temnein*, to cut). The term used in philosophy to designate the theory that the universe is not an organic whole—i.e., a whole constituted of parts each of which is what it is only in virtue of its essential relation to other parts. Atomism maintains that the universe is an aggregate of elements (atoms), each of which has an intrinsic nature, and that this intrinsic nature would remain unchanged even if there were no universe, but merely this single element existing in absolute solitariness. Atomism is often materialistic (see MATERIALISM); but spiritualistic or psychic atomism has also been stoutly maintained (see HUME), and a dualistic atomism is equally possible, and is the ordinary common-sense view, according to which the material universe is composed of irreducible and essentially independent units, while the world of mind is regarded as composed of self-subsistent souls standing only in accidental relations. These souls may further be regarded as composed of perceptions, emotions, etc., co-existent and successive. Recently there has been a significant revival of a kind of atomism in William James's philosophy of "radical empiricism"; James regards the universe as composed of elements which he calls "pure experiences," each "pure experience" being a "communitated absolute." This view is distinguished from earlier atomisms by its emphatic recognition of relations as being fully as real and as ultimate as qualities. See JAMES, WILLIAM; EMPIRICISM.

Element	Symbol	Atomic weight
Aluminium	Al	27.1
Antimony	Sb	120.2
Argon	A	39.88
Arsenic	As	74.96

Some neo-realists (see **REALISM**) are also atomistic in their philosophy. For adverse criticism of Hume's atomism, consult Green, *Introduction to Hume*, in Green and Grote's edition of Hume's philosophical works (London, 1874), or in Green, *Works* (London, 1885-86).

ATOMISTS. See DEMOCRITUS; LEUCIPPUS; EPICURUS.

ATONEMENT (from *atone*, literally, to be at one). The word is used of reconciliation with God, as expressed in the Bible and Christian thought. The underlying conceptions are common to most religions, but no other religion has formulated them into a theory as Christianity. The theory rests on the idea of a connection between an individual man, or a tribe, and a personal deity; of a rupture between man and his God; of the attempt to heal the rupture. The word can only be properly used of a personal deity. The attempt to conform to a law or ideal of life, as in Buddhism and Confucianism, is not atonement in its historic meaning, for there is no broken personal relation to be made right. Any religion which conceives of a personal God, and of that God as displeased with his people, furnishes the ground for some kind of an atonement. This includes most forms of savage religion; the popular forms of Hinduism, with their personal gods, Vishnu, Siva, and others; the Semitic religions; Mohammedanism and Christianity. The universal assumption of primitive religion is that a god is friendly to his worshipers; but soon evils and disasters lead to the thought that the god is sometimes angry and must be propitiated. The attempt is made to win back his favor by gifts, as would be the case with an angry chief. This, though probably not the origin of sacrifice (q.v.), is one of its early uses. It is natural that gifts of great value should be offered. The need of reconciliation led to valuable gifts in two ways: (1) as demanding costly gifts from the worshipers; (2) as demanding gifts valued by the deity. In this way human sacrifices arose, and also fasting, tortures, and mutilations of the worshiper. The Hebrew ritual provided for no atonement for deliberate crimes, only for unwitting offenses, ritual delinquencies, and business dishonesty. The prophetic conception was that God was not reconciled to man by offerings, but by penitence and a righteous life. The New Testament presents no detailed theory of atonement. Paul emphasized the death of Christ as an element of the reconciliation, and the author of Hebrews thought of reconciliation in terms of the sacrifices of the Hebrew ritual, while Jesus himself spoke of giving his life for the world; but the emphasis of his teaching was on the prophetic idea of repentance as the door of approach to God. In the early Church the problem of the relation of Christ's suffering to the reconciliation of man and God received little attention. The person of Christ, rather than the doctrine of the atonement, was the first great question in the history of Christian thought. That Christ paid a ransom for man was a common thought, but to whom, and how it resulted in the salvation of man, were questions answered either crudely or not at all. Some, including Irenæus, Origen, and Augustine, conceived the ransom as given to the devil. Man, by sin, fell into the power of the devil. God, being just even to the prince of injustice, made a bargain

with him by which the devil consented to receive Jesus as a ransom for man; but hell could not keep the Holy One of God, and so the devil lost both Jesus and humanity. This mythological tale of trickery made a strong, if not lofty, appeal and was long used, with increasing dramatic effect, in popular explanations of Christianity. The more refined and philosophical minds could not fail to find it degrading. Athanasius voiced the idea that the ransom was given to God. God was pledged to inflict death for the punishment of sin and could save man only by the incarnation and punishment of his Son in man's stead. How and why this should save man was, however, not satisfactorily explained. There have been three great lines of thought on the atonement in Christian theology: (1) judicial; (2) governmental; (3) moral influence. These group further, in that (1) and (2) are objective, conceiving of the sufferings of Christ as having an objective effect on the attitude of God toward man, and (3) is subjective, conceiving that the effect of the atonement is upon man, not upon God. 1. The first great treatise on the atonement was the *Cur Deus Homo* of Anselm (1033-1109). Man owes God perfect obedience; but man has sinned and so robbed God of the homage due to him. Should any one live a perfect life, that would not repair the injury done to the honor of God by past sins. Man must pay the debt, but man cannot. Since the debt is against the Infinite, only an Infinite Being can discharge it; hence the need of the God-man. Christ yielded perfect obedience, but he also gave his life. Justice did not demand death from a sinless being, and so he deserves a reward. But Christ cannot be rewarded, since all things that are the Father's already belong to him. The salvation of men, his human kindred, is therefore given him as a fitting reward. This theory rests upon legal notions of homage and merit (whether Roman or German is still disputed); upon the ideas that sin is infinite, because against an infinite God, and that the entire redemptive work of Christ lies in his death, not in his life. This general type of judicial theory has persisted to this day, sometimes with modifications, in both Catholic and Protestant theology. Other forms of the judicial, or penal, theory arose. Thomas Aquinas held that Christ's perfect obedience actually made complete compensation for sin. The theory of Aquinas has become the orthodox theology of the Catholic church. The same general theory was held by the Protestant reformers. They emphasize, however, not the violation of God's honor, as did Anselm, but of his justice. Frequently retributive justice was regarded as an eternal law, binding the action of God himself, prohibiting the free exercise of divine mercy, and demanding satisfaction before man could be saved. 2. The governmental theory arose from the work of the great Dutch jurist, Hugo Grotius (1583-1645). He set out to defend the orthodox views from the attacks of Socinus, who, assuming from Anselm that the relation of God and man was that of creditor and debtor, held that no objective atonement was necessary, since the love of God could forgive the debt of sin in a penitent soul. Grotius substituted the relation of ruler and subject for creditor and debtor. Sin is a wrong against public law, and law must be vindicated. A ruler may, however, remit a penalty if the law can be

otherwise vindicated. The death of Christ secures this result by showing impressively what sin deserves. It is not the actual punishment, but rather a symbol of punishment. So the purpose of justice is attained, and the love of God may forgive the penitent sinner. In general the Calvinistic theology rejected, and the Arminian accepted, the governmental theory. It affected New England Calvinistic theology, however, till its later representatives, the younger Edwards, President Dwight, Nathaniel Taylor, and the "New School" Presbyterians held firmly to it. It has been characteristic of the less strictly conservative of the schools of Protestant thought. 3. A third general group of theories is known as the moral-influence theory. Its roots, though not its completed form, go back to Duns Scotus (d.1308) (q.v.). He held that, since the will of God is absolute, he might have accepted deeds of love done by an angel, or by a mere man, as the satisfaction for sin, but God chose the gift of his own Son as the most impressive means of arousing love and so winning man back to himself. In modern times the conception of Christ's life and death as God's appeal to man has been very influential. It has been felt that God needed not to be reconciled to man, but man to God. The most effective presentation of this general theory made in America was in the writings of Horace Bushnell. He published three works on the subject, each of which modifies in some measure the positions of the last. His final work, *Forgiveness and Law* (1874), holds that forgiveness is possible only if one suffers on behalf of the offender; that in Christ God himself has done this on behalf of man. These sufferings are the expression of God. The correlative of expression is impression, and this exhibition of the love of God draws men to him. The moral-influence theory, in varying form, has been expressed by Schleiermacher, Nitsch, Rothe, and Ritschl and his followers in Germany; by Vinet, Bouvier, and Auguste Sabatier in French thought; by F. D. Maurice, John Caird, and Jowett in England; and, besides Bushnell, by William N. Clarke and by George B. Stevens among recent writers in America. All three types of atonement are held in modern thought, as is shown by such a book as *The Atonement in Modern Religious Thought* (New York, 1901), where essays from 17 writers are gathered, representing widely varying opinions, all held within the bounds of orthodoxy. For recent discussions, consult Dale, *The Atonement* (London, 1885); Clarke, *Outline of Christian Theology* (New York, 1897); Sabatier, *The Doctrine of the Atonement and its Historical Evolution* (New York, 1904); Tymms, *The Christian Idea of the Atonement* (New York, 1904); Stevens, *The Christian Doctrine of Salvation* (New York, 1905); Burton, J. M. P. and G. B. Smith, *Biblical Ideas of the Atonement* (Chicago, 1909). See CHRISTIAN SCIENCE.

ATONEMENT, or EXPIATION, DAY OF. A Jewish fast day, occurring on the tenth day of the seventh month (Tishri) and observed as a day of humiliation and supplication. The laws in connection with it are found in Lev. xvi., and in some scattered passages (Ex. xxx. 10; Num. xxix. 7-11), all regarded as of comparatively late origin. (See PENTATEUCH.) It was a day devoted to worship, on which all manner of work was forbidden; abstention from

food, from drink, and pleasure commanded; and so long as the temple stood, during the post-exilic period, a long sacrificial service was gone through. The centre of the service was the high priest, who had, according to the Talmudical tradition, to spend the seven preceding days in separation from all persons and in careful study of the duty imposed upon him. On the day of Atonement, dressed in white linen garments (not in the gorgeous dress of his office), he entered the holy of holies and confessed his sins. He then chose two goats and by lot determined which one was to be sacrificed. This one was killed, and its blood sprinkled in front of the veil in the holy of holies. The second one, after the high priest had rested his hands on its head and had confessed the sins of the whole people, was given in charge of trusty men, who led it outside of the city limits, and then one of them released it in the wilderness (Lev. xvi. 10-21). While the biblical ritual for the day contains some evidently ancient features, and while the sanctity of the tenth day of the "sacred" seventh month probably reverts to an early epoch, the institution of the distinctively Jewish Day of Atonement is regarded by many scholars as an outcome of religious conditions during the Babylonian exile. The earliest trace of the biblical ceremonial outside of the Pentateuch is to be found in Ezek. xlv., though his prescriptions for the day are much simpler than those found in Leviticus. With the destruction of the temple and the abolition of sacrifice, the Day of Atonement was changed in one important particular—from being a purely national fast it came to have also an individual side. At present the day is kept by fasting from sunset of the ninth to sunset of the tenth day of Tishri and by services in the evening and all day. An important part of the service is the recital of the service of the temple, as handed down by tradition.

Just as the popular sense of guilt experienced during the Babylonian exile seems to have furnished the conditions favorable for the institution of a great atonement day, so the second destruction of Jerusalem directly contributed not only toward enhancing the importance of the day, but toward giving to it a sombre character relieved only by the consolatory hope of securing, by a strict obedience to elaborate ceremonial regulations, forgiveness of individual sin and the assuagement of divine anger manifested by the loss of national independence. An entire treatise of the Talmud, known as *Yoma* (i.e., 'The Day par excellence'), is devoted to setting forth the ceremonies and ritual for the fast, and despite general laxity prevailing in wide circles, Jews of the most advanced views still observe the day as the most sacred of the year.

Bibliography. On the biblical observances and questions connected with its origin consult: W. Nowack, *Hebräische Archäologie*, vol. ii (Freiburg, 1894); I. Benzinger, *Hebräische Archäologie* (ib., 1894); I. J. Wellhausen, *Prolegomena zur Geschichte Israels* (Berlin, 1890); for the later observances; J. Lightfoot, *The Temple Service*, vol. ii of his *Collected Works* (London, 1864); A. Edersheim, *The Temple: Its Ministry and Services* (ib., 1894); L. Dembitz, *Jewish Services in Synagogue and Home* (Philadelphia, 1898).

ATOS'SA (Gk. Ἀτὸσσα, Per. *Atuša*). The daughter of Cyrus, and the wife successively of her brother Cambyzes, Smerdis, and Darius,

son of Hystaspis. She is mentioned by Herodotus, and according to one account was killed by her son Xerxes. The name corresponds merely in form to that of Vishtāspa's wife, Hutaosa, in the *Avesta*. See ZOROASTER.

ATOXYL. Sodium arsenilate. An arsenic compound having the same action as Fowler's solution and said to be many times less poisonous. Koch believed the drug to be a specific for sleeping sickness, and it was for a time much used in that disease as well as in syphilis. It was found, however, to produce atrophy of the optic nerve in some cases and is therefore less frequently employed now than formerly. In syphilis it has been entirely superseded by salvarsan (q.v.).

ATRATÓ, a-trá'tó. A river of western Colombia, South America, flowing into the Gulf of Darien (Map: Colombia, B 2). It is about 400 miles long, occupying a longitudinal valley just west of the Coastal Cordillera, its bed sloping very gently to the north, its sources high on the western slopes of the Cordillera Occidental. It is navigable for 250 miles. Its sources are not far from those of the San Juan River, which empties into the Pacific, and A. von Humboldt suggested that the two rivers might be utilized in making a canal route between the Atlantic and the Pacific. Survey parties were sent out by the United States in 1857 and 1870; but the reports in both cases were unfavorable, and the canal project was abandoned.

ATREBATES, á-tréb'a-téz or á-tré-bá'téz, or ATREBATII, á-tré-bá'shi-I (Lat.). A people of Belgic Gaul, whose name survives in the name of the old province of Artois. In a confederation against Julius Caesar they furnished 15,000 troops. There was once a colony of them in Britain, in Berkshire and Wiltshire.

ATREK, á-trék'. A river of Persia (Map: Persia, F 2). It rises in the northeastern part of the country, near Kuh Rizeh Mountain (9700 feet), and, flowing west, forms part of the boundary between Russian Central Asia and Persia. It falls into the Caspian Sea, at Hassan-kuli Bay, after a course of over 300 miles.

ATREUS, á-trōós (Gk. 'Ατρεΐς). In Greek legend, son of Pelops and Hippodamia, grandson of Tantalus, and brother of Thyestes. In the *Iliad* there is no trace of the terrible feud between the brothers. This legend develops later, perhaps under the influence of Dorian hostility to the Achæan rulers of the Peloponnesus, and is told in many forms. The main features are as follows: Atreus married Cleola, by whom he was the father of Pleisthenes; his next wife was Ærope, by whom he had Agamemnon and Menelaus; his last wife was Pelopia, daughter of his brother Thyestes. The main story of Atreus begins in blood, he and Thyestes being induced by their mother to kill their step-brother Chrysippus, the son of Pelops and the nymph Axioche. After the murder the perpetrators fled to Mycenæ, where the King, Eurystheus, was their nephew. Eurystheus lost his life in war with the Heraclidæ, and Atreus succeeded him as King of Mycenæ. Thyestes seduced Atreus's wife Ærope and stole the golden lamb which was the gift of Hermes. Atreus expelled Thyestes, who sent Atreus's own son Pleisthenes to kill him (Thyestes had brought Pleisthenes up as his own son); but the father slew the son without recognizing him. Then Atreus prepared a great revenge. Professing to be reconciled to Thyestes, he invited him to

Mycenæ, killed the sons of Thyestes, and served them as a banquet for their father. In the midst of the meal Atreus showed the heads and hands to Thyestes, who, struck with horror, cursed the house of Atreus and fled, while the sun turned its face from the scene. Thyestes went to Sicyon, and there found his daughter Pelopia, whom he violated without recognizing her. She was then married to Atreus, who was also ignorant of her parentage. Her child by Thyestes was exposed, but rescued and brought up by Atreus, who named him Ægisthus. Later Atreus sent Agamemnon and Menelaus in search of Thyestes, whom they brought back to Mycenæ; whereupon Atreus imprisoned him and sent Ægisthus to kill him. Ægisthus having been recognized by his real father, Pelopia became aware of the dreadful truth and killed herself, while Ægisthus slew Atreus, who was offering sacrifice on the seashore. In later times the great domed tombs at Mycenæ were pointed out as the treasuries of Atreus and his sons; the largest is still popularly called the "Treasury of Atreus." See ATREUS, TREASURY OF.

ATREUS, TREASURY OF. A famous subterranean structure at Mycenæ, so called on the authority of Pausanias. It is also popularly called the "Tomb of Agamemnon." It is the largest of the vaulted tombs called "bee-hive" tombs from the method of vaulting in which the arch is formed by projecting horizontal layers of stones narrowing to the top. The building consists of a circular chamber, 50 feet wide and high, connected with a small square room, both covered by the material removed in the process of building. It is approached by an entrance passage of masonry 115 feet long, leading to a deep doorway richly ornamented.

ATRI, á-tré (anciently, *Hadria*). An episcopal city in the province of Teramo, Italy, 8 miles from the Adriatic and from Mutignano, which is on the Bologna-Brindisi Railway, and 79 miles south of Ancona. The cathedral has interesting frescoes, and a fifteenth-century painting of the Madonna adoring the Child. The campanile is over 200 feet high. There are a few ruins of ancient walls and buildings, and south of the city are grottoes probably once used as prisons. Manufactures include silk, soap, and licorice. Pop. (commune), 1881, 19,642; 1901, 13,488; 1911, 14,043.

ATRIPLEX (Lat., from Gk. ἀτράφαξ, *atraphax*, the orach). The name of a genus of plants of the family Chenopodiaceæ. The species are numerous and are found in nearly all tropical and temperate climates. Many of them are weeds, but a number have come into notice as valuable forage plants for the hot alkali regions of Australia and California. For this purpose *Atriplex semibaccata* and *Atriplex leptocarpa* are among the most promising. They are commonly known as saltbushes, because they grow in saline regions, where no other valuable plant will survive.

ATRIUM (Lat. a hall; literally, dark-room, from *ater*, black, dark, referring to the smoke from the stove or hearthstone. See below). In Roman architecture, the one large apartment of the primitive Italic and Roman house; the general room which served for kitchen, dining room, reception and sleeping room. In it was the hearthstone, and the nuptial couch remained there as a symbol, even after the addition of bedrooms around it. As the Roman house became more sumptuous, small

rooms were multiplied around this central hall, which remained immediately opposite the entrance, and then took the name also of *cavædium*. There were different kinds of atria: (1) the earliest kind, with the solid roof (*atrium testudinatum*); (2) next, the Tuscan atrium (*tuscanicum*), which became the national type before the close of the Republic, with a square opening (*compluvium*) in the centre for admitting light. The roof sloped inward, so that rain water flowed into a basin (*impluvium*) beneath the opening. With the enlargement of house and atrium came (3) the tetrastyle atrium (*tetrastylum*), with four columns supporting the roof around the central opening; and finally, with the further sumptuousness of the times of Cicero and Augustus, came (4) the Corinthian atrium, where the four columns are multiplied into a real colonnade; and in this form the atrium is indistinguishable from a peristyle court, a private cloister. There was another early kind of atrium, used especially for winter apartments, in which the roof slanted upward toward the centre, like our roofs, instead of downward, and shed the water instead of collecting it (*displuvium*). The patrician and richer equestrian houses of the late Republic and Empire usually had two atria—first, the old-fashioned kind (1; 2), for the transaction of business, and in front of it the shops; and beside and beyond it, the *alæ* and *tablinum*; then a peristyle atrium, with columns, with rooms opening on to it, where the family life was carried on. The later atria were beautifully decorated with frescoes and sculptures, vases and fountains. The best-preserved atria of all kinds are in the houses of Pompeii. The term was also sometimes used of religious or public buildings, in the form of courts, such as the Atrium Vestæ, attached to the house and temple of Vesta, and the Atrium Libertatis, which contained the first library founded in Rome.

In Christian architecture the atrium was a larger columnar or arcaded open court in front of the basilical churches, used for meetings or promenades, and even for *agapæ* and fairs. In the centre stood the fountain for ablutions. In it gathered the penitents who were not allowed in the church. These *atria* went out of use in the early Middle Ages. Those at Parenzo (sixth century), Sant' Ambrogio, Milan (ninth century), San Clemente, Rome (eleventh and twelfth centuries), and in the cathedrals of Capua and Salerno are the best preserved. The Mohammedans adopted the atrium with its fountain as an indispensable feature of all their mosques. In the monastic architecture of the early and Middle Ages the cloister was evidently the atrium moved from the front to the side of the church and reserved for the use of the monks. See CLOISTER.

ATROPATENE, *ât'rô-pâ-tē'nê* (Gk. Ἀτροπατήνη). The ancient name of the mountainous Persian province of Azerbaijan, or Adarbaijan, to the west of the Caspian Sea. Its name is said to be due to Atropates, whom Alexander placed over the district in 328 B.C. In Pahlavi the name appears as Ataro-patakan. It belonged to the Kingdom of Armenia from 149 B.C. to 428 A.D. The principal city of the province is Tabriz. The second city, Urumiah, on the lake of the same name, is of great antiquity.

ATROPHY (Gk. *âtrophía*, *atrophia*, want of nourishment; from *â, a*, priv. + *τροφή*, *trophê*,

nourishment). A morbid condition of animal or vegetable life, resulting in deficient nutrition and consequent wasting either from disease or disuse. A familiar example is the atrophy of certain groups of muscles in infantile spinal paralysis or cerebral palsies. The term is not applied to the mere withholding of the requisite supply of nutriment, but to the condition produced by various diseases that affect the body. See NUTRITION; DIGESTION, ORGANS OF; DYSPEPSIA; HYPERTROPHY.

ATROPINE (derived from *Atropos*), or DATURINE, $C_{17}H_{23}NO_3$. An alkaloid prepared from the deadly nightshade (*Atropa belladonna*). The plant contains the alkaloid *hyoscyamine*, which is readily converted into atropine on addition of potash to the juice. The atropine thus produced is extracted by shaking the alkaline liquid with chloroform. The chloroform layer is removed and evaporated, leaving a residue which is extracted by means of dilute sulphuric acid and subsequently precipitated with potassium carbonate. The precipitated alkaloid is recrystallized from alcohol. Atropine itself is insoluble in water; its sulphate, however, is readily soluble and is commonly used in medicine to produce dilatation of the pupil of the eye, also as an antispasmodic in whooping cough. It is also used as a remedy for seasickness. It acts as a narcotic, and is exceedingly poisonous, half a grain of it being positively fatal. The symptoms of atropine poisoning are: rapid pulse, dry and flushed skin, dryness of the throat, etc. In cases of atropine poisoning, energetic stimulation of the skin and a hypodermic injection of pilocarpine and stimulants are recommended, after using the stomach pump. The principal physiological effect of atropine is reduction of the excitability, and eventually paralysis of the motor nerves, resulting in inability to move. See BELLADONNA; ALKALOIDS.

ATROPOS (Gk. Ἀτροπος, the unturnable, the undivertible, the inflexible, unbending, from *â, a*, priv. + *τρέπειν*, *trepein*, to turn). One of the *Moeræ*, or *Parcæ*, the Fates—who severs the thread of man's life. In late art she is represented with a cutting instrument or a pair of scales or a sun-dial. See PARCÆ.

ATRYPA (Gk. holeless, from *â, a*, priv. + *τρῦπα*, *trypa*, a hole). A name applied by Dalman in 1827 to a group of fossil brachiopods, the shells of which were by him supposed to be without a foramen in beak of the ventral valve. Under the early diagnosis the genus held a large number of species of various internal structure and exterior ornamentation, which ranged throughout all geological formations from the Ordovician to the Cretaceous. More recently the generic term has been restricted to those forms closely allied to the original species, *Atrypa reticularis* of Linnaeus, which Dalman used as the type of his genus. The best-known species of the restricted genus is this *Atrypa reticularis*, with its depressed ventral valve and its calcified brachial spires directed toward the centre of the swollen dorsal valve, which species is of interest by reason of its exceedingly long period of existence. It appeared in the earliest Silurian time, and with various modifications, characteristic of particular ages through which it lived, it continued to the end of Devonian time. Its life period is exceeded by that of only one other fossil, *Leptæna rhomboidalis*, and the study of its variations in time and

space is of the greatest interest as affording an excellent example of the manner of evolution of new species; many of its varieties having continued to evolve along distinct lines until they became entirely unlike, in a specific sense, the original form from which they separated. See, for illustration, BRACHIOPODA.

ATSINA. See GROS VENTRE.

ATSUTA, át-sōō'tā. A town of Japan in the prefecture of Aichi (Map: Japan, E 6). It is situated in the southern part of Honshiu, 4 miles by rail from Nagoya, of which it is practically a suburb. It contains a number of Shinto temples, erected in the seventh century A.D., and modeled after the famous temples of Ise. In one of them is treasured the famous sword which forms part of the Imperial regalia of Japan. Pop. (latest report), 1898, 24,941.

ATTACAPAN. See ATAKAPA.

ATTACHÉ, á'tá'shá' (Fr. attached). A subordinate or assistant attached to the suite or company of a superior officer. In modern usage the term is practically confined to subordinate members of an embassy or legation. Military and naval attachés are officers of these two services accompanying the diplomatic representative of their country, with a special view to observing conditions and movements of interest to the military or naval administration at home.

ATTACHMENT (Fr. *attachement*, from *à*, Lat. *ad*, to + Bret. *tach*, Eng. *tack*, a nail). The legal process under which a sheriff or like officer takes a person or property into custody. Also the proceeding under such a process. An attachment against the person was used most frequently, either to compel the appearance of a defendant in an action, or to secure the attendance of a delinquent witness or juror, or to bring before a court one guilty of contempt. It was, and still is, employed in England as a process for the enforcement of decrees or orders in equity. It was rarely so used in common-law actions, because a judgment creditor who resorted to it forfeited his right to go against the debtor's property. In this country the seizure of the person of a debtor in a civil action is made generally under an order of arrest, or an execution against the person. Attachment of the person for contempt of court is common, however, in this country.

The attachment of property is regulated by statute. It is not accorded to the creditor in an ordinary action for the recovery of a debt. To entitle him to this process he must show, generally, that the debtor is a non-resident of the State in which he asks for the process, or has left it with intent to defraud his creditor, or conceals himself or his property with like intent, or that he has removed, or is about to remove, from the State in order to defraud his creditors. In such cases the property is to be attached and taken into the custody of the law, so that it may be applied to the plaintiff's claim, if that is subsequently reduced to a judgment. An attachment is looked upon by our courts as a harsh and extraordinary remedy, one not known to the common law, and as a rule they are disposed to put a strict construction upon the statutes which authorize it. In admiralty, a vessel or other property against which a suit *in rem* has been instituted may be attached when the circumstances would not warrant an attachment in a State court. An attachment is spoken of as *domestic*, when it is employed against the property of a resident of

the State in which it issues; as *foreign*, when the owner of the property seized is a non-resident, who evades the personal service of a summons in the action. Consult Drake, *Treatise on the Law of Suits by Attachment in the United States* (Boston, 1891), and the works referred to under ARREST; EXECUTION; FOREIGN ATTACHMENT.

ATTACK' (Fr. *attaque*, the same in derivation as ATTACHMENT). A military operation against an enemy. It may apply to any action which brings one body of troops in battle in contact with another, but is more generally applied to a distinct military operation by which an enemy's position is assailed. Smokeless powder, magazine rifles, machine and rapid-fire guns, improved breech-loading field and horse artillery guns, scientifically trained and more intelligent troops, have practically reduced the method of attack to a science. While there is in every system of tactics a clearly defined outline of "attack formation," its actual order or method will depend altogether on the general character and contour of the ground to be fought over and the military genius of the officer in command. Generally speaking, the attacking infantry force is divided into three bodies—firing line, supports, and reserves. Before the beginning of the actual attack, a reconnaissance is generally made by the cavalry and horse artillery, and the position and strength of the defending forces discovered, together with all other information possible. If the defending forces have been compelled to occupy or have made the mistake of selecting a position which is open to attack on one or both flanks, the attack will be so arranged as to threaten them on the flanks as well as in front, a feint being made to cover the real point of attack, which will be made wherever the defenders develop the greatest weakness. Any commanding eminence will be seized if possible by the attacking force, the heaviest ordnance placed there, and the defenders' position thoroughly shelled. Artillery using "indirect" fire from concealed positions prepares the way for the modern attack, firing over the advancing infantry. Once the infantry is within the artillery zone of fire, or actual contact with the defenders is made, cavalry cease to be much of a direct factor. The necessity frequently arising of reinforcing some distant part of the firing line, however, has, among other causes, brought into existence mounted infantry. (See CAVALRY and MOUNTED INFANTRY.) These troops have the mobility of cavalry, are practically infantry, and can reinforce speedily in circumstances that would be generally impossible to a marching infantry regiment. Mounted infantry, however, is not recognized as a permanent arm of the military service, but is called into being to meet the needs of a particular campaign. Mounted infantry was first employed by General Miles of the United States army. He transformed the fifth infantry into mounted infantry during operations against the Nez Percés Indians.

The extended battle front made necessary by modern arms makes the handling of troops under fire both difficult and dangerous. The firing line is extended, followed by its supports, who are in as close a formation as circumstances will admit, while the reserves are still farther behind. The casualties of the firing line are made up from the supports. In the final charge,

which is made by the firing line, reinforced by the entire supports and whatever of the reserve circumstances have rendered necessary, the defenders' position is rushed with the bayonet. In the event of failure the reserves cover the retreat of the charging line, carrying on the advance if possible, or in any event covering the *point d'appui*. If successful, the reserve force completes the final rout of the defenders, prevents their reorganization, and, assisted by the cavalry (who are harassing the fleeing troops on the flanks and endeavoring to head them off), try to secure their guns, transport, stores, and munitions of war.

The modern attack is the point in which all minor "actions" merge, the successful carrying out of which is frequently the decisive blow of the campaign. The danger and losses incurred in such an undertaking will depend largely on the skill the defenders have shown in their selection of a position, or the extent to which nature has favored them. A recent example is the successful attack on the Spanish lines at Santiago, Cuba, by the American forces under General Shafter, in the Spanish-American War of 1898, an action where the Spaniards had every advantage of position and cover. Examples of good and bad positions may be found in the Anglo-Boer War of 1899-1902. Ladysmith, whose defense was necessary on account of the valuable stores located there, sustained one of the most terrible sieges of modern times. The position (which was forced upon the British General White) was directly under the fire of the Boer artillery, and could have been taken eventually had the Boers been as skillful as they were courageous. The position chosen by the Boers at the battle of Modder River had every possible natural advantage and was very cleverly selected. One of their flanks and their front were protected by a swift-flowing and swollen river, which afforded few if any fording places, while the other flank rested on an impassable range of mountains. Their front also had a practically impregnable character, owing to the steep kopjes. Held by trained troops, the position would have been impregnable, as the British had to advance along an open plain and were exposed to the formidable fire of the Boers. The position was eventually taken, after repeated failures, with terrible losses. The more recent war between the Balkan allies and Turkey presented numerous instances of determined attacks upon fortified places which were defended with fanatical valor. For an account of the influence of modern weapons and tactics upon methods of attack, see narrative of Russo-Japanese War describing Japanese attacks on Port Arthur. See BATTLE; TACTICS, MILITARY.

ATTACK. In music, a technical term meaning the spirit and style with which a performer, singer, or musical organization begins a phrase.

ATTAIN'DER (OF. *ataindre*, to accuse, convict). At common law, the legal extinction of all civil rights as a consequence of a judgment of outlawry for a capital offense, or of a judgment of death for treason or felony. It did not follow upon conviction, but only upon final judgment, for, says Blackstone, "after conviction only, there is still a possibility of the accused's innocence. Something may be offered in arrest of judgment, or the indictment may be quashed, or he may be pardoned, or allowed the benefit of clergy. But when judgment is once pronounced, both law and fact conspire to

prove him completely guilty. Then it is clear beyond all dispute that the criminal is no longer fit to live, but is to be exterminated as a monster and a bane to human society, and the law sets a note of infamy upon him, puts him out of its protection, and takes no further care of him than barely to see him executed. All his civil rights are extinct, for by an anticipation of his punishment, he is already dead in law." The first consequence of attainder, therefore, was the forfeiture of all the victim's property. This forfeiture, in the case of lands, related back to the time when the crime was committed, so as to avoid all intermediate sales and incumbrances. In the case of goods and chattels, attainder had no such retroactive effect. But common-law attainder did not stop with the forfeiture of the condemned criminal's estate. It produced "corruption of blood, both upward and downward, so that the attainted person could neither inherit property from his ancestor" nor retain that of which he was in possession, nor transmit it to an heir, nor be the medium through which descent was legally traceable. These consequences of attainder have been modified in England by statute. The forfeiture or escheat of real estate was limited to cases of attainder for treason or murder by 54 Geo. III, chap. 145; and by 33 and 34 Vict., chap. 23, attainder and corruption of blood were abolished, while forfeiture and escheat were limited to judgment of outlawry.

The Constitution of the United States provides that "The Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture, except during the life of the person attainted" (Art. III, Sec. 3). Similar provisions are embodied in some of the State constitutions. In other States, not only the corruption of blood, but all forfeitures of property consequent upon criminal judgments against the owners, are abolished. The United States Supreme Court has declared that the constitutional provision quoted above was introduced for the benefit of the children and heirs alone. It was a declaration that the children should not bear the iniquity of the fathers. Accordingly, if a traitor's property is confiscated by the United States, no interest is left in him that he can convey by deed, and his heirs take the inheritance at his death. Attainder consequent upon legislative enactments will be considered under BILL OF ATTAINDER. Consult: Blackstone, *Commentaries on the Laws of England*; Stephen, *New Commentaries on the Laws of England* (18th ed., London, 1903); and the authorities referred to under CRIMINAL LAW; FORFEITURE; CONSTITUTIONAL LAW.

ATTAINDER, BILL OF. See BILL OF ATTAINDER.

ATTAINT', WRIT OF (for derivation, see ATTAINDER). A proceeding in the nature of an appeal from a judgment entered upon the verdict of a jury. Under this writ a jury of 24 was summoned to determine whether or not the first jury had given a false verdict. As jurors were sworn to find the truth, a finding by the second jury, "made up of knights or other more considerable persons than the first," that the latter had rendered a false verdict, operated not only as a reversal of the verdict, but subjected the attainted jury to severe punishment for perjury. After the right of jurors to return a verdict according to their own consciences was

established by Bushel's case in 1670 (6 State Trials, 99), and motions for new trials came into use, this proceeding was seldom resorted to. In 1757 Lord Mansfield said: "The writ of attain is now a mere sound in every case." It was abolished in 1825 by Act of Parliament (6 Geo. IV, chap. 50, sec. 60) except as to jurors guilty of embezzlement. Consult Blackstone, *Commentaries on the Laws of England* (Oxford, 1765-68), and Thayer, "Trial by Jury and its Development" in his *Preliminary Treatise on Evidence at the Common Law* (Boston, 1898).

ATTALÉA (named from the gorgeousness of its growth; see ATTALUS III). A genus of palms, comprising about 25 species, natives of the tropical parts of South America. They have in general lofty cylindrical smooth stems, but there are some stemless species. The leaves are large and pinnate. The fruit has a dry fibrous husk, inclosing a nut with three cells and three seeds. The leaves of some species are much used for thatching and are woven into hats, mats, etc. The nuts of *Attalea excelsa* and of *Attalea speciosa* are burned to dry the india-rubber obtained from the *Siphonia elastica*, which acquires its black color from their smoke. The leafstalks of *Attalea funifera*, which is found in the southern maritime provinces of Brazil, and there called Piassaba, yield a fibre much used for cordage. The ropes made of it are very strong, and extremely durable in salt water. The Piassaba palm of the northern parts of Brazil, however, is totally different, and much of the Piassaba fibre imported into Great Britain is obtained from it. The fruit of *Attalea funifera*, known by the name of Coquilla nut, is as large as an ostrich's egg and supplies a kind of vegetable ivory used for making umbrella handles, etc. The fruit of *Attalea compta*, the pindóva or indajá palm, is of the size of a goose's egg, and the kernels are eatable. It is a stately and beautiful tree, with a wide-spreading crown. *Attalea cohune* is a native of Honduras, where the oil of its fruits is used for soap making and is exported for the same purpose.

ATTALIA (Gk. Ἀττάλια, *Attalia*). A city of ancient Pamphylia, on the south coast of Asia Minor, the modern *Adali*, near what is left of the river Catarrhactes, as it flows into the sea at the head of the Gulf of Adalia. It was founded by Attalus II, King of Pergamum (159-38 B.C.). In Roman times it was an important seaport, being located on the great trade and military route connecting the northwestern districts of Asia Minor with its southern coast. The Apostle Paul sailed from Attalia to Antioch in Syria, on his return from his first missionary journey (Acts xiv. 25). Unlike many of its neighbors, Attalia has maintained its relative importance to the present time.

ATTALUS (Gk. Ἀτταλος, *Attalos*). Uncle of Cleopatra, the wife of Philip II of Macedon, and general under Philip. At Philip's wedding he insulted Alexander, the son of Olympias, and thereby helped bring about a separation between father and son. After the death of Philip he undertook to oppose Alexander, but was finally killed by the latter's order.

ATTALUS, FLAVIUS PRISCUS. Prefect of Rome under Honorius, and later for one year (409-10) Emperor of the West. He was the first to be raised to that office solely through barbarian influence, being proclaimed by Alaric

and his Gothic army after the second surrender of Rome, when Honorius was deposed. The barbarians set Attalus up at Ravenna, whence he sent a message to Honorius commanding him to leave the throne, retire to a desert island, and cut off his feet. But Alaric soon wearied of him, and he was deposed. After Alaric's death Attalus remained with Ataulphus, as a musician, and in 413 helped to celebrate the nuptials of Ataulphus and Placidia. Ataulphus put Attalus forward again as a rival emperor during the insurrection of Jovinus (414), but he was taken prisoner and brought to Honorius, who inflicted on him a part of the sentence he had written for the Roman Emperor; he cut off his thumb and forefinger and banished him to the island of Lipari.

ATTALUS I, called **SOTER** (269-197 B.C.). King of Pergamum from 241 to 197 B.C. Just before he became king, or in the first year of his reign, he gained a decisive victory over the Galatians, and by 226 B.C. he had made himself master of the whole of Asia Minor west of Mount Taurus. He soon, however, lost most of his conquests. Later he became an ally of Rome against Philip V of Macedon. Attalus was a wise and just ruler and a friend of the arts and sciences.

ATTALUS II, surnamed **PHILADELPHUS** (220-138 B.C.). King of Pergamum. Before coming to the throne he gained distinction as a brave and able military leader and was on several occasions sent as ambassador to Rome. He succeeded his brother Eumenes, 159 B.C. He founded Philadelphia in Lydia, and Attalia in Pamphylia, and was a generous patron of the arts.

ATTALUS III, called **PHILOMETOR** (171-133 B.C.). The son of Attalus II and Stratonice, wife of Eumenes II. He was adopted while still a boy by Eumenes. He became King of Pergamum in 138 B.C. As a king he is known to us chiefly for the extravagance of his conduct and the murder of his friends and relatives. On the other hand, he is represented as a dilettante in literature and art. He was sunstruck while supervising the erection of a monument to his mother and died of fever. His will made the Roman people his heirs, whence his name became proverbial for munificence and splendor.

ATTAR OF ROSES, or **OTTO OF ROSES**.

The volatile oil of the petals of some species of rose. It is a nearly colorless or light yellow crystalline solid at temperatures below 80° F., liquefying a little above that temperature. It is imported from the East, where, in Syria, Persia, India, as well as in Turkey and Bulgaria, roses are cultivated to a considerable extent for the sake of the attar. In recent years it has also been prepared on a considerable scale in the northern European countries. The oil has been obtained from several species of rose. The *Rosa centifolia* is cultivated in western Asia; the *Rosa damascena* is cultivated in Bulgaria. To procure the attar the rose petals are usually distilled with about twice their weight of water, and the distillate is exposed to the cool night air in open vessels, from which the thin film of attar is skimmed with a feather in the morning. One part, by weight, of the oil is obtained from 3000 parts, by weight, of rose petals. Attar is said to have been first procured by what may be called an accidental distillation, rose petals having been exposed with water to

the heat of the sun, and to have been found floating on the surface of the water; and it is still sometimes obtained in India by such a process. It is said to be also obtained by dry distillation of rose petals at a low temperature. During the distillation of rose petals a small quantity of a solid volatile oil comes over (solid oil of roses, see below), which crystallizes and floats on the water in the receiver, and which is sometimes called *English oil of roses*. Attar of roses is not unfrequently adulterated with sandal-wood oil, oil of rhodium, geranium oil, etc. It is much used for making hair oil, a drop of it being enough to impart a pleasant odor to a considerable quantity. It is also used in making lavender water and other perfumes. The odor of attar itself is too powerful to be altogether pleasant. Attar of roses is a mixture of two substances, the one solid at ordinary temperatures and the other liquid. The solid oil of roses (rose camphor, stearoptene of oil of roses) possesses no odor, is insoluble in alcohol, but soluble in ether. It is composed of carbon and hydrogen. The liquid oil of roses, called *rhodinal* (eleoptene of oil of roses), is a very fragrant liquid, to which the attar of roses is indebted for its delicious perfume, and consists of carbon, hydrogen, and oxygen. Its composition is represented by the formula $C_{10}H_{18}O$, and it is believed to be identical with citral. The principal use to which attar of roses is put is as a perfume. Milk of roses and lavender water owe their fragrance to the presence of the attar. A good receipt for oil for the hair is olive oil, colored by alkanet, and scented by a few drops of attar, and this is very generally sold under the name of attar of roses. Medicines are occasionally perfumed by attar of roses, and it is sometimes added to unguents and spirit washes. See **PERFUMERY**.

ATTAVANTE, it'tà-vän'tà (1452-c.1518). A Florentine miniaturist, perhaps the greatest illuminator of the Italian Renaissance. He was born at Castel Fiorentino, of a noble Florentine family. His master in the miniaturist's art is unknown, but he was influenced by contemporary Florentine painters, by Verocchio, and especially by Domenico Ghirlandajo. He passed his life in Florence, where the great book lovers of the day, the Medici, Duke of Urbino and Matthias Corvinus, King of Hungary, vied with each other in the possession of his works. He is last mentioned in 1517 and died soon after that date. His principal works are the illuminations of a missal now in the cathedral of Lyons (1483), another in the Royal Library of Brussels (1485) upon which the stadtholders of the Spanish Netherlands once took oaths of fealty; and Capella, *De Nuptiis Mercurii et philologia* (with graceful mythological illustrations) in the library of St. Mark's, Venice. Other great libraries of Italy, especially the Laurentian of Florence, abound in his works, which are also to be found at Vienna and Paris. The cathedrals of Florence and Prato possess beautiful antiphonaries. Although lacking in depth of feeling, Attavante's work is unequalled in beauty of ornament and freshness of color. Consult the articles "Attavante" in Bradley, *A Dictionary of Miniaturists* (London, 1887), and "D'Ancona" in Meyer and Thiemes, *Allgemeines Lexicon der bildenden Künstler*, vol. ii (Leipzig, 1908).

ATTEMPT. An act, done with intent to commit a crime, and tending, but failing, to effect its commission, is punishable as an attempt

to commit that crime. In England it has been held that the act must have been such that, if no interruption had taken place, the intended offense would have been committed, and therefore that one who, with intent to steal, put his hand into another's empty pocket was not guilty of an attempt. Such is not the law in this country. The emptiness of the pocket prevented a theft, but the attempt to commit a theft was complete. See the works mentioned under **CRIMINAL LAW**.

ATTENTION (Lat. *ad*, to + *tendere*, to stretch, reach out, to direct one's self, strive). The problem of attention is distinctly a problem of modern psychology. It is, of course, possible, now that the study of attention has been systematically undertaken, and its part problems discriminated, to find the germs of a psychology of attention in the descriptive works of the eighteenth century, to say nothing of still older treatises; just as it is possible, after Darwin, to find the germs of an evolutionary theory of life as far back as the old Greek philosophers. None the less the analysis and measurement of the attentive state are an achievement of the second half of the nineteenth century; and if there were no other justification for the much-abused phrase "the new psychology," we have its sufficient warrant in the addition of this vast area of previously unexplored territory to the psychological domain. Attention, which in the psychologies of the Associationist School, down to and including the monumental works of Bain, is either wholly neglected or passed over with a few general remarks, now forms the subject of a large monographic literature, has a chapter of its own in the text-books of the science, and holds the foremost place in many recent psychological systems.

We shall best understand the nature of the attentive consciousness, and of the problems which it sets for solution, if we set out from a concrete instance. Suppose that the mail brings me the latest popular novel, a book that I have for some time wished to read, and that I have heard constantly discussed by my friends. I know that I ought to work at other things, but I succumb, after a struggle, and sit down to the open book. At first I read hesitatingly and with effort; my neglect of duty still forces itself upon me from time to time, and I find the early chapters of the book difficult to follow. Presently, however, I become interested; later still, I become absorbed, oblivious to everything save the fortunes of the hero and heroine. I read on until the book is finished, and then wake up, almost with a start of surprise, to the business of the real world. What has happened, that is of psychological moment, during this experience?

In the first place, the general state or condition of my whole consciousness has changed. In the older psychologies the phrase "state of consciousness" is used as the equivalent of what is not termed, more correctly, "mental process"; ideas and emotions and desires were referred to as "states of consciousness." What is here meant is something very different. We speak of the "state" of consciousness, in strict usage, in the sense in which we speak of the state of the roads, as good or bad; or of the state of a man's affairs, as flourishing or embarrassed; or of the state of his health, as robust or shattered. Now it is clear that the state or disposition of consciousness, in discursive thought or reverie, differs from its state, understood in

this way, in concentrated attention. In the former case all the ideas which constitute the consciousness are on the same level, of the same mental value; in the latter, some ideas (those held at the focus of attention) are super-eminent "robust" or "flourishing," while the ideas not attended to are depressed, relegated to the background. Here, then, is a matter that requires accurate analysis. Secondly, there is a marked difference of mental experience, as the distracted, thwarted attention with which we begin the reading of the novel passes into the rapt and absorbed interest with which we continue to read. We are attentive in both cases; but if we are to judge by what we "feel," we can hardly give the same name, without qualification, to the two states of consciousness. In other words, there seem to be various forms or kinds of attention. Thirdly, the change of conscious state which comes with the concentration of attention brings with it a characteristic change of bodily attitude. We should all recognize a picture or statue that portrayed the scout (i.e., the attitude of visual attention), or the eavesdropper (the attitude of auditory attention). These attitudes naturally give rise to certain characteristic groups of organic sensation—of sensations from skin and muscle, tendon and joint; and we shall therefore expect to find such sensations playing a constant and important part among the sense processes that form the background of the attentive consciousness.

1. We will take up these topics in order, beginning with attention as a state of consciousness. What are the essential features of the attentive state? (a) The ideas attended to are more clear and distinct than the ideas simultaneously present, but neglected by the attention, or, as we may say, attended from. The

a represents an inattentive, and b, an attentive consciousness. In a are five ideas, all proceeding at equal levels. In b, the third idea is being attended to, and the height of its wave is increased, while the other waves are depressed.

processes at the focus of attention are readily discriminated; the ideas of the background are obscure. (b) If the ideas attended to are intrinsically weak, they are strengthened or intensified by attention. A faint sound or light is rendered louder or brighter as we attend to it. No such intensification is observable in the case of ideas whose stimuli are intrinsically strong. (c) If the ideas attended to are fleeting and transient, they can be lengthened, made more durable, by attention. No such lengthening is observable in the case of ideas whose stimuli are

stable and permanent. Lastly, (d) the ideas attended to are more valuable for the general mental life than are the ideas attended from; they are more easily and certainly revivable, in memory or imagination. It is a commonplace of education that if we wish a child to remember something, we must make him attend to it. This fourth characteristic is, evidently, of a different order from the three preceding. It is a result or after effect of the others, and more especially of (a).

As to the physical basis of these changes in consciousness, it has long been known that certain nervous impulses within the central nervous system have the power of inhibiting or arresting other impulses; thus, excitation of the vagus (pneumogastric, or tenth cranial) nerve inhibits the beating of the heart (Weber). Now we can account for some of our observed phenomena by a theory of inhibition. When, e.g., a weak mental process is strengthened, or a transient process lengthened, we may well suppose that the effect is due, not to any positive reinforcement or temporal extension of the process in question, but simply to the simultaneous arrest of other and conflicting excitations within the nervous system. Attention, that is to say, allows the weak or transient process to come to its full intensive and temporal rights in consciousness by keeping down other nervous impulses whose tendency is still further to weaken or curtail that process. Attempts have been made, in the same way, to explain the growth of clearness and distinctness in the leads attended to by assuming an inhibition of conflicting ideas; so that the clearness of the attentive state would represent the normal or natural clearness of the idea, the clearness which it can attain when its development is not hindered by rival ideas. Physiologists, however, have recently discovered that, just as certain nervous impulses may arrest other impulses, or block paths of nervous discharge, so may certain impulses reinforce others, or open up paths of nervous discharge; the negative fact of inhibition is paralleled by the positive fact of facilitation. There seems to be no reason why we should not avail ourselves of this discovery for our theory of attention. The clearness of the idea attended to would then depend partly upon the arrest of conflicting ideas, but partly also upon an actual enhancement of the focal idea by the reinforcing nervous impulses. Such a view accords better with the observed mental phenomena than does the view which regards all the aspects of the attentive state as symptoms of neural inhibition. On the question of the primary seat of the inhibitory and facilitating impulses, no more can at present be said than that it is, probably, to be sought in the "association centres" of the cerebral cortex. See NERVOUS SYSTEM.

Two special questions arise out of the foregoing discussion. We may ask, in the first place, how long the state of attention continues, for how long a time an idea or group of ideas may remain poised at the apex of conscious clearness. And we may ask, secondly, how large the group of ideas attended to may be; inquiring now into the range of attention, as we have before inquired into its duration. Both questions have been submitted to the test of experiment. It has been found (a) that the sensations aroused by "nominal" stimuli, i.e., by stimuli which can hardly be seen or heard or felt, or barely be discriminated from other coexistent stimuli, are

not continuous but intermittent. Suppose that we look attentively at a faint gray patch on a white surface, or listen attentively to the faint hiss of a gas flame. If the attention remains steady, the gray and the hiss (other things being equal) will also remain steadily in consciousness. If, on the other hand, the attention fluctuates, there will be moments when the gray and the hiss undergo a loss of clearness; and since they are, at the best, only just visible and just audible, the loss of clearness will mean a loss of existence: the gray will merge into the white and the hiss will cease to be heard. Now the second alternative is realized. The gray appears, and is washed out, and appears again, at intervals of a few seconds; and so with the sound of the flame. If, then, we may take these results at their face value, attention is intermittent, and a single "pulse" or "wave" of attention lasts for only five or six seconds. It is doubtful, however, whether other things *are* equal, and whether the fluctuation of sensation is not rather due to variation in the state of the sense organ. Opinion is still divided, but the present tendency is toward a peripheral rather than toward a central explanation of the phenomena. The question of the normal duration of attention must therefore be left open. (b) The range of attention is most easily determined by the aid of visual stimuli. A number of letters, e.g., chosen at haphazard and set in a space that falls well within the observer's range of vision, are shown upon a screen for so short a time that wandering or roving of the attention from letter to letter is prevented. Under such conditions it is possible to grasp, by a single "act" of attention, some five or six separate impressions. If short and familiar words are exhibited, in place of the mixed letters, some four or five of these will be grasped by the attentive consciousness. The number of discriminable ideas present at the same time with the four or five focal ideas in the background of consciousness cannot, in the nature of things, be accurately ascertained. See CONSCIOUSNESS.

The physical basis of an intermittence of attention might be sought in the mode of functioning of the nerve cell. The cell is said by physiologists to "discharge." We may interpret the term literally, for the nerve cell is a storehouse or reservoir of nervous energy, and gives off this energy when the appropriate stimulus arrives, not continuously or piecemeal, but all at once, by way of explosion. Now an exploded cell must be recharged before it can function again, and the period of recharging may perhaps correspond to the periods of disappearance of the pale gray and the faint hiss of which we have spoken. In explanation of the limited range of attention, we can say no more than that the small group of ideas comprised within it represents the available energy of the total cortex, as directed upon the given stimuli; the fact of limitation must be considered as an ultimate fact of the psychophysical organization.

2. We pass to the question of the various forms or kinds of attention. It may be said at once that there is but one attention. The essential features of the attentive state are, always and everywhere, as we have just described them. The differences between one bit of attentive experience and another are differences, first, in the determination or motivation of attention; and secondly, in the sense processes which are set up by the attentive attitude. We deal now with

the determinants of attention. (a) There are certain stimuli and forms of stimuli which command our full and immediate attention. Thus, very intensive stimuli compel us to pay regard to them. However interesting our novel may be, we shall start up, automatically and unhesitatingly, if a gun is fired outside of the window of our room. We have no choice but to attend to the sudden, loud sound. Intensity, suddenness, novelty, movement—all these properties of stimuli are attention-compelling. The moving bird that flits across the landscape; the moving voice that rises and falls to the more stationary orchestral accompaniment; the moving stimulus in the field of touch—these things hold our attention whether we will or no. There is good physiological reason for the power of such stimuli, inasmuch as all alike are fitted by their attention-compelling properties to exert a marked influence upon nervous substance. There is also good biological reason for their efficacy. An animal so constituted as to leave unnoticed the sudden and novel and moving features of its surroundings would soon pay the forfeit of its neglect with life. This "primary passive attention," or "involuntary attention," is, then, a heritage from earlier and less secure conditions of living. Our ancestors could not have survived without it, and it persists, ingrained in our nervous constitution, even though in civilized communities the reason for its continuance has largely disappeared. (b) This single and masterful determination of attention, however, cannot persist unchanged. The organism grows in complexity; its sense organs multiply. And this means that there may be rival claimants, so to speak, for the favors of attention. Suppose that eye and ear are simultaneously called upon—the eye by a moving object in one direction, the ear by an intensive sound proceeding from a different quarter. There will, evidently, be doubt and conflict, of a piece with the doubt and conflict that are set up by the occurrence of a number of potential motives to selective action. (See ACTION.) Furthermore, as the retrospective functions develop, and the mind is stocked with memories, each of the would-be determinants of attention will form a centre of association; ideas will cluster round it, some to help and some to hinder. So we reach the stage of "active" or "voluntary attention"—the sort of attention that we give to a new game of skill that we are learning, or a new problem that we are seeking to solve. Here the attention is divided: no single set of ideas receives a full measure of it; there is effort and struggle and misdirection of energy. Again, however, attention cannot persist, unchanged, at this level. If the struggle be continued active attention passes, inevitably, into (c) "secondary passive attention." Just as the selective action slips back, with repetition, into a secondary reflex, so does active attention presently fall under the exclusive dominance of some one of the rival determinants. We begin the novel voluntarily, in face of conflicting duties. As we read we grow absorbed in the story. What is this "absorption" but a reappearance of primitive attention upon a higher plane of mental development? The attention-compelling property of the successful stimulus is no longer intensity or novelty, but something much more subtle. It is the relation of the stimulus in question to the whole content of consciousness. As soon as our mind is set for the plot of a novel, and all intruding ideas

have been banished, the incidents, as they come, have full sway over us; we are prepared for them, ready to receive them; they fit in with our mental trend and tendency. Every trained mind is thus dominated by the objects which appeal to its training; the poet, by works of the creative imagination; the physician, by the details of a new treatment, the painter, by an effect of color upon the landscape; the zoölogist, by the forms of animal life. We can never transcend the dictates of the primary passive attention; the most absorbed reader, the most abstracted thinker, starts at the sound of the gun. But our intellectual life, when it has reached the stage of achievement, is in the main a life of secondary passive attention. From the educational point of view the stage of active attention is a stage of waste, of non-attainment; mastery comes with secondary passive attention. But then, there is no road to this last save through active attention: work comes before play. The child must be led to work in order that his play, in adult life, may be of the highest possible service to society.

3. Little need be said of the sense processes that are aroused by the bodily attitude of attention, the strains and pressures that come to consciousness from eye or ear, as the attention is visually or auditorily directed. Some psychologists, envisaging attention as a purely motor phenomenon, have laid much stress upon these muscular adjustments; and there can be no doubt that they help to induce and to maintain the attentive state. But while this is true, it seems to be equally certain that the sensations which proceed from the adjustments are merely secondary characteristics of the attentive consciousness. As Kuelpe puts it, they are consecutive, not constitutive. They contribute largely to the experience of effort in active attention. And it is interesting to notice, as Fechner and James have done, the change of direction which this effort undergoes, according as the object of attention belongs to the world of things or to the world of thought. In the former case it is a straining outward; in the latter, a strained retraction or withdrawal inward. Further study of the sensations, however, throws no new light upon the mechanism of attention.

ATTERBOM, ät'tër-böm, PER DANIEL AMADEUS (1790-1855). A Swedish poet. He was born at Åsbo. As a student he fell under German literary influence, and was a founder of the *Musis Amici*, a student society which, under the name of *Aurora League*, helped to emancipate Swedish literature from the dominance of French academic tradition, through its organs, *Phosphorus* (1810-13), *Poetic Calendar* (1812-22), and *Swedish Literary News* (1813-24). The Aurora League counted among its members S. Hedborn, W. Palmblad, and other men of equal distinction. Broken in health by overstudy, Atterbom visited Germany and Italy in 1817-19,

where he met Schelling and Thorwaldsen. On his return he became (1820) instructor to the Crown Prince Oscar, and (1828) professor of philosophy at Upsala. In 1839 he was made Academician. He wrote critical literary essays, *Swedish Scers and Poets* (*Svenska Siare och Skaldar*, Upsala, 1841-43); a collection of lyrics, *The Flowers*, in which he introduced the sonnet to Swedish poetry; an unfinished but exquisite fairy drama, *The Blue Bird* (*Fogel Blå*); and the very popular romantic drama, *The Isle of Blessedness* (*Lycksalighetens Ö*, 1823). He possessed rare poetic gifts, but introduced into his verses metaphysical and religious speculation. His *Collected Poems* appeared in 1854-63 and his *Works* in 1859-70.

ATTEBURY, FRANCIS (1662-1732). Bishop of Rochester. He was born at Middleton Keynes, near Bedford, England, March 6, 1662, and educated at Westminster School, London, from which, in 1680, he passed to Christ Church, Oxford. In 1687 he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, Master of University College, under the name Abraham Woodhead, and in the same year received holy orders. In London his rhetorical powers soon won him reputation. He became lecturer of St. Bride's (1691), a royal chaplain, and minister of Bridewell. In 1698 a temporary sensation was created in the learned world by the appearance of the *Hon. Charles Boyle's Examination of Dr. Bentley's Dissertations on the Epistles of Phalaris and the Fables of Æsop*, in which he defended the Epistles, now known to be forgeries. This clever but shallow and malicious performance was in reality composed chiefly by Attebury, who had been the young gentleman's tutor at Christ Church. In 1700 he distinguished himself in a controversy with Dr. Wake and others regarding the powers and privileges of convocations. Attebury's zealous and caustic defense of the ecclesiastical against the civil authority procured him the thanks of the lower house of Convocation and the degree of D.D. from Oxford (1701); also the archdeaconry of Taunton. In 1704 he was promoted to the deanery of Carlisle, on which occasion he subjected himself to just obloquy by attempting to procure an alteration in the date of his predecessor's resignation, which happened to interpose a temporary obstacle to his appointment. In 1707 he was made a canon of Exeter; in 1709, preacher at the Rolls Chapel; in 1710 he was chosen prolocutor to the lower house of Convocation, and in the same year he had the chief hand, according to the common belief, in drawing up the famous defense of Dr. Sacheverell; in 1712 he became Dean of Christ Church, where, however, his turbulent and combative spirit had meanwhile involved him in so many controversies that there was no peace until he was removed; in 1713 he was made Bishop of Rochester and Dean of Westminster. It was supposed—not unreasonably—that Attebury aspired to the primacy; but the death of Queen Anne extinguished his hopes in that direction. His known character and Jacobite leanings made him no favorite with George I. In 1715 he refused to sign the bishops' declaration of fidelity, and some of the most violent protests of the peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restora-

tion of the Stuarts brought down upon him at length the charge of treason, and in August, 1722, he was committed to the Tower. A bill of pains and penalties was brought into the House of Commons, and passed in the Lords by a majority of 83 to 43. Atterbury, who had defended himself with great ability, was deprived of all his ecclesiastical offices, incapacitated from holding any civil or spiritual office in the King's dominions, and condemned to perpetual banishment. The people generally considered him a martyr. In June, 1723, he quitted England for France, and after a short stay at Brussels, finally settled at Paris, where he died Feb. 15, 1732. In his exile he maintained a constant correspondence with his friends and took an active part in the abortive conspiracies of the Jacobites. His fame as a writer is founded on his sermons, and his letters to Pope, Swift, and others; as a letter-writer, indeed, he has seldom been surpassed. Consult his *Memoirs and Correspondence*, ed. by F. Williams (London, 1869); his *Life*, by Beeching (London, 1909).

ATTERBURY, WILLIAM WALLACE (1860—). An American railway official, born at New Albany, Ind. He graduated from Yale University in 1886 and in the same year began railway work as an apprentice in the Altoona shops of the Pennsylvania Railroad. He was rapidly promoted, until in 1896 he was appointed general superintendent of motor power on the Pennsylvania lines east of Pittsburgh and Erie. The general management of these lines he undertook in 1903. Six years later he became fifth vice-president of the Pennsylvania Railroad, with special charge of transportation, and then in 1911 fourth vice-president. He was made a member of several learned and scientific societies. In 1913 he served as one of three members of a board of arbitration appointed to adjust firemen's demands.

ATTERSEE, it'tär-zä, or **KAMMERSEE**, käm'mër-zä. A lake in the southwestern part of Upper Austria, situated in long. 13° 30' E., 1525 feet above the sea. It is over 11 miles long, from 1 to 2 miles in breadth, and occupies an area of 17 square miles. It is surrounded by mountains, and the scenery is remarkable for its picturesqueness. A number of health resorts are situated on the shore. The lake is well stocked with fish. It has been navigable by steamers since 1869.

ATTESTATION (Lat. *ad*, to + *testis*, a witness). The verification in writing of the execution of deeds and wills by witnesses. Hence the clause at the end of these instruments, which immediately precedes the signatures of the witnesses, is called the attestation clause. See DEED; WILL; WITNESS.

ATTFIELD, JOHN (1835-1911). An English chemist, born in Hertfordshire. He was professor of practical chemistry to the Pharmaceutical Society from 1862 to 1896. He contributed numerous articles on chemical topics to *Brande's Dictionary* and to the *English Cyclopædia*; was co-editor of the *British Pharmacopæia* in 1885 and editor in 1898; he is the author of *A Manual of Chemistry, General, Medical, and Pharmaceutical* (1898), and a large number of scientific papers.

ATTIC (properly an adjective, from Gk. Ἀττικός, meaning 'in the chaste Attic style'). A term in architecture, employed to designate a low story rising above the wall cornice that terminates the main elevation of a building, or

a low story at the top of a building. In classic architecture it designates a decorative story above an entablature, as in the case of Roman

ATTIC OF THE TEMPORARY DEWEY ARCH, NEW YORK.

triumphal arches, where the dedicatory inscription was in the centre of the attic.

ATTIC. Pertaining to Attica, characteristic of the people of Athens, or Attica. From the preëminence of Athens in Greek literature, from the fifth century B.C., the Attic dialect became the usual literary language and exercised a powerful influence in the *κοινή*, *koînê*, or "common" form of Greek, which developed after the time of Alexander the Great. In the first and second centuries A.D. a revival of Attic took place among the so-called Atticists, of whom Dionysius of Halicarnassus and Lucian are conspicuous representatives. The tragedians, and perhaps Thucydides, seem to preserve traces of a somewhat older form of Attic dialect than that used by writers of the fourth century B.C. Sophocles was called "the Attic bee," from the sweetness of his compositions; the nightingale was the "Attic bird," because Philomel was the daughter of a king of Athens; Xenophon was styled the "Attic muse" for eloquence in composition. "Attic salt" indicates pungency of wit. In architecture the word is used (a) as an adjective to designate a type of base used in the Ionic and sometimes in the Corinthian order, consisting of two tori separated by a scotia (see MOLDING); (b) as a noun, to designate a supplementary story above the main cornice, interposed between it and the roof; and (c), in more colloquial usage, either as a noun or adjective, to designate the space within a high-pitched roof, whether used as a garret or divided into habitable rooms.

AT'TICA (Gk. Ἀττική, *Attikê*, earlier, Ἀκτική, *Aktikê*, from ἀκρή, *aktê*, headland, promontory, coastland). The eastern extremity of the mainland of Greece. It forms a triangular peninsula extending to the southeast into the Aegean Sea, washed on the southwest by the Saronic Gulf, and on the northeast by the strait separating it from Eubœa. On the north it is separated from Bœotia by Mount Cithæron (4620 feet) and its eastern continuation, and on the west from Megaris by a low range of hills. The soil of Attica is thin and poor and the supply of water scanty, while the character of the coast, with its numerous harbors and adjacent islands, tended to attract the inhabitants to the sea. The climate and the purity of the air have always been celebrated. Though Attica was always dependent on imported grain, the natural resources were considerable. Mount Pentelicon yielded an abundant supply of fine white marble, and Hy-mettus blue marble. The silver mines of Lau-

rium, at the southern end of the peninsula, were a valuable property of the Athenian state. The olive was of great importance in Attica; the fig, too, flourished there. Hymettus was famous for its honey. Attica is much broken up by mountain ridges, and there are only two large plains, the Athenian, surrounded by Mounts Hymettus (3370 feet) on the southeast, Pentelicon (3640 feet) on the northeast, Parnes (4634 feet) on the north, and Aegaleos on the west; and the Thriasian, around Eleusis, in the southwestern portion. The principal rivers, the Cephissus and Ilissus, both in the Athenian plain, are mere winter torrents, dry in summer, when no rain falls for four months. In the modern administration Attica forms one of the nomes of Greece.

The ancient Athenians claimed that their ancestors were *autochthones*, "sprung from the soil," and it is certain that Attica does not show the same evidences of invasion that are found in other Greek states. Thucydides declares that Attica had naturally remained in the hands of the same people, since its soil was too infertile, comparatively, to offer attraction to invaders. (See *AUTOCHTHONES*.) It is also certain that the Athenians were a branch of the Ionic division of Greek-speaking peoples. It seems clear that originally Attica was inhabited by a number of independent clans, bound together in a loose confederacy, which was changed, either by a gradual process or, more probably, by an Athenian king, into a real unity under the lead of Athens. This union was attributed in Athenian legend to Theseus, and was so thoroughly accomplished that the history of Attica is only that of Athens. Eleusis alone seems to have preserved an independent position until a comparatively late date. The villages, or *demes*, were reorganized by Clisthenes (509 B.C.), who divided them among his 10 tribes so that each tribe contained demes from the plains, the mountains, and the coast, thus destroying the last traces of local parties and completing the centralization of the Athenian state. Consult: Curtius and Kaupert, *Karten von Attika* (Berlin, 1881-97); Leake, *The Topography of Athens and the Demi of Attica* (London, 1841); Chr. Wordsworth, *Athens and Attica* (London, 1869); J. G. Frazer, *Pausanias's Description of Greece*, vol. ii, v (London, 1898); E. A. Gardner, *Ancient Athens*, chap. i (New York, 1902). See also *ATHENS*; *ELEUSIS*; *GREECE*; *HYMETTUS*; *MARATHON*; *PHALERUM*; *PIREUS*.

ATTICA. A city in Fountain Co., Ind., 70 miles (direct) northwest of Indianapolis, on the Wabash and the Chicago and Eastern Illinois railroads (Map: Indiana, B 2). It manufactures proprietary medicines, bricks, and bridges. Attica was settled in 1827 and was first incorporated in 1867. It was chartered as a city in 1905 by a general law, which provided for a mayor, elected quadrennially, and a unicameral council. The electric light plant is owned and operated by the municipality. Pop., 1890, 2320; 1900, 3005; 1910, 3335.

ATTIC MUSE, THE. A name given to Xenophon (q.v.), because of his style and because of the appreciation of and enthusiasm for the noble and beautiful which marked his character.

ATTIC SALT (Lat. *Sal Atticum*). A poignant, delicate wit, peculiar to the Athenians. In like phrase, the ruder Roman wit is called *Italian vinegar* (*Acetum Italicum*).

ATTICUS, TITUS POMPONIUS (109-32 B.C.).

A Roman litterateur. He was born six years before Cicero. His excellent education, during which he enjoyed the companionship of Torquatus, the younger Marius, and Cicero, developed, at an early age, a love of knowledge, which was increased during his stay in Athens, where he remained many years (86-65), aloof from political distractions. It was through his stay in Athens that he won the cognomen Atticus. After 65, when he returned to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in political affairs. Yet he was by no means without influence on public matters, as he lived on terms of familiar intercourse with several leading statesmen, regardless of their political leanings, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious mercantile speculations. His mode of life was frugal. When he was informed that a disorder under which he was laboring was mortal, he voluntarily starved himself. Among his personal friends Cicero held the first place. The *Annales*, a chronicle of Roman history, written by Atticus, were highly commended by his contemporaries. They were especially valuable on account of containing genealogical histories of the old Roman families. He also wrote a history in Greek of Cicero's consulship. Atticus was one of those men (not uncommon either in ancient or modern times) in whom fine culture and a fortunate social position had highly developed the faculty of good taste. He had no creative genius, but was possessed of such delicate discernment that he could detect the flaw which would have been invisible to Cicero. Every author was anxious to secure his favorable opinion. None of his writings has been preserved. He had a large library and a force of slaves engaged in copying and publishing the writings of his contemporaries, among them Cicero. His biography is found in Cornelius Nepos, and many facts concerning him in Cicero's *Epistles to Atticus*.

ATTICUS HERODES, TIBERIUS CLAUDIUS.
1. A rich Athenian who lived at the end of the first and beginning of the second century A.D. His father was found guilty of treason and his property confiscated; but Atticus found a rich treasure in a house, and the Emperor permitted him to keep it. He rose to high honor under Trajan and Hadrian, and was twice Consul.
2. Son of the preceding, born about 101 A.D. at Marathon. Carefully trained by the best teachers, he became a noted rhetorician, and at Rome numbered among his pupils M. Aurelius and L. Verus. In 143 he was Consul, but soon afterward returned to Athens. To the wealth inherited from his father he added by a marriage with Annia Regilla. He spent his money liberally in adorning the city of Athens, where he built a stadium of Pentelic marble, and the Odeum (a music hall), whose ruins still stand to the southwest of the Acropolis, in memory of Regilla. He also built an aqueduct and exedra at Olympia, a stadium at Delphi, a theatre at Corinth, at Thermopylae arrangements for sulphur baths, and at Canusium in Italy an aqueduct. He contemplated a canal across the Isthmus of Corinth, but gave it up because Nero had tried and failed. He restored several of the partially ruined cities of Greece, where inscriptions testified the public gratitude to him. For

some reasons the Athenians became his enemies, and he left the city for his villa near Marathon, where he died (177). He wrote many works, but nothing of his writing is known to exist.

ATTILA, át'ti-lá (Ger. *Etzel*; Hung. *Ethele*, conjectured to have been originally a title of honor). A King of the Huns, the son of Munzük, a Hun of the royal blood. In 434 A.D. he succeeded his uncle, Roas, as chief of countless hordes scattered over the north of Asia and Europe. His brother, Bleda, or Blödel, who shared with him the supreme authority over all the Huns, was put to death by Attila in 444 or 445. The Huns regarded Attila with superstitious reverence; Christendom held him in superstitious dread, as the "scourge of God." He was believed to be armed with a supernatural sword, which belonged to the Scythian god of war and which must win dominion over the whole world. It is not known when the name "scourge of God" was first applied to Attila. He is said to have received it from a hermit in Gaul. The Huns as a race were regarded in the same light; in an inscription at Aquileia, written a short time before the siege of that city in 452, they are described as *imminentia peccatorum flagella* (the threatening scourges of sinners). The Alani, Ostrogoths, Gepidae, and many of the Franks fought under his banner, and in a short time his dominion extended over the people of Germany and Scythia—i.e., from the frontiers of Gaul to those of China. In the first years of his reign Honoria, the granddaughter of Theodosius II, because of an intrigue with an officer of the palace, appealed to Attila for help, and offered herself to him in marriage. Though he did not marry her, he used her appeal as one of the grounds of his attacks on the Empire. In 447, after an unsuccessful campaign in Persia and Armenia, he advanced through Illyria and devastated all the countries between the Black Sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The Emperor Theodosius II collected an army to oppose the inundation of the barbarians, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedon, and Greece were overrun; 70 flourishing cities were desolated, and Theodosius was compelled to cede a portion of territory south of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451 Attila turned his course to the west, to invade Gaul, but was here boldly confronted by Aëtius, leader of the Romans, and by Theodoric, King of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne—called anciently the Catalaunian Fields—waited to meet the enemy. Here the army of the West, under Aëtius and Theodoric, encountered the forces of the Huns. The engagement is known in history as the battle of Châlons. Both armies strove to obtain the hill of moderate height which rises near Mury and commands the field of battle; and after a terrible contest the ranks of the Romans and their allies, the Visigoths, were broken. Attila now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the

height into the plain was irresistible. On every side the Huns were routed, and Attila with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the most sanguinary battle ever fought in Europe; for it is stated by contemporaries of Attila that not fewer than 252,000 or 300,000 slain were left on the field. Attila, having retired within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pile, resolving to die in the flames rather than surrender; but by the advice of Aëtius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. (See **AËTIUS**.) In the following year Attila recovered his strength and made another incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, the Apennines, and the lagoons of the Adriatic Sea, where they founded Venice. The Roman Emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of Pope Leo I, who visited the dreaded barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans; and old chroniclers relate that the Apostles Peter and Paul visited the camp of Attila and changed his purpose. By 453, however, Attila appears to have forgotten the visit of the two beatified apostles, for he made preparations for another invasion of Italy, but died of hemorrhage on the night of his marriage with the beautiful Ildiko (or Hilda). His death spread consternation through the host of the Huns. His followers cut themselves with knives, shaved their heads, and prepared to celebrate the funeral rites of their King. It is said that his body was placed in three coffins, the first of gold, the second of silver, and the third of iron; that the caparison of his horses, with his arms and ornaments, was buried with him; and that all the captives who were employed to make his grave were put to death, so that none might betray the resting-place of the King of the Huns.

The Gothic historian Jornandes describes Attila as having the Mongolian characteristics—low stature, a large head, with small, brilliant, deep-seated eyes, and broad shoulders. There can be little doubt that circumstances conspired, in the case of Attila, to give a certain largeness to his barbaric conceptions, which made him a most formidable foe to the civilization of Europe. Consult: Gibbon, *Decline and Fall of the Roman Empire* (London, 1854-55); Thierry, *Histoire d'Attila* (Paris, 1874); *The Cambridge Medieval History*, vol. i (New York, 1911). See **HUNS**.

ATTIN. See **ATTIS**.

ATTIRET, à'tér-à'. JEAN DENIS (1702-68). A French painter. He was born at Dôle, studied painting in Rome, and at 30 entered the Jesuit Order. He was sent as a missionary to China, where he became court painter to the Emperor Kien Lung, whose military exploits against the Tatars he treated in 16 historical paintings. These were reproduced in France by Cochin in the form of engravings. Attiret painted more than 200 portraits of Chinese court officials and was the founder of a European school of painting at Peking. The title of mandarin was offered to him in 1754 but refused.

AT'TIS, also written **AT'TYS**, **A'TYS**, and **AT'TIN** (Gk. *Ἄττις*, *Ἄττυς*, *Ἄτυς*, and *Ἄττιν*).

A Phrygian and Lydian divinity, worshiped in the temple of Cybele in common with this goddess. The myth of Attis is told in various ways. The form of the story given by Ovid (*Fasti*, iv, 223-372) is this: Attis was a beautiful shepherd beloved of Cybele, who imposed upon him the vow of chastity. Having broken his vow, he was made insane by the goddess, in which condition he unmanned himself. When, in consequence thereof, he attempted to kill himself, Cybele changed him into a fir tree, and decreed that henceforth her priests should be eunuchs. The myth represented the successive death and regeneration of nature, due to the changes of the seasons. The cult of Attis was native to Phrygia, but at an early date it spread into other parts of Asia Minor and the Greek islands. Traces of it appear at Athens as early as the fourth century B.C., and it was introduced at Rome, probably in conjunction with the cult of Cybele, in 204 B.C. After the official recognition of the cult by the Emperor Claudius the festival of Attis was celebrated in March with great pomp. The story of Attis is the subject of a remarkable poem by the Roman poet, Catullus. Consult: J. G. Frazer, *Adonis, Attis, Osiris* (1906); G. Showerman, *Great Mother of the Gods* (Madison, Wis., 1901); and the editors of Catullus lxiii, especially R. Ellis.

ATTIUS, ät'ti-üs, or **ACCIIUS**, äk'shi-üs, LUCIUS (c.170-90 B.C.). A Roman tragic poet. He exhibited his first play at the age of 30, continuing from that time till his death his literary labors. He was perhaps the greatest of the Roman tragic writers. He wrote about 40 tragedies, of which only about 750 lines are extant. He composed also *Annals*, mythological histories in hexameter verse, *Didascalua*, a history of Greek and Roman poetry, and a work called *Pragmatica*, treating of literary history. He wrote also on agriculture. The extant fragments are edited by Ribbeck, *Tragicorum Romanorum Fragmenta* (Leipzig, 1897). Consult the monograph by Boissier, *Le poète Attius* (Paris, 1857).

ATTLEBORO. A town in Bristol Co., Mass., 32 miles southwest of Boston; on the main line and on branches of the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It comprises several villages and contains a public library, an almshouse, a State armory, and the Attleboro Home Sanitarium. The town manufactures jewelry, buttons, silverware, cotton goods, cotton-goods machinery, yarn, carriages, leather, coffin trimmings, and shuttles. There are also extensive bleacheries and dyehouses, and gold and silver refineries and smelters. The government is administered by annual town meetings. The water works are owned and operated by the municipality. Pop., 1900, 11,335; 1910, 16,215. Settled in 1669, and originally a part of Rehoboth, Attleboro (named from Attleborough, England) was incorporated as a separate town in 1694. Consult J. Daggett, *A Sketch of the History of Attleborough* (Boston, 1894).

ATTLMAYR, ät'tl-mir, FERDINAND (1829-1906). An Austrian naval expert. He was born at Hall, in the Tyrol, served with distinction in the navy, and in 1866 became professor at the Imperial Naval Academy of Austria. He produced a number of valuable works, principally on naval tactics, among which the following are the most important: *Die Elemente des Internationalen Seerechts* (1872); *Studien über See-*

taktik und den Seekrieg (1878); *Handbuch der Oceanographie und maritimen Meteorologie* (1883); *Ueber maritime Kriegsführung* (1884); *Der Krieg Oesterreichs in der Adria*, 1836 (1896); *Ueber Maritime Strategie und Seekriegsrecht* (1901); *Das International Seerecht* (1903-04).

ATTORNEY, ät-tär'nī (OF. *atorne*; Low Lat. *attornatus*, turned to). A person upon whom authority has been conferred to act for another. If the authority is conferred by a letter or power of attorney, he is called an *attorney in fact*, or an agent (q.v.). If he is authorized by law to represent persons employing him in legal proceedings, he is called an *attorney at law*. In the latter sense it was confined in England, until recently, to lawyers practicing in the common-law courts. Those practicing in equity courts were called solicitors (q.v.), while admiralty lawyers were known as proctors (q.v.). The Judicature Act of 1873 declared that all persons theretofore admitted as attorneys, solicitors, or proctors should be called solicitors of the Supreme Court, and that all persons thereafter admitted should have the same name. Accordingly, attorney at law is an obsolete term in England.

In this country, on the other hand, it is used as the general designation of the practicing lawyer, without regard to the court in which he exercises his functions and without regard to the nature of those functions—whether they are those performed, on the one hand, by the English attorney, solicitor, and proctor, or, on the other, by the barrister (q.v.), counsel, and advocate. The qualifications of an attorney at law and the mode of his admission to the bar are fixed by statutes and by court rules. He is required, generally, to pursue a course of study, either in a law school or in the office of a practicing lawyer, to pass an examination, and to present credentials of a good moral character. His admission is by an order of the court, which has the force of a judicial determination of his fitness and of his authority as an attorney and counselor. Upon this determination he becomes an officer of the court, subject to its control and responsible to it for misconduct. He is not a public official, nor is he the possessor of a mere favor or indulgence, revocable at the pleasure of the court or of the Legislature. The order of the court admitting him as an attorney clothes him with a right which can be taken from him only by a judgment of the court, after an opportunity to be heard, for moral or professional delinquency. As a rule, only citizens who have attained the age of 21 years are admitted to the bar. In some States women are declared ineligible as attorneys at law, but the present tendency in this country is to hold them eligible. It is usual for State and Federal courts to admit to their bar, without an examination or formal certificate of character, persons who have practiced as attorneys of the highest courts of their respective States for three years or more.

Upon admission, the attorney is required to take an oath that he will demean himself, as an attorney and counselor of the court, uprightly and according to law, and that he will support the constitution of the State and of the United States. Toward his client the attorney stands in a fiduciary position. The client confides in him, and he is bound not to betray this confidence, but to observe the utmost good

faith in all matters connected with their relations. Moreover, he is bound to use reasonable care and skill in giving advice to his client and in conducting legal proceedings in his behalf. He is entitled to reimbursement by his client for all proper expenditures on the latter's behalf, and to a fair compensation for his services, in the absence of a special agreement on that point. The better to secure him in this right, the law accords him a lien on the client's papers or property which come into his possession in his professional capacity.

While an attorney is bound to his client to act with all reasonable skill and zeal in advancing the latter's interests, he is also under a duty toward third persons to act lawfully. No amount of zeal in his client's behalf will justify him in engaging, knowingly, in an unlawful act, such, for example, as instituting a suit which he knows is malicious and without probable cause. In conducting a litigation he may take a good deal of latitude; he may say much which is derogatory to the reputation of others; but, in this country, his remarks are not absolutely privileged; they must be pertinent to the subject-matter of the litigation. If they are not pertinent and are defamatory, he will be liable to an action for defamation (q.v.). Consult Weeks, *Treatise on Attorneys and Counselors at Law* (San Francisco, 1892). See BAR; BAR-MASTER; LAWYER.

Attorney-General. In England the chief law officer of the crown, and, by reason of his office, the titular head of the bar. As the legal adviser of the crown and of the various governmental departments, and as a cabinet minister, he possesses great authority and dignity. His salary is £7000 per annum, and he is not allowed to engage in private practice. The Attorney-General of the United States is the chief law officer of the Federal government and a member of the President's cabinet. His duties are prescribed by statute, and his annual salary is \$8000. Each State has a similar officer, as has each crown colony of Great Britain. *Attorney-General to the Prince of Wales* is the officer in whose name the Prince, as Duke of Cornwall, may sue and be sued in matters connected with that duchy.

Attorney, Letter or Power of. An instrument authorizing a person to act as the agent or attorney of the person granting it. A general power authorizes the agent to act generally for the principal. A special power limits the agency to particular things. A power of attorney may be by parol or under seal. The attorney cannot execute a sealed instrument that will bind his principal unless his own power is given under seal. Grants of this nature are very strictly construed. Authority given to one person cannot be delegated by him to another, unless expressly set forth in the original grant. The death of the principal at once cancels a power of attorney. All conditions in the power must be strictly observed to render the attorney's action legal. Consult the works referred to under the title AGENT.

Attorney, Warrant of. The written authority to an attorney at law to appear in a litigation for the maker. The production of such authority is rarely required by the courts. The term is applied also to the written authority given by a debtor to an attorney named by the creditor to confess judgment for the debt. It is often attached to and made part of a promissory

note. In some States it renders the note non-negotiable, but in most jurisdictions it does not affect the negotiability of the note.

ATTORNMEN, *at-tŭrn'ment* (for derivation, see ATTORNEY). The formal recognition, by a tenant, of the grantee of the freehold as his landlord. This doctrine, which has played an important rôle in the modern law of landlord and tenant, had its almost forgotten origin in the feudal system of land tenure. The intimate character of the relationship of lord and freehold tenant in this system required not only that the lord should choose his own tenant, but the correlative right of the tenant to choose his own lord. The tenant was the first to gain the right to alienate his freehold, and thus to impose upon his lord a tenant, not of the latter's choice (Statute *Quia Emptores*, 18 Edw. I, 1290 A.D.), but the right of the tenant to refuse his assent to the conveyance of the landlord's estate in the premises, and thus to render his grant ineffectual and incomplete, not only continued 400 years longer, but was extended by analogy to the common, non-feudal relations of landlord and tenant. Accordingly, it was the law of England and of the English colonies in America until the Statute of 4 Anne, chap. 16, 1705 A.D., that an owner of lands subject to a lease for life or years could not make an effectual grant of his reversion (q.v.), or estate as landlord, without the assent of the tenant in possession. This assent might be manifested by words, by agreement in writing, by the payment of rent or of a nominal sum, and was called an attornment, or turning to, submission to, the new landlord. Without such attornment the grantee of the reversion was not entitled to the rents and services of the tenancy, nor could he enforce against the tenant any covenant or condition on which the lands were held. The statute above referred to, however, dispensed with the necessity of attornment in all ordinary cases of conveyance of his estate by the landlord, making such conveyance good and effectual from its date, the tenant becoming *ipso facto* tenant of the grantee upon the terms of the existing lease, and such is now the law everywhere in the United States.

Under the old law it was possible for a tenant, by attorning to a stranger, virtually to dispossess, or disseize, his landlord, and thus put him to an action to recover possession of his lands. This extraordinary and wrongful effect of an attornment was also done away with by the Statute of Anne (sec. 10), and the tenant estopped to deny his landlord's title (see ESTOPPEL), unless the attornment be made with the landlord's consent, or in consequence of a judgment or decree of a court, or to a mortgagee after the mortgage has been forfeited. The exceptions are still a part of the law, and, under them, the doctrine of attornment is an important part of the modern law of landlord and tenant. It should be added that, though a tenant is, in the ordinary case of an alienation of the freehold by his landlord, no longer protected by the necessity of making an attornment, he does not become liable on the obligations of his lease to the new landlord until notified of the transfer. Consult: Kent, *Commentaries on American Law* (Boston, 1896); Taylor, *Treatise on the American Law of Landlord and Tenant* (9th ed., Boston, 1904); Tiffany, *The Law of Landlord and Tenant* (St. Paul, 1910). See LANDLORD AND TENANT.

ATTRACTION (Lat. *attractio*, a drawing

together, from *ad*, to + *trahere*, to draw). The phenomenon that takes place when two or more bodies belonging to the same system, but separated from contact with one another, tend to approach each other as the result of a condition of stress. Attraction is seen in the case of celestial bodies, the earth and a falling body, electrified bodies, and a magnet and a piece of iron or steel. Gravitational attraction varies as the product of the masses, and inversely as the distance separating them, or, in other words, follows the "Law of Inverse Squares." Attraction is the same in nature as repulsion, but is opposite in direction, the former being considered to be a negative force in that it tends to diminish the distance between the bodies, while the latter is considered positive in that it tends to make this distance greater. It plays an important part in the discussion of many physical phenomena and will be found treated at considerable length in GRAVITATION; ELECTRICITY; MAGNETISM.

ATTRIBUTE (Lat. *attributum*, from *ad*, to + *tribuere*, to ascribe). 1. In painting and sculpture, a symbol associated with a figure to describe and emphasize its meaning in a religious, mythological, or allegorical sense. No period of art has been without attributes, but they have been most important at times when art has been less able to give character to the figures themselves, so that they can be recognized without the help of the accompanying attributes. The brush is the attribute of the painter; the stylus, of the scribe; the crown, of royalty; wings, of genii and angels. These are class attributes. In mythology the cow is the attribute of Hathor (Egypt); the tiger, of Ishtar (Assyria); the club, of Hercules; the trident, of Poseidon or Neptune (Græco-Roman). In Christian art the gridiron is the attribute of St. Lawrence; the lamb, of St. Agnes; the keys, of St. Peter. Attributes differ from emblems (q.v.) and symbols in having no value apart from their figures. 2. In logic, a mark or quality considered as giving character to an object of thought. (See LOGIC.) It is a term much used in Christian theology to denote some characteristic of the Divine nature, such as omniscience.

ATTRITION. See CONTRITION.

ATTU, ă't'loo, or **ATTOO**. The westernmost island of the Aleutian group and of the United States land areas in America, lat. 52° 58' N., long. 172° 66' E. (Map: Arctic Regions, A 4). Upon it is a small village, with less than 100 native families. Highest elevation, 3084 feet. Excavations have thrown much light on the material culture of the early Aleuts.

ATTUCKS, CRISPUS. The first man killed in the "Boston Massacre" (q.v.), March 5, 1770. He was a half-breed Indian, or a mulatto, of Framingham, Mass., born about 1720. By some he is said to have been a quiet on-looker; by others, a ringleader in the disturbance. A monument to him stands on Boston Common. Consult the *American Historical Record* for 1872, and Kidder, *History of the Boston Massacre* (Albany, 1870).

ATTYS. See ATTIS.

ATWATER, WILBUR OLIN (1844-1907). An American chemist and pioneer in agricultural experiment station work. He was born at Johnsbury, N. Y., and graduated at Wesleyan University, Middletown, Conn., in 1865, received his doctor's degree from Yale University in 1869,

and afterward studied physiological and agricultural chemistry at the universities of Leipzig and Berlin. He was professor of chemistry at Tennessee University, at Maine State College, and at Wesleyan University. He organized and was the first director of the pioneer state agricultural experiment station in this country at Wesleyan University in 1875, and was likewise the first director of the Office of Experiment Stations of the United States Department of Agriculture, upon its organization in 1888. In the latter capacity he largely established the policies of the office and its lines of future work, including the founding of *Experiment Station Record* and the first farmers' bulletin. From 1887 to 1902 he was also director of the Storrs (Connecticut) Experiment Station, during which time important studies were made in chemistry and other lines related to agriculture and in human nutrition. In 1894 he became chief of the nutrition investigations of the United States Department of Agriculture, and cooperated with many of the experiment stations and the Carnegie Institution in comprehensive investigations of human nutrition. With Rosa, Benedict, and others he developed special forms of bomb and respiration calorimeters with which exact and fundamental studies of the metabolic changes in the human body were conducted. He wrote a large number of articles on physiological and agricultural chemistry, notably *An Experimental Inquiry Regarding the Nutritive Value of Alcohol*, in vol. viii of the National Academy of Science publications; and the following bulletins of the Office of Experiment Stations of the United States Department of Agriculture: Nos. 21, *Methods and Results of Investigations on the Chemistry and Economy of Food*; 28 (with Woods), *The Chemical Composition of American Food Materials*; 45 (with Langworthy), *A Digest of Metabolism Investigations*; and 44, 63, 69, 109, and 136 (with Benedict et al.), *Experiments in the Metabolism of Matter and Energy in the Human Body*.

ATWILL, EDWARD ROBERT (1840-1911). An American clergyman. He was born at Red Hook, N. Y.; graduated at Columbia College in 1862 and at the General Theological Seminary, in New York City, in 1864. He entered the ministry of the Protestant Episcopal church, and after service in New York, Vermont, and Ohio, became Bishop of West Missouri in 1890.

ATWOOD, CHARLES B. (1849-95). An American architect, noted principally as the designer of W. H. Vanderbilt's house on Fifth Avenue, New York, and as Chief of Design of the World's Fair in Chicago, where the Art Building (now the Columbian Museum) and Peristyle Court were his personal work.

ATWOOD, GEORGE (1746-1807). An English mathematician and physicist. He was born in London, and graduated at Trinity College, Cambridge, with high honors in 1769. Subsequently he was appointed fellow and tutor. He received the degree of M.A. in 1772 and was elected a member of the Royal Society in 1776. Through the influence of William Pitt he was appointed to a position in the customs service, where he performed a number of important mathematical calculations connected with the revenue. The apparatus known as Atwood's machine (q.v.) was described in his *Treatise on the Rectilinear Motion and Rotation of Bodies, with a Description of Original Experiments Relative to the Subject* (1784). He also wrote *A Descrip-*

tion of the *Experiments Intended to Illustrate a Course of Lectures on the Principles of Natural Philosophy* (1776), and *An Analysis of a Course of Lectures on the Principles of Natural Philosophy* (1784), as well as a number of papers on mathematical subjects, published for the most part in the *Philosophical Transactions*. For one of these he received the Copley Medal in 1796.

ATWOOD, ISAAC MORGAN (1838—). A Universalist clergyman, born at Pembroke, N. Y. He became a Universalist minister in 1859 and was the president of the Canton (N. Y.) Theological School and professor of theology from 1879 to 1899. In 1898 he became general superintendent of the denomination in the United States and Canada. His publications embrace: *A Glance at the Religious Progress of the United States* (1874); *Walks about Zion* (1880); *Revelation* (1893); *Balance Sheet of Biblical Criticism* (1896). He edited *The Latest Word of Universalism* (1879); *A System of Christian Doctrines* (1900).

ATWOOD, JULIUS WALTER (1857—). An American clergyman, born at Salisbury, Vt. He was educated at Middlebury College, General Theological Seminary, and the Episcopal Theological School at Cambridge. He was ordained deacon in 1882 and priest in 1883 of the Protestant Episcopal church. He was rector at Ipswich, Mass.; Providence, R. I.; Columbus, Ohio; and Phenix, Ariz. From 1907 to 1911 he was Archdeacon of the Diocese of Arizona, and in the latter year he was consecrated Bishop of Arizona. In addition to sermons and addresses, he is author of *The Spiritual Influence of John Greenleaf Whittier* (1893).

ATWOOD'S MACHINE. An instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity, invented by George Atwood (q.v.). It is known that a body falling freely passes through 16 feet in the first second, 64 feet in the first two seconds, 144 feet in the first three seconds, and so on. Now, as these spaces are so large, it would require a machine of impracticable size to illustrate the relations just mentioned. The object of Atwood's machine is to reduce the scale on which gravity acts without in any way altering its essential features as an accelerating force. The machine, which may be modified in its actual construction, consists essentially of a pulley, *P* (see the cut), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *g*, at its extremities. The pulley rests on a graduated wooden pillar, which is placed in a vertical position by leveling screws. Two stages, *A* and *B*, slide along the pillar and can be fixed at any part of it by means of clamps. One of these stages, *A*, has a circular hole cut in it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken and intercepts the passage of the weight. A pendulum, chronograph, or other device is used with the machine to measure time. The weight of the cylinders, *p* and *g*, being equal, they have no tendency to rise or fall, but are reduced, as it were, to masses without weight. When a bar is placed on *p*, the motion that ensues is due only to the action of gravity upon it, so that the motion of the whole must be considerably slower than that of the bar falling freely. Suppose, for instance, that *p* and *g* are each $7\frac{1}{2}$ ounces in weight, and

that the bar is 1 ounce, the force acting on the system—leaving the friction and inertia of the pulley out of account—would be 1-16 of gravity,

or the whole would move only 1 foot in the first second, instead of 16. If the bar be left free to fall, its weight or moving force would bring its own mass through 16 feet the first second; but when placed on *p*, this force is exerted not only on the mass of the bar, but on that of *p* and *g*, which is 15 times greater, so that it has altogether 16 times more matter in the second case to move than in the first, and must, in consequence, move it 16 times more slowly. By a proper adjustment of weights the rate of motion may be made as small as we please, or we can reduce the accelerating force to any fraction of gravity. Suppose the weights to be so adjusted that under the moving force of the bar or circular weight the whole moves through 1 inch in the

first second, we may make the following simple experiments: *Experiment I.*—Place the bar on *p*, and put the weight in such a position that the lower surface of the bar shall be horizontally in the same plane as the 0 point of the scale, and fix the stage *A* at 1 inch. When allowed to descend, the bar will accompany the weight, *p*, during 1 second and for 1 inch, when it will be arrested by the stage *A*, after which *p* and *g* will continue to move from the momentum they have acquired in passing through the first inch. Their velocity will now be found to be quite uniform, being 2 inches per second, illustrating the principle that a falling body acquires, at the end of the first second, a velocity per second equal to twice the space it has fallen through. *Experiment II.*—Take, instead of the bar, the circular weight, place the bottom of *p* in a line with the 0 point, and put the stage *B* at 64 inches. Since the weight accompanies *p* throughout its fall, we have in this experiment the same conditions as in the ordinary fall of a body. When released, the bottom of the cylinder, *p*, reaches 1 inch in 1 second, 4 inches in 2 seconds, 9 inches in 3 seconds, 16 inches in 4 seconds, 25 inches in 5 seconds, 49 inches in 7 seconds, and 64 inches in 8 seconds—showing that the spaces described are as the squares of the times. *Experiment III.*—If the bar be placed as in Experiment I, and the stage *A* be fixed at 4 inches, the bar will accompany the weight, *p*, during 2 seconds, and the velocity acquired in that time by *p* and *g* will be 4 inches per second, or twice what it was before. In the same manner, if the stage *A* be placed at 9, 16, 25, etc. inches, the velocities acquired in falling through these spaces would be respectively 6, 8, 10, etc. inches—2 inches of velocity being acquired in each second of the fall. From this it is manifest that the force under which bodies fall is a uniformly accelerating force, i.e., adds equal increments of velocity in equal times. By means of the bar and the stage *A*, we are thus enabled to

remove the accelerating force from the falling body at any point of its fall and then determine the velocity it has acquired.

Atwood's machine will be found described and explained in almost any treatise on physics, and complete directions for performing the experiments are given in Glazebrook and Shaw's *Practical Physics* (New York, 1893). See GRAVITATION.

ATYS. See ATTIS.

AUBANEL, ô'bânêl', THÉODORE (1829-86). A French author. He was the son of a printer of Avignon and, while following his father's profession, sought, throughout a period of 30 years, to bring about a regeneration of the language and literature of the troubadours of Provence, to which end he long collaborated with Mistral, Roumanille, and other *félibres*. (See FÉLIBRIGE.) He was called by some of his more enthusiastic admirers, "the Petrarch of France." He is best known by his poems *La Miougrano entreduberto* (Paris, 1860). A drama of his in five acts, entitled *Lou pan dôu pecat*, was performed with great success at Montpellier in 1878. See PROVENÇAL LANGUAGE; PROVENÇAL LITERATURE.

AUBE, ôb. A central department of France, occupying the southern part of the old province of Champagne, and a small portion of Burgundy (Map: France, N., K 4). The eastern part belongs to the basin of the Aube; the western to the basin of the Seine. Area, 2327 square miles. Pop., 1896, 251,435; 1906, 243,670; 1911, 240,755. The climate is mild, moist, and changeable, but on the whole healthful. A great portion of the area is arable land, producing grain, hemp, hay, vegetables, and wine. There are deposits of limestone, marl, and potters' clay. Cotton weaving is the leading manufacture, of which industry the centre is Troyes, the capital.

AUBE. A right tributary of the upper Seine (Map: France, N., J 4). It rises on the plateau of Langres, in the department of Haute-Marne, and falls into the Seine near Pont-sur-Seine, after a course of 154 miles, for a small part of which it is navigable. It is used for the transportation of coal, lumber, and grain.

AUBE, HYACINTHE LAURENT THÉOPHILE (1826-90). A French admiral. He was born at Toulon; entered the navy in 1840; served with distinction in the colonies, and was in charge of some coast defenses during the Franco-German War. In 1879 he was appointed Governor of Martinique, and on his return to France in 1881 was made a rear-admiral. His appointment to the ministry of the navy and to the rank of vice-admiral followed in 1886. Aube was a strong advocate of the torpedo system. He was a voluminous writer, some of his more important works being: *De la marine française* (1873); *La guerre navale et les ports militaires de la France* (1879); *Italie et Levant* (1884); *Marine et colonies* (1885). Most of his writings have been collected under the titles *Entre deux campagnes* and *A terre et à bord*.

AUBÉ, JEAN PAUL (1837—). A French sculptor. He was born at Longwy (Meurthe-et-Moselle), and studied with Duret and the elder Dauban at the Ecole des Beaux-Arts. Among the numerous statues and other works executed by him are the following: "Dante Alighieri" (1880), at Paris; "Général Joubert à Rivoli," at Bourges; "Gambetta," in the Place du Carrousel, Paris; "Bailly," a bronze statue in the Luxembourg Garden; a portrait statue,

and "France and Russia," a decoration—both in the Luxembourg.

AUBENAS, ôb'nâs'. A town of France in the department of Ardeche, on an eminence near the river of the same name, 24 miles southwest of Privas (Map: France, S., J 4). In the vicinity are several extinct volcanoes. The town has a fifteenth-century church, a chateau of the thirteenth and sixteenth centuries, and a flourishing trade in silk. Pop., 1901, 8362; 1911, 7206.

AUBER, ô'bar', DANIEL FRANÇOIS ESPRIT (1782-1871). A famous French operatic composer. He was born at Caen, Normandy, and died in Paris. His father, an amateur painter and violinist of some note, was a dealer in prints who sent him to England to learn the trade. But his love for music soon asserted itself, and in 1804 he returned to Paris, where his musical compositions soon attracted attention. His concertos for the 'cello and violin were performed with great success by Lamare and Mazas respectively. In 1811 a resetting of an old libretto, *Julie*, to the accompaniment of six stringed instruments, won the admiration of Cherubini at a performance by amateurs. Cherubini then gave Auber instruction in composition, and part of a mass written about this time is preserved as the prayer in *La muette de Portici*. Auber's one-act opera, *Le séjour militaire* (1813), was a dismal failure, and the discouraged composer did not again tempt fortune until his father's death left him without means of livelihood. His next work, *Le testament et les billet-doux* (1819), was not successful, but *La bergère châtelaine* (1820), a comic opera in the Rossinian style, was enthusiastically received, and the composer's fame increased with subsequent works, which followed in rapid succession (over 40 in all) until his very death. *Le mason* was produced at the Paris Opéra Comique (1825) and is one of the stock pieces of the German opera houses to-day. *La muette de Portici* (or *Masaniello*, also *Fénella*), 1828, is his most serious opera. The author of sparkling music of the light order here sounded broader and deeper emotions and produced strongly dramatic contrasts. *Fra Diavolo* was performed in 1830 and has remained his most popular work. Other operas that maintained their popularity for almost half a century are: *Le philtre* (1831); *Le cheval de bronze* (1835); *Le domino noir* (1837); *Le lac des fées* (1839); *Les diamants de la couronne* (1841). Although the last-mentioned work was followed by 14 other operas, none of these attained real success. On the contrary, they show a gradual and steady decline of the composer's powers. He was chosen to succeed Gossec at the Academy in 1829, became director of the Conservatoire in 1842, and was appointed court chapel master by Napoleon III in 1857. Auber is deemed the founder of what the French call *grand opéra*; Rossini's *Guillaume Tell* (1829), Halévy's *La juive* (1835), and Meyerbeer's *Robert le diable* (1831) and *Les Huguenots* (1836) show the influence spread by *La muette de Portici*. The formal structure, the musical individualization of conflicting ethnographical or religious elements, the stirring mass-effects, the local color in the orchestra brought to a high state of perfection, and the pageantry of these works, are all derived from Auber. In *opéra comique*, too, Auber occupies a prominent place. For external polish, captivating melody, brilliant orchestration, dash, and Parisian chic, his music re-

mains unexcelled. Consult A. Kohut, *Auber* (Leipzig, 1895), and C. Malherbe, *Auber, biographie critique* (Paris, 1911).

AUBERGE ROUGE, L', ló'bärzh'röözh ('The Red Inn'). A striking psychical romance by Balzac (1831), based on the psychic suggestion of a murder, for which the suggester is executed while the actual murderer enjoys the fruits of the crime. The story involves the questions of comparative guilt and innocence, atonement, and the proper use of the wealth gained by the wrong-doing.

AUBERLEN, ou'bër-len, KARL AUGUST (1824-64). A German theologian. He was born at Fellbach, near Stuttgart, studied at Tübingen, and became professor of theology at Basel in 1851. As a youth he was influenced by Baur, but later he adopted the conservative views of Beck and Rothe. He is still remembered by his *Prophecies of Daniel and the Revelation of St. John, viewed in their Mutual Relation; with an Exposition of the Principal Passages* (Basel, 1854; 2d ed., 1857; Eng. trans., Edinburgh, 1856); *The Divine Revelation, An Essay in Defense of the Faith* (2 vols., Basel, 1862-64; Eng. trans. of vol. i, 1867); "The Old Testament Dispensation and the Heathen World"; "The Resurrection and Ascension of Jesus Christ" (lectures in the volume entitled in English *Foundations of Our Faith* (1862; Eng. trans., 1863; 2d ed., 1868), and his commentary on Thessalonians in Lange (Bielefeld, 1864; Eng. trans., 1868). The English translation of the *Divine Revelation* contains a brief memoir.

AUBERT, d'bar', JEAN LOUIS (1731-1814). A French author, born at Paris. He first attracted attention by his *Fables*, which were published in the *Mercur de France* and favorably regarded by Voltaire. He was professor of French literature at the Collège Royal from 1773 to 1784, and from 1774 to 1786 editor of the *Gazette de France*. He was one of the leading journalists of his time. His works were collected as *Fables et œuvres diverses* (1774).

AUBERT, LOUIS FRANÇOIS MARIE (1877-). A French composer. He was born Feb. 15, 1877, at Parame. His musical talent manifested itself very early and was carefully cultivated by his artistic parents. At the age of nine he entered the Conservatory at Paris, where he studied the piano under Diemer and Fauré, and composition under Lavignac. His musical style is strongly influenced by Debussy. He wrote several collections of songs, a Fantaisie for piano and orchestra (1901), and an opera, *La Forêt Bleue* (1906), which was produced in America by the Boston Opera Company (1913).

AUBERVILLERS, d'bar've'yá'. One of the northern suburbs of Paris (Map: Paris and vicinity). There are manufactures of chemical products, glass, rubber, perfumes, and beer. In 1905 was erected here the large Hospital Claude-Bernard, for contagious diseases. Pop., 1896, 27,000; 1906, 34,000; 1911, 37,558.

AUBIGNAC, d'bé'nyák', FRANÇOIS, ABBÉ D' (1604-76). A French dramatist and critic, born in Paris. His real name was Hédelin, but he is better known as the Abbé d'Aubignac, from the abbey conferred on him by Richelieu. He was chosen by Richelieu to be the tutor of his nephew, but is described as having been excessively pedantic and conceited. Chief among his compositions are a prose tragedy, called *Zénobie*, and a tedious work on the *Pratique du théâtre*, based on Aristotle. He was one of the first to

raise the modern question in regard to the authorship of the Homeric poems.

AUBIGNÉ, d'bé'nyá', THÉODORE AGRIPPA D' (1552-1630). A French Huguenot soldier, militant poet, historian, and statesman. He was born near the town of Pons in Saintonge. As a child he was a brilliant classical scholar. He early embraced the Huguenot cause, was captured, condemned to death, escaped, and in 1563 was present at the siege of Orleans, where his father was killed. His guardian sent him to Geneva to escape persecution. He studied under Beza, but in 1567 enlisted under Condé, and later served Henry of Navarre as soldier and sometimes over-candid counselor. After Henry's assassination Aubigné fell into disfavor and in 1620 sought refuge at Geneva, whence he superintended the fortifications of Bern and Basel. In spite of his storm-tossed life, he had found time to produce much of value to literature and to contemporary history. His *Histoire universelle, 1550-1601*, published at Amsterdam (1616-20), was officially burned in France, as was also his autobiographical *Histoire secrète*, on its appearance in 1731. These are very valuable, but bitterly satirical, as is his controversial *Confession catholique du Sieur de Sancy* and *Les aventures du baron de Fæneste* (1617), one of the earliest realistic novels of the seventeenth century. His greatest work, begun while recovering from a wound (1577), is a group of satirical poems, *Les tragiques* (1616), which are sombre and unexcelled descriptions of the horrors of religious warfare. They are divided into "The Miseries," "The Princes," "The Gilded Chamber" (i.e., the courts), "The Fires," "The Words," "The Vengeances," and "The Judgment," where the Huguenot, oppressed on earth, cites his persecutor before the bar of God at the Resurrection. The 9000 verses are a strange mingling of beauty and chaos, often reckless, sometimes obscure, but with passages of a fierce inspiration, a brilliant imaginative enthusiasm, that have earned immortality, both for their own sake, as the noble utterance of an offended conscience, and as a true expression of the faith, courage, restless searching of spirit, presumption, and pride, that characterized the movement in which he bore a conspicuous part. He is a striking figure, writing with the style of Rabelais and the spirit of Henri Estienne (see STEPHANUS) in the days of Malherbe and Richelieu, without elegance, clearness, precision, or composition, but with the energy born of the Renaissance and the Reformation. An almost universal scholar in the learning of his time, Aubigné was never a pedant. For that he was too sincere, intense, earnest; and, even in bitterness, he strove to be just. Thus his History presents the mind of his epoch, even when it distorts the facts. His complete Works have been edited by Réaume and Caussade, 6 vols. (1873-93), the *Tragiques* by Lalanne (1857) and Reade (1872); *Histoire universelle*, by Ruble (1886-97). Consult: Morillot, *Discours sur la vie et les œuvres d'Agrippa d'Aubigné* (Paris, 1885); Salis, *Agrippa d'Aubigné* (Heidelberg, 1885), and a *Life* in French by G. Guizot, *Agrippa d'Aubigné* (Paris, 1890); also Macdowell, "Agrippa d'Aubigné" in *Henry of Guise and other Portraits* (New York, 1898), and Rocherlave, *Agrippa d'Aubigné* (Paris, 1910).

AUBIGNÉ, MERLE D'. See MERLE D'AUBIGNÉ.

AUBIN, ô'bân'. A town of France in the department of Aveyron, on the Orleans Railway (Map: France S., G 4). There are extensive coal and iron mines in the vicinity, and the town contains an old church, dating from the twelfth century, and a ruined castle. Pop., 1896 (of commune), 9781; 1901, 9973; 1906, 9986; 1911, 9574.

AUBREY, a'bri, JOHN (1626-97). An English antiquary. He was a diligent collector of old documents and left some valuable works of his own. He published only one book, called *Miscellanies* (1696; 5th ed., 1890), but several of his works were afterward edited and published by others. Among these were *Natural History and Antiquities of Surrey* (1719) and *Letters written by Eminent Persons of the Seventeenth and Eighteenth Centuries* (1813). The latter gives much biographical matter concerning English poets. Consult his biography, by J. Britton (London, 1845), and the essay of Professor Masson in the *British Quarterly Review*, vol. xxiv (London, 1857).

AUBRIOT, ô'brê'ô', HUGUES (d. 1382). A mayor of Paris. He was born at Dijon; was appointed Treasurer under Charles V and afterward became mayor and Governor of Paris (1364), in which capacity he organized several of the greatest public works of the city. He laid the corner stone of the Bastille, built Le Petit Châtelet, the Pont Saint-Michel, and several quays along the Seine, and completed the fortifications begun by Etienne Marcel. After the death of Charles V he was accused of heresy and sentenced to perpetual captivity in the Bastille, but was liberated by the Mailletons soon afterward. His statue adorns the façade of the Hôtel de Ville in Paris. Consult Eugène Déprez, *Hugo Aubriot, Præpositus Parisiensis et Urfanus Prætor, 1367-81* (Paris, 1902).

AUBRY, ô'brê', CHARLES MARIE BARBE ANTOINE (1803-83). A French jurist, born at Zabern, Alsace. He was assistant judge of the tribunal at Strassburg in 1870, and counselor of the Court of Cassation in Paris from 1872 to 1878. He became a commander of the Legion of Honor in 1878. He was one of the most highly esteemed French writers on jurisprudence of his century and was widely known also for his articles on legislation and a translation of Goethe's *Faust*. His principal work is the *Cours de droit civil français, d'après la méthode de Zachariæ*, 8 vols. (Paris, 1869-76).

AUBRY DE MONTDIDIER, ô'brê' de mon'-dê'dyâ'. A French knight who lived during the reign of Charles V, and, according to tradition, was assassinated in the forest of Bondy by his comrade, Richard de Macaire, in 1371. The latter was suspected of the crime because the dog belonging to the deceased Aubry invariably displayed toward him the most unappeasable enmity. Macaire was therefore required by the King to fight with the animal in a judicial combat, which was fatal to the murderer. This tale was afterward, under the titles of *Aubry's Dog*, *The Wood of Bondy*, *The Dog of Montargis*, frequently acted, the dog always gaining the greatest share of applause. It was called *The Dog of Montargis*, because Charles VIII had the fight between the dog and Macaire depicted over a mantel in his chateau of Montargis. As late as 1816 a melodrama based on the legend found great favor on the European stage. After being performed with success at Vienna and Berlin, it was to be played at the Weimar theatre of

which Goethe was the manager; but the poet resigned his office before the dog made his début. Consult Guéssard, *Macaire* (Paris, 1866).

AUBURN, a'bûrn. A town in Lee Co., Ala., 59 miles east by north of Montgomery, on the Western Railway of Alabama (Map: Alabama, D 3). It is the seat of the Alabama Polytechnic Institute, opened in 1872, and has a Carnegie library. Pop., 1890, 1440; 1900, 1447; 1910, 1408.

AUBURN. A city, and the county-seat of Placer Co., Cal., about 36 miles northeast of Sacramento, on the Southern Pacific Railroad (Map: California, D 4). It contains a library, and a county high school. Gold, granite, potters' clay, and limestone are found in the adjacent region; mining, fruit growing, and general agriculture are the leading industries. Auburn was first settled in 1848. Pop., 1900, 2050; 1910, 2376.

AUBURN. A city, and the county-seat of De Kalb Co., Ind., 23 miles by rail north by east of Fort Wayne; on Cedar Creek, and on the Vandalia, the Lake Shore and Michigan Southern, and the Baltimore and Ohio railroads, Fort Wayne and Northwestern Railway Company (Map: Indiana, D 1). It carries on a trade in grain, live stock, hay, onions, etc.; and manufactures carriages and wagons, automobiles, cycle cars, brass, ice, clothing, handles, buggy-bodies, excelsior, lumber, gas engines, windmills, etc. The county buildings and the Eckhart public library, the Y. M. C. A. building, and City Hall are the principal features of interest. There are municipal water works and electric light plant. Pop., 1890, 2415; 1900, 3396; 1910, 3919.

AUBURN. A city, and the county-seat of Androscoggin Co., Maine, 34 miles north of Portland, on the Maine Central, and Grand Trunk railroads (Map: Maine, B 4). It has extensive manufactures of lumber, boots and shoes, boxes, and cotton goods, abundant water power being supplied by the Androscoggin and Little Androscoggin rivers. The city has a public library and owns and operates its water works. In the vicinity are many points of interest, notably Lewiston Falls, Lake Auburn, and Poland Springs. Auburn was settled in 1786 and first incorporated in 1842. The charter of 1869 provides for a mayor, elected annually, and a bicameral council, which controls all important appointive offices. Pop., 1890, 11,250; 1900, 12,951; 1910, 15,064.

AUBURN. A city, and the county-seat of Nemaha Co., Neb., 74 miles south of Omaha, on the Chicago, Burlington, and Quincy and the Missouri Pacific railroads, and on the Nemaha River (Map: Nebraska, J 4). The city is in a fertile agricultural region and has fruit and corn canning industries. The water works and city-lighting system are owned by the municipality. Pop., 1900, 2664; 1910, 2729.

AUBURN. A city, and the county-seat of Cayuga Co., N. Y., 26 miles southwest of Syracuse, on the New York Central, the Lehigh Valley, and the New York, Auburn, and Lansing railroads; and on the outlet of Owasco Lake (Map: New York, D 5). It has good water power and extensive manufactures of agricultural implements, woolen goods, carpets, iron, shoes, engines, pianos, rope, etc. Auburn is the seat of the Auburn Theological Seminary (Presbyterian) (q.v.), incorporated in 1820; of a State prison, a large stone structure with provision for 1200 convicts, and a prison for

women. It also contains a women's industrial and educational building, the home and a fine statue of William H. Seward, a library, an armory, and a county courthouse. The city is governed by a mayor, elected biennially, and a city council. The mayor has the power of appointing heads of important departments—street, charities, fire, police, and health; the council has elective power in minor offices. The annual expenditures of the city are about \$550,000, the main items being \$38,000 for the police department, \$52,000 for the fire department, and \$154,000 for schools. The water works are owned and operated by the municipality. Auburn was founded by Capt. John L. Hardenbergh in 1792, and called Hardenbergh's Corners until 1805, when it was made the county-seat and received its present name. In 1815 it was incorporated as a village and was chartered as a city in 1848. Auburn is a popular summer resort on account of the many lakes in its vicinity. Pop., 1900, 30,345; 1910, 34,668. Consult H. Hall, *The History of Auburn* (Auburn, 1869), and J. H. Monroe, *History of Auburn* (1913).

AUBURN. The name of the place celebrated in Goldsmith's *Deserted Village* and commonly identified with Lissoy, County Westmeath, Ireland. Here the poet's father had a parish, and here the poet spent his boyhood.

AUBURN THEOLOGICAL SEMINARY. An American Presbyterian seminary at Auburn, N. Y., founded in 1818 by the Synod of Geneva and incorporated in 1820. In 1913 the endowment was \$790,000. The productive funds amount to \$776,000 and the annual income to nearly \$76,000. The library contains 34,720 volumes and 13,000 pamphlets. The course is three years and is designed primarily for college graduates. In 1913 the faculty numbered 11, and the students 57. President, Rev. George B. Stewart, D.D., LL.D.

AUBUSSON, ô'bu'sôn'. A town, capital of an arrondissement of the same name in the department of Creuse, France (Map: France, S., G 3). This town, which is picturesquely situated on the Creuse River 20 miles southeast of Gueret, has long been noted for its manufacture of carpets, an industry which employs about 2000 hands. Pop., 1901, 6949; 1911, 7211.

AUBUSSON, PIERRE D' (1423-1503). Grand Master of the Order of St. John of Jerusalem. He was born of a noble French family. At the age of 12 or 13 he distinguished himself, under Albert, Duke of Austria, in fighting against the Turks in Hungary. In 1444 he took part in the campaign of the Armagnacs against the Swiss. Disgusted at the disgraceful failure of this expedition, due to the heroism of the Confederates at "the German Thermopylae," he went to Rhodes and entered the Order of St. John. He distinguished himself in fighting pirates and on diplomatic missions. In 1476 he was elected Grand Master. In 1480 he defended Rhodes successfully against Mohammed II. He was a very able diplomat, and enriched and strengthened his order. In 1489 he was made a cardinal. He has been called "the shield of the Church," because his great aim was to form a league of Christians against the infidels. In 1501 he seemed on the point of accomplishing his purpose and was appointed commander-in-chief of the forces to be furnished by the Pope, the Emperor of Spain, and the kings of Castile, Portugal, Hun-

gary, and France. But the alliance had no effect on account of the jealousies of the participants. Aubusson died in 1503. Consult Streeck, *Pierre d'Aubusson* (Chemnitz, 1872).

AUCASSIN ET NICOLETTE, ô'kâ'sân' & nê'kô'lêt'. A naive romance in Old French, celebrating the love and adventures of the young couple whose names form the title. Even by the casual reader of the present day the story will be found to possess a singular charm. The author never forgets that he has a tale to tell, and the human interest always predominates. For its time, the narrative is remarkably direct, and its artlessness has all the virtue of consummate art.

AUCH, ôsh. The capital of the department of Gers, in the south of France, situated on a hill near the river Gers, 42 miles west of Toulouse (Map: France, S., E 5). Auch is the seat of an archbishop, and possesses numerous statues, a library, and a museum of natural science. Its highest point is crowned by a cathedral famous for its stained-glass windows, begun by Charles VIII and completed by Louis XIV. It has an active trade in woolen and cotton goods, fruits, wine, and brandy. Pop., 1901, 13,939; 1906, 13,526; 1911, 13,638. In ancient times Auch was called Elinberum; at a somewhat later period it took its name from the Ausci, whose chief town it was. In the eighth century it became the capital of Gascony.

AUCHENIA, â-kê'ni-â, **AUCHENIIDÆ**, â-kên-i'î-dê. See LAMA.

AUCHMUTY, ôk'mû-tî or â'my-tî, SIR SAMUEL (1756-1822). A British general, son of Rev. Dr. Samuel Auchmuty. He graduated at King's (Columbia) College in 1775 and entered the British army the next year. He was in the battles of Brooklyn and White Plains and served in three campaigns. He served in India (from 1783 to 1796), in Egypt (1800), and in South America, where, in February, 1807, he took by assault the fort and city of Montevideo. He was advanced to the rank of major-general in 1808 and two years afterward was appointed commander-in-chief at Madras. The next year he reduced the Java Settlements. In 1813 he was made a lieutenant-general and was for a time commander-in-chief in Ireland, where he died.

AUCHTERARDER, ouk'têr-âr'dêr. A village in Perthshire, Scotland, about 15 miles southwest of Perth (Map: Scotland, E 3). Cotton weaving, and the manufacture of woolen cloth and agricultural machines are the leading industries. Pop., 1901, 3159; 1911, 3175. The village was involved in the events leading to the disruption of the Church of Scotland and the formation of the Free Church, in 1843. Consult *The Auchterarder Case* (Edinburgh, 1842).

AUCKLAND, âk'land. The northern provincial district of New Zealand (q.v.).

AUCKLAND. The chief town of the province of Auckland (area, 25,750 square miles; pop., 1911, 265,000) and the northern half of North Island, New Zealand, built on the shores of the beautiful Waitemata harbor, which opens out of the Hauraki Gulf, in lat. 36° 50' S. and long. 174° 50' E. (Map: New Zealand, N. I., B 3). Waitemata harbor affords splendid accommodation for shipping and has large docks. At dead low water, springtides, there is 36 feet. North Island at this point narrows to an isthmus 6 miles across, and on the western side there is a second harbor, the Manukau, whence

vessels trade up and down the west coast. From Waitemata harbor steamers leave regularly for Australia, South Africa, Great Britain, America, and the Pacific islands, and trade valued at \$40,000,000 annually passes through this port. Auckland is 1315 miles from Sydney, 1650 from Melbourne, and 5440 from San Francisco, and it is the first and last Australasian port of call of the Oceanic mail liners from San Francisco to Sydney. The industries comprise shipbuilding, rope making, sugar refining, and trade in kauri gum and lumber. There are, besides, various agricultural, pastoral, and manufacturing industries. The imports include textiles, machinery, sugar, tea, and hardware. The city was the capital of New Zealand until 1865, when the more centrally situated Wellington was made the capital. There are many fine public and business buildings, a complete electric tram system, a university, which includes an excellent school of mines, and a very fine public library, which houses the magnificent Grey Library bequeathed to the city by the late Sir George Grey, K.C.B., and which includes many rare and some unique manuscripts. The climate is equable and the city is a favorite resort. Pop. (with suburbs), 1901, 67,226; 1906, 82,101; 1911, 102,676.

AUCKLAND, GEORGE EDEN, EARL OF (1784–1849). An English statesman, son of William Eden, Baron Auckland. He was educated at Christ Church, Oxford, and Lincoln's Inn. On the death of his elder brother in 1810, he succeeded to his brother's seat in the House of Commons. He was President of the Board of Trade from 1830 to 1834 and First Lord of the Admiralty in 1834 and 1835. In the latter year he was appointed Governor-General of India. But he was suspended in 1841 because of his Afghan war policy. In 1846 he became First Lord of the Admiralty, holding that cabinet office until his death. He was created Earl of Auckland in 1839.

AUCKLAND, WILLIAM EDEN, BARON (1744–1814). An English diplomat. He was educated at Oxford, and called to the bar in 1768. In 1772 he was appointed Under Secretary of State and afterward filled the posts of a lord of trade, a commissioner to treat with the insurgent Colonies of North America (1778), and Chief Secretary to the Lord Lieutenant of Ireland. Pitt sent him as a special commissioner to France to conclude a commercial treaty with that country (1786). Afterward he served as Plenipotentiary in Spain, Ambassador to Holland and Postmaster-General. In 1793 he was enrolled in the British peerage. He was the author of the *Principles of Penal Law* (1772), *Remarks on the Apparent Circumstances of the War* (1795), and several pamphlets. Consult *The Journals and Correspondence of William, Lord Auckland*, ed. by his son, the Bishop of Bath and Wells (4 vols., 1860–62).

AUCKLAND ISLANDS. A group of islands 200 miles south of New Zealand, lat. 50° 31' S., long. 166° 19' E. (Map: World, Western Hemisphere, P 2). It consists of the large island of Auckland (330 square miles) and a few smaller ones. They were discovered in 1806, and settled by the British in 1849, but are uninhabited at present. The New Zealand government maintains a station on Auckland Island for the relief of shipwrecked sailors.

AUCTION (Lat. *auctio*, increase, public sale by increased bids, from *augere*, increase).

A public sale of property to the highest bidder. Ordinarily the property offered for sale is described, and the conditions in accordance with which it will be sold are announced, before bids are invited. Each bid is an offer, the auctioneer's acceptance of which is indicated by his knocking down the property to the bidder. Until the bid is thus accepted it may be withdrawn; but when thus accepted a contract is formed between the seller and the buyer, containing as a part of its terms all statements and conditions publicly made to the bidders on the seller's behalf. An auction should be fairly conducted on both sides. There should be no puffing, or bidding by dummies, in the interest of the seller, nor should he be allowed to bid unless he has stipulated for that right in the conditions of the auction, or the right is accorded to him by statute, or by an order of court having control of the sale. On the other hand, any concerted action by bidders for stifling the sale is illegal and may warrant the auctioneer in refusing to accept bids; it may even entitle the seller to avoid a sale.

The conduct of auctions is regulated, with a good deal of care, by modern statutes, in England and in many of our States. Not infrequently sham auctions are declared to be criminal offenses. As a rule, an auctioneer must have a license, either from the State or the municipal authorities. While engaged in bringing the property to a sale, he is the agent of the seller only. His power to bind the principal, and the principal's authority over him, as well as their respective duties to each other, are determined by the general principles of agency. As soon as the sale is made, he becomes an agent of the purchaser, as well as of the seller, for the purpose of making a memorandum of the sale which will satisfy the statute of frauds. This agency does not continue, however, beyond a reasonable time for the performance of that duty. The auctioneer has a lien on his principal's goods in his possession, and on the proceeds from their sale, to the extent of his commissions and expenses. Because of this interest in the property, he may sue in his own name for the purchase price, or for the wrongful conversion of the property by a third person. If he sells without disclosing his principal, he may be sued by the purchaser for any breach of the contract. Even though he names his principal, he will not always escape liability, though he follows strictly the principal's directions. If, for example, he in good faith sells property as that of the principal and turns the proceeds over to the latter, he will be liable for a conversion to a third party who owned and was entitled to possession of the property.

In a "Dutch auction" the property is offered at a high price, which the auctioneer lowers gradually, until a price is named which is accepted by the bidder. Here the offer is by the auctioneer and the acceptance by the bidder. An auction sale "by inch of candle" is when the biddings are to be kept open only while a stipulated length of candle burns. These two forms of auction are practically obsolete in England and the United States. Consult Bateman, *Treatise on the Law of Auctions* (1st Amer. ed., Boston, 1883; 7th Eng. ed., London, 1895); also the works referred to under AGENT.

AUCTION BRIDGE. Auction follows the parent game of Bridge (q.v.) in most particulars. The cutting, dealing, honor count, 30

points to a game, chicane grand slam, and little slam are the same as in Bridge. If the dealer wins his first bid, the play is as in Bridge. The value of each trick over six in Auction is slightly changed as follows: spades are worth 2 points, clubs 6 points, diamonds 7 points, hearts 8 points, lilies or Royals (good spades) 9 points, and no trumps 10 points. Regardless of the declaration, the deal passes regularly from left to right.

Auction differs from Bridge in awarding the declaration to the bidder who contracts to win the highest game score on the deal. If two players bid to win an equal number of points, the declaration goes to the one contracting to take the greater number of tricks, i.e., one offering to win 2 lilies worth 18 points is counted overcalled by another bidding 3 clubs also worth 18 points, because it is obviously more difficult to take three odd tricks than to win two odd. In Bridge the dealer may pass; in Auction, he must make an opening bid.

In counting, only the declarer can score game points. If he fails to make his contract, his adversaries score only in the honor column, which does not help them toward winning game or rubber. Successful adversaries take 50 points for each trick the declarer falls short of his contract, no matter what suit he has bid. Doubling raises the value of each undertrick to 100 points, redoubling increases it to 200 points, and so on. For keeping his contract, the declarer receives a bonus of 50 points in his honor score. Winning the rubber adds 250 points to the honor column of the successful partners. Consult: Dalton, *Auction Bridge up to Date* (New York, 1910); Elwell, *Principles, Rules, and Laws of Auction Bridge* (New York, 1910); Foster, *Royal Auction Bridge* (New York, 1912).

AUCTIONEER. See AUCTION.

AUCUBA, ā'kū-bā (Jap. *aoi*, *aoka*, green + *ba*, leaf). A genus of plants of the family Cornaceae, containing 4 or 5 species, all in eastern Asia. The only cultivated species is *Aucuba japonica*, an evergreen shrub resembling a laurel. The leaves, however, are pale green, curiously mottled with yellow. It is dioecious, produces its small purple flowers in summer, and ripens its bright scarlet berries in March. It is a native of China and Japan and is grown in Europe and America as an ornamental shrub. It is propagated by cuttings of half-ripened wood or by seed. A number of varieties, mostly with variegated leaves, are in cultivation. The plant is tolerant of smoke and dust.

AUDEUS, AUDIUS (or, according to his native Syriac name, UDO). The founder of an anthropomorphic religious sect in Mesopotamia, called the Audians, which flourished during the fourth and fifth centuries. He commenced by accusing the regular clergy of worldliness, impure morals, etc., and is said to have opposed to their manner of life a strict asceticism, until his conduct seemed dangerous to the welfare of the Church, when he was excommunicated. His disciples, who were very numerous, now clung more closely to him, and he was elected their bishop. In 338 A.D. he was banished to Scythia, where he instituted a kind of rival church, and where he died about 370 A.D. He is said to have held that the language of the Old Testament—e.g., Gen. i. 27, literally interpreted—justifies the belief that God has a sensible form. From this belief the sect was sometimes called Anthropomorphites. See ANTHROPOMORPHISM.

AUDE, ōd. A southeastern maritime department of France (Map: France, S., G 5). It comprises a portion of the old province of Languedoc. Area, 2449 square miles. Pop., 1896, 310,513; 1906, 308,327; 1911, 300,537. The southern part of Aude is mountainous, but the greater portion of it belongs to the valley of the lower Aude and the canal of Languedoc. The climate is warm but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. Aude is rich in iron and coal, which it exports, and has mineral springs. The manufactures are numerous and varied. Capital, Carcassonne.

AUDE (anciently, Lat. *Atax*). A river in the south of France, rising in the East Pyrenees, in the department of Pyrénées-Orientales (Map: France, S., II 5). It flows north as far as Carcassonne, where it turns east and enters the Mediterranean near Narbonne. It is about 130 miles long.

AUDEBERT, ōd'bar', JEAN BAPTISTE (1759–1800). A French naturalist and painter, born in Rochefort. In Paris he soon won success as a miniature painter. His love of natural history and his skill in painting birds and animals secured him employment in this field. For the purpose of making sketches he visited Holland and England in 1800. That year he produced his *Histoire naturelle des singes* ('Natural History of Monkeys'), a large folio, with 63 colored plates, remarkable for their truth and beauty. After his death two more volumes appeared, which were even more excellent than the first. They were his books on humming birds, and on woodpeckers and birds of paradise (1802).

AUDHUMLA, ou-dhūm'la. According to the myths of the Scandinavian cosmogony, the name of the cow upon whose milk the giant Ymir subsisted. She licked the frost of the icy abyss, Ginnungagap, and forth sprang Buri, the father of Borr and grandfather of Odin.

AUDIFFRET-PASQUIER, ō'dē'frā'pās'kyā', EDMÉ ARMAND GASTON, DUC d' (1823–1905). A French statesman, born in Paris. In 1862 he inherited the title of Duc de Pasquier from a granduncle. During the reign of Napoleon III he was identified with the Orleanist opposition and under the presidency of Thiers was one of the Moderate Conservative Party. In 1875 he was chosen President of the National Assembly, which he had entered in 1871, and though he had been an avowed supporter of the Bourbon restoration, he then accepted the Republic. He was the first life Senator elected by the Assembly (1875); was President of the Senate from 1876 to 1879, and in 1878 was elected to the French Academy.

AU'DIOMETER (hybrid form, from Lat. *audire*, to hear + Gk. *μέτρον*, *metron*, measure). An instrument for the measurement of hearing, invented by Prof. D. E. Hughes, of London, in 1879. It consists of a battery, a microphonic key, two primary coils mounted at the extremities of a graduated bar, a secondary or induction coil which moves along the graduated bar, and a telephone, the terminals of which are connected with the terminals of the induction coil. The battery is connected with the microphonic key and the two primary coils, and the telephone is held at the ear of the person whose hearing is being tested. The amount of sound

can be gradually increased by moving the induction coil from the centre toward the larger of the two primary coils, and diminished by moving it toward the centre, the position at which it disappears being noted.

AUDIPHONE (hybrid form, from Lat. *audire*, to hear + Gk. *φωνή*, *phōnē*, sound). An instrument to assist the hearing of persons whose auditory nerve has not been entirely destroyed. One variety of audiphone consists of a thin sheet of ebonite rubber, hard vulcanite, fan-shaped, and having strings leading from the outer edge to the base of the handle, so that it may be brought to different degrees of convexity. When the outer edge is pressed against the upper front teeth and the convex side is outward, sound vibrations are conveyed to the auditory nerve through the teeth and bones of the head. This instrument has been generally abandoned in favor of the ear trumpet, and of the modern electric hearing devices built on the same principle as the telephone.

AUDI'TA QUERE'LA (Lat. the complaint having been heard, from *audire*, to hear, and *querela*, complaint). A form of action which lies for a defendant against whom judgment has been rendered (and who is therefore in danger of an execution), to restrain or prevent the execution, on account of some matter occurring after judgment, amounting to a discharge, as payment or release of the debt for which judgment was given. Blackstone describes it as an action of a high remedial character, in the nature of a bill in equity to be relieved against the oppression of the plaintiff, invented to protect a party who has a good defense, but is too late to make it in the ordinary forms of law (*Comm.* iii, 406). The modern practice of the courts in granting summary relief upon motion, in cases of such oppression, has generally superseded this form of remedy, but it may still be employed in many States of the United States where complete justice cannot be done in this summary manner. See EXECUTION; JUDGMENT; SUPERSEDEAS; ARREST OF JUDGMENT.

AUDITION, ā-dish'ūn, **AU'DITORY SENSATION** (Lat. *audire*, to hear). Our sensations of hearing fall into two great groups, as sensations of tone and sensations of noise. The former are musical, smooth; the latter, abrupt, rough, and harsh. The physical stimulus of auditory sensation is the vibration of some material body that is transmitted to the ear under ordinary conditions by a wave movement of the air particles, a to-and-fro motion in the direction in which the sound travels (longitudinal vibration). If the wave movement be that of a simple sinusoidal curve (pendular vibration), the resulting sensation is a simple tone. If the wave movement be cut short at a very early stage of its progress, or if the air be disturbed by a mere shock or concussion, we have the sensation of simple noise. The tone of a tuning fork, standing upon its resonance box, is practically a simple tone; the pop of a soap bubble is an instance of a simple noise. The musical tones of ordinary experience are doubly complicated; they consist of a number of simple tones, sounding together, and are further accompanied by complex noises. The tone emitted by a violin string, e.g., contains a half-dozen different simple tones, which may be discriminated under proper conditions (see CLANG-TINT), as well as the scraping noise that arises from the drawing of the bow across the

string. The noises of every-day life (crash, thump, clatter) are similarly complicated; they consist of a number of simple noises, among which a tonal element may often be distinguished.

AUDITION.

The series of tonal qualities. The keyboard of a grand piano extends from the A_2 of $27\frac{1}{2}$ vs. to the C_8 of 4224 vs. The range of audition is approximately from the G_8 of $12\frac{3}{4}$ vs. to the f_8 of 45,056 vs.

times as many as are employed by orchestral music. So acute is our discrimination of tones that, in the middle region of the musical scale, two tones will be judged as different by a trained observer whose vibration rates differ by but 0.2 vibrations in a second. Measurements of this sort require a delicate apparatus, which has usually taken the form of a series of tuning forks, whose pitch can be varied at will by the movement of a rider along their prongs, or of a series of reeds, very carefully tuned to minute differences of pitch, sounding under wind pressure.

The psychology of the simple noises is as yet incomplete. There seems to be no doubt that noises show differences of quality or pitch more or less resembling those of tones. The crack of a pistol is "higher" than the roar of a cannon; the snap of a large soap bubble is "deeper" than the snap of a small one. Experiments have been made in which the sound of a tuning fork is cut off from the observer's ear before the prongs have executed two complete wave movements; the sound in such a case is not a tone, but a noise. The results seem to indicate that we can distinguish between 500 and 600 simple noises, or that there are about 20 times fewer noise than tone sensations. This statement, however, requires confirmation. It has recently been suggested that there are two ultimate types of simple noise: the snap

The series of simple tonal qualities forms what is technically termed a continuous one-dimensional manifold; i.e., tones may be arranged along a single line, or scale, within which every term is separated by insensible gradations from the terms next preceding and following. Music employs less than 100 discrete tones, lying between the e of $41\frac{1}{4}$ and the d of 4752 vibrations in a second. The range of hearing is much wider, extending, under favorable circumstances, from the g of $12\frac{3}{4}$ approximately to the f of 45,056. The lower limit is determined by means of giant tuning forks, of vibrating strips (*lamellæ*) of steel, or of weighted wire forks; the upper limit by miniature tuning forks, by small steel cylinders, and by an adjustable piston-whistle (Galton's whistle) actuated by a rubber bulb. Between these extreme limits the ear can distinguish no less than 11,000 tonal qualities, or more than 100

(electric spark, soap bubble, curtained sound of fork) and the hiss; but no classification of hisses by pitch or quality has been attempted.

A word must be said about two striking phenomena of auditory sensation—beats and combination tones. 1. If two tones whose vibration rates are slightly different are sounded together, the resulting sound is not smooth, but "wavy"; it fluctuates in intensity, according as a hill of the one curve coincides with a hill or with a valley of the other. Thus two tones of 100 and 101 vibrations in the 1 sec. beat once in the 1 sec.; tones of 100 and 102 beat twice; and so on. Beats can be counted up to about 5 in the 1 sec., and can be heard separately up to about 60; beyond this limit the beating complex merely sounds harsh and rough. In certain cases the two beating tones give rise to a third—intermediate—tone which carries the beats. 2. If two tones are sounded together, various extra-tones are generated, whose vibration rates stand in definite relations to the vibration rates of the primary tones. Most important, theoretically, are (a) the first difference tone and (b) the summation tone. The pitch number of the former is equal to the difference between the vibration rates of the two generators. Thus tones of 300 and 400 vs. produce a first difference tone whose pitch number is 100. The pitch number of the latter is equal to the sum of the vibration rates of the generators; thus tones of 300 and 400 vs. produce a summation tone of 700. It was formerly thought that the difference tone is a beat tone, and that the summation tone is due to the presence of overtones in the primaries; but the difference tone, unlike the beat tone, cannot be obtained by the superposition of pendular vibrations. While it is true that a few instruments, like the harmonium, produce objective difference tones, due to secondary vibrations of the sonorous body, most difference tones are subjective, occasioned within the mechanism of the ear itself. The summation tone is apparently produced in the same way as the difference tone.

Sensations of sound appear to have developed from general bodily sensations of jar or tremor. (See *STATIC SENSE*.) The first auditory sensation proper is, probably, the noise; this theory is borne out by facts of genetic psychology as well as by the circumstance that, for our own ears, the physical stimulus of noise is an imperfect tonal stimulus; the sensations are different in kind, but their exciting causes differ only in degree. The ruling theory of audition, that of Helmholtz, maintains that tonal sensations are set up by the vibration of the cross fibres of a triangular membrane stretched between the bony walls of the cochlea of the internal ear. This "basilar" membrane represents, in miniature, the arrangement of a harp, or of the backboard of an upright piano; the long strings are tuned to the bass tones, the short strings to the treble tones. The external air wave strikes the drumskin of the ear, is transmitted inward by the chain of auditory ossicles, and arouses a wave movement in the endolymph of the internal ear. The motion is taken up by that basilar fibre which is "tuned" to its particular rate; the motion of the fibre excites the hair of a sensory cell resting upon it; and the nervous impulse passes from this cell along the auditory nerve to the brain. An overlying membrane, the "tectoria," acts as

dampener, to bring the vibrating hair to rest again. The details of the theory, as amended by Hensen, Exner, and Ebbinghaus, afford a fairly satisfactory explanation of the details of auditory sensation. We have seen that there are some 11,000 tonal qualities. It has been found that the basilar membrane consists of 16,000 to 20,000 cross fibres—more than enough to serve as the basis of these sensations. The qualities of noise we may suppose to be mediated by the simultaneous jarring of a number of adjacent basilar fibres. Beats are accounted for on the hypothesis that the incoming air wave sets in vibration not only the basilar fibre which is specifically attuned to it, but (in a lesser degree) the neighboring fibres as well. If, then, two fibres that lie near together within the membrane are set swinging by two waves of but slightly different rates, the fibres lying between these two will also be affected, and affected by both stimuli. There is, consequently, interference of the two wave motions in this narrow intermediate strip of membrane, and the intermediate tone (which carries the beats) is aroused. Combination tones were explained by Helmholtz as due to asymmetrical vibrations of the conductive apparatus (ossicles and membranes). Ebbinghaus has restored them to the cochlea by two simple and natural extensions of Helmholtz's principles. He supposes (a) that a simple wave movement of the endolymph excites a limited number of adjacent fibres, and thus a number of hair cells; and that the cells are not so sharply differentiated in function but that all alike (though in varying degrees) can mediate the same tonal sensation; and (b) that a given wave motion excites not only its own particular basilar string, but also (within certain limits) the strings that are attuned to its harmonic undertones. Thus a stimulus of 600 vibrations in the 1 sec. would, perhaps, excite the strings attuned to 599.6, 599.8, 600, 600.2, 600.4; and the cells lying upon these strings would all alike give the tone 600 in sensation. Moreover, the stimulus 600 would excite not only the 600-string, but also the strings that respond directly to stimuli of 300, 200, 150, 120, etc. These assumptions afford an easy explanation of the phenomena in question. We may add that the Helmholtz theory has received confirmation on the pathological side by the discovery that, in certain individuals, the hearing of tones is abrogated over a definitely circumscribed portion of the scale (tonal gap), or is abrogated in general, but retained over a similarly circumscribed area (tonal island)—facts that accord admirably with the functions ascribed hypothetically to the strings of the basilar membrane. Vivisectional experiments on dogs seem to show that excision of the tip of the cochlea (where the membrane is widest) produces a deafness to bass tones; but the confirmation of this is required.

In spite of its explanatory powers, the Helmholtz theory has never lacked opponents. Various objections have been urged against it; as, that the theory, in assuming that the ratio of width of the two ends of the basilar membrane is about 1:12, greatly overstates the triangularity of the membrane; that the membrane is too closely woven for its radial fibres to vibrate, even in small batches, not to speak of the separate vibration of single fibres; that the structures of the cochlea are too minutely small for the strings to act as resonators to the deep

tones which audition can distinguish; and so on. Hence a number of theories have arisen which reject the idea of resonance altogether, and assume that the basilar membrane vibrates in one piece. Waller's theory, which we may take as typical of this direction of thought, is formulated as follows: the basilar membrane is "a long, narrow drumhead, repeating the complex vibrations of the membrana tympani." It "vibrates in its entire area to all sounds (although more or less in some parts than in others), giving . . . acoustic pressure-patterns between the membrana tectoria and the subjacent field of hair cells. In place of an analysis by consonation of particular radial fibres, . . . varying combinations of sound give varying pressure-patterns, comparable to the varying retinal images of external objects." No one of these opposing theories has been worked out in any conspicuous detail. (See EAR; ACOUSTICS; PSYCHOLOGICAL APPARATUS.) Consult: Helmholtz, *On the Sensations of Tone* (Eng. trans., London, 1895); Ebbinghaus, *Grundzuge der Psychologie* (Hamburg, 1897-1902); Waller, *Introduction to Human Physiology* (New York, 1891); Titchener, *Text-Book of Psychology* (New York, 1910).

AUDITOR (Lat., hearer, from *audire*, to hear). At common law, an officer appointed by the court in the action of account to take and state the items of debit and credit between the parties to the action, determine the balance due, and report to the court.

Similar officers were appointed in chancery, who were more usually known as masters in chancery. (See MASTER IN CHANCERY.) As the common-law action of account fell into disuse, courts of common law ceased to appoint auditors; but under modern statutes, the law courts have power to appoint officers exercising quasi-judicial functions in the taking of accounts, taking of evidence, trial of issues, etc., variously known as auditors, commissioners, or referees. (See COMMISSIONER; REFERENCE.) Their reports, when filed and confirmed, form the basis of the judgment rendered by the court. The powers and duties of such officers are, in general, limited and defined by the statutes authorizing their appointment.

The term "auditor," as now employed, however, more commonly has reference to a class of persons, usually expert accountants, who have increased in numbers to meet the demands of the growing importance and complexity of industrial and financial affairs, and who perform the service of examining and stating the accounts of government departments, corporations, and private concerns. Many of our large cities, as well as the State and general governments, have official auditors (called, in New York City, commissioners of accounts) as a part of the regular administrative machinery; and the same is true of many of the larger industrial corporations. Private auditors are ordinarily subject to no legal regulation, except such as is imposed by the contract under which they are employed, and the general obligation to exercise a reasonable degree of skill, care, and caution. A higher degree of skill is required of a professional auditor than of one who does not hold himself out as an expert; such skill, in fact, as is exacted of all strictly professional men. In some of the States of the United States a class of public accountants, licensed and registered by the State, is recog-

nized by statute. For the law as to auditors under the English Companies' Acts and other statutes, consult Pixley, *Auditors: Their Duties and Responsibilities* (7th ed., London, 1896).

AUDITORY, or **EIGHTH, NERVE**. According to the older nomenclature, the *portio mollis* (because it is soft, having no sheath or neurolemma) of the seventh pair. The nerve of hearing. The superficial origin of this nerve is from the ventrolateral surface of the medulla immediately behind the transverse fibres of the pons. Two distinct bundles of fibres can be distinguished in it; one (the cochlear division), passes to the outer side of the restiform body, or inferior peduncle of the cerebellum, while the other (the vestibular division) passes to the inner side of the restiform body. The fibres take their deep origin in the gray matter of the fourth ventricle. The fibres of the cochlear division of the nerve terminate in Corti's organ, situated in the cochlea. The fibres of the vestibular division of the nerve terminate in the hair cells of the *crista* and *macula acustica* in the vestibule and semicircular canals.

The auditory nerve leaves the cranial cavity, in company with the facial nerve, through the internal meatus. At the bottom of the meatus the two divisions of the nerve separate, the vestibular branch passing to the vestibule and semicircular canals, the cochlear branch passing to the cochlea. Within the meatus the auditory nerve is connected by one or two filaments with the facial. See EAR.

AUDLEY, æd'li. A manufacturing town in Staffordshire, England, 4½ miles west of Newcastle-under-Lyne. The most noteworthy building is a church built in the time of Edward II. Pop., 1891, 12,600; 1901, 13,700; 1911, 14,776.

AUDLEY, or **AUDELEY**, SIR JAMES DE (c.1316-69.) An English knight. In 1346 he went to France in the retinue of Edward III and the Black Prince, and in 1350 participated in the naval combat with the Spaniards off Sluys. At the battle of Poitiers (Sept. 19, 1356), he fought with signal valor at the forefront of the English army until overcome by wounds. For his bravery he received an annuity from the Black Prince, who also in 1362 appointed him Governor of Aquitaine. Later he became Great Seneschal of Poitou. He was one of the original knights-companions of the Order of the Garter, instituted by Edward III.

AUDLEY, THOMAS, BARON AUDLEY OF WALDEN (1488-1544). An English Lord Chancellor under Henry VIII. He was chosen Speaker of the famous "Long Parliament" in 1529, was made a knight and Keeper of the Great Seal in 1532, and became Lord Chancellor in 1533, succeeding Sir Thomas More, at whose trial he presided. He also conducted the trials of Bishop Fisher, of the supposed accomplices of Anne Boleyn, and of the paramour of Queen Catherine Howard. Throughout his public life he was little more than a tool in the hands of the King and his minister, Cromwell.

AUDOE'NUS, JOANNES. See OWEN, JOHN (c.1560-1622).

AUDOUIN, ød'u'än', JEAN VICTOR (1797-1841). A French naturalist, born in Paris. With Dumas and Brongniart he began the *Annals of Natural Science* in 1824, and with Milne-Edwards made researches on crustacea and annelida. He was professor of entomology in the Museum of Natural History in Paris and in 1838 became a member of the Academy of Sci-

ences. He was also the founder and first President of the Entomological Society. He investigated, at the request of the government, the injuries done to vine and silk culture by insects, and contributed a great number of reports and papers on this subject. He also contributed the part on insects in Cuvier's *Règne animal*.

AUDRAN, ô'drân', EDMOND (1842-1901). A French composer. He was born at Lyons; studied music in Paris, and in 1861 followed his father, a teacher at the Conservatory of Marseilles, to that city, where he became choral director at the church of St. Joseph. He returned to Paris in 1881, and collaborated with MM. Chivol and Duru on a number of comic operas, of which the following are the most important: *La mascotte* (1881), a great success; *Olivette, le grand mogol* (1884); *Miss Helyett* (1890), and *La poupée*.

AUDRAN, GÉRARD, or GIRARD (1640-1703). The most important member of a family of French engravers and painters. He was born at Lyons; studied under his father and uncle and at Rome under Carlo Maratti, and acquired a high reputation by an important series of engravings of biblical subjects and of Pope Clement IX. He was recalled to France by Colbert, and appointed engraver to Louis XIV. His best-known work is a series of engravings illustrating the battles of Alexander, after the paintings of Lebrun. Others reproduced Mignard's decorations of the ceiling of the royal apartment at Versailles, and the cupola of the church of Val de Grace, a skillful combination of etching and line engraving, and are the very best work of their kind. He published a work entitled *Les proportions du corps humain* (1683).

AUDREY, a'dri. 1. A shepherdess in Shakespeare's pastoral comedy, *As You Like It*. Her relations, as the untutored child of nature, with Touchstone, the motley of a court, form some of the most diverting scenes of the play. 2. A character in Jonson's comedy, *A Tale of a Tub*.

AUDREY, SAINT. See ETHELREDA.

AUDUBON, a'du-bon, JOHN JAMES (†1780-1851). An American naturalist. He was born at Mandeville, in Louisiana, then a Spanish colony, on May 5, 1780, and died Jan. 27, 1851. This date of his birth, however, is merely a tradition and probably he was born some years before. His father is said to have been a French naval officer, who owned estates in Santo Domingo; his mother, a Spanish creole. His childhood and youth were spent in France, where he was educated, and where he was given instruction in drawing by the painter David. In 1798 he came to America and settled on a farm on the Perkiomen River, near Philadelphia. His father had acquired the property during the Revolutionary War and now gave it to him. Here he lived 10 years, collecting and sketching birds, and applying himself otherwise merely to field sports and social enjoyment. In 1808 he married Lucy Bakewell, the daughter of a neighbor, an Englishman, and at once migrated to the West. After passing 10 years in a vain effort to establish himself in business in Kentucky and Louisiana, and finally losing all his property, he was reduced to supporting himself by drawing portraits and even teaching dancing and fencing. This came about from his persistent inattention to business, which was constantly neglected, as he acknowledges in his autobiographic memoranda, for the sake of pursuing his studies and drawings in natural his-

tory, or merely for the pleasures of hunting, fishing, and wandering in the woods. No deepening of his difficulties could cure him of his heedlessness or cause him to forego any opportunity to add to his knowledge or series of drawings of birds.

In 1824 his projects were forwarded by a visit to Philadelphia, where he first became known to the intellectual society of the country and his abilities were recognized. Two years more of painting, teaching, and study, aided by his wife, enabled him to go to England to try to carry out his long-cherished plan of publishing his drawings of birds in a complete series of life-sized colored figures. He interested a sufficient number of subscribers to enable him to begin in London, in 1827, the publication in folio parts, at two guineas each, of his *Birds of America*, which excelled anything of the sort then extant. About five were then issued annually until its completion, in 1838, in 87 parts, containing 435 plates, giving 1065 figures. A complete good copy (of which about 175 sets are supposed to be in existence, 80 of which are in America) is now worth about \$2000. No reading matter accompanied these plates, but this was prepared later, and published in Edinburgh, from 1831 to 1839, in five successive volumes, entitled *Ornithological Biography*, the technical part of which was prepared by William McGillivray. Several editions and reprints, with reduced drawings, were made subsequently, of which the most important was the octavo edition of 1844, entitled *Birds of America*. A complete account of these combined works, and of all Audubon's other ornithological writings, is given in the appendix to Elliott Coues's *Birds of the Colorado Valley* (Washington, 1898). The years from 1830 to 1842 were spent in almost incessant travel in all accessible parts of the United States and Canada in search of new materials, or else in Europe, attending to the publication and sale of his great work. In 1842, however, Audubon purchased an estate on the bank of the Hudson River, now included within the city of New York, where a beautiful home was established for himself and his sons, Victor and John Woodhouse, and their families. In 1843 Audubon made a fruitful journey to the upper Missouri River region, the results of which were included in the first octavo edition of his *Birds of America* (1844). Thenceforth he devoted his energies mainly to the preparation of a standard work on American mammals, for which his sons not only collected much material, but for which John drew half of the colored plates; while John Bachman contributed technical and other parts. It was published in New York as Audubon and Bachman's *Quadrupeds of North America*, the first volume dated 1846 and the last 1853-54.

Audubon failed rapidly after 1847, gradually lost the use of his mind, died in 1851, and was buried in Trinity Cemetery, New York, close to his home woods, which now form a beautiful district called Audubon Park. As a man he was endowed with a hardy and most attractive frame, a winning disposition, and a brilliant, poetic mind, animated by untiring enthusiasm. He was not learned in science, nor an artist in any broad sense of the term; but his work has been a source of immense pleasure and inspiration.

The best and fullest biography of him is by his granddaughter Maria R. Audubon, entitled *Audubon and his Journals*, with zoological and

other notes by Elliott Coues (2 vols., New York, 1897). A previous *Life of John James Audubon, the Naturalist* (New York, 1869) was written by another relative, Lucy Audubon. Still earlier is Buchanan's *Life and Adventures of J. J. Audubon* (2d ed., New York, 1864), which contained many errors and was not approved by his family.

AUDUBON SOCIETY. See ORNITHOLOGICAL SOCIETIES.

AUE, ou'e. A town in the circle of Zwickau, Saxony, Germany, at the confluence of the Mulde and the Schwarzwasser, 18½ miles southeast of Zwickau by rail. It is a railway junction, the seat of a district court, and a busy industrial centre. It has five public buildings, and its institutions include a *real-schule*, and technical schools in connection with the tin and lace-making industries. Aue's manufactures include furniture, working tools, cardboard, tobacco pipes, and sheet-metal ware, and there are iron foundries, machine shops, breweries, and cotton mills. Pop., 1900, 15,230; 1910, 19,360.

AUE, au'e, HARTMANN VON (c.1170-c.1215). One of the best court epic poets of German mediæval classical literature. Born the vassal of a Swabian Herr von Aue, he was well educated, and took part in one of the Crusades (1189 or 1197?). More or less under the influence of the French poet Chrestien de Troyes, he wrote the following very popular epics: *Erce* (10,135 lines), which introduced the Arthurian romances into Germany, and which is apparently one of his earliest works, having as its theme woman's devotion; *Iwein* (8166 lines), the poet's most finished work as to form, which surpasses its French source in tenderness of feeling and in its light, happy style, and treats a similar theme from another point of view; *Gregorius* (3752 lines), a mediæval "Edipus," given a happy ending; and *Der arme Heinrich* (1520 lines), his most popular work and the only one based on a German legend—a simple poem of great charm, which seeks to glorify both the self-sacrifice of woman and the moral fibre of man. He also wrote lyrics in the style of the day. There are many excellent editions of his works.

AUENBRUGGER, ou'en-bru'gër, **VON AUENBRUGG**, ou'en-brug, LEOPOLD (1722-1809). A Viennese physician, born in Gratz, Styria, who introduced the method of percussion diagnosis in diseases of the chest. He published the results of his important investigation in a treatise entitled *Inventum Norum ex Percussione Thoracis Humani Interni Pectoris Morbos Detegendi* (1761), which marks an epoch in the modern history of medicine. The book attracted little attention until it was translated and illustrated by Corvisart in 1808. He also wrote two treatises on insanity.

AUER, ou'ër, ALOYS, RITTER VON WELSBACH (1813-69). An Austrian printer. He was born at Wels, in Upper Austria, and was trained in a printing establishment of his native town to be a compositor. During his scanty leisure moments he studied French, Italian, English, and other languages, in which he underwent an examination in 1835 and 1836 before the University of Vienna. In October, 1837, he was appointed professor of Italian in the Gymnasium of Linz, in Upper Austria. In 1839 he set out on his travels through Germany, Switzerland, France, and England, collecting materials

for his favorite art. From 1841 to 1864 he was director of the Imperial printing office at Vienna, which under his management became one of the largest establishments of the kind in Europe. He was prolific in typographical inventions and made known a photographic discovery, "spontaneous impression," in *Die Entdeckung des Naturselbstdrucks* (1854); published *Die Sprachenhalle oder das Vaterunser in 608 Sprachen*, with Roman types (1844); *Das Vaterunser in 206 Sprachen*, with their national alphabets (1847); *Die Buchschriften des Mittelalters* (1852); *Geschichte der K.-K. Hof- und Staats-druckerei in Wien* (1851), etc. See NATURE PRINTING.

AUER, LEOPOLD (1845—). A violinist, born at Veszprim, Hungary, and educated at the Conservatory of Budapest and at Vienna. From 1863 to 1865 he was concert master at Düsseldorf, and from 1866 to 1868 he held the same position at Hamburg, under Stockhausen. Afterward he became professor at the Conservatory of St. Petersburg and violin soloist to the Russian court. From 1887 to 1892 he was director of the symphonic concerts given by the Imperial Musical Society of Russia. He came to be considered one of the foremost violinists of the day, his playing being characterized by extraordinary technical skill, depth of conception, and remarkable beauty of tone. His concert tours were very successful. In 1895 he was raised to the rank of the hereditary nobility. He is, moreover, not only one of the greatest teachers, but undoubtedly he has trained more artists who subsequently attained world-wide renown than any other teacher. Elman and Zimbalist are among his pupils.

AUERBACH, ou'ër-bäg, BERTHOLD (1812-82). A German novelist born at Nordstetten. He was the founder of the contemporary German "tendency novel," in which fiction is used as a means of influencing public opinion on social, political, moral, and religious questions. Auerbach was of humble Jewish parentage, but had a liberal education at Tübingen, Munich, and Heidelberg, and was a close student of Spinoza, whose complete works he translated (1841; 2d ed., 1871). Spinoza's philosophy can be traced in the ethics of his novels of the higher social life. His life was uneventful, though embittered at the close by the growth of German anti-Semitism. His best-known works are *Das Judentum und die neueste Litteratur* (1836); a semi-biographical novel, *Spinoza* (1837); *Dichter und Kaufmann* (1839); *Der gebildete Bürger* (1842), an attempt to popularize philosophical subjects; *Schwarzwälder Dorfgeschichten* (1843), his first great success, widely translated, and expressing with a sympathetic realism the memories and scenes of youth. This was followed in the same field by the hardly less charming second series of *Village Tales* (1846), *Barfussle* (1856); *Joseph im Schnee* (1861); *Edelweiss* (1861); a third series of tales, *Nach dreissig Jahren* (1876), *Der Forstmeister* (1879), and *Brigitta* (1880). Meantime he had written a mass of now insignificant journalistic work, and, among other novels, *Auf der Höhe* (1865; Eng. trans., 1889, etc.), a philosophic romance, blending peasant life and character with that of the higher circles in a royal capital and country-seat. This was an attractive exhibition of doctrinaire ethics and established his reputation in spite of errors in construction and style. *Das Landhaus am Rhein* (1869) was

similar but less successful, and *Waldfried* (1874) sought vainly to draw literary inspiration from German unity and the French war. The rest of his 40 volumes are negligible. All Auerbach's longer work is overweighted with philosophy and a leaden humor. He is best in emotional situations and the sentiments of simple natures; excellent in description, but weak in the management of plot. Still, *Auf der Höhe* has enough inherent reality to triumph over its faults, is still read and worth reading. Auerbach's talent appears to best advantage in the *Dorfgeschichten* and in such modest stories as *Barfussce*, *Edelweiss*, and *Brigitte*. The best edition of his *Works* is that of 1892-95 (18 vols.). Consult: Zabel, *Berthold Auerbach* (Berlin, 1882); E. Lasker, *Berthold Auerbach, ein Gedenkblatt* (1882); A. Bettelheim, *B. Auerbach, der Mann, sein Werk* (1907).

AUERBACH'S KELLER. A Leipzig wine cellar and tavern, which occupies much the same place in the hearts of Goethe-lovers that the London "Cheshire Cheese" holds in the hearts of the admirers of Dr. Johnson. It is associated with the early life of the German poet, who in his student days was a regular *habitué* of it, and it is supposed to be the original of the tavern scene in the drama of *Faust*.

AUERSPERG, ou'ér-spèrk, ADOLPH WILHELM DANIEL, PRINCE (1821-85). An Austrian statesman. He served in the army from 1841 to 1860 and attained the rank of major. In 1867 he entered political life as a member of the Bohemian Diet, being elected by the Liberal land proprietors, and in 1868 became a member for life of the Upper Chamber of the Austrian Reichsrath. He was Governor of Salzburg from 1870 to 1871, and proved in that position, as well as in his subsequent political life, a staunch supporter of the constitution. From 1871 to 1879 he was the head of the Austrian ministry, as such succeeded in carrying out the electoral reform, securing direct elections to the Lower Chamber of the Reichsrath, and in strengthening the political entente with Hungary.

AUERSPERG, ANTON ALEXANDER, COUNT VON (known to literature as ANASTASIUS GRÜN) (1806-76). An Austrian statesman and poet. He was born at Laibach (Carniola), studied at Graz and Vienna; through his verse became distinguished as a Liberal; and when 26 years old was made Imperial Chamberlain. He was elected to the German preliminary Parliament in 1848 and subsequently to the National Assembly in Frankfurt. Under the Constitution of 1861 he was appointed by the Emperor a life member of the *Herrenhaus*, the Austrian upper house, where he continued prominent in opposition to the Feudal-Clerical and Slovenian parties. He was similarly active in 1861-67 in the diets of Carniola and Styria. His first noteworthy and best non-political poem was *Der letzte Ritter*, a cycle of romances (1830; new ed., 1885), eulogizing Maximilian I (and his times) in the metre of the *Nibelungenlied*. With *Spaziergänge eines Wiener Poeten* (1831; 7th ed., 1876), an attack upon the Metternich régime, he attracted great attention. Chief among his further publications are the epics *Die Niebelungen im Frack* (1843) and *Der Pfaff vom Kahlenberg* (1850); translations of popular Slovenic songs: *Volkslieder aus Kram* (1850), and *Robin Hood* (1864), an excellent adaptation of the English ballad material. His poetry is eminently contemplative and at times

overburdened with the author's reflections. In its assertion of freedom it was influential during the political controversy of the time, and it still may be read for a number of genuine lyrics. His *Gesammelte Werke* were edited by L. A. Frankl (5 vols., Berlin, 1877); certain of his letters were published as *Briefwechsel mit L. A. Frankl* (Berlin, 1897) and a selection of his *Politische Reden und Schriften* appeared in Vienna in 1906. Consult Schatzmayer, *Anton, Graf von Auersperg* (2d ed., Frankfurt, 1872), and Radics, *Anastasius Grün und seine Heimat* (Stuttgart, 1876).

AUERSPERG, CARLOS, PRINCE (1814-90). An Austrian statesman. On the advent of the new constitutional era, in 1861, he became a member of the Upper Chamber of the Reichsrath. As a representative of the Liberal landed proprietors in the Diet of Bohemia, and afterward as president of the Austrian House of Peers, he took a conspicuous part in defending the constitutional system against clerical and feudal reaction and in establishing the unity of the Empire. He presided over the Austrian ministry in 1868 and subsequently was a zealous supporter of the Liberal cabinet, at the head of which was his brother Adolph.

AUERSTÄDT, ou'ér-stët. A village in Saxony, 25 miles northeast of Weimar. Here Davout won a great victory over the Prussians under the Duke of Brunswick on the same day (Oct. 14, 1806) that Napoleon defeated their main army at Jena. The battle was fought in a mist, between 48,000 Prussians and 30,000 French. The Prussians lost one-half of their army, while Davout's loss amounted to 7000 men. Consult Lettow-Vorbeck, *Der Krieg von 1806 und 1807*, vol. i, *Jena und Auerstadt* (Berlin, 1891).

AUF DER HÖHE, ouf dër hë'e. See AUERBACH, BERTHOLD.

AUFFENBERG, ouf'en-bèrk, JOSEPH, BARON VON (1798-1857). A German dramatist, one of the less successful imitators of Schiller. He was born at Freiburg, where he first studied law, but soon began to write dramas. He became president of the committee of the Court Theatre at Karlsruhe several years afterward. The following are a few of his more important dramatic works: *Pizzaro* (1823); *Ludwig XI in Peronne*; *Der Löwe von Kurdistan*; *Alhambra*; *Das Nordlicht von Kasan*. The third edition of his complete works (22 vols.) was published at Wiesbaden in 1855. Consult E. L. Stahl, *Joseph von Affenberg* (Hamburg and Leipzig, 1910).

AUFRECHT, ouf'rèkt, THEODOR (1822-1907). A German philologist and Sanskrit scholar. He was born at Leschnitz and was educated at the University of Berlin. He early devoted himself to Oriental research, and at the age of 25 published a treatise on Sanskrit accent (Bonn, 1847). In collaboration with Kirchhoff, he issued *Die unbrischen Denkmäler* (1849-51), and with Adalbert Kuhn he founded the *Zeitschrift für vergleichende Sprachforschung* (1852). In 1862 he was appointed professor of Sanskrit and comparative philology at the University of Edinburgh. He left Scotland and accepted a professorship at Bonn, resigning his position in 1889. Among Dr. Aufrecht's many contributions to linguistic science, the most important are an edition of the *Rigveda* in Roman letters (2d ed., Bonn, 1877), *Ujvaladatta's Commentary on the Unadi-Sutra* (a Sanskrit lexico-

graphical work), *Aitareya Brahmana* (1879); *Catologus Catalogorum, An Alphabetical Register of Sanskrit Works and Authors* (Leipzig, 1896-1903), and *Katalog der Sanskrit-Handschriften der Universitäts-Bibliothek in Leipzig* (Leipzig, 1901).

AUGARTEN, ou'gär-ten (Ger. *Aue*, meadow + *Garten*, garden). A park in Vienna, once noted for its musical associations. Mozart, in 1782, was instrumental in starting concerts there, and it has been the scene of many musical first nights. It was opened in 1775 by Joseph II and is laid out in the old French style.

AUGE, a'jè. See TELEPHUS.

AU'GEAS, or **AUGEI'AS** (Gk. *Aúyeas*, *Aéyelas*, *Augeas*, *Augeias*). The son of Helios, Eleios, or Poseidon, and Hyrmina or Iphiboë. He was King of Elis and renowned for his wealth in oxen, of which he fed 3000 head in his stables. The cleansing of these stables, from the accumulations of years, in a single day, was one of the labors imposed on Hercules by Eurystheus. The hero bargained with Augeas for a tenth of the oxen as his reward, and then turned the rivers Alpheus and Peneus through the mass of ordure, thus accomplishing his promise. When Augeas refused to pay the stipulated wages, a war ensued and Augeas was slain by Hercules. The fable of the Augean stables serves as an allusion to political corruption. See HERCULES.

AUGEREAU, ðzh'rò', **PIERRE FRANÇOIS CHARLES, DUKE OF CASTIGLIONE** (1757-1816). A marshal and peer of France. He was born at Paris, of humble parentage, and after serving some time in the French carabineers, he entered the Neapolitan service, in which he remained until 1787, when he settled in Naples as a fencing master. With other French residents he was banished from that city in 1792 and immediately volunteered in the French Revolutionary army. In less than three years he was made general of a brigade. In Bonaparte's Italian campaign of 1796 he greatly distinguished himself in the field and in council. He took an active part in the battles of Millesimo, Ceva, Lodi, Castiglione (from which he received his title), Roveredo, and Bassano. In 1797 he was appointed to the command of the Army of the Rhine; but within a few months the Council of Five Hundred, not liking the spirit he displayed there, made him commander of the Tenth Division, at Perpignan. This post he resigned in 1799, when he was elected to the Council of Five Hundred. In 1800 he received the command of the army in Holland and was active in several engagements. In 1804 he was made a marshal. He fought at Wetzlar, Jena, Eylau, in Italy (1809), in Spain (1810), and at Leipzig (1813). During the campaign of 1814 he disappointed the expectations of Napoleon, who had placed great trust in him. Mistrusted by the restored Bourbons, he lived in retirement on his estate till his death in 1816. His character was far from admirable; he was rough, cruel, and selfish; he plundered shamelessly and bought plunder at reduced rates from his men. But he was a brilliant leader and a fearless soldier in the field.

AU'GERSHELL. The general English name of gastropod mollusks of the family Terebridae, suggested by their elongated, sharply pointed spiral form, and solid substance (see Plate of ABALONE, ETC.). They appear by their dentition to be related to the cones and pleurotomes, but otherwise are very distinct, having a very small

body and short siphon, proportionately, with the foot short and rounded in front and elongated behind, tipped with a small operculum. They are carnivorous, and the eyes in many species are almost invisible and in all are borne upon minute stalks. More than 200 species are known, most of which are inhabitants of the tropical seas and of the South Pacific. The shells are slender, acuminate, sometimes several inches in length, and often very solid, with flat whorls ornamented with spiral sculpturing, and usually variegated with red, brown, and orange spots and stripes. They occur all the way from the shore to rather deep water, creeping on the bottom in search of prey. The history of the family goes back to the Miocene period.

AUGER. See BORING MACHINERY.

AU'GERWORM'. The larva of the British goat moth (q.v.).

AUGIER, ð'zhya', **EMILE** (1820-89). Probably the greatest French dramatist of the nineteenth century. When comedy was in danger of being stifled between the vaudeville of Scribe and the sensational drama of the Romanticists, he, with the younger Dumas, raised it to a more vigorous, realistic life, and a truer contemporary morality than it had known since Molière. Augier was born at Valence, Sept. 17, 1820, and at first practiced law; but he inherited from his grandfather, Pigault-Lebrun, a prolific though mediocre novelist, a bent for literature, and wrote, while still in a notary's study, *Charles VII à Naples*, which was a failure. *La ciguë*, acted in 1844, showed promise and was approved by Ponsard. It achieved success and decided the dramatist's career. It was a Greek play, graceful, witty, and like *Le joueur de flûte*, written also at this time, though not acted until 1850, it pleads, in easy verse, the cause of the courtesan redeemed by love, which his later prose dramas eloquently condemn. *L'aventurière* (1848) presents the same theme in a French setting and was rewritten to suit his later position in 1860. He was still feeling his way, and is next found collaborating with Alfred de Musset in *L'habit vert* (1849), a trifle, and, like *Le postscriptum* (1869), a failure. Then, with *Gabrielle* (1849), begins Augier's second manner. In this "domestic drama" he becomes the champion of average, conventional ethics, allaying the calculations of interest to the language of sentiment, as the Romanticists had never done. From this position *Diane* (1852) shows a momentary recoil, *Philiberte* (1853) a slight advance, and *La pierre de touche* (1853) a decided progress, thanks, perhaps, to the collaboration of Sandeau, who also furnished the plot for *Le gendre de M. Poirier* (1885), Augier's first great drama, thought by many the greatest since Beaumarchais's *Mariage de Figaro*. It is a model comedy of manners, its comic force resting wholly on the interplay of characters, every one of whom is drawn to and from the life, without idealism and yet with no touch of bitterness, such as is felt in Augier's *Ceinture dorée* (1855), a satire of conventional marriage and the stock exchange, foreshadowing his great series of social satires that begins with *Les effrontés* (1861).

Progress toward sterner ethics may be noted in *Le mariage d'Olympe* (1857), which earned Augier his election to the Academy. *La jeunesse* (1858) is insignificant, but *Les lionnes pauvres* (1858) contains, in the cold, cowardly, and perverse Séraphine, Augier's greatest female charac-

ter, and verges on tragedy in the dread of destiny that it rouses at the close. *Un beau mariage* (1859) completes the cycle of "domestic dramas," and *Les effrontés* (1861) turns to the corrupting of society through the struggle for unearned wealth. Here Vernouillet is the typical speculator, and Giboyer the typical venal wit, who, in *Le fils de Giboyer* (1862), becomes a hardly disguised portrait of the clerical journalist, Louis Veuillot (q.v.). In no drama of Augier's is the interest more unflagging, the irony more caustic, and the dialogue more sparkling, than in this triangular struggle between a decaying aristocracy, a vain plutocracy, and the unscrupulous exploiters of both. The dramas that follow hardly reach this height. *Maitre Guérin* (1864) is a fine study of the tricky country lawyer; *Paul Forestier* (1868) is insignificant; *La contagion* (1866) and *Lions et renards* (1869) elaborate the theme of *Les effrontés*, and show in Estrigaud a type of the Parisian *blagueur*. After the Franco-German War Augier wrote the patriotic but prosaic *Jean de Thommeray* (1873), *Madame Caverlet* (1876), dealing with divorce, and *Les Fourchambault* (1878), which pushes the illegitimate son to the front and marks by its melodramatic sentiment the beginnings of a reaction from literary naturalism. Augier's style is vigorous, often daring, in its use of new words and even of slang. His moral earnestness makes him at times harsh; but he looked at the world with the honest sympathy of an upright and sincere student of nature. He died at Croissy, Oct. 25, 1889. Consult: Parigot, *Emile Augier* (Paris, 1890); Lacour, *Trois théâtres* (Paris, 1880); Matthews, *French Dramatists* (New York, 1881); Doumic, *Portraits d'écrivains* (Paris, 1894); Gaillard, *Emile Augier et la comédie sociale* (Paris, 1910), and Wells in his *Modern French Literature* (Boston, 1899).

AUGITE, n'gt. See PYROXENE.

AUGMENTATION, IN HERALDRY. See HERALDRY.

AUGMENTATION. In music, the repetition of a theme in such a manner that each note is increased to double its original value. Augmentation occurs most frequently in the fugue, but also has its value in the free style of writing. For augmentation of intervals, see INTERVAL.

AUGSBURG, ouzg'bŭrk (Lat. *Augustus*, the Roman Emperor who built it + Ger. *Burg*, fort, stronghold; anc. *Augusta Vindelicorum*, Augusta of the Vindelici). Capital of the Bavarian government district of Suabia and Neuburg, situated in lat. 48° 21' N., long. 10° 54' E., 39 miles west-northwest of Munich by rail (Map: Germany, D 4). It is situated about 1600 feet above sea level on a point of land formed by the junction of the Wertach and Lech rivers, and has a mean annual temperature of about 45° F. It consists of the inner town and six suburbs, and in spite of the fact that its ancient fortifications have been removed, and their place taken by broad avenues and squares, the town still presents a distinctly medieval appearance, the Jacober Strasse, a continuation of the Barfüssergasse, being rich in buildings of the sixteenth and seventeenth centuries. The main thoroughfare is the handsome Maximilianstrasse, lined with numerous interesting buildings. Several of the churches are fine Gothic structures, notably the cathedral, begun in 995 as a Romanesque basilica, but altered in the fourteenth century to the Gothic style, with fine bronze

doors, old stained-glass windows, and several altarpieces by Holbein the Elder. Among the others may be mentioned the church of St. Anna, dating from the fourteenth century, with several valuable altarpieces; and the beautiful memorial chapel of the Fugger family; the two churches (Roman Catholic and Protestant) of St. Ulrich, the former being particularly rich in ornamental metal work; and the church of the Holy Cross, dating from the twelfth century. The most notable of the secular buildings is the handsome Renaissance Rathaus, built in 1615-20, by Elias Holl, and containing the famous so-called Golden Hall, one of the finest in Germany; the former palace of the prince-bishops in which in 1530 the Augsburg Confession was presented to the Emperor; and the Fugger House, with rich frescoes, illustrating the history of the town. There is a royal picture gallery, containing a number of paintings belonging to the old German school as well as several specimens of early Dutch masters. There are also a number of learned societies, a city library with 200,000 volumes, and a collection of archives containing many valuable documents relating to the early history of Germany. The town is celebrated for its numerous beautiful fountains. It contains a fine theatre, opened in 1877, and publishes six daily newspapers. Charitable and benevolent institutions are numerous, and some of them were founded in the beginning of the thirteenth century. Augsburg increased considerably in industrial importance during the nineteenth century. It contains large cotton and woolen mills, and machine shops, and manufactures acetylene gas, paper, chemicals, jewelry, and leather. Pop., 1890, 75,523; 1900, 89,109; 1910, 102,487, mostly Roman Catholic.

Augsburg was founded about 14 B.C. It was laid waste by the Huns in the fifth century, by Charlemagne in the eighth, and by Welf of Bavaria in the eleventh; it rose each time only to greater prosperity. In 1276 it became a free city of the Empire, and reached the summit of its prosperity toward the end of the fourteenth century. About this time (1368) its aristocratic government was set aside for a democratic constitution, which lasted for 170 years, till the aristocracy, favored by Charles V, regained the ascendancy. At the time of the Reformation it was one of the most flourishing cities of Europe, preëminent in commerce, manufactures, and art. By the side of Nuremberg it was an emporium of the trade between northern and southern Europe, and its merchants were princes whose ships were in all seas. (See FUGGER, WELSER.) It was also the centre of German art, as represented by the Holbeins, Burgkmair, Altdorfer, and others. Many diets of the Empire were held in Augsburg, and the leading events of the Reformation are associated with its name. (See AUGSBURG CONFESSION.) The discovery of America, and of the road to India by the Cape, together with its sufferings during the Thirty Years' War, destroyed the town's prosperity. It lost its freedom with the abolition of the German Empire in 1806 and was incorporated with Bavaria. Consult: *Die Chroniken der schwäbischen Städte, Augsburg* (Leipzig, 1865-96); Lewis, "The Roman Antiquities of Augsburg and Ratisbon," in vol. xlviii, *Archæological Journal* (London, 1891); Werner, *Geschichte der Stadt Augsburg* (Augsburg, 1900).

AUGSBURG CONFESSION. The chief credal statement of faith in the Lutheran church.

Its history is the following: With a view to an amicable arrangement of the religious split that had existed in Germany since 1517, Charles V, as protector of the Church, had convoked a diet of the Empire, to meet at Augsburg, on April 8, 1530, and had required from the Protestant States a brief summary of the doctrines in which they differed from the Catholic church. The Elector John, of Saxony, therefore, in March, called on his Wittenberg theologians—Luther, Melancthon, Justus Jonas, and Bugenhagen—to draw up articles of faith. They took as a basis, in so far as pure doctrine was concerned, articles signed at the Colloquy of Marburg (Oct. 1-4, 1529) with the Zwinglians, substituting a strictly Lutheran one on the Lord's Supper, which had been adopted at Schwabach shortly after (October 16). These doctrinal articles, supplemented and with a practical part newly added, were laid before the Elector at Torgau (March, 1530). The Diet of Augsburg was opened June 20, 1530; but Melancthon had arrived there on May 2, and on the way had begun the famous Confession. This he finished in Augsburg, using as material the articles mentioned and various other papers, besides frequently consulting with Luther, who stayed at Coburg; since, being under the Imperial ban, he was technically an outlaw, and could not safely attend the Diet. The document was first entitled an *Apolo-gy*, as if Lutheranism was on the defensive. It was also originally intended to be merely the reply of the Elector of Saxony, but it was so shaped as to be acceptable to all the princes and cities that had accepted Lutheranism in their Confession of Faith. It was a work of infinite labor and reflected the highest credit on Melancthon. Luther heartily indorsed it. At last, on Saturday, June 25, 1530, it was formally presented to the Emperor in the private chapel of the Episcopal Palace, where the Diet met. It was in both Latin and German and was read aloud in German. But neither original was ever seen again by the Protestants, and both have probably perished.

The Augsburg Confession consists of these parts: I. Preface to the Emperor Charles V. II. Chief Articles of Faith: (1) Of God; (2) Of original sin; (3) Of the Son of God; (4) Of justification; (5) Of the ministry of the Word; (6) Of new obedience; (7-8) Of the Church; (9) Of baptism; (10) Of the Lord's Supper; (11) Of confession; (12) Of repentance; (13) Of the use of sacraments; (14) Of ecclesiastical order; (15) Of ecclesiastical rites; (16) Of civil matters; (17) Of Christ's second coming to judgment; (18) Of free-will; (19) Of the cause of sin; (20) Of faith and good works; (21) Of the worship of saints. III. Articles in which are recounted the abuses which have been corrected. (22) Of both kinds in the Lord's Supper; (23) Of the marriage of priests; (24) Of the mass; (25) Of confession; (26) Of distinction of meats; (27) Of monastic vows; (28) Ecclesiastical power. The document was signed by the Elector of Saxony, the two Dukes of Lüneburg, the Duke of Saxony, the Margrave of Brandenburg, the Landgrave of Hesse, the Prince of Anhalt, the Senate and Magistracy of Nuremberg, and the Senate of Reutlingen.

Melancthon, not looking upon the Confession as binding, began shortly after to make some alterations in its expressions; at last, in 1540, he published a Latin edition (*Confessio Variata*), in which there were important changes

and additions. This was especially the case with the article on the Lord's Supper, in which, with a view to conciliation, he endeavored to unite the views of the Lutherans and Calvinists. This gave rise subsequently to much controversy. Orthodox Lutheranism repudiated the alterations of Melancthon and long continued to subject his memory to great abuse; though it is clear that Melancthon and his adherents contemplated no substantial departure in doctrine from the original Confession. Consult Jacobs, *The Book of Concord* (Philadelphia, 1882) for the Augsburg Confession, its documents, and full discussion: Schaff, *Creds. of Christendom*, text in vol. iii, history in vol. i (New York, 1884). The text is also published in pamphlet form by the General Synod of the Lutheran Church in the United States (Philadelphia).

AUGSBURG INTERIM. See INTERIM.

AUGUR. See AUGURIES.

AUGUR, CHRISTOPHER C. (1821-98). An American soldier. He graduated at West Point in 1843, served as aid-de-camp to Generals Hopping and Caleb Cushing during the Mexican War, and took an active part in the campaign against the Oregon Indians in 1856. He was appointed brigadier-general of volunteers in 1861, was severely wounded at Cedar Mountain (Aug. 9, 1862), was promoted major-general in the same month, and subsequently commanded the departments of Washington (1863-66), of the Platte (1867-71), of Texas (1871-75), and of the Gulf (1875-78). In 1886 he retired from the military service. Consult E. P. Augur, *The Augur Family* (Middletown, Conn., 1904).

AUGUR, HEZEKIAH (1791-1858). One of the pioneers of American sculpture. He was born in New Haven, Conn., the son of a carpenter, in whose workshop he developed his remarkable talent for wood carving. At his father's wish he became successively a cobbler, grocer's clerk, and a merchant, until the bankruptcy of his firm. He then kept a fruit stand, all the time executing wood carvings for his own pleasure. Finally, several inventions, including a machine for making worsted lace, another for carving piano legs (by a process still in use), and the well-known bracket saw, relieved him from financial stress and enabled him to devote the rest of his life to his beloved art. On the advice of Professor Morse, president of the National Academy of Design, he took up sculpturing in marble. His marble bust of Chief Justice Ellsworth is in the United States Supreme Court, Washington, and his principal production, the so-called group, really two statues, of "Jephtha and his Daughter" is in the Trumbull Gallery, Yale University. With all their defects, due to lack of technical training, these statues show remarkable ability and cause deep regret that the sculptor had not been born at a time and under circumstances more propitious to the arts. Consult E. P. Augur, *The Augur Family* (Middletown, Conn., 1904).

AUGURIES and **AUSPICES** (cf. Lat. *augur*, *augurum*, *auspex*, *auspicium*). These terms are familiar to every reader of Roman history, and are, besides, so frequently employed in English in a secondary and metaphorical sense, that a vague notion of their original meaning is caught up even by those who know nothing of classical antiquities. As, however, the entire religious and political life of the early Romans was deeply penetrated by the influence of their sacred superstitions, and as among these augur-

ies and auspices held a prominent place, a clear conception of what they were is a matter of considerable moment.

Like most primitive nations, the Romans believed that every unusual occurrence had a supernatural significance, and contained, hidden in it, the will of Heaven regarding men. To reveal or interpret this hidden will, as relating to some definite matter, was the privilege of the *augur*, whose name is probably contracted from *avi-gcr* (cf. *avis*, 'a bird'), though the meaning of the second element is not clear. The *augur* was also called, in early times, *auspex*, 'observer of birds' (cf. *ams*, and *specio*, 'look at'), but this name fell into disuse. The *augur* must be distinguished from the *pontifex*, who directed the religious ritual; also from the *haruspex*, and other prophets, who predicted future events. It was the duty of the *augur* to determine whether the gods were propitious to a course of action already determined or in progress. Private *augurs* seem to have existed in the early days; but we are best informed about the public *augurs*—interpreters of Jupiter Optimus Maximus, as Cicero calls them. The origin of the *collegium augurum*, or 'college of *augurs*,' is lost in the myths of early Rome; but it is known that, by the Ogulnian law of 300 B.C., five of the nine public *augurs* must be plebeians, and it seems probable that the original number was three, representing the three early tribes. For more than 200 years the number continued the same, till Sulla, in 81 B.C., increased it to 15. Until 103 B.C. the vacancies seem to have been filled by the college itself; but at that date a more complicated process was introduced, whereby the candidates were nominated by the college, and elected at an assembly of 17 tribes chosen by lot from the 35. Under the Empire this election was transferred to the Senate, but in general vacancies seem to have been filled by the mere recommendation of the Emperor. The last-known *augur*, L. Ragonius Vetusus, is mentioned in an inscription of 390 A.D. The rank of the *augurs* was high, and the position was sought by the leading men of the state. It was held for life, and was not inconsistent with the holding of other religious and civil offices. The *augurs* were one of the four great priestly colleges ranking after the *pontifices*, but before the *decemviri* and *flamines*. They had special seats at the games and a regular income from public lands. Their insignia were the *lituus*, a staff free from knots and with curved head, and the *trabea*, a form of the toga with crimson border and crimson stripes. The *augurs* solemnly inaugurated the new *augurs* and the *flamines*, and possibly other officials, inquired about "the safety of the Roman people" at certain definite times, and consulted the gods regarding the harvest. In historic times their most important function was taking the *auspices* in connection with almost any action of the state. This rapidly became a mere religious fiction, to be used to promote or prevent action, according to the wishes of the ruling powers.

Auguries might be of two kinds: (1) "sought" (*impetrativa*), where the observer asked the gods for the sign desired; (2) *oblative*, where they were unexpected. The modes of divination employed by the *augurs*, aside from the examination of the entrails of the sacrificial victims, which was done commonly by the *haruspices*, were five in number: (1) *augurium ex caelo*; (2) *ex avibus*; (3) *ex tripudiis*; (4) *ex quadrupedi-*

bus, and (5) *ex diris*. The first, relating to the interpretation of the celestial phenomena, such as thunder and lightning, falling stars, etc., was held to be of supreme significance, especially in state matters. Thus lightning seen from the left was favorable. The second related to the interpretation of the noise and the flight of birds. It was not every bird, however, that could be a sure messenger of the gods. Generally speaking, those "consulted," as it was called, were the eagle, vulture, crow, raven, owl, and hen. The first two belonged to the class of *alites* (cf. *ala*, 'a wing'), or birds whose flight revealed the will of the gods; the last four to the class of *oscines* (cf. *cano*, 'to sing'); the first element is akin to *omen*, 'a sign'), whose voice revealed the divine will. These two modes of *augury* were the oldest and most important, though the latter passed almost out of use in historic times. The appeal to the birds was the one most frequently made by ordinary persons. Of the other three, the *auguries ex tripudis* were taken from the feeding of the sacred chickens. Grain was thrown before the sacred chickens, kept in a cage; if the birds ate readily, without allowing any grains to fall from their mouths, the omen was favorable. The *auguries ex quadrupedibus* were derived from four-footed animals within the limits of a "temple" marked for the purpose (see below); the *auguries ex diris* (a vague kind of *augury*), from any accidents or occurrences during the taking of the omens. These were usually unfavorable and required the abandonment of the undertaking. Such *dira*, e.g., the stumbling of a general's horse, might also occur outside of the "temple," and must be obeyed. They fell within the class of *auspicia oblative*. Their interpretation was the task, usually, of the *pontifices* rather than of the *augurs*.

The ground on which the *augur* stood was solemnly set apart for the purpose, and was called a *templum*, a 'temple.' Between midnight and dawn, usually, the *augur* took a wand, and marked out the heavens into four regions—*front*, *rear*, *right*, *left*. According as the signs appeared in one or the other of these divisions were the *auspices* favorable or unfavorable. Signs in the east were, to the Romans as to the Greeks, favorable. The Roman *augur*, facing *south*, found signs on his *left* favorable: hence the Latin word *sinister*, 'left,' properly means 'favorable.' The Greek *augur*, on the other hand, facing *north*, found signs on his *right* favorable. The Roman poets frequently adopt the Greek point of view (along with the Roman), and so use *dexter*, 'right,' 'on the right,' in the sense of 'favorable,' and give to *sinister* the meaning of 'unfavorable,' an interesting perversion of meaning which has persisted in its English derivative 'sinister.' How vast the political influence and authority of the *augurs* must have been is seen from the fact that almost nothing of any consequence could take place without their sanction and approval. The election of every important ruler, consul, dictator, or praetor, every civic officer, every religious functionary, was invalid if the *auspices* were unfavorable. No general could lawfully engage in battle unless the *auspices* were first taken, while the *Comitia* of the Centuries could be dispersed at a moment's notice by any member of the *augural* college on the ground of an unfavorable omen.

We have employed the two terms, "*auguries*" and "*auspices*," as synonymous. But a slight difference is perceptible between them; not the

augurs only, but the chief magistrates of Rome, held the "auspices," while the "auguries" were exclusively in the possession of the former; but the mode of divination and the end to be obtained by it seem to have been the same in both cases, though in the field the method *ex tripudiis* was most common, because of its simplicity.

The right of taking the auspices in war was confined to the commander-in-chief, and any victory gained by a legate was said to be won under the auspices of his superior, and the latter alone was entitled to a triumph. Hence has originated the very common phrase in our language, "under the auspices" of some one, which usually denotes nothing more than that the person alluded to merely lends the influence of his name. Consult: Bouché-Leclercq, *Histoire de la divination dans l'antiquité* (Paris, 1881-82); Wissowa, "Augures" and "Auspicium," in Pauly-Wissowa, *Realencyklopädie der klassischen Alterthumswissenschaft* (Stuttgart, 1896).

AUGUST. See MONTH.

AUGUST, ou'gust, EMIL LEOPOLD (1772-1822). Duke of Saxe-Gotha and Altenburg. He succeeded his father, Ernst II, in 1804. He was a great patron of science and art, and founded the famous Chinese Cabinet in the Museum of Gotha. He wrote a series of songs and idylls entitled *Kyllenikon, oder Auch ich war in Arkadien* (1805).

AUGUST, FRIEDRICH WILHELM HEINRICH, Prince of Prussia (1779-1843). A general of infantry and inspector-general and chief of cavalry. He was born at Friedrichsfelde and was a nephew of Frederick the Great. He rendered conspicuous services during the Napoleonic War, but was captured at Prenzlau and sent to France, where he was detained as a prisoner of war for 13 months. He fought in the battles of Dresden, Kulm, Leipzig, Montmirail, and Paris, and his famous brigade repeatedly decided the victory. As commander of an army corps, he captured most of the important fortresses on the northern frontier of France in 1815. He is said to have been deeply enamored of Mademoiselle Récamier, whom he had met during his captivity in France at the house of Mademoiselle de Staël and whom he would have married but for political and religious reasons.

AUGUSTA. See AGOSTA.

AUGUSTA. A city, and the county-seat of Richmond Co., Ga., on the Savannah River, 221 miles from its mouth, at the head of navigation, altitude from 140 feet above sea level in the main business section to about 450 feet at the highest residential section; lat. 33° 28' N., long. 81° 54' W., by rail 132 miles northeast of Macon, 138 northwest of Charleston, S. C., 83 southwesterly from Columbia, and 17 from Aiken. There is also an electric line to Aiken, which eventually is to be extended to Columbia. Two foot bridges and two railroad bridges span the river, which is about 300 yards wide.

Augusta is the greatest cotton-manufacturing centre in the Southern States, the second largest interior cotton market. It received over 550,000 bales in the season of 1911-12. It has many warehouses, one with a capacity of over 100,000 bales. The Augusta Canal, which furnishes from the river the city's water supply and about 12,000 horse power for manufactures, is 9 miles long, 150 feet wide, and 11 feet deep. The cost of its construction, including its enlargement, was about \$1,500,000. It is under municipal operation, and Augusta is said to be the only city in

the Union where the net income from its public-service properties—water works and power plant—pays the interest charges on its entire debt and the salaries of its officials.

A recently established hydro-electric plant will furnish 30,000 horse power, and the completion of another that is contemplated will add greatly to this. To protect the city from overflows from the river a levee was being built in 1914, upon the construction of which about \$3,000,000 was to be spent. A barge line has been established for the carriage of freight by the river, thus giving an all-water route to and from Eastern markets. This, and nine railroads, give Augusta great commercial advantages.

Besides its numerous and extensive cotton factories, from which it gets its name of "the Lowell of the South," Augusta has sash, door, and blind factories, flour mills, wagon works, iron works, brickyards, lumber plants, etc. The principal structures being erected in 1914 were the Empire Life Insurance building, the Augusta Chronicle building, the new government building, for the post office and United States court. A handsome granite building for the Citizens and Southern Bank was erected in 1913.

Augusta has seven banks—the Georgia Railroad Bank, Citizens and Southern, Planters Loan and Savings, Augusta Savings, National Exchange, Merchants, Union Savings—the total capital, surplus, and undivided profits aggregating about \$4,500,000; total deposits, nearly \$10,000,000. All are members of the Augusta Clearing House Association.

The chief educational institutions are the Medical College, Richmond Academy, Tubman High School (with excellent library), Houghton Institute, Summerville Academy, Sacred Heart College, St. Joseph's and St. Mary's and Sacred Heart academies. Paine College, supported by the M. E. Church, South, is for the training of negro teachers and preachers; Haines Normal and Industrial (or "Lucy Laney") School, and Walker Baptist Institute are negro schools conducted by negro teachers. The public-school system is well supported. There are several commercial schools, two public libraries, a good Y. M. C. A. building; and two daily newspapers—the *Chronicle* (morning), and the *Herald* (evening). The former is the oldest newspaper in the South.

The Medical College, a part of the State University, was incorporated in 1828. The University Hospital, a splendid new edifice, combining two preëxisting institutions in one, and the Wilhenford Hospital for Children, stand on the Medical College grounds (formerly the Orphan Asylum grounds). The Pine Heights Sanatorium (North Augusta) and the Margaret Wright Hospital are excellent private institutions. Among the charitable institutions are the Orphan Asylum, and Widows' Home; and there is an Associated Charities organization.

Richmond Academy is the oldest existing chartered school in Georgia and one of the oldest in the Southern States. Its statutory creation dates from 1783, its organization from 1785.

The Merchants' and Manufacturers' Association and the Georgia-Carolina Fair Association are leading business organizations, the latter holding an annual fair. Among the patriotic and social societies are Colonial Dames, Daughters of the American Revolution, Daughters of the Confederacy, Commercial Club, and Country Club. The golf links of the Country Club are very popular with Augusta's winter visitors.

The city government is composed of a mayor, whose term is three years, and 18 councilmen, three from each ward for a term of three years, one-third being elected each year. The mayor appoints the superintendents of canal and water works, and of streets and drains, the nominations to these positions being subject to confirmation by the town council, whilst other offices are filled by popular election. The police force numbers 91, officers and privates, and there is a finely equipped fire department. Both police and fire departments are governed by a civil-service board. Pop., 1860, 12,493; 1880, 21,891; 1890, 33,300; 1900, 39,441; 1910, 41,040. The city limits have been enlarged since 1910, and the population was estimated at the close of 1913 to be about 50,000.

Augusta was founded in 1735 by Oglethorpe, the founder of the Colony of Georgia, and was named by him for the daughter of George II. It is finely laid out, with broad, beautifully shaded streets, and it is one of the most popular winter resorts in the United States. From its beginning it was a great mart for the white settlers and the Indians of that region, and a meeting place for conferences and negotiations between them. It was an important military post before and during the Revolutionary War, and some of the most stubborn and heroic fighting of that war took place there and in the surrounding regions of Georgia and South Carolina. It was captured twice by the British forces, and recaptured finally in 1781 by the Americans under the command of General Pickens and Lieut.-Col. Henry Lee, father of Robert E. Lee. Fort Cornwallis, where the main British force was posted, stood where now stands St. Paul's Church. Fort Grierson, with a smaller British force, stood at Hawkes' Gully, only half a mile away. Not far from there is "Meadow Garden," the home of George Walton, a signer of the Declaration of Independence. A monument to him and the other Georgia signers stands on Greene Street. There are monuments on the same street to the poets Richard Henry Wilde, Paul Hayne, Sidney Lanier, Father Ryan, and James R. Randall, and one to Col. Samuel Hammond, a Revolutionary soldier. On Broad Street there is an imposing monument to Confederate soldiers, with marble statues of Generals Lee, Jackson, Walker, and Cobb, and crowned with one of a private soldier, heroic size. A bronze statue has been erected in Barrett Plaza to Patrick Walsh, a former mayor and United States Senator. The Southern Confederacy's powder works were located at Augusta, and their tall chimney still stands to mark the site.

For a while during and after the Revolution Augusta was the capital of Georgia, and it was there that the Federal Constitution was ratified by that State in January, 1788.

AUGUSTA. The capital of Maine, and the county-seat of Kennebec County. It is situated mainly on the west bank of the Kennebec River, 45 miles from its mouth and 74 miles by rail southwest of Bangor (Map: Maine, C 3); is on the Maine Central Railroad, and has connection by steamer with Portland (from which it is 62 miles distant), Boston, and other important cities. It has excellent water power—the Kennebec Dam, 17 feet high and nearly 600 feet long. The most extensive products are lumber, cotton goods, pulp, and paper. Augusta is built on ground rising considerably above the river

level, and contains several imposing buildings—the State House, built of granite, and affording a beautiful view from its dome; the City Hall, post office, State Insane Asylum. The city has also a soldier's monument, two hospitals, and two libraries—the Lithgow Library (public), of 8000 volumes, and the State Library, of 60,000 volumes, located in the Capitol. The administration is vested in a mayor and a bicameral council, with the usual subordinate officials. Though trading stations were established here very early, the permanent settlement of the city dates from 1754, when the Plymouth Company built Fort Western. Settlers began to come in 1762, and the place was known as Cushnoc (from the Indian village formerly situated there) until 1771, when it was incorporated as Hallowell. From part of Hallowell a new town was created in 1797, called Harrington at first, and then Augusta. It became the capital of the State in 1831 and was incorporated as a city in 1849. Pop., 1880, 8665; 1890, 10,527; 1900, 11,683; 1910, 13,211. Consult North, *History of Augusta* (Augusta, 1870).

AUGUSTA (Lat. fem. of *Augustus*, majestic, venerable). An honorary name bestowed upon women of the Roman Emperor's household as their greatest possible distinction. Livia was the first to receive it. It was sometimes even given to the Emperor's concubines. See **CONSTANTINE**; **AUGUSTUS**.

AUGUSTA, *Ger. pron.* ou-gus'tä, MARIE LUISE KATHARINA (1811–90). Queen of Prussia and German Empress, the daughter of Charles Frederick, Grand Duke of Saxe-Weimar. She was brought up at the court of her grandfather Charles Augustus, where she was intimately acquainted with Goethe. On June 11, 1829, she married William, Crown Prince of Prussia, afterward the Emperor William I. She was admired for her culture and beloved for her benevolence.

AUGUSTA IULIA GADITANA. See **CADIZ**.

AUGUSTA'LIA. Games in honor of Augustus, held on August 1, September 23 (the birthday of Augustus), and October 3–12.

AUGUSTANA COLLEGE AND THEOLOGICAL SEMINARY. Founded at Chicago, in 1860, by the Augustana Synod of the Evangelical Lutheran Church. It removed to Paxton, Ill., in 1863, and to Rock Island in 1875. The institution is co-educational except in the theological department. The library contains 20,000 volumes. The number of students distributed among the various departments is as follows: Theological, 90; collegiate, 136; academic, 188; business, 157; and music and art, 283. President, Gustav Andreen, Ph.D.

AUGUSTAN AGE. The period of highest literary activity in Rome, under the patronage of Augustus and his adviser Mæcenæas. At that time the Latin language was in its perfection, and men of letters were held in the highest honor. It was the period of Vergil, Horace, and Ovid. The term "Augustan Age" is also extended to apply to other periods of literary brilliancy, as the age of Addison, Swift, and Steele, in England, and Louis XIV's reign in France.

AUGUSTAN BAND, THE. See **AUGUSTUS' BAND**.

AUGUSTAN HISTORY (Lat. *Historia Augusta*). The usual title of a collection of biographies of Roman emperors and usurpers from Hadrian to Numerianus (117–284 A.D.), written by six authors, late in the third or early

in the fourth century. The six *Scriptores Historiæ Augustæ* are Ælius Spartianus, Julius Capitolinus, Ælius Lampridius, Vulcacius Gallicanus, Trebellius Pollio, and Flavius Vopiscus. The memoirs are important for matters of fact, in spite of later interpolations and forged documents, but their literary character is poor. A great deal of curious anecdote and much unauthenticated scandal are collected in these lives. The best edition is by H. Peter (Leipzig, 1884); there is an old translation by Bernard (London, 1740). Consult: H. Peter, *Die Scriptores Historiæ Augustæ* (1892); C. Lécirvain, *Études sur l'histoire Auguste* (1904); E. Kornemann, *Kaiser Hadrian und der letzte grosser Historiker von Rom* (1905); O. Schulz, *Das Kaiserhaus der Antonine und der letzte Historiker Roms* (Leipzig, 1907).

AUGUSTA TAURINORUM. Anciently, the capital of the Ligurian Taurini; the modern Turin.

AUGUSTA TREVIRORUM. The modern Treves (Ger. Trier); in ancient times the capital of the Treviri.

AUGUSTA VINDELICORUM. The name bestowed by Augustus upon the chief seat of the Vindehæi; the modern Augsburg.

AUGUSTE, ou-gus'te, **VICTORIA** (1858—). German Empress and Queen of Prussia. She was born at the castle of Dolzig, the eldest daughter of Frederick, Duke of Schleswig-Holstein-Sonderburg-Augustenburg, and of Princess Adelheid of Hohenlohe-Langenbourg. She was married to Prince William of Prussia—afterward William II of Germany—Feb. 27, 1881. She became known as a patroness of many charitable enterprises and published a book entitled *Erinnerungsblätter an die Palastinafahrt* (1898), which contains a record of her memorable journey through Palestine in company with Emperor William in 1898. Consult E. Evers, *Auguste Viktoria* (3d ed., 1897).

AUGUSTINE—often called **AUSTIN**—**SAINT** (?-604 or 613). First Archbishop of Canterbury. He was originally a monk in the convent of St. Andrew at Rome and became its prior. In 596 he was sent, along with other monks, by Pope Gregory I, to convert the Anglo-Saxons to Christianity and establish the authority of the Roman see in Britain. They got as far as Aix in Provence and there, testified by the reports they heard about the wildness of the Britons, desired to turn back and dispatched Augustine to Rome for permission to do so; but Gregory sent him with a firm but kindly letter to rejoin his company and ordered them to continue on their journey. At the same time he wrote to the Frankish clergy and rulers to share in the enterprise. So, in the spring of 597, Augustine and about 40 companions landed on the Isle of Thanet, in the extreme southeast of England, but at what point is uncertain. The missionaries were kindly received by Ethelbert, King of Kent, whose wife, Bertha, daughter of Charibert, King of Paris, was a Christian, and had Liudhard, Bishop of Sens, in her suite as chaplain. A residence was assigned to them at Canterbury, then called Durovernum, where they devoted themselves to monastic exercises and preaching. The conversion and baptism (Whitsunday, June 2, 597) of the King contributed greatly to the success of their efforts among his subjects.

In 597 he went to Arles, by direction of the Pope, and was there consecrated Archbishop of Canterbury and Metropolitan of England. On

his return he dispatched a presbyter and a monk to Rome to inform the Pope of his success and obtain instruction on certain questions. Gregory's directions with regard to the propagation of the faith are admirable. Thus, instead of destroying the heathen temples, Augustine was recommended to convert them into Christian churches, by washing the walls with holy water, erecting altars, and substituting holy relics and symbols for the images of the heathen gods. Augustine's subsequent efforts to establish his authority over the native British church were not so successful as his missionary labors, owing apparently to his lack of tact. He died in Canterbury, May 26, perhaps 604, though the year is not certain and is sometimes placed as late as 613. His body was removed to the cathedral of Canterbury in 1091. Bede's *Historia Ecclesiastica Genti Anglorum* is the great authority for the life of St. Augustine. Consult all the documents, in Latin and English, in A. J. Mason, *The Mission of St. Augustine to England* (Cambridge, 1897). The celebration of the 1300th anniversary of Augustine's landing brought out in London in 1897 several volumes upon him—e.g., by E. W. Benson, Father Brou, S.J., G. F. Browne, W. E. Collins. Consult also J. A. Cooke, *Early Churches in Great Britain Prior to the Coming of Augustine* (London, 1897); Stanley, *Historical Memorials of Canterbury* (New York, 1892).

The site and remains of St. Augustine's monastery were purchased in 1844 by Mr. Beresford Hope, by whom they were presented to the Archbishop of Canterbury in trust, for the erection of St. Augustine's Missionary College, at Canterbury, in connection with the Church of England. This institution was incorporated by royal charter in 1848.

AUGUSTINE, SAINT (Lat. *Aurelius Augustinus*) (354-430). Bishop of Hippo, in north Africa, the greatest of the Latin Fathers and one of the most eminent doctors of the Western church. He is called Aurelius Augustinus by Orosius and Prosper of Aquitania. From his autobiographical *Confessions*, and from the biography written by his friend Possidius, we gather the most important facts of his life. He was born in Tagaste, a town in Numidia, Nov. 13, 354, and died in Hippo, Aug. 28, 430, during the siege of that town by the Vandals. His father, Patricius, was a pagan (afterward converted), but his mother, Monica, was a devoted Christian, who labored long and earnestly for her son's conversion and who has been canonized by the Church. Augustine was brought up to be a rhetorician and studied at Tagaste, Madaura, and Carthage. From about the age of 16 until shortly before his conversion, he lived in concubinage, which, along with other youthful irregularities, he afterward bitterly lamented (cf. his *Confessions*, bk. iii). One of the greatest obstacles to his conversion was this state of concubinage, against whose bondage he struggled for a long time in vain; he seemed to be sincerely and deeply attached to the object of his passion, to whom he was faithful for many years. By her he had one son, whom he named Adeodatus ('the gift of God').

The perusal of Cicero's *Hortensius* awakened Augustine to a more serious view of life, and he became an earnest seeker after truth, but experimented with several systems before finally entering the Christian church. For nine years he was a follower of Manichæism (q.v.), a Per-

sian dualistic philosophy then widely current in the Western Empire. With its fundamental principle of conflict between two opposing world powers, symbolized by light and darkness, good and evil, Manichæism seemed to Augustine to correspond to the facts of experience and to furnish the most plausible hypothesis upon which to construct a philosophical and ethical system. Moreover, its demands upon novices (*auditores*) were not strict enough to cause great uneasiness of conscience; witness Augustine's petition recorded in his *Confessions* (viii, 17), "Lord, make me pure and chaste—but not quite yet!" He never advanced to full membership, not becoming one of the *perfecti*. After nine years he abandoned this system, failing after diligent inquiry to find in it the solution of his greatest difficulties. His next stage of development was skepticism.

About this time (383) Augustine left Carthage for Rome. His mother, almost heartbroken at his secret flight, took ship and followed. He did not remain long in the capital, but went on to Milan as a teacher of rhetoric, where he fell under the influence of the Neo-Platonic philosophy, which has so often carried serious thinkers over from doubt to faith, and where he also met the great Bishop Ambrose, who at that time was the most distinguished ecclesiastic in Italy. Augustine presently found himself attracted once more toward Christianity, and asking what answer it had to give to the problems of life. At last, one day, he seemed to hear God saying to him, "Take and read." He turned to the Scriptures and read the words, "Put ye on the Lord Jesus Christ, and make not provision for the flesh, to fulfill the lusts thereof" (Rom. xiii. 14). This decided the question. Augustine resolved to embrace Christianity and to believe as the Church believed. With his natural son he was baptized by Ambrose on Easter Eve, 387. His mother, who had rejoined him in Italy, was rejoiced at this answer to her prayers and hopes. She died soon afterward at Ostia on the return journey to Africa with Augustine.

The remaining 43 years of Augustine's life were devoted to the service of the Church. He returned to Africa, was made presbyter in 391, and Bishop of Hippo in 395, which latter office he held until his death. It was a period of political and theological unrest, for, while the barbarians pressed in upon the Empire, even sacking Rome itself, schism and heresy also threatened the Church. Augustine threw himself into the theological conflict, not from inclination, but from a sense of duty. With voice and pen he waged war, and usually he conquered. The whole of Western Christendom has entered into the fruits of his victories. Besides the Manichaean controversy, Augustine was engaged in two great theological conflicts. One was with the Donatists (q.v.), who held that the purity of the Church forbade receiving back any who had denied Christ under persecution. This Puritan theory Augustine did not share. In the course of this discussion he developed his ecclesiastical and sacramental theories. The other was with the Pelagians, followers of a British monk who disliked the idea of absolute predestination, and related to such doctrinal questions as man's primitive state, the fall, freedom of will, and depravity. In the course of this conflict, which was long and bitter, Augustine developed his theories of sin and grace, of divine sovereignty and predestination. Augustine's doctrine can be

treated from two sides, the ecclesiastical and the theological. The Roman Catholic church has found special satisfaction in the former; Catholic and Protestant theology alike are based on the latter. Both Calvin and Luther were close students of Augustine.

He taught that the true Church was characterized by four qualities—unity, holiness, catholicity, and apostolicity. Outside this Church there could be no salvation. It alone was the "ark of safety" in which a perishing world must take refuge through submission to its authority. Convinced of the indispensable necessity of church membership, Augustine finally came to believe it right to coerce the intractable; it was the duty of the Christian state to "compel them to come in." The force doctrine, so repellant to our modern ideas and so fraught with evil in the history of religion, may be found clearly stated by Augustine in his Ninety-third Epistle (408), where he cites the Parable of the Wedding Feast in support of his position, and also in the proceedings of the Synod of Carthage, held in the year 411, which is commonly said to have ended the Donatist schism. Augustine's doctrine stood between the extremes of Pelagianism and Manichæism. Against Pelagian naturalism he held that death came into the world as the result of sin, and that man is saved by divine grace; against Manichæism he vigorously defended free will. A misunderstanding of his position on grace and free will often arises from neglecting to consider that he is at the same time an ardent defender of human freedom against Manichaean fatalism, and the champion of divine grace against the theory of complete human independence.

Augustine was an energetic controversialist, as we have seen. He was also a powerful preacher; but his sermons, owing partly to the great difference between their style and method and that to which we are accustomed, and partly to their fanciful interpretation of Scripture, often disappoint the modern reader. The editors have accepted 363 sermons as genuine, among a much larger number which bear his name. In his great apologetic work, the *City of God*, Augustine appeared in the rôle of seer, unfolding the meaning of the past and the secrets of the future with abundant learning and marvelous fertility of imagination. Ten of the 22 books into which this long work is divided are devoted to refuting the pagan notion that the worship of the gods insures prosperity in this life or in the life to come. The remaining 12 trace the origin, progress, and destiny of the two cities—one of God, the other of this world—with the final triumph of the former, which is the Christian church. Thirteen years of Augustine's busy life (413–426) were occupied with this sublime attempt to construct a Christian philosophy of history. In 428, shortly before his death, Augustine wrote the *Retractions*, in which he registers his final verdict upon the books he had previously written, correcting whatever his maturer judgment held to be misleading or wrong.

The *Confessions* were written in 397; the *Epistles*, of which there are 270 in the Benedictine edition, are variously dated between 386 and 429. Among other important works may be noted his treatise *On Free-Will* (388–395); *On Christian Doctrine* (397); *On Baptism: Against the Donatists* (400); *On the Trinity* (400–416); *On Nature and Grace* (415); and *Homilies* upon several books of the Bible. The Benedictine edi-

tion of Augustine's works is still authoritative (11 vols., Paris, 1679-1700, reprinted in Migne's *Patrologia Latina* and elsewhere); but it is safe to predict that the standard edition will be that now in process of publication under the auspices of the Vienna Academy (in the *Corpus Scriptorum Ecclesiasticorum Latinorum*). The most important of Augustine's works may be read in English in the *Nicene and Post-Nicene Fathers*, first series, edited by Philip Schaff (8 vols., New York, 1886-88). The *Soliloquies* are translated by Cleveland (Boston, 1910). Separate translations of the *Confessions* are numerous, e.g., by W. G. T. Shedd (Andover, 1860) and Charles Bigg (London, 1900). F. R. M. Hitchcock, *St. Augustine's Treatise on the City of God* (London, 1900), is a convenient abstract of the complete work. Consult: "Augustine," in Smith and Wace, *Dictionary of Christian Biography* (London, 1887); Farrar, *Lives of the Fathers*, vol. ii (Edinburgh, 1889); Harnack, *History of Dogma*, Eng. trans. by Neil Buchanan, vol. v (Boston, 1898); Cunningham, *St. Austin and his Place in the History of Christian Thought* (London, 1885); and Harnack, *Augustine's Confessions*, Eng. trans. (London, 1901). For an unfavorable view of Augustine, see A. V. G. Allen, *Continuity of Christian Thought* (Boston, 1894).

AUGUSTINIANS, or AUGUSTINES.

The name given to several religious bodies in the Roman Catholic church. Although St. Augustine never framed any formal rule of monastic life, one was deduced from sermons attributed to him, and was adopted by as many as 30 monastic fraternities, of which the chief were the Canons Regular, the Knights Templar (see **TEMPLARS, KNIGHTS**), the Begging Hermits, the Friar Preachers or Dominicans (q.v.), and the Premonstratensians (q.v.). The *Canons Regular of St. Augustine*, or *Austin Canons*, appear to have been founded or remodeled about the middle of the eleventh century. Their discipline was less severe than that of monks, but more rigid than that of the secular or parochial clergy. They differed from the monks in being all clericals. They lived together, having a common refectory. Their habit was a long cassock, with a white rochet over it, all covered by a black cloak or hood, whence they were often called Black Canons. In England, where they were established early in the twelfth century, they had about 170 houses at the time of Henry VIII's dissolution of the monasteries, the earliest, it would seem, being at Nostell, near Pontefract, in Yorkshire. In Scotland they had about 25 houses; the earliest, at Scone, was founded in 1114, and filled by canons from Nostell; the others of most note were at Inchcolm, in the Firth of Forth, St. Andrews, Holyrood, Cambuskenneth, and Inchaffray. In Ireland they had 223 monasteries and 33 nunneries.

The *Begging Hermits*, *Hermits of St. Augustine*, or *Austin Friars*, one of the four great mendicant orders, were a much more austere order, renouncing all property and vowing to live by the voluntary alms of the faithful. They are believed to have sprung from certain societies of recluses who, in the eleventh and twelfth centuries, existed especially in Italy without any regulative constitution. At the instigation, as is alleged, of the rival fraternities of Dominicans and Franciscans, Pope Innocent IV, about the middle of the thirteenth century, imposed on them the rule of St. Augustine, whom they

claimed as their founder. In 1256 Pope Alexander IV placed them under the control of a superior or president, called a "general." In 1287 a code of rules or constitutions was compiled, by which the order long continued to be governed. About 1570 Friar Thomas of Jesus, a Portuguese brother of the order, introduced a more austere rule, the disciples of which were forbidden to wear shoes, whence they were called *discalceati*, or "barefooted friars." At the time of the dissolution of the monasteries of Henry VIII they had 32 houses in England. Omitting the discalced brethren the order has to-day 19 provinces throughout the world, 60 monasteries, 275 foundations, and 2050 members. In the United States there are 200 associates.

The degeneracy of the order in the fourteenth century called into existence new or reformed Augustinian societies, among which was that Saxon one to which Luther belonged. After Luther had abandoned the order, and entered upon his course of opposition to the Catholic church, he did not spare his denunciations of his former brethren. After the French Revolution the order was wholly suppressed in France, Spain, and Portugal, and partly in Italy and southern Germany. It has diminished even in Austria and Naples, but is still powerful in America.

The name of Augustinians was given also to an order of nuns who claimed descent from a convent founded by St. Augustine at Hippo, of which his sister was the first abbess. They were vowed to the care of the sick and the service of hospitals. For the English Augustinians consult: Clark, *Customs of the Augustinian Canons* (Cambridge, Eng., 1897); *Augustinian Priories of St. Giles and St. Andrew at Barnwell, Cambridgeshire, Observances there* (London, 1897); Allin, *The Augustinian Revolution in Theology*, edited by J. J. Lias (London, 1911).

AUGUS/TODU'NUM. See AUTUN.

AUGUSTOWO, ou'gus-tó'vó, or **AUGUSTOW.** A town of Russian Poland, in the government of Suwalki, capital of a circle of the same name, on the Netta, a feeder of the Bug, 138 miles northeast of Warsaw (Map: Russia, B 4). It was founded by Sigismund Augustus, King of Poland, in 1557. It has fisheries and lumber interests, manufactures cloth, and there is considerable trade in horses and cattle. Pop., 1885, 10,300; 1897, 12,700.

AUGUSTULUS, ROMULUS. The last Emperor of the western portion of the Roman Empire. His name was Augustus, but the diminutive title under which he is universally known was given him by the Romans on account of the essential pettiness of his character. He was the son of Orestes, a Pannonian of birth and wealth, who rose to high rank under the Emperor Julius Nepos, whose favor he repaid by stirring up the barbarian troops in the pay of Rome to mutiny against him. On the flight of the Emperor, Orestes conferred the vacant throne on his son, Augustulus (476 A.D.), retaining all substantial power in his own hands. Orestes, failing to conciliate the barbarians, who had helped him against Nepos, with a grant of the third of the lands of Italy, was besieged in Pavia by a large force under the command of Odoacer, and on the capture of the town was put to death. Augustulus yielded at once. Being of too little consequence to be put to death, he was dismissed to a villa near Naples, with an annual pension of 6000 gold *solidi*. His after fate is unknown.

AUGUSTUS (by birth GAIUS OCTAVIUS; after his adoption by Cæsar, GAIUS IULIUS CÆSAR OCTAVIANUS; by decree of the Senate, in 27 B.C., AUGUSTUS) (63 B.C.—14 A.D.). The first Roman Emperor. He was the son of Octavius and Attia (daughter of Julia, the youngest sister of Julius Cæsar). He was born Sept. 23, 63 B.C. The Octavian family came originally from Velitræ, in the country of the Volsci, and the branch from which Augustus descended was rich and honorable. His father had risen to the rank of senator and prætor, but died in the prime of life, when Augustus was only four years old. Augustus was carefully educated in Rome under the guardianship of his mother and his stepfather, L. Marcus Philippus. At the age of 12 Augustus delivered a funeral oration over his grandmother; at 16 he assumed the *toga virilis*. The talents of the youth recommended him to his grand uncle, Julius Cæsar, who adopted him as his son and heir in 45 B.C. At the time of Cæsar's assassination (March 15, 44), Augustus was a student under the celebrated orator, Apollodorus, at Apollonia, in Illyricum, where, however, he had been sent chiefly with a view to gain practical instruction in military affairs. On learning of Cæsar's murder, he returned to Italy, and at his landing at Brundisium was welcomed by deputies from the veterans there assembled; but, declining their offers, he chose to enter Rome privately. At this time he received a copy of Cæsar's will and learned that he had been named by Cæsar as his heir, and had been adopted by him in his will. The city was at this time divided between the two parties of the Republicans and the friends of Marcus Antonius, who was Consul; but the latter had, by adroit manœuvres, gained the ascendancy and enjoyed almost absolute power. Augustus was at first haughtily treated by the Consul, who refused to surrender the property of Cæsar. After some fighting, known as the Mutinensian War, which ended in the defeat of Antonius by the forces of the Senate, and his flight across the Alps, Augustus, who had made himself a favorite with the people and the army, succeeded in getting the will of Julius Cæsar carried out. He found an able friend and advocate in Cicero, who had at first regarded him with contempt. The great orator, while imagining that he was laboring in behalf of the Republic, was in fact only an instrument for raising Augustus to supreme power. Presently Decimus Brutus, having assumed control in Gallia Cisalpina, ordered Augustus to oppose Antony; when Octavianus refused to do this, the Senate turned against him, and Octavianus, in self-defense, entered into secret negotiations with Antony. Finally, on receipt of an order from the Senate to fight Antony and Lepidus, he refused and, advancing to Rome, demanded and secured for himself the consulship. When Antonius returned from Gaul with Lepidus, Augustus joined them in establishing a triumvirate, Nov. 27, 43 B.C. He obtained Africa, Sardinia, and Sicily; Antonius, Gaul; and Lepidus, Spain. The Eastern provinces were in control of Brutus and Cassius. The power of the triumvirs was soon made absolute by the massacre of those unfriendly to them in Italy, and by their victories at Philippi over the Republican army, commanded by Brutus and Cassius. After the battles of Philippi the triumvirs made a new division of the provinces—Augustus obtaining Italy, Antony, the East, and Lepidus, Africa.

The Perusian War, excited by Fulvia, wife of Antonius, seemed likely to lead to a contest between Augustus and his rival, but was ended by the death of Fulvia, and the subsequent marriage of Antonius and Octavia, sister of Augustus. Shortly afterward, the claims of Sextus Pompeius and Lepidus having been settled by force and fraud, largely through the aid of Agrippa, the Roman world was divided between Augustus and Antonius, and a contest for supremacy began between them. While Antonius was lost in luxurious dissipation at the court of Cleopatra, Augustus was industriously striving to gain the love and confidence of the Roman people and to damage his rival in public estimation. At length war was declared against the Queen of Egypt, and at the naval battle of Actium (q.v.), 31 B.C., Augustus was victorious and became sole ruler of the whole Roman world. Soon afterward Antonius and Cleopatra ended their lives by suicide. The son of Antonius, by Fulvia, and Cæsarion, son of Cæsar and Cleopatra, were put to death; and in 29 B.C., after disposing of several affairs in Egypt (which had now become part of the Roman Empire), Greece, Syria, and Asia Minor, Augustus returned to Rome in triumph, and, closing the temple of Janus, proclaimed universal peace.

His subsequent measures were mild and prudent. To insure popular favor, he abolished the laws of the triumvirate, adorned the city of Rome, and reformed many abuses. At the end of his seventh consulship he proposed to retire from office, in order that the old republican form of government might be reestablished, but he was ultimately induced to retain his power. Hitherto, since Cæsar's death, the Consul had been named Octavianus (Octavian); but now, in January, 27 B.C., the title of *Augustus* (from Latin *augeo*, 'to increase': it means 'exalted,' 'sacred,' or 'consecrated') was conferred on him. In the eleventh consulship of Augustus (23 B.C.), the tribunitian power was conferred on him for life by the Senate. Republican names and forms still remained, but they were mere shadows. Augustus was in all but name absolute monarch. In 12 B.C., after the death of Lepidus, he had the high title of Pontifex Maximus, or high priest, bestowed on him. The nation surrendered to him all the power and honor that it had to give.

After a course of victories in Asia, Spain, Pannonia, Dalmatia, Gaul, etc., Augustus (9 A.D.) suffered the greatest defeat he had sustained in the course of his long rule, in the person of Quintilius Varus, whose army was totally destroyed by the Germans. (See ARMINIUS.) This loss so affected Augustus that for some time he allowed his beard and hair to grow as a sign of deep mourning, and often exclaimed, "O Varus, restore to me my legions!" From this time Augustus confined himself to plans of domestic improvement and reform, and so beautified Rome that it was said, "Augustus found Rome a city of brick, and left it a city of marble." He also founded cities in several parts of the Empire. Altars were raised by the grateful people to commemorate his beneficence; and, by a decree of the Senate, the name Augustus was given to the month Sextilis. Agrippa and Mæcenæ were his friends and counselors.

Though surrounded thus with honor and prosperity, Augustus was not free from domestic trouble. The abandoned conduct of his daughter Julia was the cause of sore vexation to him. He

had no son, and Marcellus, the son of his sister, and Gaius and Lucius, the sons of his daughter, whom he had appointed as his successors and heirs, as well as his favorite stepson Drusus, all died early. Age, domestic sorrows, and failing health warned him to seek rest, and to recruit his strength he undertook a journey to Campania, but his infirmity increased, and he died at Nola (Aug. 19, 14 A.D.), in the seventy-seventh year of his age. According to tradition, shortly before his death, he called for a mirror, arranged his hair neatly, and said to his attendants: "Have I played my part well? If so, applaud me!" Augustus had consummate tact and address as a ruler and politician, and could keep his plans in secrecy while he made use of the passions and talents of others to forward his own designs. The good and great measures which marked his reign were originated mostly by Augustus himself. He encouraged agriculture, patronized the arts and literature, and was himself an author; but only a few fragments of his writings have been preserved. Horace, Vergil, and other celebrated poets and scholars were his friends. His was the Augustan Age of literature. His death threw a shade of sorrow over the whole Roman world; the bereaved people erected temples and altars to his memory, and numbered him among the gods. For ancient accounts of Augustus' life, see the biography by Suetonius, especially as edited by E. S. Schuckburgh (Cambridge, 1896), and the Monumentum Ancyranum. (See ANGORA.) Consult: Gardthausen, *Augustus und seine Zeit* (Leipzig, 1891-1904); Beulé, *Auguste, sa famille et ses amis* (Paris, 1867); and Boissier, *La religion romaine*, vol. i (Paris, 1883); E. S. Schuckburgh, *Augustus* (London, 1903); J. B. Firth, *Augustus Cæsar* (New York, 1903).

AUGUSTUS, APOTHEOSIS OF. A famous cameo in the Cabinet des Medailles et Antiques at Paris. It is cut on a sardonyx, measuring nearly a foot in height, and is the largest cameo known. It contains 26 figures of great Romans, and formerly was thought to represent a triumphal procession of Joseph in Egypt.

AUGUSTUS, ARCH OF. A triumphal arch with three openings, erected in honor of Augustus in the Roman Forum in 20 B.C., in commemoration of the restoration of the eagles and prisoners captured by the Parthians from Crassus in 53 B.C. It was destroyed by workmen about 1540, the foundations alone being discovered in 1888 between the temples of Cæsar and of Castor and Pollux. Consult Hülsen-Carter, *The Roman Forum* (Rome, 1906).

AUGUSTUS, FORUM OF. The second of the imperial fora at Rome, founded by Augustus. It was surrounded by massive walls and colonnades and was adorned with statues of distinguished men of the Republic. In the centre of the forum stood the temple of Mars Ultor, commemorating the battle of Philippi, and the vengeance exacted by Augustus from Cæsar's murderers, and dedicated 2 B.C. An entrance arch and portions of the walls and of the temple still remain. Consult S. B. Platner, *The Topography and Monuments of Ancient Rome* (New York, 1911).

AUGUSTUS, MAUSOLEUM OF. An imposing circular structure of white marble, 280 feet in diameter, erected by Augustus in 28 B.C. in the Campus Martius at Rome. It was surmounted by a cone of earth covered with evergreen trees, and crowned by a colossal bronze statue of

Augustus. On the sides of the entrance, on the south, stood two obelisks, now in the Piazza del' Esquilino and the Piazza del Quirinale. On the outer wall, on each side of the entrance, were copies of decrees in honor of those interred in the mausoleum, and the Res Gestæ of Augustus, of which we have a copy in the Monumentum Ancyranum. (See ANGORA.) The first burial in the vaults was that of the young Marcellus in 28 B.C., the last that of Nerva in 98 A.D. During the Middle Ages the cone of earth was removed and the top transformed into a hanging garden. The structure was later used as a stronghold, a bull ring, and a circus. The brick shell is still visible.

AUGUSTUS, RES GESTÆ (exploits) OF. See ANGORA; AUGUSTUS, MAUSOLEUM OF.

AUGUSTUS (1526-86). Elector of Saxony, the son of Duke Henry the Pious and of Katherine of Mecklenburg. He was born at Freiburg, then the seat of his father's court. While still a youth, he spent some time at Prague, and there formed an intimate friendship with Maximilian, afterward Emperor Maximilian II of Germany. In 1548 he married Anna, daughter of Christian III of Denmark, who was universally popular on account of her devoted adherence to Lutheranism and her fine character. After the death of his brother Maurice, in 1553, Augustus succeeded to the electorate. His rule is chiefly noticeable as bearing upon the history of the newly established Protestant church. In 1555 he was instrumental in bringing about the Peace of Augsburg. Augustus first used his utmost influence in favor of the Calvinistic doctrine; but later he adopted the Lutheran tenets and persecuted the Calvinists. By his skillful internal administration he raised his country far above the level of any other in Germany, introducing valuable reforms both in jurisprudence and finance, and giving a decided impetus to education, agriculture, manufactures, and commerce. He wrote a book on the management of orchards and gardens and commanded that every newly married pair should, within the first year of their marriage, plant two fruit trees. The Dresden Library owes its origin to him, as do also some of its collections. In January, 1586—the Electress having died the year previous—Augustus married a young princess of Anhalt, but died a month after. Consult Falke, *Geschichte des Kurfürsten August von Sachsen* (Leipzig, 1868).

AUGUSTUS I, FREDERICK (1670-1733). Elector of Saxony and King of Poland (as such styled Augustus II), commonly called the Strong. He was the second son of the Elector John George III and of the Danish princess, Anna Sophia, and was born at Dresden. In youth he traveled over a great part of Europe and tasted the pleasures of the different courts. When, in 1694, he succeeded his brother George as Elector, instead of turning his arms against France, according to previous arrangement, he undertook the command of the Austro-Saxon army against the Turks in Hungary. After the battle of Olasch, in 1696, he returned to Vienna and set himself up as a candidate for the throne of Poland, vacated by the death of John Sobieski. Bidding higher than Prince Conti for the crown (10,000,000 Polish florins), and adopting the Catholic faith, he was elected King by the nobles, and was crowned at Cracow, on Sept. 15, 1697, as Augustus II of Poland. On ascending the throne he promised to regain for his new

kingdom the provinces that had been ceded to Sweden. He joined Peter the Great in his war against Charles XII, but his forces were repeatedly overthrown by the Swedes. The crown of Poland was wrested from him, and Stanislas Leszczynski was made King in his place. Augustus was forced to sign the ignominious Peace of Altranstädt in 1706, in which he abandoned his claims to the Polish throne. However, on receiving intelligence of the defeat of Charles XII at Pultowa, in 1709, he declared the Treaty of Altranstädt annulled, marched with a powerful army into Poland, of which he again became master, and renewed the war with Sweden, which continued till the death of Charles XII at Fredrikshald, in 1718, led first to a truce and eventually to a peace with that kingdom. Meanwhile a confederation of Polish nobles had been formed against the Saxons and fought against them with much success, till, in 1716, through the armed intervention of the Czar, a compact was made between the Poles and Augustus by which the Saxon troops left the kingdom. The King now found himself obliged to employ conciliation, and the splendor of his dissolute court soon won the favor of the Polish nobles, who followed his example but too closely. Saxony had bitter cause to regret the union of the crowns. Its resources were shamefully squandered on the adornment of the capital, Dresden, on the King's mistresses, his illegitimate children, and the alchemists who deluded him with hopes of the elixir of life. Augustus supported the fine arts as ministering to luxury, but did little for the cause of science. Despotism in principle, though easy in temper; ambitious as well as luxurious; reckless alike in the pursuit of war and pleasure, death overtook him in the midst of projected festivities. On his way to the Warsaw Diet, gangrene of an old wound set in, and he died Feb. 1, 1733, and was buried at Cracow. By his wife he left an only son, who succeeded him. The most celebrated of his numerous illegitimate offspring was Maurice of Saxony (Marshal Saxe). Consult Desroches de Parthénay, *Histoire de Pologne sous le roi Auguste* (Hague, 1733-34).

AUGUSTUS II, FREDERICK (1696-1763). Elector of Saxony and King of Poland (as such styled Augustus III). He was the son and successor of Augustus the Strong. Though carefully educated by his mother in the Protestant faith, he adopted Catholicism in 1712 while on a journey through Italy. In this step he was probably influenced by his ambition for the crown of Poland. After succeeding his father in the electorate in 1733, he was chosen King of Poland by a part of the nobility. Aided by Russia and Austria, he triumphed over the rival claims of Stanislas Leszczynski, supported by Louis XV, and was unanimously proclaimed three years later as Augustus III. He left all the cares of government to his favorite, Brühl, who ruined Saxony to minister to the pleasures of his King. In 1740 he opposed Maria Teresa in the hope of gaining territory for Poland, but in 1742 he joined Austria against Frederick of Prussia, but their armies were defeated in 1745, and Augustus had to flee from his capital. He made peace with Frederick and recovered Saxony. In the Seven Years' War Augustus, as the ally of Austria, suffered the loss of his army at Pirna (1756); his country was overrun, his state papers fell into Frederick's hands, and he himself had to flee to Poland, where his popularity, never very great, was much diminished by his

recent reverses in Saxony. After the Peace of Hubertsburg (Feb. 10, 1763), Augustus returned to Dresden. He died Oct. 5, 1763. His son, Frederick Christian, succeeded him in the electorate, and Stanislas Poniatowski became King of Poland. Augustus was a spendthrift, like his father, and spent immense fortunes in beautifying his capital, Dresden. Consult Ruthière, *Histoire de l'anarchie de Pologne* (Paris, 1819).

AUGUSTUS' BAND—better termed the **AUGUSTAN BAND** (Gk. *Σπειρα Σεβαστή*, *Speira Sebastē*, Lat. *Cohors Augusta*). One of the cohorts of provincial troops stationed in Syria during the Roman rule. It is questioned whether it was named Sebaste after the honor title of the Emperor or after the geographical title of Samaria, which was at that time called Sebaste and where the cohort may have been recruited. It did not belong to the legionary forces, which formed the heart of the Imperial army, and consisted only of Roman citizens, but to the auxiliaries, which were recruited from the natives of the provinces in which they were stationed, and consisted of those who did not, generally speaking, possess citizen rights. From the reference in Acts xxvii. 1 it was evidently located in Cæsarea, which, after the deposition of Archelaus (5 A.D.), became the residence of the Procurator of Judæa, incorporated at that time into the enlarged province of Syria.

This band differed from the Italian band (Gk. *Σπειρα Ἰταλική*), mentioned, in Acts x. 1, as stationed at the same place, in that the latter was evidently composed of Roman volunteers who had been recruited in Italy.

AUGUST WILHELM, vil'hēlm, Prince of Prussia (1722-58). Founder of the present reigning line of the Hohenzollerns. He was born in Berlin, the second son of King Frederick William I and a brother of Frederick the Great. Although a man of winning personality, he lacked the independence and decision of character of his elder brother. Appointed by Frederick (in 1757) commander of the Army of Kolin, he revealed such a lack of military ability in conducting the retreat from Bohemia that he was deprived of his command, whereupon he retired permanently to his castle at Oranienburg. The accusation brought by him against Frederick in the well-known *Relation über den Feldzug von 1757*, which at first proved so damaging to the reputation of the great commander, was disproved by the publication in 1887 of the *Politische Korrespondenz Friedrichs des Grossen*. As Frederick died without issue, he was succeeded by the son of August Wilhelm, who assumed the title of Frederick William II.

AUK, āk. A name applied collectively to a family of Arctic diving sea birds, Alcids, in the order Alcidiformes, which includes the birds known as guillemots, murre, lomvies, puffins, and auklets. All belong in the north polar regions, taking the place of, and in many ways closely paralleling, the Antarctic penguins. They are particularly numerous upon the Alaskan and Siberian coasts. Some species, however, dwell considerably south of the Arctic Circle, and others formerly did so. Their nearest relatives are the grebes and loons, and by some taxonomists all are included in the single order Pygopodes. They differ from the former by the presence of well-developed tail feathers and lack of lobes upon the toes, and from the loons by the absence of a hind toe. They are thickest, stout birds, only a few living species exceeding a foot

in length; the legs are set so far back that the birds seem to stand on their tails, and are able to move about on land only with difficulty and awkwardly, while the feathers of the wings and tail are so short that flight is feeble and secondary to the use of the wings as paddles for swimming under water, where they progress with remarkable speed and endurance. The sea is their real home, where they obtain their food by diving and pursuing fishes; and their plumage, in adaptation to these conditions, is exceedingly dense and lustrous, and the skins are extensively utilized by the Eskimo in the making of light clothing. The colors are usually black, brown, or dark lead color above, and white beneath, but in the nuptial season bright colors and a variety of ornamental crests, plumes, and appendages to the bill appear temporarily. The bill in the auks (especially the puffins) is exceedingly compressed, and often has a knife-like culmen, and deep, thin under mandible. An interesting feature of this extraordinary kind of beak is that, in the breeding season, among the puffin group of the family, the beak becomes considerably increased in size, and various appendages may be added about its base, varying with the species, while it glows with bright colors; but as the season passes, and the semi-annual molt of feathers begins, these excrescences and the plates about the base scale off, and the gay colors disappear. Consult Stejneger, *Bulletin United States Nat. Museum*, No. 29, illustrated (1885); and *Harriman Alaska Expedition*, vol. ii (New York, 1902).

Auks migrate in autumn from their most northerly haunts and from all frozen coasts to the open spaces of sea, where they spend the winter afloat or on the drifting ice. With the opening of spring they resort in enormous numbers to the coasts of the northern oceans wherever rocky cliffs confront the sea; and they take possession of niches and ledges as breeding places, sometimes in tens of thousands, each affectionate pair preëmpting and defending a little home space. Only a single egg is laid, which is large for the size of the bird, conical in outline, and is constantly watched and warmed by the parents alternately. No nest whatever is made, but the egg is held upon the webbed feet and kept warm between the thighs. (Selous, *Bird Watching*, London, 1901.) These eggs are marbled and blotched with a great variety of colors. Accounts differ as to how the young get down to the water, and it is probable that various methods of carrying are employed, while some seem simply to throw themselves or be tumbled off the ledge into the sea. Foxes and various animals raid these hosts wherever accessible, and the natives of the Arctic regions depend largely upon them for food, securing both birds and eggs in great numbers and preserving them for winter food. Similarly the eggs are considered an important resource of the non-civilized inhabitants of the Aleutian and Kamtchatkan coasts, southern Greenland, and the Hebrides. Three species of the North Atlantic deserve particular mention:

The GREAT AUK, or Garefowl (*Plautus impennis*), which is now extinct, but within historic times was an inhabitant of the North Atlantic coasts as far south as the Hebrides and the Gulf of Newfoundland. It was as large as a goose, and black and white in colors. It is fully described under EXTINCT ANIMALS and GAREFOWL, and is illustrated on the Plate of AUK, ALBA-

TROSS, ETC. Consult Grieve, *The Great Auk* (London, 1885).

The LITTLE AUK (*Alca or Alle alle*) is the smallest of the tribe, not larger than a robin, black above and white beneath, and occurs in vast numbers throughout the Atlantic Arctic region, and southward in winter sometimes as far as New York and the Great Lakes. See DOVEKIE.

The RAZOR-BILLED AUK (*Alca torda*) is 15 to 18 inches in length, black and white (in summer head and neck snuff-brown), has a bill of remarkable height and sharpness, and breeds as far south as the coast of New Brunswick. See RAZOR-BILL; GUILLEMOT; PUFFIN.

AULARD, d'lär' (FRANÇOIS VICTOR) ALPHONSE (1849—). A French historian born at Montbron (Charente). In 1886 he was appointed to the newly established chair of history of the French Revolution at the Sorbonne. He served as president of the *Commission supérieure des Archives*; of the *Société de l'histoire de la Révolution*, and of the *Mission laïque française*. In his earlier years Aulard was professor in numerous lycées and faculties of letters throughout France. He wrote: *Les orateurs de l'Assemblée constituante* (1882); *Les orateurs de la législative et de la convention* (1885); *Le culte de la raison et le culte de l'être suprême, 1793-1794*; *Essai historique* (1892); *Etudes et leçons sur la révolution française* (1893-97); *Paris pendant la réaction thermidorienne et sous le Directoire* (1898-1902); *Paris sous le consulat* (1903-04). He edited *La société des Jacobins* (6 vols., 1889-97) and *Recueil des actes du comité de salut public* (after 1890). Later works and those undated include: *Histoire politique de la révolution française, origines et développement de la démocratie et de la république, 1784-1804* (1901); *La révolution française et les congrégations: exposé historique et documents* (1903); *Taine, historien de la révolution française* (2d ed., 1908); *Napoléon Ier et le monopole universitaire: origines et fonctionnement de l'université impériale* (1911); *Danton* (a monograph in the *Collection Picard*); with L. M. M. A. Debidour, *Notions d'histoire générale et histoire de France depuis l'antiquité jusqu'à nos jours*, and *Polemique et histoire*. In 1913 was published the seventh series of *Etudes et leçons sur la révolution française*.

AULD LANG SYNE, ăld lăng sîn (Scottish, old long since). A Scottish popular song, corresponding to the National Anthem of England or our own "America." Songs bearing this name have been known since the seventeenth century. The newest version, the one most commonly sung nowadays, has but little in common with its numerous earlier prototypes. Musical historians have not yet agreed upon either the authorship of the verse or the composer of the tune. The former is generally attributed to Robert Burns (who, however, credits it to an old minstrel); the latter has very many claimants, among them one George Thomson, who included it in a collection of Scottish airs published in 1799. This was the first time the song was fitted to what are believed to be Burns's words. Consult *Grove's Dictionary of Music and Musicians* (New York, 1910).

AULD REEKIE (Old Smokey). 1. A name given by the Scotch to Edinburgh. 2. A Scottish nickname for the devil.

AULD ROBIN GRAY. A pathetic ballad, published anonymously in 1772, by Lady Anne

AUK, ALBATROSS, ETC.

1. BLACK-HEADED GULL (*Larus ridibundus*).
2. KING PENGUIN (*Aptenodytes longirostris*).
3. WANDERING ALBATROSS (*Diomedea exulans*).

4. CRESTED GREBE (*Colymbus cristatus*).
5. TUFTED PUFFIN (*Lunda cirrhata*).
6. GREAT AUK, OR GAREFOWL (*Plautus impennis*).

Barnard, who had written it two years before, in her twenty-first year, but who did not acknowledge it until two years before her death, in 1825. She afterward wrote a sequel to the ballad, in which "Auld Robin" dies, Jamie returns from the sea, and the two lovers are happily united. The characters in the ballad are said to have been real persons. "Auld Robin" was a Scottish shepherd, and "Jamie" was Sir James Bland Burges, who wished to marry Lady Margaret Lindsay, a sister of Lady Barnard. The author's original purpose in writing the ballad is said to have been to raise money for an old nurse.

AULIC COUNCIL (Lat. *aulicus*, Gk. αὐλικός, *aulikos*, from Gk. αὐλή, *aulē*, hall court). One of the two highest courts of the Holy Roman Empire, coördinate with the Imperial Chamber. Originating during the later Middle Ages as a paid Council of the Emperor, it was organized in its later form by Maximilian I in 1497, as a rival to the Imperial Chamber, which the Diet had forced upon him. It seems to have been at first employed principally in preparing business matters regarding the crownlands and the Empire generally, in order to expedite the decisions of the Imperial Chamber. It soon, however, began to assume or acquire higher functions. Later, the states submitted important grievances to its independent consideration; but it did not receive a fixed constitution before 1559. At the Peace of Westphalia, 1648, its powers were greatly limited, but in 1654 it was formally recognized as the second of the two supreme courts, equal in dignity to the Imperial Chamber, and the highest court of appeals in the Empire. It was composed of a president, a vice-president, a vice-chancellor, and 18 councilors, who were all chosen and paid by the Emperor, with the exception of the vice-chancellor, who was appointed by the Elector of Mainz. Of the 18 councilors, six were Protestants, whose votes, when they were unanimous, were an effective veto, so that a religious parity was to some extent preserved. The councilors were divided into two classes, barons and counts, and jurists. The seat of the Aulic Council was at the Imperial residence, i.e., at Vienna. The Council held aloof from politics, but under its jurisdiction were placed: (1) all matters concerning the reserved rights of the Emperor; (2) all questions of appeal on the part of the states from decisions in favor of the Emperor in minor courts; (3) whatever concerned the Imperial jurisdiction in Italy. On the death of the Emperor the Council was dissolved and had to be reconstructed by his successor. It ceased to exist on the extinction of the Holy Roman Empire in 1806. Consult Herschenbahn, *Geschichte des kaiserlichen Reichshofraths* (Mannheim, 1791-93).

AULICH, ou'lik, LUDWIG (1792-1849). A Hungarian general, born at Pressburg. Upon the outbreak of the Hungarian Revolution of 1848 he served as lieutenant-colonel in an Austrian infantry regiment, which afterward swore allegiance to Hungary. As colonel of the regiment he fought against the Servians at St. Tamás, allied with the Austrian army under Schwarzenberg. As general of the Second Hungarian Army Corps he contributed greatly to the victories achieved over Prince Windischgrätz and was received in Pesth as the hero of the day. Upon the resignation of Görgei he became Minister of War, but was delivered over to Austria

by the Russians upon the conclusion of peace, and was hanged with 12 other generals.

AULIS (Gk. Αὔλις). Anciently, a small port in Boeotia, on the Euripus, famed for its temple of Artemis, but in itself a place of little importance. It was the traditional gathering place of the Greek fleet before the Trojan War and was the scene of the sacrifice of Iphigenia (q.v.).

AULNAY DE CHARNISÉ, ô'ná' de shür'-né'zá'. See CHARNISÉ.

AULNOY, or **AUNOY**, ô'nwá', MARIE CATHERINE, COMTESSE D' (1650-1705). A French author, chiefly remembered for her *Contes des fées*, popular fairy tales (1698), in successful imitation of Perrault. Many of the stories have been translated into English. She wrote also *Mémoires de la cour d'Espagne* (1690), and several novels, of which *Histoire d'Hippolyte*, *Comte de Douglas* (1690), is the best.

AULON. The Greek name for Avlona. See VALONA.

AULOS. A Greek wind instrument similar to the clarinet and oboe (qq.v.).

AULYE-ATA, or **AULIE-ATA**, ou'lyá á'tá. The chief town of a district, and fortress in the territory of Syr-Darya, Russian Turkestan, on the Talas River. The town is picturesquely situated in a hilly region, 5700 feet above the sea, on the way from Tashkent to Verniy. Fruit raising is the chief industry, and there is trade in leather, cattle, and horses. Pop., 12,000, including a considerable number of Russians.

AUMALE, ô'mál' (through *Aubmarle*, *aubemarle*, Eng. *Albemarle*, from ML. *Albamarla*, white marl, clay). A town in France, 37 miles northeast of Rouen (Map: France, N., G 3). Here, in 1592, in a battle between the Spaniards and French, Henry of Navarre was wounded. Pop., in 1911, 2412. Consult Semichon, *Histoire de la ville d'Aumale* (Paris, 1862). The manufacture of glass and steel is the chief occupation of the modern town. Aumale was the name of a county in the early part of the sixteenth century, belonging to Claude of Lorraine, son of René II. Claude was created Duc de Guise and became the head of that famous house.

AUMALE, CHARLES DE LORRAINE, DUC D' (1556-1631). An ardent partisan of the League in the politico-religious wars which devastated France in the latter half of the sixteenth century. After the murder of his uncle, the Duc de Guise at Blois, in 1588, he divided with the Duc de Mayenne the leadership of the League. He was defeated at Senlis by the Duc de Longueville and shared in the disasters of Arques (1589) and Ivry (1590). He held out for the League in Amiens until the populace expelled him; when he suddenly allied himself with the Spaniards, who had invaded Picardy, refused the royal pardon, and delivered over to the enemy several places in his possession. For this he was impeached, condemned, and sentenced to be broken alive on the wheel (1595). His property was confiscated, but he himself escaped. He died in exile at Brussels.

AUMALE, CLAUDE I, DE LORRAINE, DUC D' (d.1550). The son of René II, Duc de Lorraine. For his bravery at the battle of Marignano, in 1515, and his loyalty after the disaster at Pavia, Francis I made him Duc de Guise.

AUMALE, CLAUDE II, DE LORRAINE, DUC D' (1525-73). A son of Claude I. He was a bitter enemy of the Huguenots and of their leader,

Coligny. He acted as Governor of Burgundy, fought at Metz in 1552, was present with Guise at the taking of Calais in 1558, and participated in the battles of Dreux, Saint-Denis, and Montcontour during the Civil War. He was killed at the siege of La Rochelle in 1573.

AUMALE, HENRI EUGÈNE-PHILIPPE, LOUIS D'ORLÉANS, DUC D' (1822-97). The fourth son of Louis Philippe, King of the French. He was born at Paris and was educated at the Collège Henri IV, where he showed a good deal of talent. When 17 years of age he entered the army, soon distinguished himself by his bravery, and passed rapidly through the various grades of rank. In 1843 he commanded a subdivision of the French army in Algeria and performed some brilliant exploits in his campaign against the famous Abd-el-Kader. In 1844 he directed the expedition against Biskra and in 1847 succeeded Marshal Bugeaud as Governor-General of Algeria, in which capacity he received the surrender of Abd-el-Kader. After the Revolution of 1848 he resigned and withdrew to England, where he devoted himself to literature. On the outbreak of the Franco-German War he was refused permission to serve in the French army, but in February, 1871, was chosen a member of the Assembly by the electors of the department of Oise and in December took his seat, the members of his family having been allowed to return to France. In 1873 he was made general of division and presided over the council of war that tried Marshal Bazaine. He subsequently held other military commands, but in 1886, on the passage of the Expulsion Bill, he was debarred from the army and withdrew to England. Not long after this it was learned that he had given the Château de Chantilly, with its magnificent collections, to the Institute of France, of which he had been a member in 1871, the Institute to hold the bequest in trust for the French nation. The decree of banishment was revoked in 1889. He died, May 7, 1897, at Zucco, in Sicily. His wife, Marie Caroline Auguste de Bourbon, daughter of Leopold, Prince of Salerno, whom he married in 1844, died in 1869, and in 1866 and 1872 he lost his two sons. Two volumes of his *Histoire des Princes de Condé* were published in 1869. His pamphlet, *Lettre sur l'histoire de France* (April, 1861), excited a sensation by its attacks upon Napoleon III and Prince Napoleon. Among other publications is his *Les institutions militaires de la France* (1867).

AUNE, ðn. The French cloth measure corresponding to the English *ell*. Both words are derived from the Lat. *ulna*. The English ell = 1½ yards = 45 inches; the French *aune usuelle* (or *nouvelle*) = 1½ meters = 47¼ inches English. The old *aune* was a little shorter.

AUN'GERVILLE, RICHARD. See BURY, RICHARD DE.

AUNOY, COUNTESS D'. See AULNOY.

AUNT PHIL/LIS'S CABIN. A story by Mary H. Eastman (1852), a reply to *Uncle Tom's Cabin*.

AURA (Lat., Gr. *αἶψα*, *aura*, air, breeze). A term anciently used to denote an ethereal vapor emanating from volatile substances; literally, "aura" signifies a vapor or emanation from a body which it surrounds like an atmosphere. Pelox first used the term over 20 centuries ago in connection with epilepsy, because he believed the paroxysm began as a "spirituous vapor in the veins of the extremities and ascended to the head," thus producing unconsciousness. The

spiritualists apply the word to a supposed mysterious light associated with the presence of a spirit form. In electricity "aura" means 'the air current caused by the discharge of an electric spark.' Medically the *aura epileptica* is a curious and often indescribable sensation which at times precedes an epileptic seizure. The most common manifestation is that of an indefinable sensation beginning at the pit of the stomach and rising to the head,—the epigastric aura. Instead of this the aura may take the form of roaring in the ears, flashes of light before the eyes, or a bitter or metallic taste in the mouth. In a few epileptics the aura assumes the character of a brief state of mental exaltation. See EPILEPSY.

AURAM'IN. See COAL-TAR COLORS.

AURANGABAD, ou-rūn'gā-bād' (*Aurungzebe* + Hind., Pers. *abad*, abode, dwelling, town). A city of Hyderabad, India, on the Dudna, an affluent of the Godavari, 234 miles east of Bombay by rail and 67 miles northeast of Ahmednagar (Map: India, C 5). It has a considerable trade in grain, and mills cotton. Its notable monuments comprise the great mosque, the mausoleum of Aurungzebe's wife, and the ruins of the palace or citadel. The five sculptured caves of Ajanta are in the district of Aurangabad. The city was founded in 1620; under Aurungzebe it became the capital of the Deccan and a city of great importance. After the transference of the capital to Hyderabad its importance declined, and its population has decreased from 100,000 to less than 25,000.

AURANGZIB. See AURUNGZEBE.

AURANT'IA, ʒ-rān'shī-ā. See COAL-TAR COLORS.

AURATES. The salts of auric acid (q.v.).

AURELIAN, WALL OF. A massive wall begun by Aurelian in 271 A.D. as a defense against the barbarians, and completed under Probus in 280. It was repaired and strengthened by gate towers built over a century later under Arcadius and Honorius. It was about 54 feet in height and over 12 miles long. The wall was built in great haste and includes the remains of buildings and garden walls, some with statues in their original niches. This method of construction has made possible the recovery of a number of statues and frescoes on the walls of houses filled in instead of being demolished in the hurry of building. Existing structures such as the strong supporting wall built round the Horti Aciliorum on the Pincian Hill, aqueduct arches, and tombs, such as the well-known Pyramid of Cestius, were incorporated in the wall. A covered way near the base of the wall is provided with loopholes toward the outer side and an arcade on the inner side. Towers to the number of 381 were connected with this passage and with the battlements above; the passage ran all around the wall, to facilitate the movement of troops. The course of the wall followed the line of oetroi, or customs barrier. A large part of the wall is still in a more or less perfect state of preservation, but all traces of its course along and beyond the Tiber have disappeared. Much has been learned from a study of the stamped bricks used in the construction of this wall (see *Supplementary Papers of the American School of Classical Studies in Rome*, vol. 1). Consult Lanciani, *Ruins and Excavations of Ancient Rome* (Boston, 1897), and Platner's *Topography and Monuments of Ancient Rome* (Boston, 1911).

AURELIANUS, LUCIUS DOMITIUS (c.212-275 A.D.). One of the most powerful of the later Roman emperors. He was of humble origin. Enlisting early as a common soldier, he rapidly distinguished himself and held the highest military offices under Valerianus and Claudius II. On the death of Claudius (270 A.D.) Aurelianus was elected Emperor by the army. He began his reign by continuing the war with the Goths which Claudius had begun; he drove them across the Danube. This success he followed by vigorous and successful opposition to the barbarian Iuthungi and Allemanni, whom he expelled. Thereafter he commenced the erection of a new line of fortified walls around Rome, which were not completed till the reign of Probus (276). Their ruins still mark the boundaries of Rome in the time of Aurelian. Finding that the province of Dacia (now Transylvania and Wallachia) could not be maintained against the assaults of the Goths, he surrendered it, on certain conditions, and strengthened the frontier of the Roman Empire by making the Danube its boundary. He next turned his attention to the East, where the renowned Queen of Palmyra, Zenobia (q.v.), had extended her sway from Syria to Asia Minor and Egypt. Aurelianus defeated her in two battles and besieged her in Palmyra, from which she attempted to escape when she saw defiance would prove unavailing. She was, however, taken prisoner. Soon afterward the city surrendered and was treated leniently. Shortly after Aurelianus had departed, a new insurrection took place. He returned in 273 and gave the splendid city up to destruction. Aurelianus was again called to the East by a rebellion in Egypt, instigated by Firmus, a merchant of Seleucia, of great influence, whom he speedily overthrew. In 274 Tetricus, who had held imperial power in Gaul since before the death of Gallienus, finding himself unable to wield it, surrendered it to Aurelianus. By restoring good discipline in the army, order in domestic affairs, and political unity to the Roman dominions, Aurelianus merited the title awarded to him by the Senate, "Restorer of the Roman Empire." He fell as the victim of a conspiracy among his officials during his campaign against the Persians (275). His life by Vopiscus forms part of the Augustan history (q.v.). (See **AURELIAN**, WALL OF.) Consult L. Homs, *Le règne de l'empereur Aurélien* (1904), and *The Cambridge Mediæval History*, vol. i (New York, 1911).

AURELIAN WAY. A military road leading from Rome along the coast to Pisa, extended in 109 B.C. to Genoa and under Augustus into Gaul.

AURELIUS, MARCUS, surnamed ANTONINUS (121-180 A.D.). A Roman Emperor. He was born at Rome, April 21, 121, the son of Annius Verus and Domitia Calvilla. His original name was Marcus Annius Verus. On his father's death he was adopted by his grandfather, who spared no pains to render him preëminent in every art and science. His fine qualities early attracted the notice of the Emperor Hadrian, who used to term him not *Verus*, but *Verissimus*, and who conferred high honors on him, even while he was yet a child. When only 17 years of age, he was adopted, with Lucius Ceionius Commodus Verus (commonly known as Lucius Verus), by Antoninus Pius, the successor of Hadrian; and Faustina, the daughter of Antoninus, was selected for his wife. His name

henceforth was Marcus Ælius Aurelius Antoninus (Ælius he derived from Hadrian's family; Aurelius was the original name of Antoninus Pius). In the year 140 he was made consul; and from this period to the death of Antoninus, in 161, he continued to discharge the duties of his various offices with the greatest promptitude and fidelity. The relation which subsisted between him and the Emperor was of the warmest and most familiar kind. On his accession to the throne he strikingly illustrated the magnanimity of his character by voluntarily sharing the government (which Antoninus had left, in his last moments, and the Senate offered, to him alone) with young Lucius Verus, to whom Aurelius gave his daughter Lucilla in marriage. Toward the close of 161 the Parthian War broke out, and Lucius was sent to the frontiers of the Empire to repel the incursions of the barbarians; but, intoxicated with the enervating pleasures of the East, he obstinately refused to go beyond Antioch, and intrusted the command of the army to his lieutenant, Avidius Cassius, who gained several brilliant victories. Lucius returned to Rome in 166 and enjoyed a triumph to which he had no real claim; for all the great achievements of the war were accomplished by his officers, while he was reveling in the most extravagant licentiousness.

In the meantime Marcus Aurelius had distinguished himself by the prudence and energy with which he administered affairs at home. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Chatti (Hessians) were waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself raged a pestilence, believed to have been brought home by the troops of Lucius; frightful inundations and earthquakes had laid large portions of the city in ruins, destroyed the granaries, and thus created almost universal distress, which stimulated to an incalculable degree the terror which the citizens entertained of their savage enemies. To allay the popular perturbation, Marcus resolved to go forth to the war himself. Hecatombs were offered to the offended gods, and the Roman legions set out for the north. Marcus and Lucius were, for the time, completely successful. The pride of the Marcomanni and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube was humbled, and they were compelled to sue for peace in 168; in the following year Lucius died. The contest was renewed in 170 and may be said to have continued with intermissions during the whole life of the Emperor. Although fond of peace, both from natural disposition and philosophic culture, he displayed the sternest rigor in suppressing the revolts of the barbarians; but, in order to accomplish this, he had to enroll among his soldiery vast numbers of gladiators and slaves, for his army had been thinned by the ravages of the plague. His headquarters were Pannonia, out of which he drove the Marcomanni, whom he subsequently all but annihilated as they were crossing the Danube. The same fate befell the lazyges; but the most famous as well as the most extraordinary of all his victories was the miraculous one which he gained over the Quadi (174), and which gave rise to copious discussion among Christian historians and others. Dio Cassius's account is that the Romans were perishing of thirst in the heat of summer, when

suddenly the cloudless sky darkened and abundant showers fell; as the soldiers were taking advantage of the water thus unexpectedly supplied to them, the barbarians attacked them and would have cut them to pieces, had not the barbarians themselves, bewildered by a storm of hail and fire, been vanquished by the Romans. That some extraordinary phenomenon occurred is evident, for there is a letter of Aurelius still extant in which he commemorates the event; and he was a man incapable of uttering a falsehood, not to mention that there was an entire army living to disprove the statement if untrue. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission and obtain clemency; but the practical advantages that might have resulted from this were nullified by a new outbreak in the East. Though suffering from failing health, he was obliged to leave Pannonia. Before long, however, he learned that Avidius Cassius, who had rebelled against him in Asia and had seized the whole of Asia Minor, had perished by assassination. The conduct of Marcus Aurelius on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. Like Cæsar in similar circumstances, but in a more purely humane spirit, he received the head of his murdered adversary with feelings quite opposite to what had been anticipated, rejecting the bloody gift with all the loathing of a benevolent nature and even shrinking from the presence of the murderers. On his arrival in the East he exhibited the same remarkable magnanimity. He burned the papers of Cassius without reading them, so that he might not be at liberty to suspect any as traitors; treated with extreme gentleness the provinces which had rebelled; disarmed the enmity and dispelled the fears of the nobles who had openly favored his insurgent lieutenant. While he was pursuing his work of restoring tranquillity, Faustina died in an obscure village at the foot of Mount Taurus; he paid the most lavish honors to her memory. Dio Cassius and Capitolinus charge her with gross infidelity and various crimes and blame Aurelius for giving no heed to her wrongdoing.

On his way home he visited lower Egypt and Greece, displaying everywhere the noblest solicitude for the welfare of his vast Empire, and drawing forth from his subjects, who were astonished at his goodness, sentiments of the profoundest admiration and regard. At Athens, which this Imperial pagan philosopher must have venerated as a pious Jew did the city of Jerusalem, he showed a catholicity of intellect by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever labored more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Toward the close of the year 176 he reached Italy and celebrated his merciful and bloodless triumph on December 23. In the succeeding autumn he departed for Germany, where fresh disturbances had broken out among the restless and volatile barbarians. He was again successful in several sanguinary engagements; but his originally weak constitution, shattered by perpetual anxiety and fatigue, at length

failed, and he died, either at Vienna or at Sirmium, on March 17, 180, after a reign of 20 years. In his honor his son Commodus erected the Antonine Column (q.v.).

Marcus Aurelius was the flower of the Stoic philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of pagan history can show. Perhaps, as a modern philosophic theologian suggests, it was because Stoicism was the most solid and practical of the philosophic theories, and the one which most earnestly opposed itself to the rapidly increasing licentiousness of the time, that the chaste heart of the youth was drawn toward it. At 12 years of age he avowed himself a follower of Zeno and Epicurus. Stoics were his teachers—Diogenes, Apollonius, and Junius Rusticus; and he himself is to be considered one of the most thoughtful teachers of the school. Oratory he studied under Atticus Herodes and Cornelius Fronto. With Fronto he long corresponded. His love of learning was insatiable. Even after he had attained the highest dignity of the State, he did not disdain to attend the school of Sextus of Chæroneæ. Men of letters were his most intimate friends and received the highest honors, both when alive and dead. His range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. Nor must we forget that these were cultivated not merely in the springtime of his life, when enthusiasm was strong and experience had not saddened his thoughts and when study was his only labor, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an Empire. The man who loved peace with his whole soul died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained, uncorrupted to the end of his life, his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, Roman citizens everywhere, and many others in distant portions of the Empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship and was believed to appear in dreams, like the saints of subsequent Christian ages.

There is one feature in his character, however, which it would be dishonest to pass over—his hostility to Christianity. He was a persecutor of the new religion, and, it is clearly demonstrated, was cognizant, to a certain extent at least, of the atrocities perpetrated upon its followers. Numerous explanations have been offered of his conduct in this matter. The most popular one is that he for once allowed himself to be led away by evil counselors; but a deeper reason is to be found in that very earnestness with which he clung to the old heathen faith of his ancestors. He believed it to be true and to be the parent of those philosophies which had sprung out of the same soil; he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition and a mysterious political conspiracy, was secretly spreading throughout the Empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms. It was, therefore, compara-

MARCUS AURELIUS
FROM THE BUST IN THE BERLIN MUSEUM

tively easy, even for so humane a ruler, to imagine it his duty to extirpate this unnaturally hostile sect. John Stuart Mill finds in this tragic error of the great Emperor a most striking warning against the danger of interfering with the liberty of thought.

In 177 Aurelius published his first edict against the Christians, and the persecution lasted during this and the following year. The aged Polycarp was burned at the stake at Smyrna, and St. Cecilia was martyred at Rome (Sept. 16, 178), while large numbers perished in the furious persecution at Lugdunum (Lyons), in Gaul. Athenagoras of Athens, a Christian philosopher, addressed to the Emperor a defense (*Apologia*) of the Christians, still extant, which did not avail to check the martyrdom.

Aurelius was the author of a beautiful ethical work, known now as the *Meditations*, though Aurelian himself gave it a different name. It is written in Greek, and is the finest product of the Stoic philosophy. The work is not a systematic treatise, but a series of communings, worked out at widely different times, amid public business or when battles were imminent. It has been edited by Stich (Leipzig, 1903); translated by Long (London, 1862, 1900), Rendall (London, 1897), and (in selections) by Smith (London, 1899). Consult: Watson, *M. Aurelius Antoninus* (1884); Farrar, *Seckers after God* (London, 1868); Renan, *Marc-Aurèle* (Paris, 1881; translated, London, 1888); Dill, *Roman Society from Nero to Marcus Aurelius* (London, 1904); E. Vernon Arnold, *Roman Stoicism* (London, 1911). For the correspondence with Fronto, consult Robinson Ellis, *Correspondence of Fronto and Marcus Aurelius* (Oxford, 1904), and M. Dorothy Brock, *Studies in Fronto and his Age* (Cambridge, 1911).

AURELIUS, MARCUS, STATUE OF. A fine bronze equestrian statue in Rome, which, during the Middle Ages, stood near the Lateran, and was removed in 1538 to its present commanding position on the Capitoline Hill. Its preservation is probably due to the fact that it was popularly believed to be the statue of Constantine, the first Christian Emperor. In 1347, when Rienzi was chosen to the tribuneship, wine and water were caused to flow from the nostrils of the horse. The pedestal is the work of Michelangelo, and was cut from a column of the temple of Castor and Pollux.

AURELIUS VICTOR, SEXTUS (fl. 360 A.D.). A Roman historian. He wrote *De Caesaribus*, a collection of brief biographies of the emperors from Augustus to Constantius. According to his own account, contained in that work, he was appointed by Julian Governor of a division of the province of Pannonia, and, by Theodosius, city prefect. He is also generally identified as the Aurelius Victor who was Consul with Valentinian, 373.

AUELLE DE PALADINES, d'rèl' de pà'-lâ-dên, LOUIS JEAN BAPTISTE d' (1804-77). A French general. He entered the army in 1824, served in Algiers in 1841-48, won distinction in the Crimean War, and became a general of division in 1855. He was not in active service at the outbreak of the Franco-German War, but received a command after the battle of Sedan, organized the Army of the Loire, and drove Von der Tann-Rathsamhausen from Orleans, winning the first victory for France. He was repulsed in an attack upon the army of Prince

Frederick Charles, was beaten by the Grand Duke of Mecklenburg at Artenay, and was soon afterward removed from his command, though he subsequently commanded the National Guard in the department of the Seine. He was chosen a member of the National Assembly after the armistice and in 1875 was elected a life Senator. He wrote *Campagne de 1870-71; la première armée de la Loire* (1872).

AU'REOLE (Lat. *aureola*, golden, sc. *corona*, crown). The glory which radiates from the body of a transfigured, divine, or other supernatural being in representations of Christian art. It differs from the nimbus (q.v.), which radiates from the head only, in being an emanation of light from the entire body. It is of various shapes—circular, oval, or egg-shaped, quadri-lobed and lozenge. Sometimes, as in enthroned figures of Christ, there is a double aureole—one around the upper, and the other around the lower part of the body. The aureole is of two kinds; circumscribed or diffused, according as the rays of light, as they flare outward, end in an encircling band or melt into space. These rays are sometimes straight, sometimes flamboyant. The aureole was of later origin than the nimbus; it was not used until after the eighth century and was generally abandoned by Renaissance painters of the fifteenth century. It was used almost exclusively around figures of Christ, the Trinity, and the Virgin Mary.

AUREUS, a'rê-ûs, or DENARIUS AUREUS (Lat. golden, from *aurum*, gold). The oldest standard gold coin of Rome, first coined 207 B.C. Its weight varied from 1-30 to 1-72 of a pound, but its average weight was 121 grains, and its value about \$5.00. Consult G. F. Hill, *A Handbook of Greek and Roman Coins* (London, 1899). See NUMISMATICS, *Roman Coins*.

AU'RIC ACID (Lat. *aurum*, gold). A name formerly given to gold peroxide, a brown-black powder which is obtained by precipitating the auric chloride with alkalis. It combines with basic radicals to form salts, which are called *aurates*, as ammonium aurate, which is the scientific name for fulminating gold.

AU'RICAL'CITE. A carbonate of calcium and copper, occurring in powdery crusts of a light-blue to greenish-blue color, usually on malachite and azurite (q.v.), of which it is an alteration product. It is found at Chessy, France, in the Clifton district of Arizona, and in the province of Sonora, Mexico.

AU'RICLES (Lat. *auricula*, dimin. of *auris*, ear). Two cavities of the heart. See CIRCULATION.

AURIC'ULA (Lat. dim. of *auris*, ear, so named on account of a fancied resemblance of the leaves to the ears of an animal), *Primula auricula*. A plant of the same genus with the primrose, little grown in America, but valued in England for the fragrance and beauty of its flowers. The auricula is a native of the Alps and other mountains of the middle and south of Europe and sub-alpine situations in the same countries. It is found also on the Caucasus and the mountains of Syria. It grows in shady and moist places. In the wild state it has comparatively small flowers, of a simple yellow color, on short stalks, forming an umbel. It has been greatly improved by cultivation. Red, pink, crimson, apple-green, and mulberry are the chief colors which the different varieties exhibit. More than 1200 varieties have been cultivated, and new ones are from time to time raised from

seed. Some of them are entirely of one color, others of two or more; some are delicately shaded, and some variegated. The flowers of desirable varieties are large and almost round, with the white or yellow eye of the centre distinct, and its color does not mix with the ground color. The scape must be tall, and the full umbel of erect flowers rise entirely above the leaves. The green margin adds much to the beauty of many varieties. The auricula blooms in April and May, and often also a second time at the end of autumn. It succeeds best in a rich, light soil. The finer varieties are cultivated in pots. They ought, previous to flowering, to stand in an airy, sunny situation. They are propagated by offsets, generally in the latter part of August. When auricula is to be raised from seed, care ought to be taken to select the finest flowers, which are encouraged to ripen their seeds by exposure to sun and air. They ought to be protected from heavy rains by hand-glasses placed over them. The seed is sown either in autumn or spring, usually in boxes placed under shelter or in a slight hotbed. See PLATE OF GREENHOUSE PLANTS.

AURICULAR CONFESSION. See CONFESSION.

AURIFA'BER (Lat. for family name Goldschmied). German Protestant theologians and reformers.—1. **ANDREAS** (1514-59). A friend of Melancthon; born in Breslau. He received the degree of M.A. at Wittenberg University in 1534. He taught in the philosophical faculty; then was school principal. He took up medicine and was body physician to Duke Albert of Prussia for 10 years. In 1542 he returned as professor of medicine to Wittenberg and after 1545 was ducal body physician at Königsberg and professor in the university, although his instruction was much interrupted by the diplomatic journeys on which he was sent by the Duke. He was an ardent defender of Osiande (q.v.) (1498-1552), whose daughter was his second wife. As an Osianderian he was bitterly attacked by the ultra-conservative Lutherans, whose leader (Flacius) dubbed him "dog-doctor," because he had issued a book upon the treatment of canine diseases. He died at Königsberg, Dec. 12, 1559. His writings were chiefly medical.—2. **JOHANNES** (1517-68). A brother of Andreas, and, like him, a friend of Melancthon; born at Breslau, Jan. 30, 1517. He received the degree of M.A. at Wittenberg University in 1538 and became professor at Rostock in 1550. After a varied and fruitful activity (chief author of the Mecklenburg Church Ordinances, 1551), he became professor of theology at Königsberg in 1554, resigned in 1565, and died at Breslau, Oct. 19, 1568. He also was involved in the Osiander strife which wrought up the theologians of that time.—3. **JOHANNES** (c.1519-75). A zealous friend of Luther; born in the county of Mansfeld, Saxony, and educated at Wittenberg. He became tutor to the young Count Mansfeld and in the war of 1544 was with the army as chaplain. He lived with Luther as his secretary (1545) and was present at Luther's death, Feb. 18, 1546. He was a furious critic of Melancthon. After being for some years court preacher at Weimar, he was compelled to flee to Eisleben (1561), and there began those Lutheran publications which have given him fame. In 1566 he was appointed minister of the Lutheran church at Erfurt, holding the place until his death, Nov. 18, 1575. He

began, in 1540, collecting Lutheran MSS., and by 1553 had 2000 letters of Luther's; the same year he shared in the 12-volume German and Latin edition of Luther which appeared in Jena in 1556. He issued two volumes of Luther's letters (1556-65); also a supplement to the Jena edition and the *Works* in 1564-65 (2 vols.). In 1566 he issued his famous *Tischreden und Colloquia Dr. M. Luthers*.

AURIGA (Lat. *auriga*, charioteer, driver), or **THE WAGONER**. A northern constellation lying immediately to the east of Perseus. Its chief ornament is a Aurigæ or Capella (q.v.), a star of the first magnitude. On Feb. 1, 1892, a remarkable *nova*, or new star, was discovered in the foot of Auriga by Anderson of Edinburgh, although it had been recorded photographically on negatives taken at Harvard on Dec. 10, 1891, but had remained undetected. At its brightest it showed as a star of about the fourth magnitude, and remained visible to the naked eye for about a month, afterward becoming rapidly invisible. The double character of its spectrum during the early stages led to the hypothesis of a grazing collision between two bodies rushing past each other with the enormous relative velocity of 550 miles per second as the cause of the outburst, but the hypothesis was not substantiated, and it appears more likely that the birth of the star was due to some stupendous explosion. After remaining invisible for nearly four months the star mounted again to the tenth magnitude, but its spectrum was found to have undergone a remarkable change, having become assimilated to the nebular type. It has since reverted to its stellar character and is now of the thirteenth magnitude. The three stars, ϵ , ζ , and η Aurigæ, which are situated about 5° southwest of Capella, were known to the ancients as the "Kids." Vergil refers to them as *pluviales Hædi*, and Horace as *insana sidera*, because their heliacal rising in October was supposed to portend stormy weather.

AURIGNA'CIAN. See PALEOLITHIC PERIOD.

AURIGNY, ô'rè'nyé'. See ALDERNEY.

AURILLAC, ô'rè'yák' (probably from Aurelius, the Roman Emperor). A town of France, capital of the department of Cantal (Auvergne), situated in a pleasant valley on the banks of the Jordanne, about 269 miles south of Paris (Map: France, S. G 4). It is said to owe its origin to a Benedictine monastery founded in the ninth century by St. Géraud. The streets are wide but irregular, and are kept clean by streams supplied by a reservoir and by a canal from the Jordanne. Neighboring quarries supply slate. The principal buildings are the churches of Notre Dame and St. Géraud; the castle of St. Etienne, now occupied by a normal school; the theatre; former college buildings which now contain a small museum; and the grain market. There are monuments to the French philanthropist M. de Montyon and General Delzons. Paper, jewelry, copper utensils, umbrellas, leather, and lime are the chief industrial products. The English, in the fourteenth and fifteenth centuries, often besieged the town, and it was taken and pillaged during the religious wars in the sixteenth century. Pope Sylvester II, whose statue is to be seen at Aurillac, was born there, as was the infamous Carrier of the French Revolution. Pop., 1901, 17,459; 1906, 17,772; 1911, 18,036.

AURIN (Lat. *aurum*, gold), $C_{18}H_{14}O_8$. A coloring substance used in the manufacture of

lacquers. It is obtained in the form of beautiful green needles, by the action of sulphuric and oxalic acids on carbolic acid at 130°-150° C. Reducing agents transform it into a colorless substance known as leucarin, $C_{10}H_8O_3$. Owing to the difficulty of fixing it, it is not much used as a dye, though its solution in alkali has a beautiful fuchsine-red color.

AURISPA, ou-ré'spà, GIOVANNI (c.1369-1460). A distinguished Italian humanist of the fifteenth century, born at Noto, in Sicily. In 1418 he went to Constantinople for the purpose of learning Greek; after some years he returned to Italy, bringing with him 238 manuscripts of ancient Greek authors, among them Pindar, Callimachus, Æschylus, Sophocles, Plato, and Procopius. On his return he lived at Venice and later held the chair of Greek literature at Bologna. Through Niccolò de' Niccoli he was called to Florence as teacher of Greek, but cut short his stay and soon removed to Ferrara. In 1438 the Greek Emperor, John Palæologus, called him to assist in the council called by Pope Eugene IV, at Basel; the latter made Aurispa his secretary in 1441, which office he held for six years. He died at Ferrara in 1460. Of his many translations the following only have been published: Hierocles' *Liber in Pythagoræ Aurea Carmina*, *Latinilate Donatus* (Padua, 1474); *Philisci Consolatoria*, etc. (Paris, 1510). Many other translations remain in manuscript in Italian libraries. Consult Voigt, *Die Wiederbelebung des klassischen Alterthums*, vol. i (Berlin, 1893), and Symonds, *Renaissance in Italy*, vol. ii (London, 1877).

AUROCHS, ā'rōks (MHG. *ūrohso*, from *ūr*, AS. *ūr*, Eng. *ou're*, wild ox + *ohso*, ox). The European bison or wisent (*Bos bonasus* or *Bison europæus*). The name "aurochs" is also sometimes applied to the urus, the ancient wild ox of Europe (*Bos primigenius*), the supposed progenitor of our domestic cattle. See BISON and Plate of Bisons.

AURORA. A city in Kane Co., Ill., 39 miles west of Chicago, on the Fox River, and on the Chicago and Northwestern, the Chicago, Aurora, and De Kalb, the Chicago, Milwaukee, and Gary, the Elgin, Joliet, and Eastern, the Aurora, Elgin, and Chicago, and the Chicago, Burlington, and Quincy railroads (Map: Illinois, D 2). It is an important manufacturing place, producing extensively carriages and wagons, silver-plated ware, wheel scrapers, motor cycles, grindstones, sashes and blinds, etc. It has also machine shops, smelting works, stove works, brass foundries, cotton mills, and railway repair shops. The city is the seat of Aurora College, has a Carnegie library, and owns and operates its water works and electric light plant. It was settled in 1834 and incorporated in 1837. Under a charter of 1887 the government is vested in a mayor, elected for two years, and a city council. Other officers also are elected by the people. Pop., 1860, 6011; 1890, 19,688; 1900, 24,147; 1910, 29,807.

AURORA. A city in Dearborn Co., Ind., 29 miles west by south of Cincinnati, Ohio, on the Cleveland, Cincinnati, Chicago, and St. Louis, and the Baltimore and Ohio Southwestern railroads, and on the Ohio River (Map: Indiana, E 3). It has a public library and an attractive park. The leading manufactures include foundry and machine-shop products, tools, furniture, wheels, barrels, buggies, flour, brick, and coffins. There is a considerable trade in

hay, grain, and tobacco. Aurora was settled in 1819 and was chartered as a city in 1848. Pop., 1900, 3645; 1910, 4410.

AURORA. A city in Lawrence Co., Mo., 30 miles southwest of Springfield; on the Frisco Lines and the St. Louis, Iron Mountain, and Southern railroads (Map: Missouri, C 5). The principal industries are fruit growing, and lead and zinc mining. There are also foundries, flour mills, publishing houses, marble works, a canning factory, etc. A considerable water power is obtained from dams in the White River. Pop., 1890, 3482; 1900, 6191; 1910, 4148.

AURORA. A city, and the county-seat of Hamilton Co., Neb., 110 miles (direct) west by south of Omaha; on the Burlington and Missouri River Railroad (Map: Nebraska, G 3). It is in a farming and stock-raising region and has brick works and flouring mills. The water works are owned by the municipality. Pop., 1890, 1862; 1900, 1921; 1910, 2630.

AURORA. A village in Cayuga Co., N. Y., 16 miles by rail southwest of Auburn; on Cayuga Lake, and the Lehigh Valley Railroad (Map: New York, D 5). It is a beautiful residential town, in the centre of a fertile agricultural region, and is the seat of Wells College for Women, founded 1868, Wallcourt, a school for girls, and Somes School for Boys. Town meetings are held every other year to elect officers. About 2 miles north of Aurora is the site of the Jesuit Mission to the Cayuga Indians in 1656. Aurora was settled in 1789, principally by emigrants from Connecticut. Pop., 1905, 623; 1910, 693.

AURORA (Lat. *Aurora*). The Roman goddess of the dawn, or "morning redness," counterpart of the Greek Eos. According to Hesiod, she was the daughter of Hyperion and Thia, sister of Helios and Selene, and wife of the Titan Astræus. Zephyrus, Boreas, Notus, Hesperus, and the other stars were her children. She rises in the east from Oceanus, or, in another story, from the couch of Tithonus, and her rays are the first indication of the coming of Helios (the sun). In legend Aurora appears chiefly as the abductor of beautiful youths, Tithonus, Orion, and Cephalus, the hunter. By Tithonus she became the mother of Memnon, and by Cephalus of Phæton. In the earlier poets Aurora is never more than the early morning, and Euripides first identified her with *Ἥμερα*, *Hēmera* ('the day'). In art she appears as present at the death and burial of Memnon, as carrying away her favorites, and as a goddess of light, either as a winged maiden, or as rising from the sea in a chariot with winged horses, preceding Helios.

AURORA, also called "The Triumph of Apollo," a renowned ceiling painting by Guido Reni in the Casino Rospigliosi at Rome. Aurora precedes the chariot of the sun god, scattering flowers in his path. The fresco is notable for its coloring and is the greatest work of the painter. For illustration, see RENI, GUIDO.

AURORA BOREALIS (Lat. northern dawn or light). A luminous phenomenon seen during the night time in the heavens, most frequently in Europe, to the north of the observer's zenith, but sometimes covering the whole sky. By connecting together the statistics from all possible observers, Fritz was able to show that there is in the Northern Hemisphere a belt of greatest frequency. The centre of this belt passes through the southern part of Hudson's

Bay, a little south of Cape Farewell and Iceland, through North Cape, Norway, over the mouth of the Lena River, over Point Barrow, Alaska, thence to the centre of Hudson's Bay. Observers who are north of this belt see the aurora more frequently to the south than to the north, and also see it less and less frequently the farther north they go; observers who are south of the belt see the aurora to the north of them, but see it less frequently as they are nearer to the equator. A similar rule obtains in the southern hemisphere. There can be no doubt that the aurora is the result of a discharge of electricity through the atmosphere. It has been supposed that since a very thin atmosphere, such as that remaining in a glass jar or receiver of an air pump, converts the short bright electric spark into a lengthened delicate discharge, analogous to the aurora, the existence of the aurora itself necessarily implies a very thin atmosphere, and that therefore its light must emanate from a region 50 or 100 miles above the earth's surface. In order to explain the aurora, Arrhenius has recently advanced a theory based upon the discharge by the sun of electronegative ions. Such ions, caught in the earth's magnetic field, would be carried toward the magnetic poles and nearer to the earth's surface. On arriving at the lower layers of the atmosphere, they would part with their energy, giving rise to a discharge in appearance like that of a vacuum tube. As regards the height of the aurora above the earth's surface, several methods have been devised for calculating it; but it appears certain that the definite features that we see in the aurora light are perspective phenomena, and that the calculation of their height cannot be safely made by the method of simultaneous observations at two stations and measured altitudes and azimuth. In fact, the argument for the existence of the auroral light quite close to the earth's surface is too strong to be ignored. The character of this light is partially determined by means of the spectroscope, which establishes the fact that it comes from luminous particles of vapors or gases. The most prominent line of its spectrum is a yellow line, nearly identical with the yellow line known as the air line of the atmosphere. The special lines of the auroral spectrum apparently belong to the nitrogen.

The aurora present a variety of interesting optical phenomena that may generally be analyzed into component parts; viz., long, slender beams of light, usually yellow, but sometimes green, purple, violet, or rose. These beams are, by observation, ascertained to be approximately parallel to the free magnetic needle; by their association together they appear to form cylindrical bars, waved surfaces, rich drapery, and small clouds of light. Inasmuch as the slender beams are parallel to each other, it can easily happen that an observer may be so located as to see some of them end on; these will be scarcely visible. Other beams near by will appear greatly foreshortened and pointing directly to the vacant centre. Those at a distance will appear less foreshortened, but also pointing toward the centre. There is thus formed a so-called corona, or circle, or rays surrounding the central region. Observation has shown that its position corresponds very closely to that point in the sky toward which the free magnetic needle would point. It is therefore common to say that auroral beams are parallel

to the magnetic needle; and this fact suffices to assure us that the aurora is composed of luminous magnetic matter acted upon by the so-called earth's magnetism, but, more properly, by the magnetic field surrounding the earth, just as is the compass needle.

Bibliography. The literature relative to the aurora borealis is very extensive and widely diffused. Excellent general summaries of our knowledge are: Fritz, *Das Polarlicht* (Leipzig, 1881); Angot, "Aurora Borealis," *International Scientific Series*, vol. 81 (London, 1896); Lemström, *L'aurora boréale* (Paris, 1886). The largest collections of observations arranged in the order of date will be found in the works of: Lovering, *On the Periodicity of the Aurora Borealis* (Boston, 1873); Fritz, *Verzeichniss von Beobachtungen des Polarlichtes* (Vienna, 1873); Rubenson, *Catalogue des aurores boréales observées en Suède* (Stockholm, 1879-82). The reports of the various international expeditions for the observation of meteorology and magnetism in the polar regions during 1881-83 fill about 30 volumes, of which one-fourth treat of the aurora. Information concerning the aurora is also contained in the reports of the polar expeditions of Nansen, Duc d'Abruzzi, Scott, and Drygalski. The pioneer work in this line was that done by the French *Expédition du Nord* (1838-42), whose volumes on auroras were prepared by Bravais and Martius. The question of the altitude of the aurora has been reviewed by C. Abbe in an article under that title published in *Terrestrial Magnetism* (Baltimore, 1900).

AURORA LEIGH, lē. A novel in blank verse, by Elizabeth Barrett Browning, which tells of the childhood of a young girl; the death of her Italian mother, her return to her father's English home; her gradually passing despair in her new surroundings; her love for her cousin, Romney Leigh; her melancholy disillusion, and her final marriage with him. Written during Mrs. Browning's early married life in Florence, it was published in 1856. She subsequently wrote of this poem that it was "the most mature of my works—the one in which my highest convictions of work and art have entered."

AURUNCI. See AUSONES.

AURUNGZEBE, ʔrūng-zēbʔ, or **AURANGZIB** (Hind. ornament of the throne). The last great Emperor of the Mogul dynasty in India. He was born in November, 1618, and died March 3, 1707. He was the third son of Shah Jahan, and in religion he was a bigoted Sunni, one of his additional titles being Mohi-eddin, 'reviver of religion.' He was set by his father over the Mogul Deccan, while his elder brothers, Dara and Shuja, resided respectively at Agra, with the court, and in Bengal. The youngest brother of Aurungzebe, named Murad, was Viceroy of Gujarat. In 1657 Shah Jahan fell seriously ill, and a contest for the throne was immediately begun by his sons. Aurungzebe, by a mixture of duplicity and fanaticism, outwitted his brothers, the two elder of whom he murdered, and made his father a prisoner in his own palace of Agra, and kept him so until the death of the latter, possibly by foul play, in 1665. The usurper assumed the title of Alamgir, or 'conqueror of the world.' The reign of Aurungzebe, which began in 1658, was troubled, almost as soon as it had begun, by the opposition of a Mahratta chieftain, a

daring freebooter from the mountains of Konkan, named Sivaji. Treachery was employed against this wily foe in vain, for he remained independent until his death, in 1680. A religious war against the Rajah of Udaipur, which dragged on for several years, resulted unsuccessfully for Aurungzebe, who was forced to abandon his military operations in Rajputana in 1682 on account of an abortive rebellion of his son Akbar. Between 1682 and 1689, however, Aurungzebe conquered the sultans of Bijapur and Golkonda and thereby brought the Moguls into touch with the English at Madras. The closing years of Aurungzebe's long reign were full of sorrow, and it is noteworthy that he alone, of all the Mogul emperors, forbade the composition of any history of his reign. Despite the external pomp and ceremony the Mogul Empire was tottering to its fall. The treachery of Aurungzebe alienated Mohammedan Shites from him, while his religious bigotry won for him the undying hatred of the Hindus, whose faith he had insulted and had endeavored to exterminate. Consult Stanley Lane-Poole, *Aurangzeb* (London, 1893); *Rushā at-r-Alamgiri, or Letters of Aurungzebe*, translated from original Persian into English by Jamshid H. Billimoria (London, 1908); T. N. Sarkan, *Anecdotes of Aurangzeb and Historical Essays* (London, 1912); id., *History of Aurangzeb* (London, 1913).

AUSABLE (ā-sā'b'l) **CHASM**. A narrow gorge, 2 miles long, worn by the Ausable River, in the State of New York, in the hard quartz sandstone of the Potsdam formation, popular for its scenic attractions. The rocks of the neighborhood are traversed by numerous faults or lines of displacement, along which lines the hard rocks have been to some extent crushed and broken. The river has taken advantage of these lines of weakness and has worn its zigzag course to a depth, in places, of 175 feet along the almost vertical fault planes, thus affording an excellent example of the relation between faults and lines of drainage.

AUSCULTATION (Lat. *auscultare*, to listen). A mode of exploration—by listening—of the condition of the heart, the lungs, the pleura, the œsophagus, certain arteries and veins, the abdominal organs, the gastro-intestinal tract, and the gravid uterus. Diseases, especially those of the heart and lungs, may be detected by listening to the sounds produced in the cavity of the chest. This is done either by the unassisted ear (immediate auscultation) or by the aid of a simple sound-conveying instrument, the stethoscope (q.v.) (mediate auscultation). The normal sounds produced by respiration and the beating of the heart are readily distinguished by the trained ear from the several abnormal sounds indicating disease. Auscultation is one of the most important means of diagnosis. Hippocrates observed the friction sound in dry pleurisy as well as succession in pyopneumothorax. Auenbrugger of Vienna, in 1761, introduced percussion, and Piorry of France invented the pleximeter. Both probably appreciated some of the facts of auscultation. But Laënnec, in 1816, was the first to demonstrate the great value of auscultation and to introduce it into general use. Raynaud, in 1829, and Collin, in 1831, added respectively to our knowledge of pleuritic friction and pericardial friction. (See **PERCUSSION**.) According to the views, however, then generally held by physicians, the sounds

produced by auscultation and percussion were capable of directly revealing the nature of diseases. In 1839 Skoda, in his *Abhandlung über Auskultation und Perkussion*, demonstrated that those sounds were only manifestations of peculiar physical states in the body. Being directly produced by certain diseases, those states, and not the sounds caused by them, must be considered as the true symptoms from which the character of diseases can be inferred. Consult Cabot, *Physical Diagnosis* (New York, 1912), and Le Febvre, *Physical Diagnosis* (New York, 1905).

AUSGLEICH (ous'glik) **OF 1867**, THE. The written agreement which created the dual monarchy of Austria-Hungary out of the Empire of Austria and the Kingdom of Hungary. This agreement, or treaty between two equal states provides for a unique form of government. Each state retains its own Parliament, courts, administration, and constitution; but for both of them there is provided but one flag, ruler, and, in certain specified cases, one common policy. A common administration is provided for finance, foreign affairs, and war. Furthermore, for the purpose of guiding and controlling the common government in these three particulars and for providing joint legislation, two legislative bodies are elected—one Austrian, one Hungarian—termed "Delegations." These bodies have equal power; they meet alternately in Vienna and Budapest, and before them for approval must be laid the proposals of the common ministries. The powers of these delegations are severely limited, and the Ausgleich itself, which provides for their existence, cannot be legally changed in any way except by international agreement between the two sovereign powers of Austria and Hungary.

AUSONES, ā'sō-nēs (Aῶνες, Gk. form of the name *Aurunci*). A hardy mountain tribe of ancient Italy, south of Rome, probably of Oscan stock, which in historical times dwelt on the coast between the rivers Volturnus and Liris; the Romans called them Aurunci. From 340 to 295 B.C. they fought the Romans, but they were completely subdued and their territory was given to Cales and Suessa Aurunca. The name "Ausonia" was later given to all the lands of the non-Latin tribes of central Italy, and finally by the poets it was used as synonymous with Italy itself.

AUSONIA. See **AUSONES**.

AUSONIUS, DECIMUS MAGNUS (c.310–394 A.D.). The most conspicuous Roman poet of the fourth century A.D. He was born at Burdigala (Bordeaux) about 310. His father was a man of considerable importance, having been at one time honorary prefect of Illyricum, and he appears to have taken care that the young Ausonius should receive an excellent education. Many amiable female relatives fostered and probably flattered the talents of the boy. After finishing his curriculum at Tolosa (Toulouse), he returned to Burdigala, where, after practicing for a short time at the bar, he turned his attention to literature (c.334) and soon distinguished himself as a professor of oratory. Many years later he was appointed by Valentinian tutor to his son Gratian, afterward quæstor, and by Gratian, Prefect of Latium, and subsequently Consul of Gaul (379). On the death of Gratian (383), Ausonius retired from public life to his estate at Burdigala, where he occupied himself with literature and rural pursuits until the time

of his death. The question whether or not Ausonius was a Christian has occasioned much controversy. He probably conformed to Christianity, but with a sort of pagan indifference. His works include translations of Greek eclogues, a collection of 150 epigrams, epistles in verse and prose, 20 so-called idyls and other descriptive pieces, which were admired in their day, and of late have once more come to be read with appreciation for their love of nature. But though destitute of the highest poetic quality, Ausonius occasionally displays a certain neatness and grace of expression, which show that in a better era he might have proved a greater poet. Besides these, he also wrote a panegyric on the Emperor Gratian, full of bombastic adulation. His best-known poem, *Mosella*, on the river of that name, contains many charming bits of description and some strikingly modern touches. The best edition of the text of Ausonius is that by Peiper (Leipzig, 1886). The *Mosella* has been edited with translation and commentary by De la Ville de Mirmont (Paris, 1889). Consult: Dill, *Roman Society in the Last Century of the Western Empire*, especially bk. ii, chap. iii (London, 1899); Mackail, *Latin Literature* (New York, 1896); J. K. Wager, *Questiones Metricæ Imprimis ad Ausonium Pertinentes* (Leipzig, 1907); A. Delachaux, *La latinité d'Ausone: étude lexicographique et grammaticale* (Lausanne, 1909).

AUSPICES. See AUGURIES.

AUSSEE, ou-sa' (Ger. *aus*, from + *See*, lake). A market town of Styria, Austria, situated at the southwest end of the crownland, at an elevation of 2135 feet (Map: Austria, C 3). Its mountain air, pine woods, and salt baths have made it a popular bathing place and health resort. The chief products are wood carvings and rock salt. In the vicinity are situated the three mountain lakes of Alt-Aussee, Grundl-See, and Toplitz-See, famous for their beautiful scenery. Pop., 1900, 1566; 1910, 1600.

AUSSIG, ou'sik (from Bohem. *Oustí nad Labem*, river mouth over Elbe). A flourishing manufacturing town of the Austrian crownland of Bohemia, about 455 feet above sea level, situated on the left bank of the Elbe, at its junction with the Biela, about 69 miles northwest of Prague, and 9 miles from the Saxon frontier (Map: Austria, D 1). Its notable public buildings are the Stadthaus, and the town church, supposed to date from 826, containing a fine painting of the Madonna, by Carlo Dolce, presented by Israel Mengs, whose son, the famous artist, Raphael Mengs, was born in Aussig. The town's affairs are administered by a municipal council of 36 and an executive board of eight members. The leading industrial establishment is a chemical factory employing upward of 1500 workmen, the largest in Austria. There are also manufactures of glass, pottery, woolen and cotton goods, and a considerable trade in grain, fruit, wood, mineral water, and coal, especially the latter, which is loaded on river barges and shipped down the Elbe. The town is an important station on the direct railway line from Dresden to Prague and one of the stations of the Elbe Steamship Line. It has two harbors on the river. Pop., 1890 (largely German), 24,000; 1900, 37,300; 1910, 39,255. Aussig was destroyed in 1426 by the Hussites and was taken by the Swedes, under Baer, in 1639.

AUSTEN, JANE (1775-1817). A novelist whose books, if not startling or imposing, are

held by the best judges to stand, despite their limitations, with the best work in English fiction. She was born Dec. 16, 1775, at Steventon, Hampshire, where her father was rector. Her education was better than that of the average country-bred girl of her time, and to a familiarity with contemporary English literature she added a knowledge of French and Italian. The English squirearchy and the upper professional classes, especially in the country, provided her with material for a series of novels peopled by characters astonishing in their vitality, who dwell in the memory as securely as those of Scott or Thackeray. Her touch is unfailingly creative, and by virtue of her method and material she is the mother of the modern novel in much the same sense in which Scott is the parent of the modern romance. Scott's praise of her is not less discriminating than generous, when he writes: "That young lady had talent for describing the involvements, feelings, and characters of ordinary life, which is to me the most wonderful I ever met with. The big Bow-Wow Strain I can do myself, like any now going; but the exquisite touch, which renders ordinary commonplace things and characters interesting from the truth of the description and the sentiment, is denied to me." In Miss Austen's portraiture there is a fine irony that gives her work a wonderful zest and tang. Her books, thanks to her style and to her art of observing, selecting, and combining, prove that from the daily round and common tasks of a quiet and uneventful life perennially delightful fiction can be made, which may bid fair to appeal as strongly to other times and peoples as to our own. Her first published novel, *Sense and Sensibility*, appeared in 1811, to be followed between that year and 1816 by *Pride and Prejudice*, *Mansfield Park*, and *Emma*. Miss Austen died July 24, 1817, and it was not until the year after her death that two of her books appeared in print. These were her last novel, *Persuasion*, and *Northanger Abbey*, which had been written in or before 1797. Neither her *Letters* (published 1884) nor the few literary fragments that complete her work are of any strong interest. For the latter, see *Lady Susan*, a story in epistolary form, and *The Watsons*, conveniently accessible in the collected works of Jane Austen (Boston, 1898). The important books about her and her work are: J. E. Austen Leigh, authorized *Life* (London, 1870); S. F. Malden, *Life* (London, 1889); Goldwin Smith, *Jane Austen* (New York, 1890); W. H. Pollock, *Jane Austen: Her Contemporaries and Herself* (New York, 1899); Constance Hill, *Jane Austen: Her Home and her Friends* (New York, 1902); G. E. Mitton, *Jane Austen and her Times* (London, 1905); J. H. and E. C. Hubbard, *Jane Austen's Sailor Brothers* (London, 1906); W. D. Howells, *Heroines of Fiction* (New York, 1902); Austen-Leigh, *Jane Austen: Her Life and Letters; A Family Record* (New York, 1913); Cornish, in *English Men of Letters Series* (London and New York, 1913).

AUSTEN, PETER TOWNSEND (1852-1907). An American chemist; born at Clifton, Staten Island, N. Y. He received his education at the School of Mines of Columbia University, studied chemistry in Germany, and took his doctor's degree at the University of Zürich, Switzerland. In 1876 he returned to the United States and was made instructor-in chemistry at Dartmouth College. In 1877 he was appointed professor of

chemistry at Rutgers College and during the following 10 years was engaged in teaching in that college and in the New Jersey Scientific School, serving also as State chemist of New Jersey. In 1887 he resigned his chair, and during the next six years devoted his attention exclusively to industrial work. In 1893 he resumed his career as a teacher and was made professor of chemistry at the Brooklyn Polytechnic Institute, where he remained until 1898. In 1899 he became the president of the Austen Chemical Research Company. Dr. Austen published a large number of interesting papers in applied chemistry, patented several valuable manufacturing processes, and wrote: *Kurze Einleitung zu den Nitro-Verbindungen* (Leipzig, 1876), and a translation of Pinner's *Repetitorium der organischen Chemie*, under the title *An Introduction to the Study of Organic Chemistry* (New York, 1883).

AUSTER. The Latin name of the dry south or southwest wind, the modern sirocco, called *vóros*, *notos*, by the Greeks. The name is connected with the root of *uro*, to burn.

AUSTERLITZ, ous'tér-lét's ("the east town on the Littawa"; from Ger. *Ost*, East). A town in Moravia, about 12 miles east-southeast of the town of Brunn (Map: Austria, E 2). It stands on the Littawa and has a population (1900) of 3703. Austerlitz is celebrated as the place where Napoleon I defeated the combined forces of Austria and Russia, under the command of their emperors (Dec. 2, 1805). The capitulation of the Austrian General Mack at Ulm on Oct. 17, 1805, had been followed by the French occupation of Vienna on November 14; but though Napoleon held the capital of the enemy, his forces were inferior to the allied army of Austrians and Russians under Kutusoff and Prince Lichtenstein, which was assembled around Olmütz and threatened a junction with another army under the Austrian archdukes and a force from Prussia. Napoleon determined to strike at the Allies before the expected junction could be effected. He moved northward from Vienna and at Austerlitz came in touch with the Allies, who had advanced to meet him. The latter, numbering some 84,000 men opposed to the 70,000 French, attacked in five columns, aimed in oblique order against the French right, their intention being to concentrate on that wing, outflank the enemy, and cut off their communication with Vienna. Napoleon, seeing their purpose, conceived the bold design of permitting the enemy to gain a temporary success over his right wing, which would allow him in turn to concentrate his forces against their weakened centre, and, having broken that, to take them in the rear. The plan was admirably executed. At 8 o'clock on the morning of December 2 the left wing of the Allies, consisting of three Russian columns, advanced across a country of frozen marshes, assailed Davout, who held the fords of the Goldbach, forced the passage of that stream, and compelled the French to retreat for some distance; with the aid of reinforcements, however, Davout was able to hold his own, as indeed Napoleon had planned. Meanwhile heavy masses of French under Soult had been hurled against the centre of the Allies, comprising the fourth Russian column, under Kutusoff; and after a sanguinary conflict the latter was overwhelmed. Lannes, too, on the left of the French, succeeded in driving back the allied right under Bagration. The victorious

French troops were then swung upon the rear of the left of the Allies, and of the unhappy three columns the third was entirely crushed, while the others were shattered into fragments. The battle became a rout, and as the remnants of the Allies fled across the river the French artillery broke the ice and thousands of fugitives were drowned. The Allies lost 35,000 men in killed, wounded, and prisoners, while the French loss was only 7800. As a result of the battle, Austria was forced to sign the Treaty of Pressburg on Dec. 26, 1805. In the military career of Napoleon no other event, probably, stands out so brilliantly as Austerlitz, because of his numerical inferiority, the audacity of his plan, the precision with which it was executed, and the completeness of the victory. The glory of Austerlitz—spoken of, sometimes, as the battle of the three emperors, from the presence of the Russian and Austrian emperors in the field—made even the disaster at Trafalgar seem of little consequence.

AUSTERLITZ, THE SUN OF. A term applied to anything which augurs good. It is an allusion to the sudden appearance of the sun which brightened the overcast dawn just before the battle of Austerlitz, and which Napoleon accepted as an auspicious omen for the French.

AUSTIN. A city, and the county-seat of Mower Co., Minn., 100 miles south of St. Paul, on the Chicago, Milwaukee, and St. Paul, and the Chicago Great Western railroads, and on Red Cedar River (Map: Minnesota, E 7). It is the seat of the Southern Minnesota University, and has three parks. Among the prominent buildings are the Carnegie library, central high school, county courthouse, State armory, post office, and St. Augustine's Church (Roman Catholic) and Methodist Episcopal Church. The city is surrounded by fertile prairie land, the products of which are principally live stock, butter, corn, barley, flax, and grass seeds. It exports extensively and has meat-packing establishments, flouring mills, brick and tile works, foundry, railroad shops, cement works, creamery, machine and steel works, roller mills, broom and brush factories, etc. Settled in 1854, Austin was incorporated as a village in 1868 and in 1873 was chartered as a city. The government is administered under a charter of 1903, which provides for a mayor, biennially elected, and a city council. The city owns its water works and electric light plant. Pop., 1900, 5474; 1910, 6960.

AUSTIN. The capital of Texas, and the county-seat of Travis County, about 145 miles west by north of Houston, on the north bank of the Colorado River, which, in its lower course, is navigable for steamboats, and on the Houston and Texas Central, the International and Great Northern, the Missouri, Kansas, and Texas, and the Austin and Northwestern railroads (Map: Texas, D 4). It is about 40 feet above the river in the lower portion and gradually rises to an elevation of 120 feet. It is well laid out with wide and shaded streets. Capitol Square (10 acres) contains the Capitol building, of red Texas granite, which cost \$3,500,000, and, next to the National Capitol at Washington, is the largest State Capitol in the United States. Other prominent structures are the State land office, county courthouse, and the buildings of the University of Texas (coeducational), opened in 1883. There are also the Confederate Home; a State asylum for the insane; an institution for the blind; an institution for the deaf and

dumb; an institution for the deaf, dumb, and blind (colored); a school for defectives; St. Edward's College; Southwestern Presbyterian Theological Seminary; Tillotson Institute (colored); Samuel Huston College (colored); several seminaries and academies, monuments, hospitals, etc. Two fine bridges span the river, and in 1893 a great dam, one of the largest in the world, was built 2 miles above the city, to provide water and power. It was carried away by a flood in 1900 and rebuilt at a cost of \$1,720,000. It forms a lake 26 miles long and develops 6000 horse power. (See DAMS AND RESERVOIRS.) The export trade in agricultural produce, live stock, cotton, grain, wool, and hides is very large, and an extensive wholesale trade in harness and leather goods, groceries, dry goods, drugs, etc., is carried on. The manufactures include cotton-seed oil, lime, planed lumber, mantels, chili powder, mattresses, trunks, brooms, farm machinery, bricks, wire fence, gasoline engines, building materials, carriages, cement blocks, cigars, soap, and candles. The commission form of government, providing for a mayor and four councilmen, was adopted in 1909. The water works and electric light plant are owned and operated by the city. Austin, originally called Waterloo, was first settled in 1838, and in the following year was named after Stephen F. Austin (q.v.); incorporated and made the capital of the Republic of Texas in 1839; and later became the permanent capital of the State. The first free school in Texas was established here in 1871. Pop., 1900, 22,258; 1910, 29,860.

AUSTIN, ALFRED (1835-1913). An English poet, born May 30, 1835, at Headingley, near Leeds. He graduated at the University of London in 1853 and was called to the bar in 1857, but abandoned law for literature. He became editor of the *National Review* in 1883. He was made Poet Laureate of England in 1896. Among his many volumes of verse are *The Seasons; A Satire* (1861); *Savonarola*, a tragedy (1881); *English Lyrics* (1890); *The Conversion of Winckelmann and Other Poems* (1897); *Songs of England* (new ed., 1900), and *A Tale of True Love and Other Poems* (1902), dedicated to President Roosevelt. Austin attracted some notice in 1870 by an essay entitled *The Poetry of the Period*, in which he severely criticised Tennyson, Browning, and other Victorians. As a critic he was original and interesting, and although he had not the imagination of the poets whom he attacked, he wrote some graceful verse. He also published *The Garden that I Love* (1894; 2d series, 1907), and *In Veronica's Garden* (1895)—two pieces in prose interspersed with short poems; *Haunts of Ancient Peace* (1902; new ed., 1908); *A Lesson in Harmony* (1904); *The Door of Humility* (1906, 1907); *Sacred and Profane Love* (1908); *The Bridling of Pegasus*, which the author called "prose papers on poetry" (1910); *Love Poems* (1911). Consult his *Autobiography* (2 vols., 1911).

AUSTIN, JANE GOODWIN (1831-93). A novelist who dealt with Colonial New England. The more noteworthy of her romances are *Fairy Dreams* (1860); *Moonfolk* (1874); *Mrs. Beauchamp Brown*, her best-known book (1880); *A Nameless Nobleman* (1881); *The Desmond Hundred* (1882); *Nantucket Scraps* (1882); *Standish of Standish* (1889); *Betty Alden* (1891); *David Alden's Daughter and Other Stories* (1892).

AUSTIN, JOHN (1790-1859). The most distinguished of English writers on jurisprudence. He was born at Creting Mill, in Suffolk, England, on March 3, 1790. At the age of 16 he entered the army and served as a subaltern in Sicily and elsewhere for five years. Resigning his commission, he returned to London and took up the study of law, and in 1818 was called to the bar. In 1820 he married Miss Sarah Taylor, of Norwich, a gifted woman, to whose devotion, courage, and steadiness of purpose he was indebted for the few but remarkable achievements of his life. In the same year he went to live in Westminster and was a welcome member of the circle to which belonged Jeremy Bentham and James and John Stuart Mill, and many others of the foremost minds and characters in England. But his great social and conversational gifts did not bring him success at the bar, a natural infirmity of will and deficiency of courage being aggravated by weakness of constitution and frequent attacks of fever and debility. Accordingly he retired from practice in 1825, and the following year, upon the establishment of the University of London, he received the appointment of professor of jurisprudence in that institution.

This was before the period of the scientific study of the law in England, and her lawyers had not yet become aware of the existence of the science of jurisprudence. Hence his unrivaled powers of analysis and classification received scant recognition and his work resulted in disappointment and apparent failure. To prepare himself for his task, he went to Bonn, then the principal seat of juristic learning in Europe, and spent the winter reading and studying under Niebuhr, Brandis, Schlegel, Arndt, Welcker, and Mackeldey. Returning in the spring of 1828, he began his lectures at University College. His earnestness and enthusiasm were not adequate to render his precise and accurate definitions and his profound and refined reasoning attractive to the professional students of law, and it soon became evident that there was no demand for the scientific teaching of jurisprudence. The number of his students dwindled to a mere handful. Unfortunately no provision was made for the chair of jurisprudence beyond class fees; and in the absence of students Austin, in 1832, was reluctantly compelled to resign his appointment. In the same year he published his *Province of Jurisprudence Determined*, a work at the time little appreciated by the general public, so that the slight success it met with did not encourage him to undertake other publications on the subject. In the estimation of competent judges, however, it placed its author in the highest rank among writers on jurisprudence. In 1833 he was appointed by Lord Brougham a member of the criminal-law commission. The post was not much to his taste, as he did not believe that the public received any advantage from such bodies, in the efficacy of which for constructive purposes he put no faith.

In 1836 he and his friend and pupil, Sir George Cornewall Lewis, were appointed commissioners to inquire into the laws and usages, the administration and state of government of the island of Malta, a congenial task which was performed with remarkable ability and thoroughness. But again his health broke down, and in 1838 he returned to England, only to be ordered abroad by his physicians. The next 10 years were spent on the Continent, but the Revolution of 1848 drove him back to England. He then

settled at Weybridge, in Surrey, where he lived until his death in December, 1859. His lectures on the principles of jurisprudence had remained in manuscript and were left by him in a fragmentary and imperfect state. It is due to the intelligence and zeal of his widow that they were subsequently collected and arranged for publication and in 1863 given to the world under the title *Lectures on Jurisprudence, Being the Sequel to "The Province of Jurisprudence Determined,"* of which latter she had published a second edition in 1861. On this work his fame now rests.

Austin's great merit consists in the remarkable clearness and penetration of his analysis of legal conceptions. He was the first English writer to attach precise and intelligible meaning to legal terms, as well as the first systematic writer on law in the English language. With an adequate knowledge of the principles and methods of Roman and English law, he combined an extraordinary talent for classification and definition. Fragmentary and incomplete as it was, his work revolutionized the science of jurisprudence and became the text-book of the school of analytical jurists that has dominated the legal thought of the nineteenth century in England and America. His doctrines have had but little influence elsewhere, however, the continental jurists adhering with singular unanimity to the classification and conceptions of the Roman law. Indeed, even in the Anglo-Saxon world, a reaction has lately set in against the Austinian conceptions of law and politics, owing to the enlarged knowledge of human society and the historical spirit which have so profoundly modified the thought of our generation. Austin's limitation of the conception of positive law to the commands of a sovereign, and his restriction of sovereignty to an external political authority, have been especially subjected to criticism. They are, however, reasserted and strongly defended by his most distinguished disciple, Prof. Thomas E. Holland, in the latest edition (1900) of his *Elements of Jurisprudence*, and by W. Jethro Brown in *The Austinian Theory of Law* (Boston, 1910). For the opposite view Sir Henry S. Maine's works may be consulted, especially *Early Law and Custom* (London, 1883), and *Early History of Institutions* (London, 1875). The pathetic story of Austin's life is related by his widow in her introduction to the second edition of his *Province of Jurisprudence Determined* (London, 1861); and John Stuart Mill has included a sympathetic but just and discriminating criticism of the man and his work in his volume *Dissertations and Discussions* (4 vols., London, 1875). See JURISPRUDENCE; LAW; SOVEREIGNTY.

AUSTIN, JONATHAN LORING (1748-1826). A diplomatic agent of the United States in Europe during the Revolutionary War. He was born in Boston, graduated at Harvard in 1766, and engaged in trade at Portsmouth, N. H. In 1775 he entered the American army as a major, and for a time was one of General Sullivan's aids. He also served as secretary of the Massachusetts Board of War, and in October, 1777, was sent to Paris by Massachusetts to announce to Franklin and his associates the news of Burgoyne's surrender at Saratoga. Franklin soon afterward sent him on a singular secret mission to England, where he met many members of the Opposition and furnished them with much information concerning American affairs. The trip was full of incident, and, says one of Franklin's biographers (Morse), "brings to mind some of the Jacobite

tales of Sir Walter Scott's novels." He carried dispatches to Congress from the United States Commissioners in Paris early in 1779, and in January, 1780, was dispatched to Europe to secure loans for Massachusetts in Spain and Holland, but failed in his mission and was captured and held for a short time by the British. Late in 1781 he returned and subsequently held various State offices of more or less importance.

AUSTIN, MARY HUNTER (1868—). An American author and playwright, born at Carlinville, Ill., and educated at Blackburn University. For 17 years she made a special study of Indian life in the Mojave Desert, and her publications set forth the intimate knowledge she thus acquired. She is the author of *The Land of Little Rain* (1903); *The Basket Woman* (1904); *Isidro* (1905); *The Flock* (1906); *Santa Lucia* (1908); *Lost Borders* (1909); *Christ in Italy* (1912); *The Lovely Lady* (1913). Her play, *The Arrowmaker*, dealing with Indian life, was produced at The New Theatre (New York) in 1911.

AUSTIN, OSCAR PHELPS. An American statistician, born in Newark, Ill., and educated in the public schools. The earlier years of his life were spent in journalism, and he served as reporter, editor, and Washington correspondent for metropolitan dailies. Subsequent to making a special study of statistics, he was appointed (1898) chief of the Bureau of Statistics of the Department of Commerce and Labor. This position involved the editing and compilation of most of the important statistical documents prepared by the bureau during a period of about 14 years. When the Bureau of Statistics was abolished, and merged in the Bureau of Foreign and Domestic Commerce in 1912, Austin became its assistant chief, having under his direction the division of statistics. In 1903 he was appointed professor of commerce and statistics at George Washington University. Besides several books intended for children, his writings include discussions of the commerce of different nations, or of entire continents, and books of comparison on colonial systems of the world, submarine telegraphs, great canals, manufacturing systems, and national debts.

AUSTIN, SARAH TAYLOR (1793-1867). An English translator and author, the wife of John Austin. She was born at Norwich, a member of a family remarkable for the men and women it has produced distinguished by literary and scientific ability. She spent several years abroad, enjoying the friendship of many eminent persons in continental society. She translated, from the German: *Characteristics of Goethe*, by Falk, and others, with notes (1833); *The Story without an End*, by Carové (1834), and Ranke's *History of the Popes* (1840). Though Mrs. Austin did some original work, as *Germany from 1760 to 1814*, she is chiefly known as an excellent translator. Consult the London *Athenæum* for Aug. 17, 1867.

AUSTIN, STEPHEN FULLER (1793-1836). An American pioneer and politician, known as the founder of the State of Texas. He was born in Wythe Co., Va., the son of Moses Austin, who originally, from Connecticut, projected the Texan colony which was finally established in 1821 by his son, on the site of the present city of Austin. The latter, by his energy, ability, and hardihood, made the experiment a success; and other colonists settled in the vicinity, until the Americans became so numerous that they held a

convention in March, 1833, to form a separate State government. Without heeding the Spanish population they agreed upon a plan, and Austin took it to the City of Mexico to obtain its ratification; but a revolution there prevented a hearing, so he wrote advising the Texans to form the State government without waiting for the consent of the Mexican authorities. This cost him three months' imprisonment and a longer surveillance; but in 1835 he returned to Texas and took command of the small Revolutionary army. In November he went as commissioner to the United States and endeavored to obtain the recognition of Texas as an independent State. He returned in 1836 and was made a candidate for the presidency of the lately established Republic of Texas. Samuel Houston, who defeated him for this office, chose him his Secretary of State, but Austin died suddenly on Dec. 27 of the same year. Consult Yoakum, *History of Texas* (New York, 1856), and Wooten, *History of Texas* (2 vols., Dallas, 1899), which contains many hitherto unpublished documents concerning the Austins and their work.

AUSTIN, WILLIAM (1778-1841). An American lawyer and author, born in Massachusetts. In addition to *Letters from London* (1804), *An Essay on the Human Character of Jesus Christ* (1807), and several minor works, he published the legendary tale of "Peter Rugg, the Missing Man," in the *New England Galaxy* (1824-26). Consult *Literary Papers of William Austin*, with a biographical sketch (Boston, 1890).

AUSTIN FRIARS. A monastery in old London, on Broad Street, built by the Earl of Hereford and Essex in 1253-54 and holding the tombs of various historic characters. After the dissolution of the monasteries by Henry VIII in 1536-38, which included the confiscation of 173 Augustinian houses, Austin Friars became a Dutch church under a grant of Edward VI. The building suffered various alterations, the spire being razed and the nave walled up. The Dutch residents of the city still worship there. See AUGUSTINIANS.

AUSTRALASIA, ă's'tral-ă'shă or -zhă (Neo-Lat. Southern Asia, from Lat. *australis*, southern + Asia). A geographical term of rather loose application, used by some British geographers to denote all the islands of the southern Pacific, including Australia, New Guinea, New Zealand, Melanesia, and Polynesia; while most writers in America and the European continent confine it to Australia, Tasmania, and New Zealand.

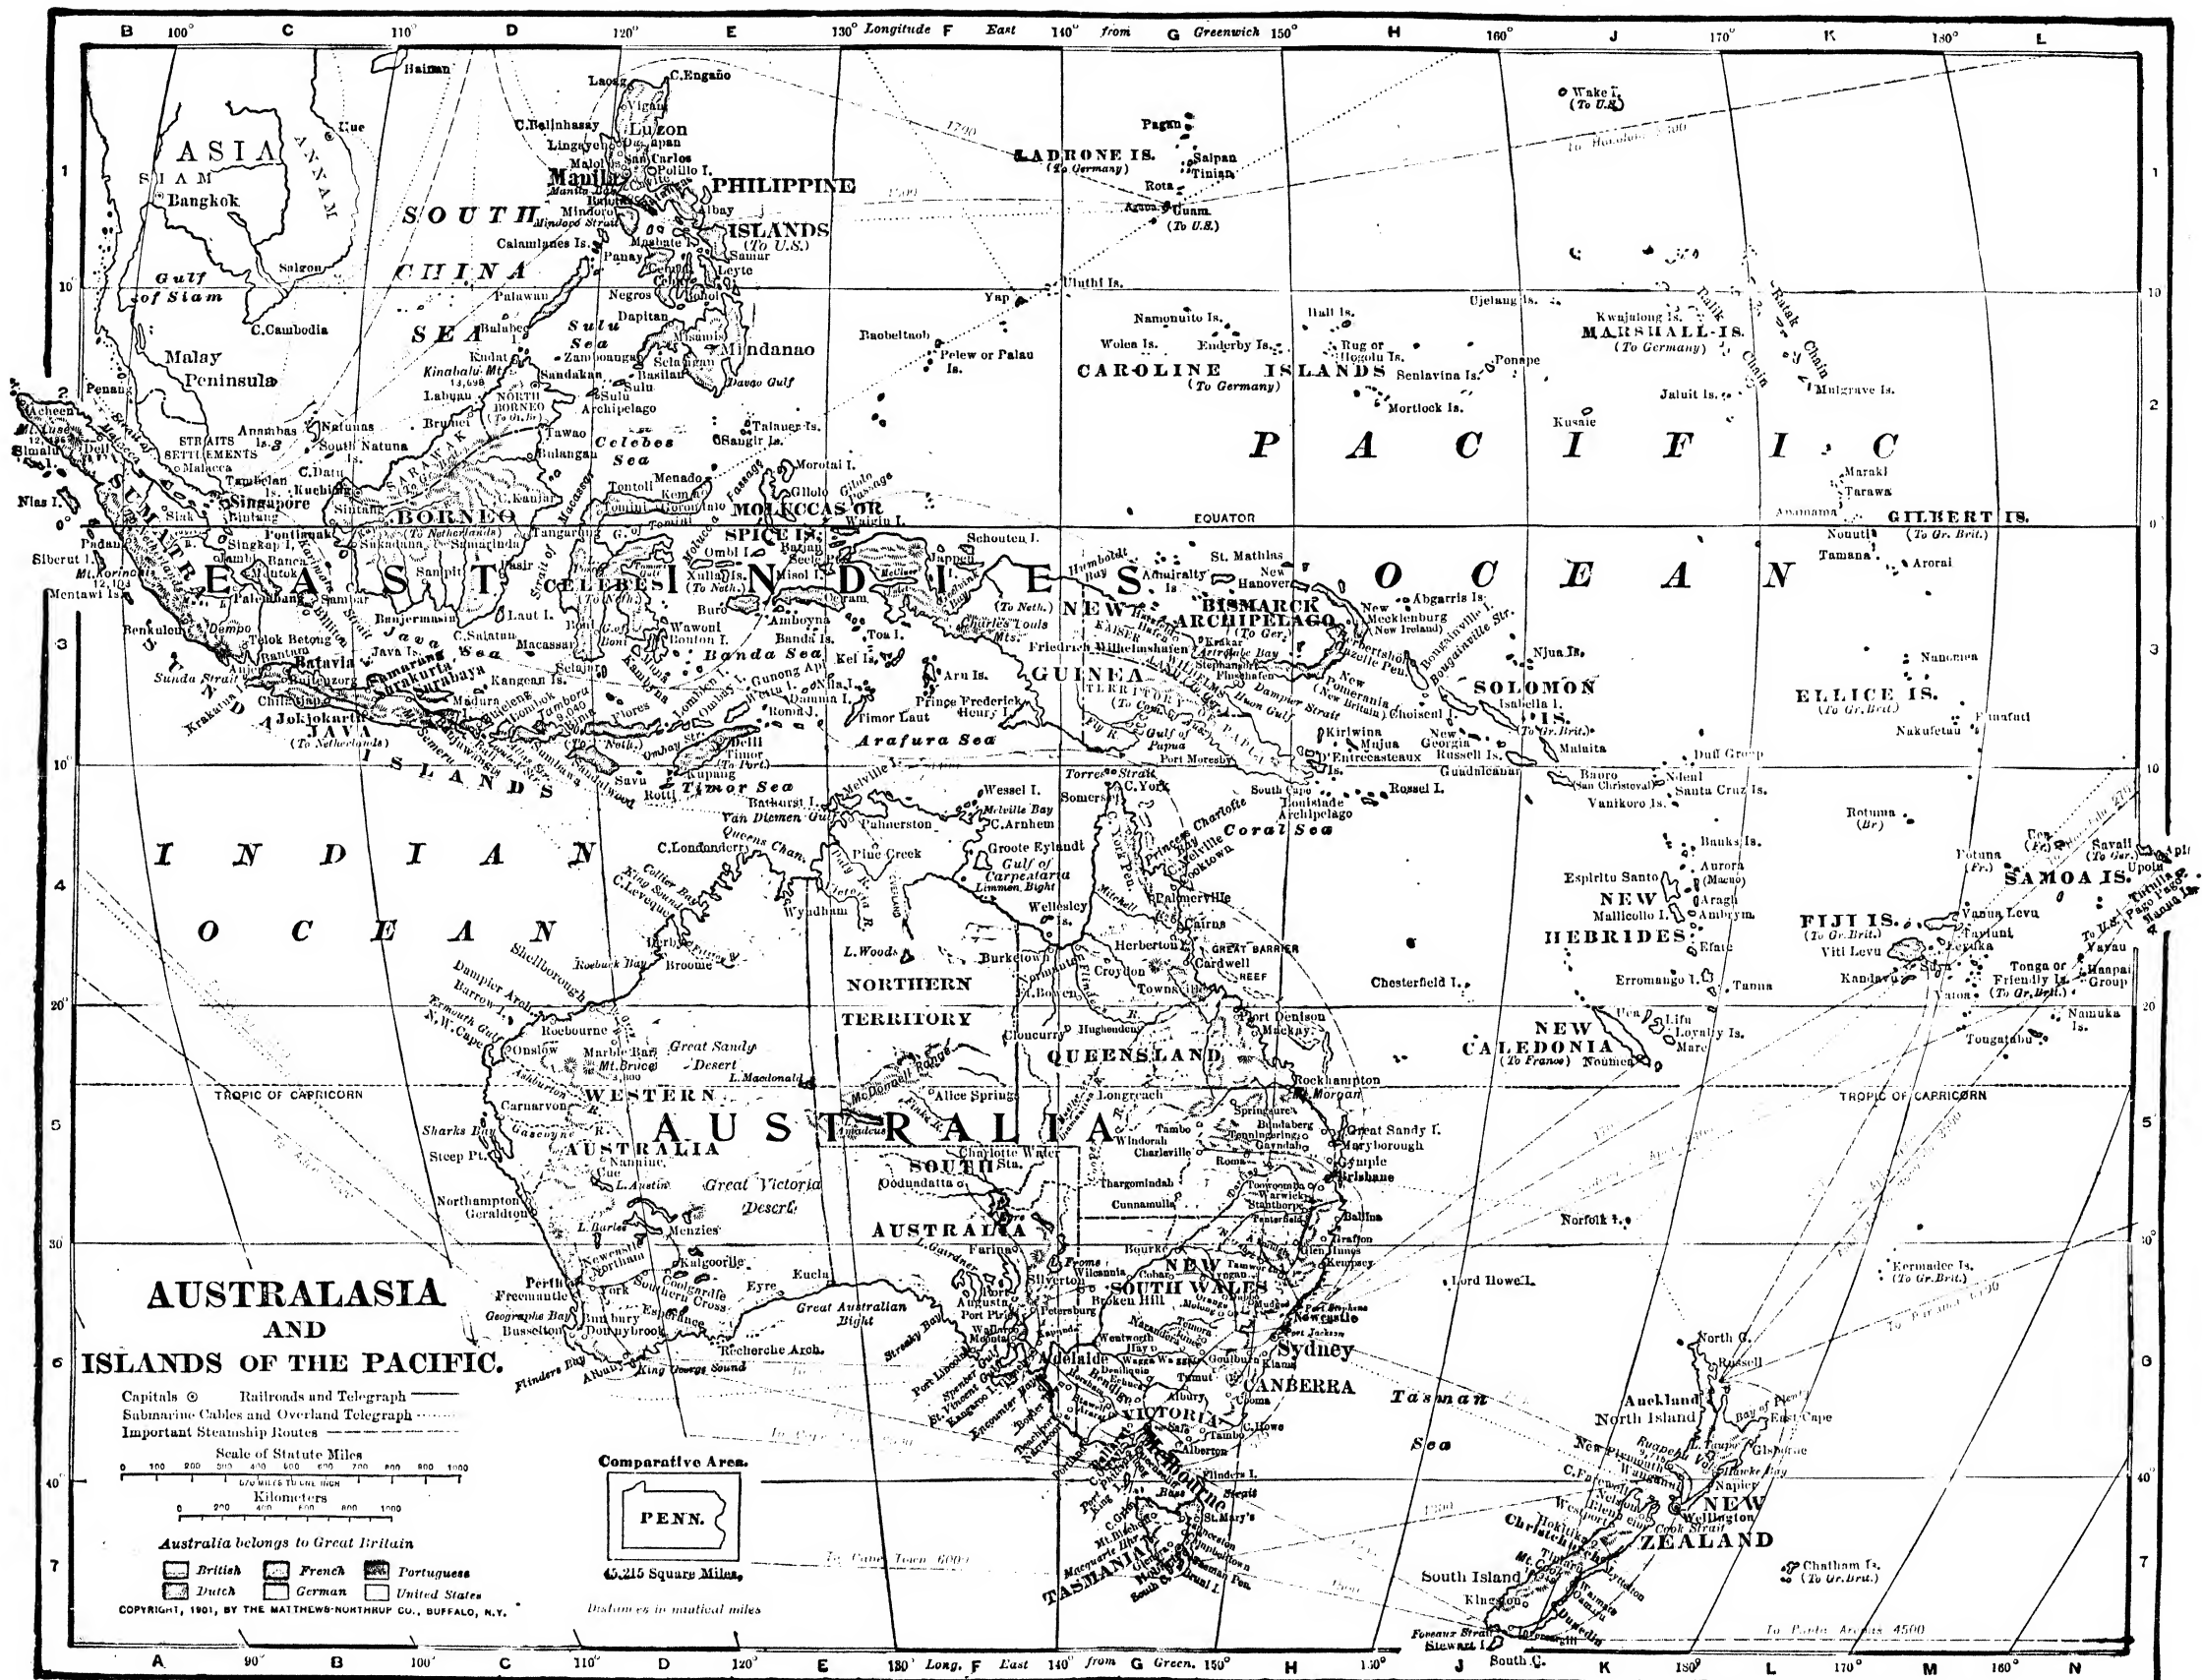

AUSTRALIA (Neo-Lat. Southland, from Lat. *australis*, southern). The island continent lying southeast of Asia and the East Indies. It is situated wholly within the Southern Hemisphere, between lat. 10° 50' and 39° 10' S., and between long. 112° 52' and 153° 34' E. Roughly its shape is that of a hexagon with two reëntrant sides. The greatest length is along the middle parallel, at about 25° S., and is nearly 2400 miles; while the greatest breadth, which is in the eastern part, in long. 143° E., is about 1900 miles. Its area is 2,946,700 square miles, slightly less than that of continental United States. In common with the two other southern continents, South America and Africa, Australia is compact in shape, its coast having few large indentations or projections. Only at three places are there sharply defined large peninsulas: (1) Arnheim Land and (2) York Peninsula, in the north, which inclose the largest indentation of the continent, the Gulf of Carpentaria; and, in

the south, the smaller (3) Eyre and York peninsulas, inclosing Spencer Gulf, and the peninsula which, with the York Peninsula, incloses St. Vincent Gulf, on which Adelaide lies. The great inward bend on the south side of the continent, corresponding to the two reëntrant sides of the hexagon to which Australia was compared in shape, is known as the Great Australian Bight. Owing to its compact mass the centre of the continent is at least 550 miles from the nearest coast and the "coast-distant" region (i.e., at least 375 miles from the nearest coast) occupies a relatively larger area than does the analogous region in the larger continent of Europe (17 per cent as against 15½ per cent). As regards its world relationships Australia may be defined as the southern end of the Afro-Eurasian land mass, being connected with the Asiatic continent by means of the island bridges, as it were, of Indonesia and New Guinea. The fact that these islands rest upon a continental platform, together with the faunal and floristic evidence, points to the existence of a former land connection with Asia. To the north this transition is established by the shallow Arafura Sea, which connects Australia with New Guinea, while in the south Tasmania, inasmuch as it lies upon the same continental platform (Bass Strait, average depth, 200 feet), must be counted as belonging physically to Australia. While the continent thus faces land masses to the north, it looks out upon an immense waste of water to the west and south. To the east lies the Pacific, island-dotted, to be sure; but the aggregate land area of its islands is negligible. Thus, on three sides Australia stands aloof. Prior to the development of interoceanic communication such isolation meant stagnation.

Topography and Hydrography. Of all the continents Australia presents the least relief. Except for a narrow mountainous belt in the east, its surface consists mainly of an extensive tableland and a lowland. Nowhere does it attain high altitudes; 95 per cent of its surface lies below 1500 feet, and three-quarters lie between 600 and 1500 feet. Its mean elevation, 1150 feet, is less than that of any other continent save Europe (1000 feet). Its highest altitude is only 7350 feet, attained by Mount Kosciusko.

From east to west, Australia may be divided topographically into (1) the Eastern Mountains, (2) the Central Lowlands, and (3) the Great Plateau Region.

The Eastern Mountains accompany the whole east coast in a belt convex to the east from York Peninsula in the north almost to the mouth of the Murray in the south. This belt has an average width of 150 miles and is the only continuous mountain region in the continent. It consists of plateau-like masses on which are superimposed mountain ranges; these masses are separated from each other by deep gaps. The mountain belt slopes gradually down to the lowlands on the west, while it has an abrupt descent toward the sea. At the base of the seaward slope lies a narrow coastal plain which is divided into compartments by transverse spurs from the main axis of the mountains. Taken as a whole, the eastern mountain belt increases in altitude from north to south. It may be roughly divided into two sections: (1) the Queensland Highlands, and (2) the Southeast Highlands, the transverse Macpherson Range south of Brisbane being considered the line of

division. In the north, in the York Peninsula, the Queensland Highlands are represented only by low granitic ridges. To the south the highlands expand to a width of 300 miles; they do not constitute a compact mountain region but consist of numerous ramifying ridges which culminate in the Bellenden Ker Mountains (5440 feet). For some 1200 miles the Queensland Highlands are flanked by the Great Barrier Reef, the coral-overgrown outer margin of the continental platform. Within this wall, which lies some 30 to 75 miles from the coast, is an inland sea averaging some 20 fathoms deep. The Southeast Highlands consist mainly, from north to south, of the mountain masses of the New England Range, the Blue Mountains, the Australian Alps, and, bending around to an east-west trend, the Victorian Highlands. The New England Range is for the greater part over 3000 feet in height; it culminates in Ben Lomond, 5000 feet. To the south it is separated by various gaps, mainly the depression of the Hunter River valley, from the Blue Mountains. The steep cliff wall with which the Blue Mountains break off to the east long presented an insurmountable barrier to the western march of settlement. The Goulburn Gap, which contains Lake George, the largest lake of New South Wales, separates the Blue Mountains from the Australian Alps to the south. This massif is the highest mountain mass in Australia; it culminates in Mount Kosciusko, 7350 feet. Its name is hardly appropriate, as its forms are rather those of rounded domes than of Alpine crags. However, the higher altitude, with its greater precipitation, makes for considerable snowfall, snow sometimes remaining almost all the year on the sheltered slopes. The moraines and smaller lakes and tarns due to former glaciation also give a touch of Alpine character. To the east the Victoria Highlands abut immediately on the Kosciusko massif; here they attain hardly inferior altitudes (Mount Hotham, 6100 feet; Mount Feathertop, so-called from its snow cap, 6300 feet; Mount Bogong, 6500 feet). To the west the Victoria Highlands gradually decrease in height, where they bear the name of the Grampians (3500 feet) until they strike the coast at Mount Gambier in 38° S. lat. and 141° E. long.

The second topographical division of Australia, the Central Lowlands, lies between the Eastern Mountains on the east and the Great Plateau Region on the west and extends across the continent from the Gulf of Carpentaria to the south coast. It may further be subdivided into (1) the Darling-Murray basin, (2) the region with interior drainage, and (3) the lowland surrounding the Gulf of Carpentaria. The first is separated from the second by a divide which runs southwesterly from the Eastern Mountains in 25° S. lat., to the coast at Adelaide. Different parts of this range are known as the Grey Range, the Stanley Range, and the Adelaide Range. The common boundary between the second and third divisions is the east-west divide separating the interior drainage from the drainage of the Gulf of Carpentaria.

The Murray-Darling basin, which occupies about one-seventh of the whole continent, contains the only large river system of Australia. Its longest member, the Darling, with its source streams, the Condamine and Barwan, rises on the inner slopes of the Eastern Mountains in the latitude of Brisbane and flows southwest into the Murray, which, together with its tributaries,

the Lachlan and Murrumbidgee, heads in the Eastern Mountains south of the latitude of Sydney, and flows west and then south until it empties into the Indian Ocean. This drainage basin, as large as that of the Danube, does not attain an importance commensurate with its size. Although its source streams are well fed, the limestone region through which the rivers flow in the lowland, and the progressive decrease of rainfall and increase of evaporation to the west rob the streams of the greater part of their supply. Only 25 per cent of the precipitation of the Murray drainage basin and 1½ per cent of that of the Darling basin ultimately reach the sea.

The region with interior drainage is characterized by the lack of outlet of its rivers. This is due to the extreme aridity of the region. Its drainage channels, whose condition is generally that of dry river beds, have their origin in the Great Plateau Region, in the divide to the Gulf of Carpentaria and in the Eastern Mountains, whence they flow convergingly southeast, south, and southwest as the Finke River, the Georgina River, and Cooper Creek, respectively, and empty (when they carry water) into Lake Eyre. Lake Eyre is the largest lake of the continent; having no outlet, it is saline. It lies 35 feet below sea level. To the south it is continued by the depression containing Lake Torrens—likewise without outlet—and Spencer Gulf; this depression is probably a rift valley, or structural trough. It is bounded on the east by the north-south trending Flinders Range. Additional lakes without outlet are Lake Gairdner, west of Lake Torrens; Lake Blanche, north of the Flinders Range; and Lake Frome, on the eastern flank of its northern end.

The lowlands surrounding the Gulf of Carpentaria are tropical in character. They consist mainly of the drainage basin of the Leichhardt, Flinders, Gilbert, and Mitchell rivers.

The third topographical division of Australia, the Great Plateau Region, occupies the remainder—about 54 per cent—of the continent. Its average elevation is about 1000 feet. Along its western edge, near the coast, it contains a belt of higher land, while its eastern border, adjoining the Central Lowlands, is flanked by east-west trending ranges of considerable height. Mainly on the score of climatic differentiation the Great Plateau Region may be subdivided into three parts: (1) the tropical region of the north coast, (2) the temperate region of the southwest tip of the continent, and (3) the desert region of the interior. The tropical region includes the Kimberley district, a region of greater elevation culminating in the King Leopold Range and drained by the Fitzroy and Ord rivers, and Arnhem Land, also higher than the plateau surface, drained by the Daly and Roper rivers. The temperate region rises gradually from the interior to the west coast, where it breaks off to the sea in the escarpment of the Darling Range. It is characterized by an annual rainfall of over 10 or 15 inches. The interior desert region is the culminating expression of the aridity of the continent. For the greater part it has the appearance of a limitless, slightly undulating surface, broken here and there by low, bare ridges. The surface is strewn with rock fragments; the characteristic vegetation is spinifex grass. Toward the west coast the land rises; this section is drained to the sea by the Murchison, Gascoyne, Ashburton, and Fortescue rivers. On the

eastern border of the plateau region are the east-and-west trending ranges mentioned above, among which the system of ranges known as the Macdonnell Range (summit, 4800 feet) and the Musgrave Range (summit, 5200 feet) are the most important. To the south the plateau region with its desertic conditions breaks off abruptly at the sea, making the coast of the Great Australian Bight inaccessible and inhospitable.

Climate and Rainfall. Australia lies within the region of the southeast trades and the high (atmospheric) belt. It is thereby predisposed to a warm, dry climate; this tendency is emphasized by its compact mass, which does not allow oceanic influences to penetrate far into the interior. Its extent through 30° of latitude (10°–40° S.) naturally makes for a great variety of climate; broadly speaking, the continent belongs to three zones as defined by the July (southern winter) and the annual isotherm of 68° F.: (1) the tropical zone, which includes York Peninsula, Arnhem Land, and the Kimberley district; (2) the semi-tropical zone, which includes the middle zone of the continent up to a line excluding the southwestern tip, the southern part of South Australia and New South Wales and all of Victoria, and (3) the warm temperate zone which includes the last-named regions.

In a region so extensive very great varieties of climate are naturally to be expected, but it may be stated as a general law that the climate of Australia is milder than that of corresponding latitudes in the Northern Hemisphere. During July, which is the coldest month in southern latitudes, one-half of Australia has a mean temperature ranging from 40° to 64° F., and the other half from 64° to 80°. During December the temperature ranges from 50° to above 95°, half of Australia having a mean temperature of 83°. The region possessing a mean summer temperature in excess of 95° F. is the interior of the Northern Territory of South Australia, north of the 20th south parallel; and the whole of the country, excepting the seaboard, lying between the east meridians of 120° and 140° and north of the 25th south parallel, has a mean temperature in excess of 90° F. On the other hand, the Pacific slopes of New South Wales are remarkable for the salubrity. The climate of the great plains of Queensland, New South Wales, and northern Victoria, in spite of the heat of part of the summer, is eminently healthy. In Victoria the heat is generally less intense in summer and the cold greater in winter than in New South Wales. Melbourne, in lat. 37° 50' S., has a mean temperature of 57.3°, and therefore corresponds to Bathurst in New South Wales, Washington in the United States, and Madrid, Lisbon, and Messina, in Spain, Portugal, and Sicily respectively; but with this difference—the variation between summer and winter temperatures is less at Melbourne than at any of the cities just cited. It is a rare thing for Melbourne summer heat to exceed 85° or the winter temperature in the daytime to fall below 40°. The mean temperature of Brisbane, during the first, second, and last months of the year is about 76°, while during the sixth, seventh, and eighth it averages about 60°. However, the winter in Rockhampton, farther north, averages 65° with a summer heat almost to 85°, while at Townsville and Normanton, still farther north, the average temperature is increasingly higher. In this respect the southern portions

greatly resemble the coast of Italy, the coldest months being June, July, and August, during which the temperature is very agreeable, ranging between 52° to 54° F.; but the climate of the Northern Territory is exceedingly hot, except on the elevated tablelands. In the southern and early settled parts of Western Australia the mean temperature is about 64°, with a maximum of 106°, and a minimum of 39°. But although for three months of the year the heat is very great in the daytime, the nights and mornings are almost always cool.

The rainfall of Australia varies as greatly as its climate. In New South Wales, the parent state, it ranges from an annual average of 64 inches at Port Macquarie, on the north coast, and Kiandra, in the Monaro district, to 9 inches at Milparinka, in the trans-Darling country. The coastal districts average about 42 inches per annum; on the tableland the mean rainfall is 32 inches, but in the western interior it is as low as 20 inches, while at the ten stations in the far west the average was only 14 inches. The average rainfall of Sydney during 42 years was 50 inches, while during 1901 a fall of 40 inches was recorded. During the year 1900 the rainfall at Melbourne amounted to 28.09 inches, the second highest total during the preceding decade, while for a long series of years it averaged 25.58 inches, with an average of 131 days during the year on which rain fell. At Echuca, during 1900, the number of inches of rain recorded was 15.8, while at Portland it was 32.82, and at Wilson's Promontory, 42.8. The average rainfall of Queensland is high, on account of its situation within and near the Tropic of Capricorn. Along the northern coast it ranges from 60 to 70 inches per annum. At Brisbane 50.01 inches is the average of 35 years, and even on the plains of the interior from 20 to 30 inches fall every year. During 1900, 34.41 inches of rain fell in Brisbane—the number of wet days being 110. On the whole, the weather of South Australia is remarkably dry. At Adelaide there are, on an average, 120 rainy days per annum; during 60 years the mean rainfall was 20.88 inches per annum, while farther north the quantity recorded was considerably less. The country is, however, naturally healthful, and in evidence of this it may be mentioned that no great epidemic has ever visited this state. Notwithstanding the great heat experienced by Europeans in the Northern Territory, it is a fact worthy of notice, also, that the malarial fevers which are so troublesome to the pioneers throughout almost the whole of the northern parts of Australia, partially, and in some cases wholly, disappear after the land has been settled and consolidated by stock. The rainfall in the extreme north, especially in January and February, is exceedingly heavy. The average annual rainfall in the coast districts is about 63 inches. Western Australia has practically only two seasons, the winter, or wet season, which begins in April and ends in October, and the summer, or dry season, which comprises the remaining six months of the year. During the wet season frequent and heavy rains fall, and thunderstorms with sharp showers occur in the summer. The extremes of drought and flood experienced in the other states are almost unknown in Western Australia, but during the summer months the northwest coast is sometimes visited by hurricanes of great violence. At Perth, in 1900, the rainfall was 36.61 inches, and rain fell on 124 days. Observations extending over a

period of 22 years show an average rainfall at Perth of 33 inches. In the northern parts of Western Australia the heat is excessive, though the dryness of the atmosphere makes it preferable to most tropical climates.

Geology. The Eastern Mountains are composed mainly of Silurian beds, with, however, large areas of Carboniferous formation, while in the neighborhood of Sydney, New South Wales, and Ipswich, Queensland, are large areas of what are probably Jurassic beds. Throughout the range intrusions of granite are abundant. The Darling Range, on the west coast, is composed of more recent beds, probably Jurassic. East of this range, stretching far into the interior, the country is overlaid irregularly with granite, and the same rock appears in many, if not most, of the mountain ranges of the interior, breaking through the Tertiary and Cretaceous beds which floor the plains and plateaus of this region. The distribution of these last two formations in the interior may be broadly characterized by the statement that the interior portions of Queensland and New South Wales are underlain mainly by Cretaceous beds, while the interior of Western and South Australia is mainly covered with Tertiary formations. There are, however, considerable tracts in the interior which are covered by older rocks. Thus, in the southern part, north of Spencer Gulf and the Gulf of St. Vincent, is a large area of Paleozoic beds extending inland as far as Lake Eyre, while from the head of the Gulf of Carpentaria an area of the same age extends southward. Tasmania is composed mainly of Silurian strata; Carboniferous and Jurassic beds and older crystalline rocks appear, however, both in the interior and on the east coast. Gold-bearing rocks and other valuable mineral deposits are widely disseminated throughout Australia.

There are no active volcanoes on the continent, but there are several areas of extinct volcanoes. They are very numerous in the State of Victoria in the southeast, where they have had much to do with shaping the present conformation of the land. There are but few in New South Wales, although outflows of basalt through low vents were numerous and extensive in that colony during Tertiary times. In Queensland the volcanic area is extensive, especially in the interior. In South Australia is the well-known volcanic group which has Mount Gambier for its central figure.

Flora. A brief description of the vegetational provinces of Australia may be helpful as an introduction to the discussion of its flora. We may distinguish between seven provinces. 1. The tropical forest occupies the whole northern and east coast from Arnhem Land nearly to the latitude of Brisbane. It is a fairly open, deciduous forest of the drier monsoon type. The equatorial type of forest is found only in tracts with sufficient ground water. Mangroves fringe the coast here and there. 2. The wet summer evergreen forest occupies the seaward slopes of that section of the eastern mountain belt designated the Southeast Highlands. (See *Topography; Drainage*.) It belongs to the luxuriant moist type of warm temperate countries, with tall eucalyptus as the dominant feature. 3. The dry summer evergreen forest covers the Victorian Highlands, the southern end of the Flinders Range on the east shore of St. Vincent Gulf and the southwestern tip of the continent. It belongs to the Mediterranean type of ever-

green vegetation. 4. Practically the whole Darling-Murray basin between the Eastern Mountains and the Flinders Range, except adjacent to the lower course of the Murray, is steppe. The *hinterland* of the western part of the Great Australian Bight belongs to this formation. 5. Savanna occupies a belt roughly 300-400 miles wide across the whole northern part of Australia from the Kimberley district east to the southern part of the Queensland Highlands. As far as Arnhem Land it reaches the coast; from here eastward it lies on the inner side of the tropical coastal forest. 6. That part of the Great Plateau Region which is not occupied by the vegetations already described or by desert is the home of the scrub. This most typical of Australian plant formations consists of a dense mass of low trees and shrubs which, in its impenetrability, has been one of the greatest obstacles in the exploration of the interior. 7. Finally, the desert occupies most of the plateau between 120° and 133° E., included between the savanna on the north and the scrub on the south, and detached areas occur northeast of Macdonnell Range and north of Lake Eyre.

The flora as a whole is very distinctive, and, moreover, is of two very marked and characteristic types. That of the moist east and north coasts is tropical in its luxuriance, and that of the interior, and the south and west coasts, is characteristic of the desert. Upwards of 12,000 species of plants are found, of which number not less than 7000 are peculiar to the continent. The leaves of many of the plants are of tough, fibre-like consistency, and some of them are needle-shaped; thus rapid evaporation is prevented, for they do not expose as much surface to the heat rays as do the broad-leaved plants. The foliage is somewhat monotonous after the manner of regions where specific types prevail. Australia possesses a great extent of territory in which the soil would produce a rich vegetation if only the proper watering could be accomplished.

Eastern and northern Queensland, with its moist tropical climate, produces a dense plant growth of Indo-Malayan character, such as tree ferns, bamboos, palms, and canes, with numerous parasitic plants and orchids. The palm and the pandanus (of the screw-pine family), with their aerial roots and palmy branches, are distinctive forms of this section. The bottle tree also, with its curious shape, deserves mention. The grass tree is also found in the eastern Australian region. In Victoria the vegetation is almost tropical in its richness in the mountain regions, but on the plains is somewhat sparse, the trees growing in park-like clumps. Here the eucalyptus reaches its greatest height (exceeding 400 feet), tree ferns present their wonderful growth, and numerous small ferns aid in giving a peculiar aspect to the vegetation. Fan palms and acacias flourish. Grass and salt bushes are distinctive types of lowland flora. In the great central region known as South Australia and the Northern Territory there is a sparse vegetation, the scrub or mallee being general, together with sedges, grasses, etc., as well as the grass tree, thorny plants, and a stunted growth of eucalyptus. Thickets of the paper-bark tree also occur. This growth (known as the "bush") is impenetrable by man in some regions. On the coast are found mangroves.

In July (midwinter) the following vegetation conditions prevail: in northern Australia, along the borders of the Gulf of Carpentaria, the

vegetation is tropical in character with no cessation of the growing period. To the south of this, all along the northern part of the continent, is a less rich tropical vegetation with a cessation during the dry season. In the southern part of the east coast and the eastern and western parts of the south coast are evergreen trees and a bushy growth, with a short period during which vegetation is at a standstill. In the remainder of the continent are grass lands, bushy steppes, and desert areas in which the vegetation rests at this time of year (the winter time of the Southern Hemisphere). In January (mid-summer) on the north coast the narrow strip of rich tropical vegetation suffers no interruption in growth, and in the belt of less rich tropical vegetation to the south of it vegetation is in its full development during the rainy season. The vegetation in the southeastern and southwestern parts is much restricted by the summer drought. In the interior the steppes have their summer verdure in regions where there is sufficient rain, but in the southwest the principal season of growth is from September to October, during the southern spring.

Fauna. The animal life is more peculiarly isolated than is that of any other great region of the globe. This is due to the fact that the destruction of the connection of Australia with Asia, although belonging to a relatively recent geological period (late Cretaceous or early Tertiary) happened at a relatively remote time in the biological time scale, before the larger orders had reached an advanced stage of development or had been able to reach Australia.

Of the non-aquatic mammalia only two of the orders found on the other continents are represented, the bats and the rodents. The others have their places taken by the two orders peculiar to Australia, the marsupials or pouch mammals, and the Monotremata or egg-laying mammals. There are six families of marsupials which include about 30 species. They differ greatly in form, in appearance, and in habits, resembling wolves, marmots, weasels, squirrels, flying squirrels, and jerboas, and feeding on flesh, insects, roots, fruits, honey, leaves, and grass. The flesh eaters are the native cats, rats, and mice, which are common to the continent, and the larger species, the so-called tiger of Tasmania. The insect eaters are the bandicoots or bandicoot rats. The root eaters are the wombats, all large burrowing animals. The fruit eaters are the native bear, a sloth-like creature, three varieties of opossums, the flying opossums, and the flying squirrels. The grass eaters are the kangaroos, of which there are numerous genera; the large kangaroos, the small kangaroos, the rock wallabies, and the hare kangaroos. The Monotremata, the egg-laying mammals, are the Ornithorhynchus and the spiny ant-eater; the former of which, with its otter-shaped body and duck bill, is regarded as the most curious of existing mammalia. It is not certain that the dingo, or wild dog, is a native of Australia, although he is a characteristic mammal at the present time. Among the bats are some which attain great size and are called flying foxes, and which feed on fruits; others of smaller size live on insects. The bird fauna has numerous species. Among the larger birds are the emu, the eagle, and the black swan. The lyre bird is remarkable for its peculiar plumage. Paradise birds, cockatoos, parrots, paroquets, snipe, quail, pigeons, ducks, plovers, falcons, honey suckers, scrub

birds, mound makers, shrikes, weaver finches, kingfishers, frogmouths, and flower peckers are all abundant.

The reptiles of Australia are less distinctively peculiar than the birds and mammals. No families of snakes are confined to this continent, but there are some peculiar genera of Pythonidæ and Elapidæ, to which latter family fully two-thirds of the snakes of Australia belong. These are poisonous; so that Australia has more poisonous snakes in proportion to the total number than has any other region. In eastern Australia about half the snakes are poisonous, but in other parts the ratio is not so high. The number of species increases very rapidly from the southern part toward the northern with the increase in temperature. Lizards are numerous; three of the eight families occurring being peculiar to Australia. Tailed amphibians are not found in Australia, but 11 families of toads and frogs are present. There is only one family of fish peculiar to the waters of Australia, but many genera are found there which do not occur elsewhere. Australia is relatively poor in insect life. The butterflies are by no means numerous; in South Australia there are less than 35 species, although in Queensland there are over 100. This continent is much richer in beetles than in butterflies, the longicorns being especially abundant.

Mineral Resources. There are few countries in the world which are endowed with such a diversity of large mineral deposits as Australia. The total area of the Commonwealth in square miles is 2,974,581, while its population, according to the decennial census of April 3, 1911, is 4,455,005 (exclusive of full-blooded aboriginals), or 1.49 persons per square mile. The total value of the mineral production to Dec. 31, 1911, was £784,706,891.

This total of £784,706,891 is shared by the states as follows: New South Wales, £216,146,025 (of which coal, £65,427,673, gold, £58,760,846, silver and lead, £56,476,104); Victoria, £293,462,072 (of which gold, £289,663,989); Queensland, £99,726,118 (of which gold, £73,739,851); South Australia, £29,761,866 (of which copper, £27,285,052); Western Australia, £107,569,275 (of which gold, £103,850,486); Tasmania, £35,176,277 (of which tin, £11,429,499, copper, £9,816,537); Northern Territory, £2,865,258 (of which gold, £2,043,017). The total value of mineral production in 1911 was £23,480,211, compared with £23,215,191 in 1910 and £23,045,162 in 1909.

The present position of Australia, commercially, is largely due to the discovery of gold, the development of the other industries being, in a country of varied resources, a natural sequence to the acquisition of mineral wealth. The first definite record of the discovery of gold in Australia is a note by James McBrien, assistant surveyor, in a field book which he used while making a survey of the Fish River (New South Wales) between Rydal and Bathurst. The note is dated Feb. 15, 1823. Mention is also made in the early records of New South Wales of several other finds, but it was left for Count Strzelecki (in 1839), and the Rev. W. B. Clarke (in 1841) to demonstrate its existence in payable quantities, which was further substantiated by E. H. Hargraves' discovery in April, 1851, of Lewis Ponds and Summer Hill Creek. The first discovery of gold in Victoria was probably that made by W. Campbell at Clunes in March, 1850. In July, 1851, it was

announced that L. J. Nichel had found gold in the Yarra Ranges, and James Esmond in the Pyrenees Mountains. A few months thereafter many other noted fields in Victoria were opened up, and the gold fever took possession of Australia. The first find in South Australia is believed to have been in 1846, and in Tasmania in 1849. The rush to Canoona, in Queensland, took place in 1858, and though it turned out a failure, it led to the opening of payable fields about the time (1859) of the severance of that territory from New South Wales. Gold appears to have been found in Western Australia as early as 1848, but the first gold field, Kimberley, was not proclaimed until 1886, and the second, Yilgarn, not until 1888. In September, 1892, Bayley made his famous discovery at Coolgardie, and gold production progressed by leaps and bounds until 1903; since then, though the gold mines of Western Australia continue to be the richest in Australasia, their output has gradually declined. It was in 1903 that the maximum output of the Commonwealth was obtained, £16,294,684, of which the share of Western Australia was £8,770,719; the other states obtained their greatest yields as follows: New South Wales, £2,660,946, in 1852; Victoria, £12,214,976, in 1856; Queensland, £2,871,578, in 1900; South Australia (not including Northern Territory), £76,025, in 1904; Tasmania, £327,545, in 1899; Northern Territory, £111,945, in 1881. In the Commonwealth the total gold raised up to the end of 1911 was valued at £536,196,981. The value of the gold produced in each state in 1911 and from the beginning of mining to the end of that year is shown in the following table:

State	In 1911	To end of 1911
New South Wales	£769,353	£58,760,846
Victoria	2,140,855	289,663,989
Queensland	1,640,323	73,739,851
South Australia	15,000	892,810
Western Australia	5,823,075	103,850,486
Tasmania	132,108	7,245,982
Northern Territory	30,910	2,043,017
Commonwealth	£10,551,624	£536,196,981

The first discovery of silver in Australia was probably in 1839 in New South Wales, and the Wheal Gawler mine, near Glen Osmond, South Australia, opened in 1841, was probably the first silver mine worked in the Commonwealth. Silver has since been discovered in all the states, either alone or in the form of sulphides, antimonial and arsenical ores, chloride, bromide, iodide, and chloro-bromide of silver, and argentiferous lead ores, the largest deposits of the metal being found in the last-mentioned form. The largest silver mines are in New South Wales, the output of the other states being comparatively small.

Up to 1882 the quantity of silver won was very limited, but in that and the following year extensive discoveries of the metal—associated principally with lead—were made in various parts of New South Wales, notably at Broken Hill and Silvertown. The Broken Hill field extends over 2500 square miles of country, and has developed into one of the principal mining centres of the world. The lode is the largest yet discovered, and varies in width from 10 to 200 feet. The yield, including the silver lead locally produced and the concentrates exported, of the Broken Hill mines alone, from their inception to Dec. 31, 1911, was over £84,600,000, and the dividends and bonuses paid to the end of that year amounted to £14,554,185. The mine output of silver and lead in the Commonwealth to the end of 1911 was valued at £65,849,880.

Copper in Australia was first discovered at the Kapunda mine in South Australia in 1842. From 1846 copper mining may be said to have been one of the leading industries of that state, the output to the end of 1911 amounting to £27,285,052; for the year 1911 the output was valued at £332,500. In 1911 Queensland held first rank as a copper-producing state, with an output of £1,151,351; Tasmania was second, with £408,649. The production of the Mount Lyell mine in Tasmania has declined in recent years. The output in the Commonwealth to the end of 1911 amounted to £59,149,716, and in that year £2,564,278. The fluctuation in the market value of this metal was for some time a check to the industry, and many of the low-grade mines were compelled to close down.

Tin was first discovered, in New South Wales, probably in 1851. It exists in all the states, but Tasmania contains the richest deposits—the Mount Bischoff being the most celebrated tin mine in Australia. Queensland and Western Australia also possess rich deposits. The value of the tin won in Australia up to Dec. 31, 1911, was £30,227,626, and in that year £1,209,973 (£513,500 in Tasmania, £307,847 in Queensland, and £307,089 in New South Wales).

Iron is distributed throughout the Commonwealth, but want of capital has to a great extent interfered with the progress of the industry. In New South Wales extensive deposits of this ore exist in the Mittagong, Piper's Flat, Goulburn, Queanbeyan, and Port Stephens districts, and at Carcoar and Cadia.

Among the other metals and metalliferous minerals found in the various states may be mentioned aluminium, antimony, bismuth, manganese, platinum, tellurium, lead, mercury, molybdenum, titanium, wolfram, nickel, cobalt, chrome iron or chrome ore, zinc ores, and radioactive ores. The zinc in New South Wales is usually associated with silver, lead, and copper. For many years attention was directed by the

MINERAL PRODUCTION OF THE AUSTRALIAN COMMONWEALTH IN 1911

State	Gold	Silver and lead	Copper	Tin	Zinc	Coal	Total (incl. other)
New South Wales	£769,353	£2,652,548	£590,102	£307,089	£1,414,890	£3,167,165	£9,405,301
Victoria	2,140,855		2,088	3,417	301,142	2,463,865
Queensland	1,640,323	23,460	1,151,351	307,847	313,998	3,658,738
South Australia	15,000		332,500			473,604
Western Australia	5,823,075	15,002	78,118	55,220	189	111,154	6,105,853
Tasmania	132,108	253,381	408,649	513,500	26,214	1,349,497
Northern Territory	30,910	1,470	22,900	59,353
Commonwealth	£10,551,624	£2,767,276	£2,564,278	£1,209,973	£1,415,169	£3,919,673	£23,480,211

Broken Hill mines of New South Wales to the production of a high-grade zinc concentrate from the sulphide ores, but with only fair success. This difficulty was, however, overcome by the dry magnetic separation plant. The zinc output of New South Wales in 1911 amounted to £1,414,980, almost the entire production of the Commonwealth.

Coal was first discovered in New South Wales in 1797, at Coalcliff, on the coast to the north of Wollongong. Later in the same year Lieutenant Shortland discovered the Hunter River, with the coal beds situated at its mouth. It was not, however, until 1826 that coal mining really began. Coal is also mined in Queensland, Victoria, Tasmania, and Western Australia, but the quantity is small compared with the output of New South Wales, which to the end of 1911 was valued at £65,427,673, while that of the Commonwealth was £74,151,686. The total produced in 1911 was 10,550,127 tons, valued at £3,920,672.

The name "kerosene shale" has been applied to a variety of torbanite, cannel, or boghead mineral which occurs in a number of localities in New South Wales. The name "kerosene shale" is, however, an unsatisfactory one, because the mineral has little or none of the character of shale. The output of shale from the mines of this state in 1911 was valued at £36,980.

Of the other non-metalliferous substances, the gems and gemstones take first place. They have been discovered in various parts of Australia, but systematic search has been made principally for the diamond and the noble opal. Diamonds are found in New South Wales, Queensland, and South Australia, but only in the first-named state have any attempts been made to work the diamond drifts, the output to Dec. 31, 1911, being £118,407. Noble opal to the value of £1,295,100 was won in New South Wales from 1890 to 1911. Other gemstones, including the sapphire, emerald, oriental emerald, ruby, amethyst, garnet, chrysolite, topaz, onyx, and zircon, have been found in the various states, but they are not mined to any extent. Plumbago exists in New South Wales and Western Australia; bitumen in Victoria and New South Wales; elaterite, or elastic bitumen, in New South Wales and South Australia.

Common rock salt has been found in rock crevices in several parts of New South Wales, but is not known to exist in quantities sufficiently large to be of commercial importance. Large quantities of salt are obtained from the salt lakes in South Australia.

Marble is found in many parts of New South Wales, Victoria, South Australia, and Tasmania. In the former state quarries have been opened up in several districts, and some very fine specimens of stone obtained.

Limestone is mined in New South Wales and is largely used for the manufacture of hydraulic cement, as well as for fluxing purposes in smelting works. Limestone is also mined in Queensland, South Australia, Tasmania, Victoria, and Western Australia, but is used mainly for fluxing purposes. The production of Portland cement in New South Wales in 1911 was valued at £315,569 (not included in figures given for total mineral output).

Agriculture. In the western half of Australia, save at favored points along the coast, the rainfall is too scant to justify cultivation. The value of the rain is greatly lessened, moreover, by the fact that it falls in torrents and

is mostly carried away at once by the water-courses. Surface streams for irrigation are not plentiful, but there is an unusually large number of subterranean currents; many artesian wells have been bored, particularly in South Australia and western New South Wales and Queensland, and numerous localities have thus been brought under successful cultivation. But as yet most of the western half of Australia lies untouched, while most of the eastern half resembles the western plains of the United States half a century ago, being given over entirely to grazing.

This eastern region has proved second to none anywhere in adaptability to sheep raising. Even the forest areas afford excellent pasturage; and the winters are so mild as not to interfere with grazing the year round. The only serious drawback is an occasional drought. For several years Australia has led the world as a wool producer, and her sheep have been her greatest source of wealth. The highest number of sheep ever reported was in 1891, when the total amounted to 106,421,068, the share falling to New South Wales alone being 61,831,000. Owing to prolonged drought the number fell to 72,040,211 in 1901, and 53,668,347 in 1902. Since then there has been a marked recovery, and at the end of 1911 the number of sheep in the Commonwealth was 93,003,521. Sheep are raised mainly for their wool, the total production of which (in the grease) amounted to 543,495,000 pounds in 1891, 509,902,000 pounds in 1901, 522,062,000 pounds in 1905, and 768,572,533 pounds in 1911. The breed of sheep is steadily improving, as is shown in the increase of the average weight of clip per sheep from less than 4 pounds in 1861 to a little over 7 pounds in 1905, about one-half pound more than in the United States. Formerly little or no mutton was exported, due to the breed of sheep being too valuable as a wool producer and the distance from European markets. But with the improvement of the cross-breeds, which are grown for table use, and the discovery and application of a process of cold storage of the meat for transportation, an export trade has been established which is assuming considerable dimensions.

Cattle are no less favored by the Australian climate than sheep. Queensland and New South Wales are the great cattle-raising states, the former having 42.89 per cent of the total in 1911 and the latter 26.93 per cent. The number of cattle in the Commonwealth increased from 3,724,813 in 1865, to 11,767,488 in 1895. By 1900 the number fell to 8,640,225, but increased to 11,744,714 in 1910 and 11,828,954 in 1911. The exportation of cold-storage beef is much greater than of mutton and is constantly increasing. Dairy farming has been carried on in Australia from a very early period in its settlement, but its mercantile importance began with the manufacture of butter by machinery in the early eighties. Originally the butter factories were mostly private concerns, but they have been superseded by factories owned coöperatively by the farmers. This transformation was largely due to government aid and encouragement. Thus New South Wales engaged the services of a dairy expert, and caused the importation of representative dairy breeds from England. Improved methods of shipping the product have greatly aided the industry. In 1904 there were 1,551,000 dairy cows in the Commonwealth, and in 1911 2,120,659; in the latter year 211,577,745 pounds of butter and 15,886,712 pounds of cheese

were produced, by far the greater part in New South Wales and Victoria. The raising of swine, which is carried on largely in connection with dairy farming, is a big industry and is yearly growing. Horses are bred mainly for local purposes. In 1905 their total number in the Commonwealth was 1,674,790 and 2,279,027 in 1911.

During the decade preceding 1891, in which there was a remarkable growth in sheep raising, land cultivation increased but slightly; but in the subsequent decade the increase was enormous. A change from the pastoral to the agricultural stage was taking place, similar to the transformation on the western plains of the United States. The rate of increase of cultivated land from 1861 to 1901 was twice that of the increase of population; and the area under crop increased from 8,812,463 acres in 1900-01 to 12,107,017 in 1911-12.

the coast of Queensland, and all kinds of temperate-zone fruits farther southward; while the orange, lemon, and fig thrive along almost the whole of the eastern shore line, even as far south as Victoria. The part of the land so far cultivated is but a minute portion of that which is available. Against the disadvantage of remoteness from the world's market, it has the advantage of producing fruits at a season when there is no competition from northern countries.

The different state governments have sought to encourage the development of the crown lands, and the state laws have been adapted to the nature and possibilities of the land and the varying desires and financial conditions of the settler. The terms for acquiring new lands include various kinds of conditional purchases, the instalment plan being in vogue. Sometimes residence is exacted. Certain lands

ACREAGE OF PRINCIPAL CROPS AND TOTAL ACREAGE, 1911-12

State	Wheat	Oats	Corn	Barley	Potatoes	Vines	Fruits	Sugar cane	Hay	Green forage	Total

In the three leading agricultural states—New South Wales, Victoria, and South Australia—wheat in 1911-12 constituted 65.59, 59.45, and 73.88 per cent, respectively, of the total area under crop. Only in Queensland and New South Wales is there sufficient rainfall to assure a crop of corn. The increase in wheat has been proportional to that of the total cultivated area, yet wheat is not a universally successful crop. In places droughts are frequent, and in many localities a long unbroken succession of the one crop has impoverished the soil. The average yield per acre for the Commonwealth has increased; it was 8 bushels in 1899 and about 12 bushels in 1909, while for the 10 years ended in 1912 the average was 10.48 bushels. Sugar cane is already by far the foremost crop of Queensland and is important in New South Wales. Australia now produces nearly all the sugar it needs. Wine, especially in Victoria and South Australia, is an important product. The cultivation of cotton has been tried in Queensland, but without marked success. Coffee and bananas are successfully grown on

may be acquired by annual lease. (For a more detailed statement, see articles on the different states.) All the states encourage suitable immigration. The various agents-general in London do their utmost to place before the inhabitants of the British Isles the advantages offered by Australia.

Manufactures. The establishment of a Commonwealth tariff, Oct. 4, 1901, gave to the Australian manufacturer the whole of Australia for a market instead of his own state, with the result that manufactures increased considerably. A successful effort has been made to establish the manufacture of iron, and large works are in operation at Lithgow, New South Wales. Many other industries, too, are showing great activity, notably boot manufacturing, Australia now making nearly all the boots and shoes her people require.

The progress of the manufacturing industry in Australia is somewhat irregular even in the more advanced states. The majority of the manufactories may be classified as domestic industries—i.e., industries naturally arising from

the circumstances of the population, or connected with the treatment of perishable products; but there is nevertheless a fair number of firmly established industries of a more complex character.

The value of the output of manufacturing industries (including the value of the raw materials) was as follows in 1907 and 1911:

State	1907	1911
New South Wales	£37,231,012	£54,346,011
Victoria	29,693,634	41,747,863
Queensland	11,209,515	15,675,662
South Australia	8,923,004	12,580,851
Western Australia		5,311,086
Tasmania		3,525,087
Commonwealth		£133,186,560

The value of the output in 1911 was made up as follows: Raw materials used, £79,041,576; fuel and light, £2,752,950; salaries and wages, £27,531,876; all other expenditure, interest, and profits, £23,860,158.

In 1911 there were 14,455 manufacturing establishments in the Commonwealth, employing (an average number of) 311,772 hands.

Railways. One of the most serious problems with which Australia has had to contend is inland transportation. Being an almost riverless continent, she is mainly dependent on artificial systems. These must largely precede civilization and open up the country for industrial development. The construction of railways through uninhabited or sparsely settled regions necessitated an enormous cash outlay in the face of a light estimate of immediate returns and an uncertainty as to the ultimate outcome. This burden and responsibility were assumed by the government itself. It has sought to further the development of the country and at the same time reap the benefits of the growth occasioned by the construction, ownership, and management of its own railways. As a result, in 1912 only 1779 miles of railway remained in private hands. The cost of construction and equipment of government railways, aggregating 16,898 miles, up to June 30, 1912, was £160,557,160. After the interest and running expenses have been paid, the balance, if any, goes to the consolidated revenue fund; on the other hand, if there is a deficiency it is met from the ordinary state revenue.

Victoria, in 1883, and subsequently South Australia, New South Wales, and Queensland, took the control of the railways out of the hands of the minister of railways or public works, and vested it in special commissions or commissioners. The government administration of railways has not been entirely free from grave faults and wasteful undertakings, yet it has advanced the settlement of the country in a way that could never have been expected from private enterprise. Thus, not only have cheap passenger and freight rates been secured, but new industries have been fostered by special freight rates, and various emergencies have been met, such as the transportation of sheep to watering places in times of drought. The employees enjoy an eight-hour law and receive comparatively high wages. For the year ended June 30, 1912, the gross revenue on government lines was £19,101,000, the working expenses £12,471,000, and the percentage of working expenses to gross

earnings 65.29. The following table shows the total railway mileage, for government lines June 30, 1912, for private lines Dec. 31, 1911 (a, government lines; b, private lines available for general traffic; c, total open for general traffic; d, private lines used for special purposes only, e, grand total):

State	a	b	c	d	e
New South Wales	3,832	141	3,973	125	4,098
Victoria	3,622	14	3,636	37	3,673
Queensland	4,266	346	4,612	21	4,633
South Australia	1,939	277	1,939	58	1,997
Western Australia	2,598	346	2,875	555	3,430
Tasmania	496	166	662	39	701
Northern Territory	145		145		145
Commonwealth	10,898	944	17,842	835	18,677

The mileage in 1912, the estimated population per mile, and the area (in square miles) per mile are shown below:

State	Mileage	Pop	Area
New South Wales *	4,098	457	78.1
Victoria	3,673	372	24.1
Queensland	4,633	137	145.3
South Australia	1,997	216	196.0
Western Australia	3,430	105	339.4
Tasmania	701	287	39.6
Northern Territory	145	23	3,602.7
Commonwealth	18,677	260	166.7

* Including Federal Capital Territory.

Telegraphs and Telephones. The telegraph and the telephone systems are in the hands of the government, and progress in their development has been very rapid. The first telegraph for public use was established in 1854, from Melbourne to Williamstown. In 1871 there were about 11,500 miles of line, exclusive of railway telegraphs; in 1881, 25,470 miles; in 1901, 41,951 miles; in 1911, 44,013 miles of line, with 97,053 miles of wire. There are now north and south and east and west lines across the continent. A cable connects Darwin with Java, and through that with the European cables; another connection is made through a wire extending from Broome, Western Australia, to Banjuwangi. There is also the Pacific cable which connects Southport, Queensland, and Norfolk Island, thence to Fiji, Fanning Island, and Vancouver. The states on the mainland are all connected by electric telegraph, and Tasmania and New Zealand are connected to Australia by submarine cable.

Under the Wireless Telegraphy Act of 1905 the Postmaster-General has the exclusive privilege of establishing wireless-telegraphy stations within Australia; he is empowered, however, to grant licenses for the establishment and use of such stations. The first official wireless station was opened at Melbourne in February, 1912. Up to the end of 1912 the Commonwealth government had given approval for the erection of 19 stations, at or near the following localities: Port Moresby, Thursday Island, Cooktown, Townsville, Rockhampton, Brisbane, Sydney, Gabo Island, Melbourne, Hobart, Mount Gambier, Adelaide, Esperance, Perth, Geraldton, Broome, Roeburne, Wyndham, and Darwin. It was expected that all of these stations would be in operation by the end of June, 1913. Even-

tually the number of stations is to be increased to 32.

Commerce. Producing raw material so largely and manufactured products so little, Australia has an enormous foreign trade, exceeding all other countries in her per capita production and all except Belgium in the per capita value of her trade. One of the results of a federal tariff has been an increase in manufactures and the number of hands employed. Still so marked has been the increase in production, the external trade has increased and not diminished. The total oversea shipping entered and cleared at the ports of the Commonwealth is stated at 52,414 tons in 1831, 1,149,476 in 1861, 4,726,307 in 1891, 6,541,991 in 1901, and 9,984,801 in 1911. In 1911 the entrances aggregated 4,993,220 tons (of which 3,159,738 from British countries), and the clearances 4,991,581 (of which 3,215,158 to British countries); the percentage of British (including colonial) shipping was 74.18, and of foreign shipping 25.82. The interstate shipping entered and cleared in 1911 amounted to 23,167,747 tons, of which 6,528,328 were credited to New South Wales, 6,193,082 to Victoria, 4,313,759 to South Australia, 2,682,159 to Western Australia, 1,695,828 to Queensland, 1,623,716 to Tasmania, and 130,875 to Northern Territory.

The development of Australian foreign commerce may be seen in the following table, wherein are indicated total imports; domestic exports, or exports of Australian produce; re-exports, or exports of foreign produce; total exports:

	Tot. imp.	Dom. exp.	Reexp.	Tot. exp.
1901	£42,433,810	£47,741,776	£1,954,396	£49,696,172
1907	51,809,033	69,818,500	3,007,747	72,824,247
1908	39,799,273	62,118,903	2,192,155	64,311,058
1909	51,171,896	62,843,711	2,475,125	65,318,836
1910	60,014,351	71,836,195	2,654,955	74,491,150
1911	66,967,488	76,205,210	3,277,048	79,482,258

Specie and bullion included in figures above:

	£	\$	£	\$
1901	£934,864	£14,423,298	£846,921	£15,270,219
1907	1,834,200	9,713,190	1,474,270	11,187,460
1908	1,190,352	13,526,398	663,822	14,190,220
1909	1,056,375	7,580,158	1,100,126	8,680,284
1910	1,331,000	3,587,201	1,048,076	4,635,277
1911	1,969,581	10,403,796	1,643,290	12,047,086

The principal classes of imports, with values for 1911, are as follows (in parentheses is shown the value of imported products of the United Kingdom): Apparel, textiles, etc., including boots and shoes, £17,840,496 (£11,462,927); manufactures of metals, including machinery, £14,211,581 (£8,507,499); paper and stationery, £2,831,808 (£1,651,715); drugs, chemicals, fertilizers, etc., £2,178,600 (£896,921); alcoholic liquors, etc., £1,920,824 (£1,138,158); jewelry, timepieces, fancy goods, £1,755,583 (£611,355); leather and manufactures thereof and substitutes therefor, including rubber (excluding boots and shoes), £1,586,503 (£544,583); metals unmanufactured and partly manufactured, mainly pig iron and bar and rod iron (excluding specie and bullion), £1,519,133 (£928,172); earthenware, cements, glass, etc., £1,228,122 (£553,817); foodstuffs of animal origin, £816,915 (£266,740). The foregoing imports aggregate £45,889,565, of which the value of £26,561,887 represents produce of the United Kingdom, £5,106,062 of Germany, £4,894,909 of the United States, and £1,868,774 of France. The total imports (less specie and bullion) in 1911 amounted to £64,997,907, of

which £32,365,588 (49.80 per cent) produce of the United Kingdom, £9,007,065 (13.68 per cent) of the United States, £6,363,248 (9.79 per cent) of Germany, £2,268,692 (3.49 per cent) of France, and £1,141,075 (1.75 per cent) of Belgium. In respect of point of shipment, 60.28 per cent of the imports in 1911 came from the United Kingdom, 11.93 per cent from the United States, and 6.82 per cent from Germany.

Of Australian produce, exported to the value of £76,205,210 in 1911, the more important classes of exports are: Animal substances, £29,714,471 (exclusive of animal foodstuffs, £9,015,505); vegetable foodstuffs, £11,910,303; metals unmanufactured, ores, etc., £10,674,748; specie, £8,210,595; oils, etc., £2,234,884. The exports of wool in the grease in 1911 were 578,823,623 pounds and of scoured and washed wool 71,770,640 pounds, the total valued at £26,071,193. The export of wheat was 55,147,840 bushels, and of flour 175,891 tons, representing 8,794,550 bushels of wheat.

Total imports and total exports in 1911 amounted to £66,967,488 and £79,482,258, respectively. Direct total imports from and direct total exports to the United Kingdom were valued at £39,499,011 and £35,309,982 (58.98 and 44.42 per cent); United States, £7,747,991 and £1,464,155 (13.45 and 1.84); Germany, £4,437,153 and £6,642,012 (6.63 and 8.36); Belgium, £2,007,557 and £6,111,943 (3.00 and 7.69); France, £614,045 and £8,180,084 (0.92 and 10.30).

Banks. The banks number 23, most of which have numerous branches throughout the Commonwealth, the total number of banking establishments in 1912 being 2043. The paid-up capital June 30, 1912, was £28,647,884, with reserved profits amounting to £12,419,733; total liabilities, £152,218,589 (deposits £149,806,597); total assets, £165,771,256 (specie and bullion, £28,686,012). The savings banks are either government or quasi-government institutions. Their number, including branches and agencies, at the middle of 1912, was 1941; depositors, 1,736,004 (1,258,689 in 1907); deposits, £66,956,778 (£42,098,289 in 1907). The average amount per depositor in savings banks in 1912 was £38 11s. 4d., and per head of population, £14 8s. 4d. Of the deposits, £25,361,338 were in New South Wales and £19,662,465 in Victoria.

Government. The Commonwealth of Australia is a federal state under the supreme authority of the crown of Great Britain, and was so constituted on Jan. 1, 1901, by the union of the British colonies of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania. The provisions of the federal constitution will be found treated in detail under AUSTRALIAN FEDERATION.

Defense. The Australian states have always been opposed to the maintenance of a standing army; the principal ports are protected by fortifications, and forts have been constructed at King George's Sound and Thursday Island. On June 30, 1912, the strength of the Commonwealth military forces was 23,696, comprising: permanently employed, 2234; citizen soldiers, 21,127; volunteers, 121; and area officers, 213. Infantry numbered 10,148; light horse, 5613; field artillery, 1626; garrison artillery, 1954; and engineers, 1206. In addition to the 23,696, there were land forces to the number of 146,352, including 92,277 "senior cadets," and rifle clubs numbering 50,621 men. Total land forces, 168,048.

By an agreement of 1903 (subsequently amended), Australian naval defense has been maintained by ships of the Imperial navy, consisting of one first-class armored cruiser, three second-class cruisers, and five third-class cruisers. To take the place of this squadron it was decided in 1909 to create a naval force Australian in character. By June, 1912, three destroyers, each of 700 tons' displacement, were in commission. The battle cruiser *Australia*, commissioned in 1913, has a displacement of about 19,200 tons, 26 knots' speed, an 8-inch armor belt amidships, and a 4-inch belt at the ends, and an armament of 8 12-inch and 16 4-inch guns, and 5 torpedo tubes. The second-class cruisers *Sydney* and *Melbourne* arrived in Australian waters in 1913, while a third cruiser of the same class, the *Brisbane*, was under construction. In 1913 the British Admiralty presented the Commonwealth with the cruiser *Pioneer*. While on the Australian station the warships are under the exclusive control of the Commonwealth in time of peace, but pass under Imperial control if required for war purposes. A navy yard is maintained at Sydney, and a naval college is to be established on federal territory at Jervis Bay. On June 30, 1912, the naval forces numbered 4969, of whom 3983 were reserves.

Finance. The different state governments of Australia have ventured farther into the industrial field than any of the older governments of the world, in consequence of which their annual revenues and expenditures attain a disproportionately large figure. The consolidated revenue of the Commonwealth increased from £11,296,985 in 1901-02 to £15,019,034 in 1907-08 and £20,548,520 in 1911-12; while the expenditure in 1907-08 was £6,162,129 and in 1911-12 £14,724,097. Per capita expenditure in the latter year, £3 4s. 6d. About two-thirds of the revenue is derived from customs. The surplus of revenue over expenditure is apportioned among the states. The Commonwealth debt, contracted in 1911 and 1912, amounted at the middle of the latter year to £6,371,847.

The total state revenues increased from £34,867,646 in 1907-08 to £41,278,034 in 1911-12, while the expenditure rose from £32,502,163 to £40,858,581. Per capita expenditure of the states in the latter year, £8 18s. 10d. Revenue and expenditure, respectively, of the several states in 1911-12: New South Wales, £15,776,816 and £15,277,001; Victoria, £10,009,796 and £9,999,342; Queensland, £5,989,347 and £5,965,692; South Australia, £4,450,739 and £4,450,739; Western Australia, £3,966,673 and £4,101,082; Tasmania, £1,084,663 and £1,064,725. The gross public debt June 30, 1912, £277,124,095; sinking funds, £5,701,767; net debt, £271,422,328; net debt per capita, £58 10s. 3d. Of the total net debt the share of New South Wales was £99,398,654; Victoria, £59,605,685; Queensland, £47,053,186; South Australia, £31,118,574; Western Australia, £23,364,790; Tasmania, £10,881,489. For further financial details of the states, see separate articles.

The foreign indebtedness of Australia appears still greater when the fact is considered that British capital has been put into private undertakings within the states to an enormous extent.

Population. The estimated population of Australia at the end of 1788, the year of the first settlement, was 859 (not including aborigines); at the end of 1800 it was 5217; in 1825

it had increased to 52,505; in 1840, 190,408; in 1850, 405,356; in 1860, 1,145,585; in 1870, 1,647,756. The census of 1881 showed a population (exclusive of full-blooded aborigines) of 2,250,194 (with a masculinity, i.e., number of males per 100 females of 117.35); census of 1891, 3,174,392 (115.89); census of 1901, 3,773,801 (110.14); census of April 3, 1911, 4,455,005 (107.99). The increase per cent in the decade ended with 1860 was 182.61; 1861-70, 43.84; 1871-80, 35.43; 1881-90, 41.22; 1891-1900, 19.48; 1901-10, 17.52. The population by states at the last two censuses was as follows.

State	Sq. miles	Pop. 1901	Pop. 1911
New South Wales	309,460	*1,354,846	1,646,734
Victoria	87,884	1,201,070	1,315,551
Queensland	670,500	498,129	605,813
South Australia	380,070	†363,157	408,558
Western Australia	975,920	184,124	282,114
Tasmania	26,215	172,475	191,211
Northern Territory	523,620		3,310
Federal Cap. Ter.	912		1,714
Commonwealth	2,974,581	3,773,801	4,455,005

* Including Federal Capital Territory.

† Including Northern Territory.

The foregoing table does not include full-blooded aborigines. Such of these as were living in a civilized or semi-civilized condition in proximity to whites were enumerated at the 1911 census and numbered 19,939. The total number of aborigines is unknown, but a general opinion that it was about 150,000 long prevailed. Recent estimates, however, place the total at less than 100,000. Thus, in his report of June, 1910, the Queensland chief protector of aborigines estimates the total at 74,753, distributed as follows: New South Wales, 6897; Victoria, 256; Queensland, 20,000; South Australia (including Northern Territory), 20,600; Western Australia, 27,000. It is believed that the aborigines are gradually decreasing in number. The last aborigine in Tasmania died in May, 1876.

The immigrant races consist mainly of natives of the United Kingdom and their descendants. The population of Australian born has in recent years increased rapidly, and at the 1911 census, out of a total of 4,424,537 persons whose birthplaces were specified, 3,667,672, or 82.90 per cent, were Australian born, while of the remainder, 591,729, or 13.37 per cent, were natives of the United Kingdom, and 31,368, or 0.72 per cent, were natives of New Zealand; i.e., 96.99 per cent of the population were born either in Australasia or the United Kingdom. The other birthplaces most largely represented were: Germany, 32,990 (0.75 per cent); China, 20,775 (0.47); Scandinavia (Sweden, Norway, and Denmark), 14,706 (0.33); Polynesia, 3410 (0.08); British India, 6644 (0.15); the United States, 6642 (0.15); and Italy, 6719 (0.15). The total population of Asiatic birth was 36,442 (0.82 per cent), of whom 3474 were born in Japan.

The 1911 census showed 1,409,823 persons under 15 years of age, 2,854,753 persons 15 and under 65, and 190,429 persons 65 and over. The number of males was 2,213,035; females, 2,141,970. Persons never married numbered 2,783,543; married, 1,469,622; widowed, 191,743; divorced, 4500; not stated, 5597.

According to religion the population was classified as follows in 1911: Church of England, 1,710,443; Presbyterian, 558,336; Methodist,

547,806; Baptist, 97,074; Congregational, 74,046; Lutheran, 72,395; Church of Christ, 38,748; Salvation Army, 26,665; Seventh-Day Adventist, 6095; Unitarian, 2175; Protestant (undefined), 109,861; Roman Catholic, 921,425; Greek Catholic, 2646; Catholic (undefined), 75,379; others, 31,320 (total Christian, 4,274,414); Hebrew, 17,287; Confucian, 5194; Mohammedan, 3908; Buddhist, 3269; pagan, 1447; others, 5680 (total non-Christian, 36,785); indefinite, 14,673; no religion, 10,016; object to state, 83,003, unspecified, 36,114; total, 4,455,005.

According to occupation the 1911 census classified the people as follows: Professional, 144,611; domestic, 201,366; commercial, 286,687; transport and communication, 157,391; industrial, 562,337; primary producers, 586,148; indefinite (of independent means), 23,055; dependents, 2,449,986; unspecified, 43,424; total, 4,455,005. The primary producers included 284,700 persons engaged in agriculture; pastoral pursuits, 151,864; hunting, 4793; fisheries, 7805; forestry, 24,405; water conservation and supply, 6780; mining and quarrying, 105,804; total, 586,148. The dependents included 2,441,047 persons dependent on natural guardians, 8587 supported by voluntary and state contributions, and 352 under legal detention; total, 2,449,986.

The population of Australia has shown an excessive tendency to accumulate in the capital cities. In every state the population of the capital far outnumbers that of any other town therein and ranges between 21 and 46 per cent of the entire population of the state. The 1911 census shows that, out of a total population of 4,455,005, 1,694,400, or 38.05 per cent, were in the six capital cities and suburbs. This immense proportion of metropolitan population, implying a deficiency of primary producers in agriculture, indicates an imperfect economic development. As compared with Australia's 38.05 per cent, in New Zealand the percentage of the population of the capital (Wellington) on the total for the Dominion was 7.01. Population of the capital cities and their suburbs, with percentage on total of state (1911): Sydney (N. S. W.), 629,503 (38.19); Melbourne (Vic.), 588,971 (44.82); Brisbane (Qld.), 139,480 (23.03), Adelaide (S. A.), 189,646 (46.06); Perth (W. A.), 106,792 (37.86); Hobart (Tas.), 39,937 (20.87). Darwin, capital of Northern Territory, had 958 inhabitants, or 28.94 per cent of the total.

The statistics of town population as returned by the 1911 census, relate first to localities as defined by the residents therein and second to local government areas. No clearly defined boundary exists for a "locality," and the population given represents the number of persons who returned themselves as belonging thereto; a "local government area" is a district having fixed limits and incorporated for municipal purposes. The following figures show town population, first as a "locality" and second as a "local government area," April 3, 1911: Sydney (N. S. W.), 107,133 and 112,921; Melbourne (Vic.), 38,293 and 103,593; Prahran (Vic.), 25,489 and 45,367; Adelaide (S. A.), 32,981 and 42,294; Richmond (Vic.), 38,559 and 40,442; Perth (W. A.), 31,300 and 35,767; Brisbane (Qld.), 17,715 and 35,491; North Sydney (N. S. W.), 32,764 and 34,646; South Brisbane (Qld.), 21,332 and 34,478; Fitzroy (Vic.), 34,141 and 34,283; Brunswick (Vic.), 32,201 and 32,215; Balmain (N. S. W.), 31,961 and 32,038; Broken

Hill (N. S. W.), 30,953 and 30,972; Marriekville (N. S. W.), 25,993 and 30,653; Bendigo (Vic.), 17,883 and 28,539; Hobart (Tas.), 27,505 and 27,526; Newtown (N. S. W.), 26,427 and 26,498; St. Kilda (Vic.), 25,499 and 25,334; Hawthorn (Vic.), 24,353 and 24,450; Redfern (N. S. W.), 24,275 and 24,427; Paddington (N. S. W.), 24,150 and 24,317; Leichhardt (N. S. W.), 24,139 and 24,254; Port Adelaide (S. A.), 3386 and 24,015; Essendon (Vic.), 10,087 and 23,740; Footscray (Vic.), 21,933 and 23,643; Unley (S. A.), 4397 and 23,773; Ballarat (Vic.), 38,686 and 22,017.

Immigration. The discovery of gold has done more than any other factor to attract immigration from abroad and from one state to another. An illustration of this is the remarkable development of Victoria in the decade following 1850 and of Western Australia from 1891 to 1901. The assistance rendered to immigrants by the state governments has been of importance, the states having borne the expenses in whole or in part of 725,983 immigrants up to the end of 1911. The conditions for acquiring land have been most favorable. The net immigration, or excess of arrivals over departures, has been as follows: 1861 to 1865, 31,762; 1866-70, 47,714; 1871-75, 40,326; 1876-80, 83,869; 1881-85, 148,367; 1886-90, 95,917; 1891-95, 15,660; 1896-1900, -945; 1901-05, -7177; 1906-10, 37,999; 1911, 46,695; total, 540,187. From 1861 to the end of 1911 the excess of arrivals over departures was 246,591 in New South Wales, 191,498 in Queensland, 126,404 in Western Australia, and 16,524 in South Australia; while in Victoria, Tasmania, and Northern Territory, there were excesses of departures over arrivals numbering respectively 32,195, 7626, and 1096. Australia is not so attractive as formerly to European settlers, while at the same time the Australians discourage Asiatic and other colored immigration. The immigration of Pacific Islanders ceased by law after March 31, 1904, and all agreements for their employment terminated on Dec. 31, 1906, when all Pacific Islanders found in Australia were deported. As the result of federal legislation limiting and ultimately excluding Kanaka labor in the cane fields, it has been found that it is quite possible to carry on the cultivation of sugar cane with white labor.

Religion. In the first days of Australian settlement the Church of England was the only church recognized and aided by the government. Later, state aid was extended to the Roman Catholics, Presbyterians, and Wesleyans, and offered to certain other denominations, which refused to accept it. The Church of England, which greatly outnumbers the others in all the states, has six dioceses in New South Wales, five in Victoria, four in Queensland, three in Western Australia, and one each in South Australia, Tasmania, and New Guinea. There is a General Synod, which convenes every five years. The Roman Catholic church has seven dioceses in New South Wales, four in Victoria, two dioceses and one vicariate in Queensland, two dioceses in South Australia, two dioceses and one vicariate in Western Australia, one diocese in Tasmania, and a vicariate in New Guinea. Formerly the Wesleyan Methodists, Primitive Methodists, and the United Methodist Free Church were all separate bodies. They are now united under the name of the Methodist Church of Australasia. For statistics of population by religion, see *Population*.

Education. In the early days of the states, education was provided for by state-aided religions, by organizations of various denominations, and by tuition fees exacted from the pupils. In time education was made secular and free. In Tasmania nominal fees are still charged, yet not required in cases of inability to pay. Religious instruction is provided for in state schools, but only outside of regular school hours. It is given by a clergyman instead of by regular teachers and is subject to the desire of parents. The Roman Catholics, however, maintain their own schools, in all the states, in which the teachers are members of the various religious orders. Education is compulsory in all the states, and the strict enforcement of the law in late years has produced a marked improvement in the attendance. The following table shows the number of state and private schools, pupils, and teachers, and the expenditure on state school maintenance in 1911:

State	State schools	Teachers	Enrollment	Average attendance	Maintenance	Private schools	Enrollment
New South Wales.....	3,125	5,980	223,603	160,776	£1,048,584	756	60,968
Victoria	2,061	5,155	204,086	146,464	834,276	587	55,898
Queensland	1,232	2,733	91,624	70,194	351,942	141	16,100
South Australia	736	1,241	55,662	38,724	198,979	176	11,650
Western Australia.....	495	1,043	34,969	29,448	187,301	123	9,000
Tasmania	381	816	28,821	18,130	84,317	114	7,138
Northern Territory.....	3	3	85	60	629	1	50
Commonwealth.....	8,033	16,971	638,850	463,799	£2,706,208	1,898	160,794
1901	638,478	450,246	1,816,296	..	124,485

High schools and grammar schools are maintained by the states and a number of scholarships are available in the various universities for the successful pupils. Throughout the Commonwealth there are a large number of colleges, providing secondary education, some of which are subsidized by the states, and the majority maintained by the various denominations. Technical education is now given in all the capitals and in most of the larger towns, and some of the technical colleges are amongst the finest educational establishments in the Commonwealth. University instruction is partly supported by the states. Sydney University was opened in 1851, Melbourne in 1855, and Adelaide in 1876. The University of Tasmania was founded at Hobart and Launceston in 1890. In 1911 a university was opened at Brisbane (Queensland) and in 1913 one at Perth, Western Australia.

State Activity and Social Conditions. Especial interest attaches to Australia because of the wide scope of its state activities. In this respect Australia excels the older countries of the world, a number of its governmental ventures not having been elsewhere attempted, being generally held to be without the proper province of the state. It is, therefore, being closely watched, and the results attained are destined to have a far-reaching influence. The most important of these activities comprehend the construction, ownership, and control of railways and tramways; the construction and maintenance of highways; the surveying of all country roads; the ownership and control of telegraph and telephone lines as a part of the postal system; government savings banks, state banks; irrigation, including the boring of numerous artesian wells; supplying watering places for cattle and water to mines; assisting agriculture by granting reduced freight rates on government

railways in the transportation of seeds and implements, or of cattle in time of drought; appropriating large sums for the furthering of agriculture in various other ways, such as the extermination of injurious animals and insects.

The states have also advanced loans to farmers and granted bounties to producers of butter and cheese and to fruit growers, etc. The paying of bounties is not limited to agriculture. They are liberally resorted to in all cases where it is believed that a new industry or a useful departure may be thus established. South Australia manufactures wine and also runs a cyanide plant. Western Australia has state batteries for treating the ores from her mines. New South Wales, Victoria, and South Australia have cold storage for perishable exports. Tasmania exports timber. Old-age pension systems adopted by New South Wales, Victoria, and Queensland were superseded July 1, 1909, by an act passed by the Commonwealth Parliament

providing for old-age pensions throughout Australia. The number of pensions existing June 20, 1912, was 79,071. A Commonwealth act effective from Oct. 10, 1912, provided for an allowance of five pounds to every white woman who gives birth to a child. Claims for such allowance were granted to the number of 59,169 from Oct. 12, 1912, to April 26, 1913. The municipal activities have been very limited compared with those of the state.

Titled aristocracy and hereditary class distinctions are recognized in Australia as elsewhere in the British Empire. The British crown confers honors on public men and has initiated the practice of creating local baronetcies, which are hereditary class distinctions. There are no 'poor rates,' but the government often finds employment for the able-bodied. Numerous hospitals are maintained by the government. State aid is given to private philanthropic institutions, and there are a number of charities wholly supported by private philanthropy.

The Aborigines. The Australian aborigines, whom most ethnologists would rank as a separate race of mankind, are middle-sized, the average stature of Central Australian males being 166.3 cm.; they are less strongly and massively built than the European generally, long-headed, with depressed nose and wide nostrils, large mouth, thick lips, etc.; features suggesting now the Negroid, now the Caucasian type. The color of the skin is dark, running all the way from a yellowish tint to a pronounced chocolate-brown. The hair, with which the Australians are well provided on body and face, is black and straight or wavy generally, sometimes curly, but never woolly. Beneath an apparent physical unity all over the continent lurks considerable variation, which, like the ensemble of the Australians, may in part be due, as Ratzel

AUSTRALIAN ABORIGINES

1. MAN OF NEW SOUTH WALES.
2. WOMAN OF NEW SOUTH WALES, showing scar-tattooing.
3. A SHIELD, front, back and side views.
4. BARK CANOES.
5. TREE, showing outline of canoe on bark, before cutting.

6. MAN OF QUEENSLAND.
7. MAN OF SOUTH AUSTRALIA.
8. MAN OF NORTH AUSTRALIA, with spear, axe and club.

10. MESSAGE STICKS.

holds, to poor nutrition (the common condition of man in this habitat) and in part to prehistoric and historic race-intixture with primitive South Asiatics, Malays, Papuans, etc. Huxley (1870) believed that one of the earliest races of prehistoric Europe was Australoid in type, and other ethnologists down to Keane (1896), Giuffrida-Ruggeri, and Schoetensack (1901) consider the Australians on somatic evidence related to the men of Spy and Neanderthal, in Quaternary Europe.

Linguistically the Australians present great internal variation. According to Father Wm. Schmidt's recent researches, the homogeneity formerly assumed to characterize all Australian languages prevails only in the southern half of the continent, where there is great uniformity, both in grammar and vocabulary. On the other hand, the very much smaller area extending from Roebuck Bay in the west to Cape Flattery in the east, and nowhere including territory south of the twentieth degree south latitude, except in the Arunta district, is occupied by tribes whose languages are not at all related to those of the southern group. Indeed, these North Australian languages differ very considerably from one another, revealing no lexical resemblance and very few grammatical ones. Even a classification based on the most general phonetic traits must recognize three distinct linguistic groups. So far as outside relations of Australian languages are concerned, a remote connection with Papuan tongues seems possible, while any affinity with the Malayo-Polynesian stock is out of the question. Sociologically, the most noteworthy things are the complicated marriage systems, the numerous and elaborate initiation ceremonies for youth, the corroboree-dance, and the totem system, recent study of which has shed much light upon primitive religion. In the way of inventions, their methods of tree climbing, the boomerang and the throwing stick, the waddy (club), their message sticks (with the beginnings of writing), and shamans' staffs, are to be mentioned. Their ground and tree drawings, rock pictures, etc., are of great interest. Pottery is unknown, and few of the rudiments of agriculture are present. The case against the Australians as a degenerate race is not made out. See TASMANIA.

Exploration. The fact that the earliest known manuscript maps of Australia are the work of French cartographers would suggest that French navigators were the first to visit those coasts. In 1521 there were indications of a southern continent on maps drawn by La Salle and the German Schöner. Ten years later the land mass begins to take more definite shape on the map of Orontius Finaeus, of Provence, and by 1542, on the maps of Jean Rotz, the outline begins to conform distinctly to what we now know as Australia. There are, however, no other surviving records of voyages to that region, and it is practically certain that the Sieur de Gonneville and Capt. Jean Parmentier, the only Frenchmen who are known to have sailed the eastern seas thus early (1529), did not go beyond Sumatra. It is probable that the maps were drawn from information obtained from Portuguese sources, although the earliest extant account of a voyage which may have reached Australia, that of the pilot Gaetan, was made in 1545.

The first authenticated voyage to Australia was made by the Dutch in 1606, although there are good reasons for thinking that five years

earlier (1601) Manoel Godinho de Eredia, a learned and skillful Portuguese navigator, who had been commissioned by the Viceroy Ayres de Saldanha to verify reports derived from the Malayans of a large land toward the south, saw the continent. There is, however, no uncertainty about the voyage of the Dutch yacht, the *Duyfken* or *Dove*, which sailed from Bantam, in Java, Nov. 18, 1605, and coasted southward from New Guinea along the west side of the York Peninsula in the Gulf of Carpentaria to Cape Keerweer or Turnagain (14° S.). As he was back at Banda, in the Moluccas, in June, 1606, the commander of the *Duyfken* is supposed to have made the first recorded observation of the Australian coast about March of that year. Later in this same year Luys Vaez de Torres, who commanded one of the ships in a Spanish squadron which had been ordered from Callao, Peru, to make exploration in the eastern seas, became separated from the other vessels and continued his voyage westward, touching the east end of New Guinea, and then passing through the strait to which his name has been given. He touched the north coast of Australia at several points, but, finding only an unsafe shore and savage natives, he did not follow it far. During the next 30 years the Dutch pursued the exploration of the west coast of Australia with as much industry as the Portuguese had displayed in exploring that of Africa a century and a half earlier. In 1616 Dirk Hartog, in the *Endraught*, discovered the land which is named after his ship, and the cape and roadstead to which his own name has been given. Jan Edels left his name on the west coast in 1619, and in 1622 the ship *Leeuwin* or *Lioness* reached the point on the west coast to which its name is still attached. Five years later Peter de Nuyts sailed along the south coast, and the same year Carpenter, in the Dutch service, entered the Gulf of Carpentaria. Abel Jansen Tasman was sent out from Batavia in 1642 to investigate the real extent of the Southern Land. Going wide of Cape Leeuwin, he hit upon the land to which he gave the name of the Governor-General at Batavia, Van Diemen's Land, which is now more generally known as Tasmania. Tasman kept on, and by sailing east proved that there was no connection between this land, which he supposed joined with the Australian continent, and the greater continent about the southern pole. He touched New Zealand and then returned to Batavia, having settled many of the geographical problems regarding this part of the world. Two years later Tasman probably continued his explorations in the neighborhood of the Gulf of Carpentaria, and, it was at this time that the name "New Holland" was given to the continent. This name continued to be the one most commonly used until the middle of the nineteenth century, when the name "Australia," probably first suggested by Matthew Flinders in his *Voyage to Terra Australis*, began to supplant it.

Capt. James Cook, commanding the *Endeavour*, was sent to Tahiti to observe the transit of Venus on June 3, 1769. This successfully accomplished, he continued to New Zealand, passing through the strait which bears his name. On April 19, 1770, he reached a land hitherto unknown to the map makers, and the naturalist of his party, Joseph Banks, found in the neighborhood of their anchorage so many specimens of plants entirely new to science that they named

the place Botany Bay. Cook coasted north, almost losing his ship on the Great Barrier Reef, but by keeping inside along the coast until he had passed Endeavor Strait he proved that this land was distinct from New Guinea. He gave the name of New South Wales to the land he had coasted, from some resemblance that he saw to the shores about the English Swansea. Returning to England, Cook was sent out again in 1772 to continue his explorations. Cook's reports led to talk of settling the southern continent and claiming it for England. In 1788 Captain Phillip landed some convicts at Botany Bay, where Sydney now is, and from this time on the English have steadily stretched out along the coasts and inland. In 1797 a naval surgeon named Bass started south with six men in a whaleboat from Port Jackson and proved the existence of open water, now called by his name, between the continent and Tasmania. One of Bass's companions, two years later, sailed eastward from Cape Leeuwin along the southern coast. At Encounter Bay he met a French ship and named the spot from the incident. He proceeded as far as Port Phillip. The Australian coast line was all practically determined when, in 1822, Capt. P. P. King completed his five-year voyages of investigation of the river mouths of the continent.

The successful exploration of the interior began with Lawson, Blaxland, and Wentworth's journey across the Blue Mountains of the east coast in 1813, to the fertile plateau beyond. The next year Evans discovered the Lachlan and Macquarie rivers and penetrated the Bathurst plains. Captain Sturt, in 1818-29, succeeded in dispelling the notion which had gained currency of a great inland sea, but in its place he substituted the more discouraging one of a vast lifeless desert. This seemed to be confirmed when, in 1847, the German, Leichhardt, who had previously crossed overland from New South Wales to Port Essington, in North Australia, started to traverse the continent from Queensland to Western Australia, and was never heard of again. In 1860 Burke and Wills, with an outfit furnished by the colony of Victoria, successfully crossed the eastern portion of the island from north to south, and between 1858 and 1862 John McDouall Stuart performed the much more difficult feat of crossing from south to north, near the middle, in order to trace a course for the telegraph line which was erected shortly afterward. Between 1868 and 1874 John Forrest penetrated from Western Australia as far as the central telegraph line, and Ernest Giles did the same from the north between 1872 and 1876. These two routes were joined in 1897, when Daniel Carnegie successfully accomplished the journey by the direct route from the Coolgardie gold fields in the south to those of Kimberley in the north. Other expeditions under Gosse and Warburton in 1873 and H. V. Barclay in 1878 added materially to the knowledge of the country west of the central telegraph line. Lake Eyre was explored by Gregory in 1901-02, and in the latter year the continent was traversed from Fowler Bay in the south to Cambridge Bay on the north coast by Maurice and Murray. See AUSTRALIAN FEDERATION.

AUSTRALIAN FEDERATION. On Jan. 1, 1901, the five Australian colonies of the United Kingdom, together with Tasmania, united to form a federal state under the name of the Commonwealth of Australia. The movement toward federation had its beginnings as early as 1849, though the first successful step toward consolidation was not made till 1883. The union of the Australian colonies was favored by the fact that in the main they possessed a homogeneous population, with the English-speaking race predominant, and almost identical political institutions. Economic differences were exceedingly acute between the colonies of New South Wales and its southern and highly developed industrial neighbor Victoria, on account of the latter's having adopted protection as a fiscal policy against the exports of the parent state. Nevertheless, this and other economic differences between different sections of the continent could not, and in the end did not, prove an insuperable obstacle toward the attainment of an object which so many other causes united to favor. As the result of a measure adopted by a convention at Sydney in November, 1883, the first important advance toward federation was made in 1885, when, on August 14, the Federal Council of Australasia was created by act of the Imperial Parliament. There were five colonies represented, Victoria, Queensland, Tasmania, Western Australia, and Fiji. New South Wales, South Australia, and New Zealand did not join. This body was endowed with certain limited powers in minor legislation, but

in its very nature it was merely an advisory body, possessing no authority to impose its will upon the different colonies. It held eight meetings; and naturally ceased to exist with the inception of the Commonwealth. Its usefulness had died long before. In March, 1891, a National Convention, assembled at Sydney, declared in favor of Australian union and laid down the principles upon which the new Commonwealth should be based, the fundamental idea being that of a federal government with ample powers over foreign affairs, customs, and public defense, but circumscribed in its scope by the provision that all powers not expressly granted to the central government remain vested in the states. No definite result followed the action of the convention until January, 1895, when a conference of colonial premiers, meeting at Hobart, drafted an Enabling Act providing for the election of delegates to a Constitutional Convention, and the act was submitted to the legislatures of the various colonies.

On March 22, 1897, the Constitutional Convention met at Adelaide, whence it adjourned to Sydney and finally to Melbourne, completing its work on March 17, 1898. The constitution as drafted was submitted to the people of the colonies, and was adopted by a majority vote of nearly five to one in Victoria, of two to one in South Australia, and of over four to one in Tasmania. In New South Wales 71,595 votes were cast in its favor, and 65,228 votes against it; but as the Legislature had stipulated that a minimum of 80,000 votes or about one-third of the total electorate should be necessary for ratification, the constitution was declared rejected. In the above four colonies the vote for federation stood 219,712 to 108,363 against it. Queensland and Western Australia took no action in the matter. After certain changes demanded by New South Wales had been effected in the constitutional draft, the instrument was once more submitted to the people in 1899, and though opposition was still strong, the Federalists won by a vote of 107,420 to 82,741 in New South Wales, and by increased majorities in the other colonies that had previously taken action. Queensland also ratified the constitution. The total vote was 377,988 to 141,386, the majority being 236,602, as compared with 111,349 at the first vote. Early in 1900 the constitution was submitted to the Imperial Parliament at Westminster, and was adopted with but a single modification, to be noted hereafter. By the statute of 63 & 64 Vict. chap. 12 (which received the royal assent July 9, 1900), the five colonies which had ratified the constitution were merged into the new Commonwealth of Australia, with the provision that Western Australia should be admitted to the Commonwealth on ratifying the constitution. Western Australia ratified the constitution July 31, 1900, by a vote of 44,800 to 19,691. On Sept. 17, 1900, Queen Victoria signed the proclamation declaring that on and after Jan. 1, 1901, the people of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, should be united in a federal commonwealth, under the name of the Commonwealth of Australia. And on Jan. 1, 1901, the new Commonwealth was proclaimed in the capitals of the former colonies, now known as original states.

The constitution of Australia is modeled obviously upon that of the United States, in that it

is based upon the principle formally stated, that all powers not delegated to the central government are reserved to the states. During the process of constitution making, this principle encountered great opposition from those who favored a strongly centralized state, modeled upon the constitution of Canada. The legislative power of the Commonwealth is vested in a Federal Parliament composed of the sovereign of Great Britain, a Senate, and a House of Representatives. The sovereign appoints as his representative the Governor-General, who may summon, prorogue, and dissolve Parliament, which must meet, however, every year. The Senate is composed of six members from each of the states, elected at large for a term of six years. The members of the House of Representatives are chosen for three years and must comprise, as nearly as possible, twice the number of senators, but no state may have less than five members in the lower house. For the first Parliament New South Wales was apportioned 26 seats; Victoria, 23; Queensland, 9; South Australia, 7; Western Australia, 5; and Tasmania, 5; total, 75. (In 1913 the total number of seats remained the same, but New South Wales had 27 and Victoria 22.) Parliament has the power of increasing the membership of either house, but no state may be deprived of its absolute or proportionate representation without its consent. The qualifications for an elector to either house of Parliament are the same as those for an elector to the lower house in the different states. In defining the scope of the Federal Parliament the framers of the constitution did not show themselves so ardently in favor of state rights as to grudge it the exercise of wide powers. Profiting, on the contrary, by the experience of the United States in the matter of the conflict of state laws, and influenced, too, by the opposition of those who advocated a strongly centralized government, they included within the jurisdiction of Parliament such subjects as divorce, bankruptcy, and corporations, and prepared the way for the absorption of the colonial railways by the federal government. Closely summarized, the exclusive powers of Parliament are as follows: (1) Taxation, both direct and indirect, borrowing money on the public credit, currency, coinage, and legal tender; (2) defense; (3) the regulation of foreign and interstate commerce, including navigation, shipping, and interstate railroads, and the granting of uniform bounties on the production and exportation of goods (but each state may grant bounties for the encouragement of the mining industry); (4) banking and insurance carried on in more than one state; (5) bankruptcy, copyright, patents, trademarks and corporations; (6) marriage, divorce, parental rights and guardianship; (7) census and statistics, weights and measures; (8) external affairs, immigration and emigration, quarantine, the influx of criminals, naturalization, and the control of any race, other than the aborigines, requiring special legislation (this referring to the important question of Chinese and Japanese coolie labor); (9) posts, telegraphs, and telephones; (10) astronomical and meteorological observations, coast service, and fisheries; (11) industrial arbitration in questions involving more than one state, invalid and old-age pensions; (12) the service of criminal and civil process, and the establishment of judicial comity among the states; (13) the control of the railways for the purposes of national defense, the

permanent acquisition of the railways with the consent of the states involved, and the construction of new railways; (14) finally, all legislation incidental to the execution of powers specifically delegated. Any state law that is in conflict with a law passed by Parliament, acting within its jurisdiction, is void.

Legislation may be initiated in either house, but money bills must originate in the House of Representatives. The Senate has no power to amend an appropriation bill, but may reject such measure. In case of a deadlock between the two houses lasting more than three months, as when the Senate persists in rejecting a bill repeatedly passed in the lower house, or in adding amendments which that house refuses to accept, recourse is had to a dissolution and to a general election, and if the deadlock continues in the new Parliament the two houses meet in joint session and decide the matter by a majority vote. The executive power is vested in a Governor-General, nominated by the crown, and in a council of not more than seven salaried ministers, appointed by the Governor-General and responsible to Parliament, of which they must be members. The judicial power is vested in a Federal Supreme Court known as the High Court of Australia, exercising original jurisdiction in cases involving treaties with other nations, or the representatives of foreign nations, or cases to which the Commonwealth is a party, or a state, or the residents of different states. It hears appeals from the minor federal courts and from the supreme courts of the states. No appeal may be taken from the decision of the High Court to the British Privy Council on questions involving the limits of the constitutional powers of the Commonwealth or of the different states, unless the High Court certifies that the question is one which ought to be determined by the Sovereign in Council. In all other cases, appeals lie to the Privy Council, subject to the rules of procedure established by the Australian Parliament.

The rights of the states are affirmed in the clause reserving to them all powers not delegated to the federal government. Their present constitutions continue in force, their laws are judicially recognized, and their territorial integrity and political influence are guaranteed by the provision that no amendment altering the boundaries of a state or reducing its absolute or proportional representation in Parliament is valid without the consent of the state; whereas an ordinary amendment to the constitution may be passed by a majority of both houses of Parliament, and ratified by the people of a majority of states, constituting at the same time a majority of the whole body of electors in the nation. New states may be carved out of one or more of the original states with their consent, and Parliament may prescribe conditions for the admission of new states into the union.

The Australian constitution, like the Constitution of the United States, upon which it is modeled, is the result of compromise between the principles of loose federalism and centralization. The former was undoubtedly favored by the great majority of people, but met with strong opposition from the powerful labor element, which was especially influential in New South Wales and Victoria, and succeeded in defeating the constitution at the first referendum.

The Commonwealth has been regarded by many students of politics as a step toward complete

Australian independence. The veto power lodged in the crown and the right to appoint the Governor-General of the Commonwealth are of only little importance as binding ties between the mother country and Australia, in view of the British theory of the relations of the executive toward the legislature. Practically the only bond between Australia and the Empire is the right of appeal from the courts of the Commonwealth to the Sovereign Council. In the constitutional draft submitted to the British Colonial Secretary, it was provided that no appeal should lie to the Privy Council except in cases involving the interests of some other part of the Empire. The British Colonial Office insisted upon the modification of this clause, and in the final act it was given the form already described. It is generally conceded, however, that in practice the tendency would be to restrict the exercise of the right to appeal to the utmost.

On Jan. 1, 1901, the birth of the new Commonwealth was signalized by appropriate ceremonies at Sydney. The Earl of Hopetoun was the first Governor-General, and he intrusted the formation of the first federal ministry to Sir Edmund Barton. The elections to Parliament were fought out on the tariff issue, and resulted in a majority for the Protectionist government. Parliament was opened on May 9 at Melbourne, which was designated as the temporary capital until the selection of a site for a federal district within the boundaries of New South Wales. A narrow policy of immigration was initiated in 1900 by the enactment of a law aiming at the absolute exclusion of Asiatics and the practical exclusion of European contract labor. After a prolonged struggle a tariff bill of protective character was passed in 1902. In the same year the Earl of Hopetoun was succeeded as Governor-General by Baron Tennyson, who in 1904 made way for Baron Northcote. Baron Northcote was succeeded in 1908 by the Earl of Dudley, who was succeeded in 1911 by Baron Denman. The parliamentary elections of December, 1903, which left the Protectionist and Free Trade parties about equally balanced, showed a remarkable growth of the Labor party, which stands practically for a modified socialism and the principle of a so-called "white Australia"—i.e., the complete exclusion of non-European races and a jealous restriction of the right of entry into the country. Sir Edmund Barton resigned in 1903, and there followed a rapid alternation of ministries based on changing combinations among the three parties. From April to August, 1904, the Watson Labor ministry was in power. The rigorous enforcement of the "white Australia" policy and the immigration laws, and the socialistic nature of much of the legislation of the ensuing period, brought a certain amount of strain into the relations between the Commonwealth and the Imperial government. The federal government was charged by the English press with pursuing a selfish policy in the matter of restricting population. A project formulated in 1905 by General Booth, head of the Salvation Army, for the colonization of 5000 English families in Australia, was soon abandoned on the ground that the Commonwealth had failed to lend any encouragement to the scheme. The Reed free-trade ministry, which was in office at the beginning of 1905, after an ineffective anti-socialist campaign, was defeated by a combination of the Labor and Protectionist parties, and a ministry of the latter character

under ex-Premier Deakin succeeded. In view of the close relationship existing between the government of Great Britain and Japan, the government in December, 1905, carried an amendment to the immigration law permitting the temporary admission of Asiatic tourists, students, and merchants; the contract labor clause was also modified. In 1909 the Commonwealth and New South Wales entered into an agreement for the surrender to and acceptance by the Commonwealth of an area of about 900 square miles to constitute a federal territory wherein should be built the permanent federal capital. A proclamation was issued, Dec. 5, 1910, vesting the territory in the Commonwealth on and from Jan. 1, 1911. Most of the territory is in the Yass-Canberra district; a few square miles are at Jervis Bay, where several small acquisitions were made by the Commonwealth subsequent to the original cession; the total area ceded was stated in 1913 at 912 square miles. Work on the capital city, Canberra, was begun in 1913; the site is 204 miles from Sydney, 429 from Melbourne, 912 from Adelaide, 929 from Brisbane, and about 123 (or 96 by another route) from Jervis Bay. Pending the completion of Canberra, Melbourne continued the temporary capital of the Commonwealth. Consult Garran, *The Coming Commonwealth* (Sydney, 1897); Quick, *The Annotated Constitution of the Australian Commonwealth* (Sydney, 1901); Turner, *First Decade of the Australian Commonwealth* (New York, 1911).

AUSTRALIAN GUM TREES. See EUCA-LYPTUS.

AUSTRALIAN LITERATURE. Australia was not claimed for Great Britain until 1770, and the first settlements were penal. Then followed the sheep farmers and, on the discovery of gold in 1851, a horde of adventurers. By 1859, Australasia (Australia, Tasmania, and New Zealand) consisted of seven independent colonies. The period of national unity did not begin until 1901, when these states, except New Zealand, were federated under the name of the Commonwealth of Australia. Young Australia has not had time to develop a varied and mature literature of her own. She is just emerging from a position like that in which the United States found itself about a century ago—from the imitative period. Her first writers, who came midway in the nineteenth century, were Englishmen or Scotsmen bred at the public schools and at the universities, some of whom returned to the land of their birth; while several contemporary writers, though in some instances born in Australia, have settled in London. Hence by Australian literature in general we can mean no more than English literature inspired by the life and scenes in this island of the South Seas.

The early settlers carried out with them little volumes of their favorite poets, and in the loneliness of bush life began to write lyrics in imitation. Indeed, there is hardly an English or American poet of the nineteenth century whose voice has not been echoed in Australia—Wordsworth, Byron, Tennyson, Browning, Poe, and many others. But as time has gone on, Australian verse has more and more forgotten its models and has assumed local color. Its themes are taken from incidents of the town and the bush. The poets sing of the "burning wastes of barren soil and sand," or, in another mood, of "the sunlit plains extended" and "the won-

drous glory of the everlasting stars," or, as Kipling writes, "the thin, tin crackling roofs." Of the Australian singers of the nineteenth century, the earliest was Barron Field, Judge of the Supreme Court of New South Wales, who published at Sydney, in 1819, *The First Fruits of Australian Poetry*. Among succeeding verse makers were W. C. Wentworth, author of *Australasia*; J. D. Lang, Sir Henry Parkes, and Lionel Michael, author of *Songs without Music* (1857). A new period for Australian poetry began with Adam Lindsay Gordon and Henry Clarence Kendall. Gordon, born in the Azores, in 1833, educated at Oxford, emigrated to South Australia, in 1851, taking leave of England in lines imitated from *Childe Harold*. He became a horse dealer, horse trainer, and the best steeplechase rider in the colonies, as well as the strongest of the first generation of Australian poets. His life was particularly pathetic, and he died by his own hand, in 1870. Gordon published three volumes: *Sea-Spray and Smoke-Drift* (1867), *Ashtaroth* (1867), and *Bush Ballads* (1870). In his sporting poems and narratives, based on his own wild experiences, we first get at the heart of Australia. The horse and the rider he glorified in ballads that have the ring of Scott and Macaulay. The Byronic influence never left him. His despair reaches intense expression in *Whither Bound?* Kendall was born at Ulladulla, New South Wales, in 1842. There, in the lonely bush, he passed his boyhood. His life was saddened by an inherited love for drink, which he mastered only after years of struggle. He died near Sydney, after spending a year in a madhouse, in 1882. His first volume, *Songs and Poems* (1862), was followed by *Leaves from an Australian Forest*, containing his best work, and *Songs from the Mountains*. Of less force than Gordon, Kendall, "the national poet," sang with great beauty of the Australian hills, streams, and forests, in poems like "September in Australia," "The Hut by the Black Swamp," and "A Death in the Bush." He was the purest and most spontaneous poet of the group to which he belonged. The early Australian poets were an ill-fated race, who, after checkered, necessitous, and tumultuous lives, sank most of them untimely into early graves. An exception was Alfred Domett (1811-87), a successful and prosperous man, who rose to be Premier of New Zealand. Robert Browning, an early friend, joined Tennyson and Longfellow in praise of his work. He is said to be the subject of Browning's poem, "Waring." He is most favorably known by *Ranolf and Amohia* (1872), a narrative poem on a Maori subject. Charles Harpur (1812-68) was preëminently the poet of the bush, and has incomparably caught its atmosphere of weird melancholy in his poems, of which several volumes were published between 1835 and 1868. Include with Gordon, Kendall, Domett, and Harpur, James Brunton Stephens (1835-), author of *Convict Once* (London, 1871), and many other poems, and the giants of Australian song are named. More recent verse compares favorably with most of what is being produced in England and America. It lacks, however, the simplicity, sincerity, and force of the older poets who voiced the wild and melancholy moods of their often ill-starred lives. The older singers cultivated literature "on a little oatmeal"; the later singers are better groomed, more presentable, and more prosperous,—often civil servants, editors, professors, or men of affairs, and their verse, if less

moving, is more ambitious and elegant. Everywhere journalism is the stepping-stone to literature, and a vigorous journalism is characteristic of Australia. All the state capitals have great dailies, some of them as wealthy and as prosperous as the great English newspapers, and in their columns most of the writers, especially those still to be mentioned, have made their start. The younger school of the later nineteenth and early twentieth centuries owes much to a brilliant journalist, devotedly Australian, Mr. J. F. Archibald (1858-), of whom it is but right to speak in any account of present-day Australian literature. Ceaselessly urging upon his compatriots the choice of home scenes, themes, and characters for verse and story, he has been studious in helping and encouraging young literary aspirants, and many of the most talented writers of the day have first advanced under his ægis. Among more than 100 poets, recently dead or still at work, may be mentioned, somewhat arbitrarily perhaps, D. B. W. Sladen (1856-), author of several volumes of poems, a critic who has done good service to Australian literature, and a prolific miscellaneous writer; Edward Dyson (*Rhymes from the Mines*, 1896); Charles Allan Sherard (*A Daughter of the South*, 1889); Alexander Sutherland (1852-); E. B. Loughran (*Neath Austral Skies*, 1894); J. B. O'Hara (*Songs of the South*, 1891); William Gay (*Sonnets*, 1896); George Gordon McCrae (1833-), noteworthy for poems based on aboriginal legends, and a man of marked originality; W. P. Reeves (1857-); Will Ogilvie (1869-); Col. Kenneth Mackenzie; Bernard O'Dowd (1866-); Roderick Quinn (1869-); and Edwin J. Brady (1869-), a writer of sea-songs. Victor Daley (1858-1905), by his *At Dawn and Dusk* (1897), represents a cosmopolitan element and expresses various moods that have nothing distinctive of his country about them. The two leading versifiers of to-day, judged by the wide circulation of their books, are Henry Lawson, only less known than Gordon and Kendall, and author of *While the Billy Boils*, etc., and A. B. Patterson (1864-), whose *Man from Snowy River* (1895) and other books are redolent of the drover's track and the wanderings of the swagman. The women of Australia vie with their brothers for poetic laurels, nearly a quarter of the Stevens *Anthology* (see below) falling to their share. Certainly not the least of these, and perhaps the best, is Miss Louise Mack, who voices the Australian woman's attitude toward art and life in *Dreams in Flower*, and elsewhere. Other women, slightly earlier or later in time, are Miss Werner, Miss Castilla, Miss Jessie Mackay, and Miss Ethel Turner, the last named distinguished for child poems fine in form and feeling.

In Australian fiction—and the same is true of the earlier poetry—there was, until late in the nineteenth century, nothing distinctively native, save the subjects chosen—no different set of literary values, moods, or views of life. English eyes, nerves, and technique were, however, at work upon new material; and environment was subtly differentiating the colonial character from the home product. Australian literature to-day is presenting this new type of man, responsive to his new surroundings—less reverent, free from conventionality, less socially deferential than his British forebears, full of the zest of life, gay and buoyant on the whole, though sometimes imbittered by pioneer hardship, hardy, brave, a

little ruthless, with a freakish, wild, exaggerated humor, and a rapid wit that recall similar American traits. The earlier novelists had little distinctive literary personality; there was always the overshadowing presence of Dickens, Charles Reade, Bret Harte, or another. Before 1901 Australia had produced some 300 published volumes of novels and tales, not to mention unnumbered productions of the same kind that never survived newspaper appearance. Now more than 100 prose writers, mostly of fiction, are at work. The earliest novels appeared at Sydney from 1840 to 1850; they were melodramatic, with the escaped convict or the bushranger for hero. In a like capacity the gold digger appeared in the next decade to rival the picturesque cut-throat. At this time some passable work was done in fiction by Miss C. H. Spence, but Henry Kingsley, brother of Charles Kingsley, who went to the gold fields in 1853, and published *The Recollections of Geoffrey Hamlyn*, perhaps the best Australian novel written to the date of its appearance (1859), was really the father of Australian fiction. B. L. Farjeon's *Grif* (1869) is another notable novel, depicting Melbourne night life with a vividness worthy of Dickens. In 1870 (rewritten, and published in London, 1874) appeared what may be called a classic of Australian fiction, Marcus Clarke's powerful *For the Term of His Natural Life*, sole survivor of a host of convict novels, and the most lasting record in fiction of the convict system. Lord Rosbery has called it "the most terrible of all novels." It has been translated into several modern languages. Marcus Clarke (1846-81), primarily remembered for this novel, may here have parenthetical notice on the score of his excursions into general literature, which gave him a singular distinction in his day and country.

To return to fiction, bush ranging found its best chronicler in Charles Alexander Browne, better known by his pen-name, "Rolf Boldrewood." He was born in London in 1826, and was in turn squatter, magistrate, goldfields commissioner, and the strongest and most mature of Australian novelists. Beginning late in life, he turned the varied wealth of his colonial experience into fiction. His *Ups and Downs* (also called *The Squatter's Dream*) presented the life of the sheep breeders. It was *Robbery under Arms* (Sydney; London, 1888) that made and established the author's reputation, and can claim to be at once something like a work of art and a vivid, faithful transcript of the scenes, incidents, and temper of the wild, early days. There followed well-nigh a score of other full-size novels by this wonderfully fertile octogenarian, reflecting many sides of local life and character—the bush, the diggings, rural and urban scenes, in which are introduced all the representative social types. So true are his stories that they constitute an invaluable sociological museum; so vivid and lively are they that they are sure to be long read with delight. A. B. Peterson is novelist as well as poet, and in *An Outback Marriage*, published in the nineties, is of those who, if they abandon the bushranger, still keep to the bush. The tragedy and farce of the life there, its loves and jealousies, its illicit relations, and haphazard morals and manners, are reflected in the book just named. No better account of station life in the heart of Australia can be found than is afforded by this novel, though a score of good kindred stories are at hand. The vivid and

rather crude pictures of the relations of Polyne-sians and whites, and of other phases of South Sea Island life, by Louis Becke (1857-) will repay attention. They are for the most part stirring novels of adventure, some written in collaboration with the journalist, Walter Jeffrey, in the Stevenson or Conrad style, such as *By Reef and Palm* (1896), *Pacific Tales* (1897), *Wild Life in the Southern Seas* (1897), and *The Mutineer* (1899). Guy Boothby gained wide popularity with *The Beautiful White Devil* (1896) and *Dr. Nikola* (1896). Among present-day Australian novelists none has a greater vogue than Arthur Hoey Davis ("Steele Rudd"), whose picture of the Queensland small farmer is probably true, if not flattering, to that class the colony over. This author may be called the first of Australian humorists, a humorist of the broadest type. As in England and the United States, so in Australia, some very fine work in fiction has been done by women. Ada Cambridge (Mrs. G. F. Cross) is, perhaps, best known. At the age of 26 (1870) she went to Australia with her husband and has lived there ever since, mostly in the bush districts of Victoria. In *The Three Miss Kings* (1891) she conceived the notion of depicting the life of three girls, brought up in a bush home, and their subsequent career. Mrs. Cross has also succeeded admirably with the problem-novel, and now some dozen works of fiction stand to her credit. Mrs. Campbell Praed, born in 1851, a native of Queensland, has published about 25 novels. In their stern and pessimistic outlook they resemble the work of Hall Caine, Mrs. Dudeney, and Thomas Hardy. A typical novel of hers is *Longleat and Koor-albyn* (1887). Madame Couvreur, better known by her pen-name, Tasma, lived many years in Victoria. She returned to England in 1879, and 10 years later published *Uncle Piper of Piper's Hill*. She wrote two other good Australian stories—*In Her Earliest Youth* (1890) and *Not Counting the Cost* (1895). Miss Ethel Turner, already named among the poets, claims a place here also as the author of delightful "juveniles," notably of *The Seven Little Australians* (1894) and its sequel, *The Family at Misrule* (1895). Australian fiction and literature in general at present lack authors of outstanding distinction and ability. Literary energy and enthusiasm abound; the national and original note grows steadily clearer; and there is rich promise of future achievement.

AUSTRALIAN OATS. See RESCUE GRASS.

AUSTRASIA, as-trā'shā or -zhā (Med. Lat., from OHG. *ōstar*, eastern), or THE EAST KINGDOM. The name of the eastern possessions of the Merovingians, which extended, roughly speaking, from the boundaries of Thuringia and Bavaria to the rivers Meuse and Scheldt. Metz was its capital and Verdun its most western town. Its population was almost wholly Germanic. The

designation arose after the death of Clotaire I in 561. Under the Carolingians the name disappears. See **BURGUNDY**; **NEUSTRIA**.

AUSTRIA, ARCHDUCHY OF. The nucleus of the Austrian Empire. It lies on both sides of the Danube, from the mouth of the Inn to the borders of Hungary, and embraces the crownlands of Lower and Upper Austria and Salzburg (qq.v.).

AUSTRIA, LOWER. See **LOWER AUSTRIA**.

AUSTRIA, UPPER. See **UPPER AUSTRIA**.

AUSTRIA-HUNGARY, or, officially, **THE AUSTRO-HUNGARIAN MONARCHY** (Med. Lat. *Austria*, from Ger. *Oesterreich*, eastern realm + Hungary). The largest European country after Russia since the separation of Sweden and Norway. It forms a compact territory, lying between lat. 42° and 51° N. and between long. 9° 30' and 26° 30' E., and is bordered for a shorter distance by the sea than any other great European state. Its coast line comprises the greater part of the eastern shore of the Adriatic, the bulk of the country receding to a great distance from the sea. It is irregularly bounded on the north by Saxony, Prussia, and Russia; on the east by Russia and Rumania; on the south (including Bosnia and the Herzegovina) by Rumania, Servia, and Montenegro; on the southwest by the Adriatic Sea and Italy, and on the west by Switzerland and Bavaria. The former Turkish provinces of Bosnia and the Herzegovina were placed in 1878, by the Treaty of Berlin,

under the administration and military occupation of the Austro-Hungarian government, and on Oct. 5, 1908, were formally annexed to the monarchy. Austria is sometimes called Cisleithania, "the country on this side the Leitha" (a tributary of the Danube forming part of the boundary between Lower Austria and Hungary), while Hungary is called Transleithania, "the country beyond the Leitha." The total area of the Austro-Hungarian monarchy is 261,241 square miles, distributed as follows: Crownlands represented in the Austrian Reichsrat (Parliament), 115,831.9 square miles; lands of the Hungarian crown, 125,641.2 square miles (of which Hungary proper 109,216.1 and Croatia and Slavonia 16,425.1); Bosnia and the Herzegovina, 19,767.9 square miles. The maximum length of the monarchy, from east to west, is about 800 miles; maximum breadth, from north to south, about 650 miles. The table above shows the area and the *de facto* population of Austria by crownlands, of Hungary by divisions, of Croatia and Slavonia, of Bosnia, and of the Herzegovina. The population figures are those returned by the censuses of Dec. 31, 1900, and Dec. 31, 1910; for Bosnia and the Herzegovina, however, the figures are those of the censuses of April 22, 1895, and Oct. 10, 1910, and hence the totals given for the monarchy cannot be quite exact. As Bosnia and the Herzegovina were not annexed until 1908, the population of the monarchy as constituted in 1900 was 45,405,267.

The population according to the language, or the principal language, spoken was returned as follows at the 1910 census, for the more important languages of Austria and Hungary:

Provinces	Square miles	Population 1900	Population 1910
Lower Austria	7,654.4	3,100,493	3,531,814

* Including, in Austria, foreigners, of whom about 300,000 are Magyars.

The figures for Hungary in the foregoing table do not include those of Croatia and Slavonia, which are as follows: Croatian, 1,638,354 (62.5 per cent); Servian, 644,955 (24.6); German, 134,078 (5.1); Magyar, 105,948 (4.1); Slovak, 21,613 (0.8); Ruthenian, 8317 (0.3); Rumanian, 846; other, 67,843 (2.6). For the monarchy (including Bosnia and the Herzegovina) population by language was as follows in 1910: German, 12,010,669; Magyar, 10,067,992; Bohemian, Moravian, Slovak, 8,410,998; Polish, 4,978,959; Ruthenian, 3,998,872; Servian and Croatian, 5,545,531; Rumanian, 3,224,147; Slovene, 1,252,940; Italian and Latin, 768,422; others (including foreigners in Austria and the military in Bosnia and the Herzegovina), 1,131,693; total, 51,390,223.

Topography. Austria-Hungary is the most mountainous part of Europe excepting Switz-

erland. Four-fifths of Austria is 600 feet above the sea. The mountains are comprised in three great systems—the Eastern Alps, the Carpathians, and the Bohemian Highlands. The Alps cover the crownlands of Tyrol, Salzburg, Carinthia, Carniola, Styria, and the parts of Upper and Lower Austria south of the Danube. The mountains, though lower than the Swiss Alps, often rise above the snow line. The eastern spurs of the Alps stretch through Croatia towards the southwestern part of Hungary. The total area of the Austro-Hungarian Alps is estimated at about 40,000 square miles, of which nearly 700 square miles are covered with glaciers. Their highest peaks are in the Rhetian and Noric Alps, which extend from Switzerland to the Danube. The Ortler Spitze, the loftiest summit in Austria-Hungary, rises to a height of nearly 12,800 feet. The Carpathian Mountains, greatly inferior to the Alps in height, describe an immense curve, amounting to two-thirds of a circle, about Hungary, girding it on the north and east, and covering an extensive area in Transylvania. In their broad sweep of above 800 miles, from the Danube at Pressburg back to that river at the Iron Gates, they embrace the vast Hungarian plain, a region more level than the prairies of the United States. The highest peak of the Carpathians is the Gerlsdorfer Spitze, about 8700 feet. Finally, the mountains that edge the western, northern, and eastern edges of Bohemia and Moravia are the connecting link between the mountain systems of Austria-Hungary and the Mittelgebirge or hilly regions of central Europe. At the head of the Adriatic is the remarkable highland region, of limestone formation, known as the Karst. On the borders of Dalmatia and Bosnia is a mountain range which bears the name of the Dinaric Alps. The mountains of Austria-Hungary are famous for their picturesque scenery and abound in caverns, some of them very large. In the Alpine provinces the finest glacier scenery is around Gross Glockner in Carinthia; the finest rock scenery is in the Dolomites. The Adriatic coast land, with its many islands, its bays, and frowning heights, is one of the most picturesque regions in Europe.

Hydrography. Among the rivers of Austria-Hungary, the Danube is the most important, and is second only to the Volga in all Europe, its basin embracing about three-fourths of the total area of the country. It enters Upper Austria at Passau and, crossing Lower Austria in an easterly direction, enters Hungary, which it traverses eastward and beyond the Bakony Forest, then turns abruptly and flows due south to the border of Croatia, where it receives the Drave, then flows again eastward, receives from the north its principal affluent, the Theiss, and from the west the Save, and at the Iron Gates breaks through the southern extremity of the Carpathian range, to descend thence into the great plains of Rumania and Bulgaria. The Danube is a very important factor in the economic life of the country, affording the largest navigable waterway. Besides the Danube there are several large rivers in Austria-Hungary. The Theiss, with its largest tributary, the Maros, collects all the waters of eastern Hungary and delivers them to the Danube at Titel. Two other great tributaries of the Danube, the Drave and Save, collect the drainage of Croatia, Slavonia, Bosnia, Carniola, Carinthia, and a great part of Styria, since the high mountains bordering the Adriatic coast prevent any streams from the interior reaching

that sea. The Elbe drains most of Bohemia, while the Dniester traverses eastern Galicia, and the Vistula forms part of the boundary line between Russian Poland and Galicia. The Inn traverses northern Tyrol, and the Adige, the principal river of Austria emptying into the Adriatic, flows through the southern part of that province. The Danube rises in Germany, but the Dniester, the Vistula, the Oder, and the Elbe, whose chief régime is in Germany or Russia, have their sources in Austria-Hungary. The lakes are comparatively few and insignificant. The most important are the Plattensee and the Neusiedlersee, in the western part of Hungary. There are numerous small lakes, especially in the Alps, some of them situated at an altitude of over 7000 feet and famous for their scenery. The uneven surface of Austria-Hungary is not favorable for the construction of artificial waterways, and the canals of the country are few and comparatively unimportant. The Franzens Canal is the longest (137 miles) and connects the Danube with the Theiss. Austria-Hungary is famous for its hot and mineral springs, of which there are over 2800, mostly situated in Bohemia, Hungary, and Transylvania. The most important of them are Karlsbad, Marienbad, and Teplitz (Bohemia). Austria surpasses all other European countries in the number and value of its mineral springs.

Climate. The climate of Austria-Hungary, while generally mild, differs considerably in different localities. The average annual temperature varies from 62° F. in Ragusa, in the southern part of Dalmatia, to 51° in Budapest and 48° at Prague. The northern Carpathians are characterized by very cold winters and cool summers, while in the valleys of Transylvania the winters are very severe and the summers very hot. The mean annual temperature of Vienna is about 50° F. The rainfall is very abundant and at times excessive, in the western part of the country, near the Alps, where in some places the total annual rainfall exceeds 100 inches; it is lowest in Lower Austria, Moravia, and Silesia, averaging about 25 inches per year. The western part of the country receives much more rain than the eastern.

Fauna. The geographical position of Austria as a part of southern central Europe gives it the fauna characteristic of its latitude, and there is little that is locally characteristic or different from that of the neighboring countries. The valley of the Danube forms one of the recognized migration highways for birds, between northeastern Europe and southern Asia; and the river abounds in fish that ascend from the Black Sea, furnishing important fisheries, of which that for sturgeon is notable. The valley regions have been largely denuded of wild animals by the civilization that has occupied them for so many centuries; but in the high Alps the chamois and ibex still survive in considerable numbers under legal protection; and the other high mountains still shelter bears, lynxes, wolves, and representatives of most of the species of smaller animals which originally dwelt there.

Flora. The flora of Austria-Hungary is characterized by great diversity and richness. It may be divided into vertical zones regulated by relative altitude on the mountains, from the fig and grape producing southern valleys to the Alpine summits. In the west the general flora is much like that of southern Germany, but on

the lower Danube and near the Adriatic trees and plants of a warmer climate prevail.

Geology. In its geographical structure Austria-Hungary shows as much variety as in the formation of its surface. Archæan rocks are represented by gneiss, schist, and granite in the Alps, Bohemian Highlands, and Carpathians and are noteworthy for their mineral riches. The Silurian formation underlies a large area in central Bohemia, where are located the celebrated silver mines of Příbram, and is also prominent in the Alps and in Galicia. The Devonian formation occurs in Moravia, Galicia, and the Alps. Carboniferous strata, frequently inclosing coalbeds, are found in central and western Bohemia, in Moravia, Silesia, Galicia, Styria, and Hungary (Eibenthal). Rocks of later age are represented by Triassic, Jurassic, Cretaceous, Tertiary, and alluvial beds, as well as by igneous intrusions. The Tertiary strata are of great economic importance, as they inclose valuable deposits of lignite and salt and also are intersected by igneous dikes that carry the gold and silver ores of Schemnitz, Kremnitz, and Nagy-Bánya. The vast plain of Hungary is covered by Tertiary and Quaternary deposits deeply mantled by loess and alluvium, which give to this granary of the empire its great fertility.

Mining. The mining industry of the monarchy dates centuries back, and some of the mines were worked by the Romans. The mineral deposits are remarkably rich and varied, including many metals, besides precious stones, mineral oil, and useful earths. Gold is found mainly in Hungary, while silver occurs in Hungary and Bohemia, and quicksilver in Carniola. Iron is the most important metallic product of the monarchy, and is worked in Styria, Bohemia, and various parts of Hungary. Copper is found in Salzburg and Hungary; lead is worked especially in Carinthia and somewhat in Galicia and Hungary. The most important and the most common mineral of Austria-Hungary is coal (including lignite). While coal is worked in all the Austrian crownlands except Salzburg and Bukovina, the greater part of the output comes from Bohemia, which produces more than one-half of the mineral products of Austria and nearly one-third of its metal products. Rock salt exists in immense beds on both sides of the Carpathians, in the county of Máramaros in Hungary, in Transylvania, and in Galicia. The salt mines of Wieliczka in Galicia are the most famous in the world. Salt is also made by state salt works by evaporating the water of salt springs, and from the sea water on the coast of the Adriatic. The sale of salt in Austria is a government monopoly. Of other salts, alum, sulphate of iron, and sulphate of copper are the most important. The useful earths include all sorts of clay up to the finest porcelain earth (in Moravia, Bohemia, and Hungary). Of precious and semi-precious stones the most abundant are the Hungarian opal (which passes in commerce as Oriental), Bohemian garnet (the finest in Europe), carnelian, agate, beryl, amethyst, jasper, ruby, sapphire, topaz, etc. In 1885 oil wells of great productiveness were opened at Kolomea, in Galicia, and heavy import duties were soon laid on foreign petroleum. Considerable deposits of zinc, tin, manganese, bismuth, sulphur, arsenic, uranium, nickel, and graphite are also found in the various parts of the monarchy.

The following table shows the amount in metric quintals and the value in thousands of

kronen of the principal mining products in Austria in 1905 and 1909:

Products	1905		1909	
	Quintals	1000 kr.	Quintals	1000 kr.
Coal . . .	125,852,628	99,875	137,130,425	141,343
Lignite . . .	226,920,760	100,957	260,437,157	138,685
Iron ore . .	19,137,819	16,814	24,902,769	22,730
Lead ore . .	233,383	4,216	205,501	3,499
Silver ore . .	210,474	3,010	211,017	3,386
Mercury . .	868,562	2,240	923,373	2,161
Zinc ore . .	299,828	2,410	339,548	1,988
Graphite . .	344,160	1,351	407,104	1,581
Copper ore .	106,772	565	118,258	819
Gold ore . .	359,369	758	297,090	594

The total value of the mining products of Austria, as reported for 1905, were 233,145,531 kronen; 1907, 295,486,865; 1909, 317,490,564; 1911, 363,054,000. These figures do not include the value of the salt and petroleum output. Salt production in 1905 amounted to 3,433,747 quintals, valued at 45,579,033 kronen; in 1909, 3,598,006 quintals, valued at 46,740,565 kronen. Petroleum production is limited to Galicia. In 1901 the output was 4,046,000 quintals, valued at 23,010,000 kronen, and 27,072 quintals of ozocerite, valued at 2,572,000 kronen. The combined output in 1905 was 7,973,484 quintals, worth 23,718,999 kronen; in 1909, 20,884,569 quintals, worth 34,928,285 kronen (of which, petroleum 20,863,415 quintals, 32,221,494 kronen).

The more important furnace products in Austria were as follows in amount and value in 1905 and 1909:

Products	1905		1909	
	Quintals	1000 kr.	Quintals	1000 kr.
Pig iron . .	11,196,136	83,227	14,650,508	117,084
Zinc . . .	93,261	5,283	116,877	5,942
Lead . . .	129,680	4,810	129,412	4,676
Silver (grammes)	38,453,492	3,754	39,002,175	3,256
Mercury . .	5,198	2,551	5,848	3,170
Copper . . .	8,701	1,508	9,848	1,442
Gold (grammes) .	204,292	656	148,439	482

The total value of the furnace products of Austria, as reported for 1905, was 103,205,734 kronen; 1907, 132,807,655; 1909, 137,235,740; 1911, 156,559,000. There were employed in the mines of Austria in 1909 150,209 persons; in the salt works, 6617; in smelting, 8941; in the petroleum and ozocerite industry, 6446.

In Hungary the more important mining and furnace products included in 1911 lignite valued at 77,200,000 kronen; pig iron, 43,848,000; coal, 15,481,000; iron ore, 13,334,000; gold, 10,469,000; and silver, 907,000. In 1908 the lignite output was 70,344,993 quintals, valued at 61,546,000 kronen; in 1910, 75,788,460 quintals, 69,828,000 kronen. Coal, 9,820,169 and 10,851,320 quintals, 12,794,000 and 13,877,000 kronen; pig iron, 5,229,739 and 5,020,558 quintals, 43,556,000 and 40,987,000 kronen. The gold output was valued at 10,787,000 kronen in 1908 and 9,960,000 kronen in 1910. The total value of mining and furnace products rose from 70,948,982 kronen in 1893 to 106,743,742 kronen in 1900, 106,173,334 in 1905, and 152,837,807 in 1910. In addition is the salt output, which in 1908 amounted to 2,475,326 quintals, worth 33,-

924,000 kronen, and in 1910 2,462,056 quintals, 33,950,000 kronen. In 1911 79,336 persons were employed in mining and smelting in Hungary, and 2622 in the salt works.

Agriculture. Rich soil, abundance of water, and a mild climate have combined to make Austria-Hungary one of the foremost agricultural countries in Europe. Its crops are remarkable for their variety, embracing, besides all the common European products, a great many subtropical plants and fruits. The most fertile lands are those in Hungary, Bohemia, Moravia, Lower and Upper Austria, and Galicia.

The distribution of land is stated as follows for 1910, in hectares (1 ha. = 2.471 acres):

DISTRIBUTION OF LAND	AUSTRIA		HUNGARY	
	Ha.	P. ct.	Ha.	P. ct.
Arable land . . .	10,641,996	35 37	13,916,061	42.82
Gardens . . .	377,965	1 26	427,492	1.32
Vineyards. . . .	223,077	0 74	309,813	0 95
Meadows, past- ures, etc.	7,171,779	23 90	3,191,686	9.82
Woodland . . .	9,788,080	32.63	3,977,022	12 24
Lakes, marsh, etc.	105,024	0.35	8,096,505	27 41
Unproductive (un- taxed)	1,692,872	5.63	66,254	0.20
	30,000,793	100.00	1,701,604	5.24
			32,496,437	100.00

With the great variety in climatic and topographical conditions of the monarchy, ranging from the sunny slopes of the Adriatic coast land to the snow-clad Alps, and from the vine-clad hills of the Tirol in the west, to the broad, fertile plains of Hungary in the east, the agricultural products of Austria-Hungary offer as great contrasts as can be found between those of any two countries of Europe.

The first half of the table below gives the area (in hectares; 1 hectare = 2.471 acres) sown to main crops, and the second gives the yield (in quintals of 220.46 lbs.) for 1910 and 1912:

PRODUCTS	AUSTRIA		HUNGARY	
	1910	1912	1910	1912
Wheat . . .	1,213,579	1,260,317	3,793,999	3,877,309
Rye . . .	2,060,980	2,032,138	1,137,576	1,240,339
Barley . . .	1,101,525	1,065,903	1,163,090	1,116,740
Oats . . .	1,833,018	1,866,931	1,165,995	1,097,563
Corn . . .	311,773	304,184	2,830,398	2,437,217
S. Beets . .	253,731	264,456	117,760	175,885
Wheat . . .	15,673,315	18,952,639	49,297,262	50,251,406
Rye . . .	27,671,921	29,748,033	13,155,227	14,411,799
Barley . . .	14,722,147	17,065,756	12,134,360	15,701,907
Oats . . .	20,631,564	24,300,998	10,845,119	11,656,408
Corn . . .	4,416,782	3,885,058	54,229,398	44,882,694
S. Beets . .	70,618,000	79,237,695	29,222,365	48,366,413

Sown to flax in 1912: 36,739 hectares in Austria, with a yield of 233,752 quintals fibre and 165,235 quintals seed; under vineyards: 224,293 hectares, yielding 3,969,873 hectoliters of wine. Tobacco: 3422 hectares and 56,651 quintals in Austria; 48,527 hectares in Hungary. In Austria (1912) 10,245 hectograms of silkworm eggs placed for hatching yielded 2,185,470 kilograms of cocoons; in Hungary proper, 10,790 hectograms of eggs, 1,151,120 kilograms of cocoons.

The eastern half, or Hungary, serves as the granary of the monarchy, besides exporting con-

siderable quantities of grain to southern Germany and Switzerland. The western half, or Austria, produces everything from wheat to subtropical fruits, but it depends on Hungary for much of its grain supply. Among its chief products are industrial plants, such as sugar beets, hops, potatoes, etc. The varied nature of the two parts of the monarchy may be seen from the foregoing table.

Thus it will be seen that Austria furnishes a little more than one-fourth of the total wheat crop of the country, less than one-tenth of the corn, and less than one-tenth of the tobacco crop. If, in addition to this, it is remembered that even these small figures include the crops of Galicia, which geographically belongs to the eastern half of the monarchy, and whose products of wheat, corn, and tobacco constitute one-third, one-fourth, and two-thirds of the total respective crops of Austria, the latter's share in those crops will be seen to be very small indeed. On the other hand, Austria furnishes nearly three-fourths of the rye crop of the monarchy and about two-thirds of the potato crop, both of which are largely used in the distilleries. Vine growing has shown a decline in Hungary, but the monarchy still holds an important place among wine-producing countries. Horticulture is carried to great perfection, and the orchards of Bohemia, Austria proper, Tirol, and many parts of Hungary produce a profusion of fruits. The chief orchard products of the monarchy, in the order of their commercial importance next to grapes, are plums, peaches, apricots, apples, nuts, almonds, chestnuts, and figs, considerable quantities of which are exported annually. In Tirol, Dalmatia, and southern Hungary olive and mulberry trees are successfully raised and are gaining in area of cultivation. Potatoes are raised everywhere, and in elevated districts are often almost the sole subsistence of the inhabitants. Great quantities of cider are made in Upper Austria and Carinthia and of plum brandy in Slavonia. In Dalmatia oranges and lemons are raised; much more olive oil is imported than is produced in the country.

Stock breeding is largely developed in the Alpine highlands and in the Hungarian plains, in both of which pastures are abundant and the land is best adapted for grazing purposes. In Austria, however, not enough cattle are raised to satisfy the home demand. Sheep breeding in Austria has suffered a great decline from the competition of Australian wool. The breeding of sheep, like that of horses, has been a special object of care to the government. The finer wools are produced, but the greater part of the clip is not of superior grade. The pride of Austro-Hungarian stock breeders is their horses, which are among the finest in Europe, and whose number in the monarchy is second only to that in Russia and Germany. Horse breeding is promoted by "military studs." Besides a number of imperial studs, there are a great many private ones, especially in Hungary.

Live stock in Austria (1910), Hungary (1911), and Bosnia and the Herzegovina (1910): horses, 1,802,848, 2,350,647, and 221,981; cattle, 9,160,009, 7,318,088, and 1,309,922; sheep, 2,428,101, 8,547,042, and 2,499,422; swine, 6,432,080, 7,578,690, and 527,271; goats, 1,256,778, 426,975, and 1,393,068.

Forestry is one of the most important industries in Austria-Hungary. Of the total area of forest in Austria more than two-thirds is under

pinus and other trees found in high altitudes, while in Hungary beech and oak predominate, though pines also are abundant. The forests are chiefly situated in the Carpathians, Alps, and other mountains. The administration of the forests and domains belonging to the state is under control of the ministry of agriculture, and includes schools of forestry; and the exploitation of the forests is subject to restrictive regulations. The average annual yield of the forests exceeds 1,050,000,000 cubic feet of timber, over 40 per cent of which is used for manufacturing and building purposes, and less than 60 per cent as fuel. The extensive forests, besides timber, yield a number of secondary products, as tar, potash, charcoal, bark, cork, etc.

The land distribution in Austria-Hungary differs in its several parts. In Galicia, Bukowina, and to a considerable extent in Hungary, where the cultivation of wheat and cattle and sheep raising constitute the chief branches of agriculture, large estates thrive best and occupy from 25 to 46 per cent of the total area under farms. Nearly 87 per cent of the peasants, however, own their farms. But these are often not large enough to yield a living, and their owners depend on employment as day laborers on neighboring large estates. On the other hand, in Dalmatia and southern Tirol, where fruit raising, wine making, and silk culture constitute the chief occupation, small farms are most successful and the peasants are prosperous, owning from 92 to 97 per cent of the land. In the remaining crownlands peasant holdings occupy about three-fourths of the total agricultural area.

Manufactures. The industrial development of Austria-Hungary has advanced rapidly in recent years, and in many cases this has been due to the material support received from the government in direct subventions, reduced freight rates on state railways, and exemption from import duties on certain raw products and machinery. The following are the 11 most important industries in the country, employing more than 100,000 persons each: 1. The clothing industry, with nearly 700,000 workers—less than three-sevenths of whom are employed in Hungary, and the rest in Austria. 2. Manufacture of foods and drinks, nearly 500,000 persons, three-tenths of them in Hungary. 3. The textile industry, nearly 400,000 persons, less than one-tenth employed in Hungary. 4. Building trades, nearly 435,000, over one-fourth of whom are employed in Hungary. 5. Wood working, about 300,000, less than a third of them in Hungary. 6. The iron and steel works furnish employment to 375,000 persons, over one-third of whom are in Hungary. 7. The quarries and potteries keep some 260,000 persons busy, less than one-fifth of them in Hungary. 8. Machine building and tool and implement making give employment to over 200,000, one-third of them in Hungary. 9–11. Finally, the paper, leather, and chemical industries each gives work to between 60,000 and 70,000; less than one-fourth of these are employed in Hungary.

The mere enumeration of the principal industries of Austria-Hungary shows the overwhelming industrial importance of Austria in the monarchy. It is this industrial diversity of Austria and Hungary that makes the monarchy more or less self-sufficient, the two halves depending upon exchange with each other for their material well-being. The chief seats of industry in Austria are Bohemia, Silesia, Moravia, and

Lower Austria. In Hungary Budapest is the heart of industrial activity, 40 per cent of the factory population being employed there; yet the number of Budapest's manufacturing establishments is but 10 per cent of the total, which shows that most of the large modern factories and mills of Hungary are located in its capital.

The most important industries conducted on a large scale, and playing a leading part in commercial and financial life, are the textile and iron and steel industries. The maintenance of the textile industries has always been an object of special solicitude with the people of Austria, because it not only furnishes employment, but also affords a market for the wool and flax crops of the country. But although the wool and linen industries are still flourishing, their relative importance is receding before the rapidly growing cotton industry. The raw cotton is imported from the United States and India, and is converted into finished products in the spinning, weaving, bleaching, dyeing, and printing establishments of the monarchy. In 1831 the imports of raw cotton amounted to 12,456,000 pounds; in 1858 they rose to 87,523,000 pounds. Cotton was seriously threatening the very existence of the linen industry, when the breaking out of the Civil War in the United States, with the consequent cotton famine, gave the linen industry a chance to revive. After the war the cotton industry took a new lead, and the imports of cotton jumped to 132,739,000 pounds in 1871, 245,482,200 pounds in 1891, 358,269,500 pounds in 1898, and 479,280,040 pounds in 1907; in 1910, the import was 410,716,980 pounds. The silk industry has also advanced rapidly, owing chiefly to the increased cultivation of the silkworm in Hungary. Formerly the seat of silk manufacture was largely centred in southern Tirol and the neighboring region; now there are large silk-spinning establishments in Szekszárd, Pancsova, and Újvidék (Neusatz), in Hungary, in which country 107,637 families were engaged in the production of raw silk in 1903, as against only 1059 families in 1879. All of the textile products enumerated constitute an important item of export from Austria-Hungary.

The iron and steel industry is abreast of the times in its methods of manufacture. The production of pig, cast, and wrought iron, Bessemer steel, iron bars, etc., although large, is barely sufficient to cover the home demand on the part of the manufacturers of steel rails, iron plate, steel wire, etc., besides the numerous comparatively smaller manufactures of all kinds of metallic ware. In addition there is the very important machine-building industry, which includes the manufacture of locomotives, agricultural machinery, and all kinds of machinery used in modern manufacturing establishments. Many of these products, however, are produced in quantities inadequate to meet the domestic demand.

The milling industry is still carried on to a considerable extent by small establishments, in which the motive power is wind or water, but there are now thousands of steam mills, most of them in Hungary. Some of them, as those in Budapest, are on a large scale.

In 1890 there were 106,616 distilleries, the great mass being diminutive stills, of which 27,055 were in Austria, and 79,561 in Hungary. In 1898, out of 30,637 distilleries in Austria, only 600 used any kind of machinery, and a simi-

lar proportion held in Hungary. But of the 25,434,000 gallons produced by the 79,010 distilleries in Hungary in 1896, 24,884,000 gallons, or 97.8 per cent of the total product, were turned out by 501 distilleries, or about one-half of 1 per cent of all the distilleries. In 1910 there were 45,384 distilleries in Austria and 62,411 in Hungary. The combined annual production of alcohol is about 60,000,000 gallons. The number of breweries is on the decrease, because the small breweries are crowded out of existence by their new large rivals. In 1865 there were 3143 breweries; in 1880 there were 2217; in 1890, 1859 (1761 in Austria and 98 in Hungary); in 1903, 1513 (1423 and 90); in 1911, 1266 (1183 and 83). The annual output of the Austro-Hungarian breweries is over 550,000,000 gallons and is exceeded only by those of Germany and Great Britain in all Europe.

The beet-sugar industry is one of considerable importance in Austria, as well as in Hungary, and is fostered by the government by a very liberal bounty system. In 1865 there were 147 refineries in the monarchy; the number grew to 215 (198 in Austria and 17 in Hungary) in 1890, and 234 (214 in Austria and 20 in Hungary) in 1898, and the annual output increased from 845,000 tons of sugar in 1890 to nearly 935,000 tons in 1898, which not only covered the entire domestic demand, but also furnished a considerable surplus for export. In 1909 the output in Austria was 1,003,731 tons; in 1910 in Hungary, 333,343 tons. About three-fifths of the Austrian sugar is produced in Bohemia. The sugar industry gives employment to over 90,000 people, of whom about one-fifth are employed in Hungary.

The glass industry is especially developed in Bohemia, whose products are famous and constitute a very important article of export. The pottery products are also of importance and include the most artistic and expensive porcelain and china ware. The chemical industry thrives especially in Bohemia, Silesia, Lower Austria, and Hungary, and its most important products are potash, sulphuric and hydrochloric acids, pharmaceutical goods, and dyestuffs and explosives. The manufacture of paper, carried on extensively, furnishes large quantities for export, giving employment to some 60,000 people. The manufacture of friction matches is carried on extensively in Austria.

The leather industry sprang up at an early date, as a natural outgrowth of the country's enormous stock raising, and has developed to such an extent as to require the importation of considerable quantities of hides from abroad; and yet it is unable to supply the domestic demand for leather, which also has to be imported in great quantities.

The manufacture of tobacco has constituted a government monopoly since 1670. It is carried on in 51 factories, of which 30 are in Austria and 21 in Hungary, giving employment to over 60,000 persons, more than 90 per cent of whom are women. The annual output of the government factories aggregates about 1,875,000,000 cigars, 8,400,000,000 cigarettes, over 435,000 quintals of smoking tobacco, and between 12,000 and 13,000 quintals of snuff. The estimated gross revenue from the tobacco monopoly, according to the budgets for 1912, was 318,258,100 kronen for Austria and 185,267,000 kronen for Hungary.

Transportation. Railways.—The first steam

railway in Austria, the Kaiser Ferdinand Nordbahn, 8 miles long, was opened in November, 1837; a horse railway—the first ever built in Europe—had existed since 1825. The first steam line was built by a private company, and it was not till 1841 that the government began to construct railways on its own account. In the meantime the great prosperity of the country in the early forties, with its consequent abundance of idle capital seeking investment, stimulated the construction of many private lines and sent up the price of railway shares on the exchanges. The poor crops of 1845, however, and the commercial panic of 1846 which followed, brought ruin to many and left the railways in a pitiful plight. It was in these circumstances that the government determined upon the policy of nationalizing the railways and appropriated over \$10,000,000—soon increased to \$25,000,000—for buying up the shares of private railway companies; and in less than a year (September, 1847) the government owned a controlling interest in four of the largest railways of the country—the Hungarian, the Lombardo-Venetian, the Gloggnitz, and the Oedenburg railways. The financial straits in which these railways found themselves forced the government to pursue to an end the policy it had once begun and buy out the roads entirely. By September, 1854, the government was in possession of 1100 miles of railways, or practically the entire mileage of Austria. In the following year, however, it suddenly reversed its policy and began to dispose of its acquired lines, and by 1858 the total length of the state lines dwindled down to some 8 miles. This radical change in railway policy, while partly due to official mismanagement under state control, was mainly caused by the government's need of a large amount of ready cash, in order to effect a change in its monetary standard. The following decade was marked by feverish activity in construction, due largely to indiscriminate grants of subventions by the government to private companies. From 1860 to 1870 the length of private lines increased from 1815 miles to 3800 miles, while the proportion of subsidized roads increased from 20 per cent at the close of the fifties to 75 per cent in 1866. In 1873 the Austrian government, partly influenced by the great drain upon its finances caused by the granting of subventions, and partly stimulated by the success of state railway ownership in Germany and in France, made an attempt to return to its former policy. As an initial step in that direction, a law was passed in 1877 conferring on the government the right to take over, with a few exceptions, all the lines which had been receiving a subvention from it or whose payment of interest had been guaranteed by it. The total amount paid out by the government in the form of subventions and guarantees up to 1876 was about \$49,000,000. Since 1877 the state has steadily increased its railways, both by construction and by purchase, so that at the beginning of 1905 it owned and controlled over 56 per cent of the total railway mileage, which amounted to 13,425.

The experience of Hungary with its railways has been, in the main, the same as that of Austria, with the difference that the Hungarian government, since the *Ausgleich* of 1867, has pursued the policy of state ownership and control with greater energy. The first steam railway was opened in July, 1846, a line 21 miles

long, from Budapest to Vâes (Waitzen). At the beginning of 1905 the total length of railway lines was about 12,533 miles, of which nearly 73 per cent was owned or controlled by the government. The following table

YEAR	AUSTRIA		HUNGARY	
	State (miles)	Private (miles)	State (miles)	Private (miles)
1850 ...	516	325	120	17
1860	8	1817		1002
1870	8	3781	221	1935
1880	1221	5867		
1890	4129	5359	3533	3440*
1904.	7614	5130	9149†	1849†

* Including 2000 miles operated by the state.
† 1903.

illustrates the growth of railway lines in Austria and Hungary. At the beginning of 1911 the mileage in Austria was 14,335; in Hungary, 13,087; in Bosnia and the Herzegovina, 1215; total, 28,638.

Merchant Marine and Shipping. Cut off from the sea on all sides except for a small outlet on the Adriatic, Austria-Hungary naturally falls behind all of the leading European countries in her merchant marine. In 1903 this comprised 16,229 vessels of 437,830 tons in Austria, and 466 vessels of 134,229 tons in Hungary. Of these, Austria had 382 steamers of 390,487 tons, and Hungary 128 steamers of 132,483 tons. Austria employed altogether 43,858 seamen, and Hungary 2905. In 1884 the merchant marine of the entire monarchy consisted of 9206 vessels of 324,458 tons, employing 29,358 people. In 1910 190,105 vessels of 28,235,486 tons entered and 189,986 of 28,335,345 tons cleared at Austro-Hungarian ports; as against 85,000 vessels of 11,000,000 tons in 1891. About 90 per cent of these vessels carried the Austro-Hungarian flag, next in the order of importance being those of Italy, Greece, and Great Britain. The most important seaports are Trieste in Austria and Fiume in the Kingdom of Hungary. The Danube is navigated by a large number of steamboats throughout the whole of its course in Austria-Hungary, and affords a great outlet to the Black Sea.

Commerce. The lofty mountains surrounding the country on nearly all sides and the small extent of its coast line are great obstacles in the way of development of foreign commerce. On the other hand, the great diversity of natural resources in the monarchy is especially favorable to an active internal trade. For purposes of commerce, Austria and Hungary form a single customs union, maintained by mutual agreement. According to it the commercial relations of the two halves of the monarchy to each other and to foreign countries are exactly the same as in the case of the separate States of the United States; no import or export duties can be levied on goods going from one part of the monarchy to the other, and all duties on foreign goods are uniform throughout the country. Nearly 1,000,000 people are employed in commerce. Eighty-five per cent of the entire foreign commerce is by land.

The following tables show the development of foreign commerce from 1895 to 1910. Imports

of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports, in thousands of kronen:

Year	Mdse home consumption	Total mdse.	Coin and bullion	Total imports
1895 ..	1,444,986	1,487,052	107,659	1,594,711
1900	1,696,358	1,748,968	44,898	1,793,866
1905	2,146,133	2,213,145	55,982	2,269,127
1910	2,852,852	2,929,734	43,099	2,972,833

Exports of domestic merchandise, of total merchandise, of coin and bullion, and total exports, in thousands of kronen:

Year	Domestic merchandise	Total mdse.	Coin and bullion	Total exports
1895	1,483,620	1,568,118	50,362	1,618,480
1900	1,942,003	2,061,705	66,546	2,128,251
1905	2,243,780	2,390,722	59,533	2,450,255
1910	2,418,606	2,587,641	80,931	2,618,572

In 1909 and 1910 imports of raw materials, in millions of kronen, amounted to 1604.4 and 1582.3; partially manufactured materials, 435.0 and 476.0; manufactures, 706.9 and 794.6; exports of raw materials, 875.5 and 870.3; partially manufactured, 406.0 and 434.9; manufactures, 1037.4 and 1113.4. In 1911 imports and exports, in the special trade, were valued at 3,191,712,000 and 2,404,304,000 kronen respectively. In that year the larger classes of imports were as follows, in millions of kronen: Cotton, 313.7; coal, 189.0; seeds, 151.6; wool, 146.4; machinery and implements, 119.0; common metals, 119.0; hides (raw), 108.7; coffee, 92.6; cereals, 88.1; iron and iron manufactures, 83.9; leather, 73.0; silk and silk thread, 62.2; silk manufactures, 60.1; jewelry, 59.4; eggs, 57.5; cotton goods, 56.2. The larger classes of exports were: wood, 270.6; sugar, 216.6; cotton goods, 123.5; eggs, 112.6; apparel, etc., 97.8; coal, 94.9; wooden manufactures, 81.4; machinery, 78.2; iron and iron manufactures, 72.5; hides (raw), 72.5; woolen goods, 71.5; glass and glassware, 71.2; metal articles, 60.5; paper and paper manufactures, 60.1.

Special trade in merchandise by countries, in thousands of kronen:

COUNTRY	IMPORTS		EXPORTS	
	1910	1911	1910	1911
Germany	1,153,882	1,263,204	1,062,483	1,038,217
United States	236,920	289,760	81,352	58,452
United Kingdom	228,534	229,448	224,433	216,279
British India	214,038	219,739	68,624	51,574

Total, including other ...	2,852,852	3,191,712	2,418,606	2,404,304

Commerce between Austria-Hungary and the United States has increased steadily since the end of the nineteenth century.

Following is a table showing figures compiled by the United States Department of Commerce and Navigation:

Year	Imports to the United States from Austria-Hungary	Exports from the United States to Austria-Hungary
1895.....	\$2,125,772	\$6,510,319
1900....	7,046,819	9,079,667
1901....	7,222,650	10,067,979
1902....	6,167,127	10,150,601
1903....	7,156,688	10,569,929
1904....	8,225,282	10,372,689
1905....	11,623,746	10,553,204
1906....	14,890,019	13,865,433
1907....	15,136,185	16,009,629
1908....	16,174,738	15,425,659
1909....	14,226,703	15,436,587
1910....	14,962,731	17,408,910
1911....	19,514,787	16,958,099
1912....	22,388,930	16,713,794

The chief articles of import from the United States are cotton and some machinery and other manufactured goods, while Austria-Hungary exports to us mainly beet sugar, glassware, pottery, furniture, millinery, jewelry, and beans.

No account of Austro-Hungarian commerce would be complete without some reference to the amount and nature of the commerce between the two halves of the monarchy. The preponderantly industrial activity of Austria and the agrarian activity of Hungary is shown by the fact that in round numbers, 10 per cent of Austria's exports to Hungary is raw material, 12 per cent is unfinished goods, while the balance is finished manufactures. In return Hungary sends her 57 per cent raw materials, 7 per cent unfinished goods, and only 36 per cent finished manufactures.

The raw materials sent from Hungary to Austria consist almost exclusively of animals, cereals, flour, and other foods.

Banking. The banking system of the monarchy is quite simple. It centres in the Austro-Hungarian Bank, with headquarters at Vienna and Budapest, 71 branches in the principal cities of the country and agencies in many other towns. This bank has the exclusive privilege of issuing paper money, and to that extent exercises even a more complete control over the monetary situation of the monarchy than the Bank of England does over that country. It was organized in 1816, under the name of the "Austrian National Bank," and from the beginning was endowed with the great powers it now enjoys. Except for the period lasting from 1848 till the middle of the sixties, when the country's resources were drained to exhaustion by the ravages of the Revolution and foreign wars, it has enjoyed great prosperity during its entire existence and has had a high reputation for stability and sound management. In 1877 it was recognized as the Austro-Hungarian Bank, in order to bring it into conformity with the new political status of the country. The charter of the bank, which expired in 1910, was renewed and extended until 1917. Its capital was increased in 1900 from 180,000,000 kronen (\$36,540,000) to 210,000,000 kronen (\$42,630,000). Its resources have steadily increased, and in 1912 its assets and liabilities balanced at 3,743,168,000 kronen (note circulation, 2,815,797,000; reserve fund, 28,408,000).

The most important bank next to the Austro-Hungarian Bank is the Austrian Credit Bank for Trade and Industry (*Oesterreichische Credit-Anstalt für Handel und Gewerbe*). Its functions are the same as those of the large private banking houses of the United States; viz., the promotion of all kinds of industrial undertakings, and negotiating state and provincial loans. It was founded in 1855, with an authorized capital of \$40,000,000, which was subsequently reduced to \$16,000,000, and has branches in the largest cities of the country. Other important banks are: The Lower Austrian Discount Company, organized 1853 (\$4,000,000); the Anglo-Austrian Bank, organized 1864, capital \$7,000,000; the Austrian Territorial Bank (*Länderbank*), organized 1880, with \$16,000,000, mostly French capital, invested in railways, mines, and foreign loans; the Union Bank; and the General Austrian Mortgage Bank (*Bodenkredit-Anstalt*), organized 1864. The latter advances loans on real estate by issuing mortgage bonds, which are sold in the open market, so that it practically serves as an intermediary between the real-estate owners and the capitalist who does the actual advancing of money. Nearly all of these banks have branches throughout the country. The Vienna Clearing House (*Giro und Cassen-Verein*), in addition to attending to ordinary clearing-house transactions (see CLEARING HOUSE), performs many other services for banks and business firms.

There are a number of other banks—savings, pawning, mortgage banks, etc. All in all, there were, at the end of 1909, 77 joint-stock and private banks (besides branches and agencies) in Austria, with assets and liabilities balancing at 10,125,119,000 kronen. This comparatively small number is due to the fact that the system of branch banking is in vogue. In Hungary the system of small independent banks is more in favor.

The postal savings-bank system has attained a high development in Austria-Hungary. Besides the savings department proper, in which deposits are accepted for the smallest amounts, there is a check department, in which the minimum deposits are fixed at \$40. The use of the post office as a banking institution has proved of inestimable benefit to the business community. The postal savings department has been converted into a gigantic clearing house for the entire country. The number of postal savings banks in Austria increased from 5562 in 1896 to 6913 in 1911; the number of depositors in the savings department proper increased during the same period from 1,174,902 to 2,371,732; and the total deposits at the end of 1911 amounted to 671,197,509 kronen. The number of postal savings banks in Hungary increased from 3983 in 1895 to 4555 in 1911; the number of depositors increased during the same period from 276,565 to 823,251; and the total deposits at the end of 1911 were 116,522,000 kronen. The private savings banks of Austria increased from 488 in 1895 to 669 in 1911; depositors at end of 1911, 4,262,108; deposits, 6,045,174 kronen. Private savings (and some other) banks in Hungary numbered 1984 at the end of 1911, with 1,143,853 creditors and deposits amounting to 3,841,734,000 kronen (exclusive of 867,238,000 kronen on account current).

Education. Owing to the diversity of race and language which prevails in the various crownlands of Austria, the system of public edu-

cation presents many differences. In general, the organization and management of all public institutions of learning in Austria (Cisleithania) are left to the provincial authorities; but these are required to conform to a uniform scheme of instruction established by act of the Imperial Reichsrat and applied by the Minister of Public Instruction. School administration is under the supervision of local, district, and provincial boards, and district and provincial inspectors. The features common to all the crownlands are the division of educational institutions into primary, secondary, and higher schools, and the very low cost at which instruction in schools of all grades is imparted. Characteristic, too, of all the Austrian crownlands is the high degree of excellence which technical education has attained. The care of primary instruction is incumbent on the local communities, and attendance is compulsory at the primary schools between the ages of 6 and 14 (except in Carniola, Istria, Dalmatia, and Galicia, 6 to 12; and in Bukowina, 6 to 13). The course of instruction includes, besides the ordinary branches, the subjects of religion, physical training, and, in the case of girls, domestic science. In 1893 the number of national schools and grammar schools (*Volksschule*, *Bürgerschule*) in Cisleithania, in which elementary education was imparted, was 18,807, with a teaching force of 67,354 men and women and an enrollment of 3,160,837 pupils. At the end of 1910 there were 23,847 elementary schools (including 1245 private schools), with 108,006 teachers and 4,520,138 pupils; children of school age, 4,818,870.

Above the elementary schools are the *Gymnasias* and the *Realschulen*, offering courses of eight and seven years respectively. The *Gymnasias* prepare for the universities, the *Realschulen* for the technological institutes. For the support of the secondary schools, the state, the provinces, and the larger communes coöperate. In 1896 there were 182 *Gymnasias*, with a teaching staff of 3699 and an attendance of 59,975, and 84 *Realschulen*, with 1579 teachers and 26,429 students. In 1913 the number of *Gymnasias* was 343, and the enrollment 108,838, while the *Realschulen* had increased to 148 in number, with 49,151 students. Universities of Cisleithania, eight in number, supported by the state, are located at Vienna, Prague (two, German and Czech), Graz, Innsbruck, Cracow, Lemberg, and Czernowitz. Each comprises faculties of theology, jurisprudence and political science, medicine, and philosophy. The universities at Vienna and Cracow and the German university at Prague date back to the fourteenth century; and of these the first ranks among the foremost universities of the world, especially as to its faculty of medicine. In 1893 the number of professors and tutors in all these universities was 1140 and the number of students 13,528. In the winter of 1912-13 the combined faculties included 1900 teachers and the students numbered 30,591, of whom 2624, or 8.5 per cent, were women. In 1909-10 there were 49 theological colleges (of which 43 were Roman Catholic) with a total of 1941 students. Of the technological institutions, the most important are the seven state high schools at Vienna, Prague (two), Graz, Brünn (two), and Lemberg; the agricultural high school at Vienna, and mining academies at Leoben and Příbram. In addition, there are numerous schools of agriculture, forestry, and mining, industrial schools, military and

naval academies, and schools of fine arts and music. In all, the special schools of Austria in 1909-10 numbered 5721, with 381,702 students. General culture is highest in the German-speaking crownlands (Bohemia included) and lowest among the Slavic races of Dalmatia, Galicia, and Bukowina.

Of learned societies, libraries, museums, and art galleries there is a very great number, the most prominent of which are the imperial academies of science at Vienna, Prague, and Cracow. The Imperial Library at Vienna possesses 900,000 volumes, and the library of the University of Vienna nearly 600,000. The periodical press increased in number from 2137 publications in 1894 to 3149 in 1903.

The educational system of Hungary is similar in its general outline to that of Austria, but differs from it in the greater uniformity of organization, due to the preponderating influence of the Magyar element in the population. The persistent attempt to make Magyar the exclusive language in the public schools has been a marked feature of educational policy in Hungary proper in recent years. Attendance at the elementary schools, grammar schools, and the so-called repetition courses (which three classes comprise the "primary" schools) is compulsory for all children between the ages of 6 and 15, and it is incumbent on all communes to provide, generally with the aid of the state, adequate facilities for elementary instruction. In 1894 the number of primary schools was 16,881, and the enrollment of pupils 2,270,584, or nearly 80 per cent of all children of school age. In 1910-11 there were 19,339 primary schools, with 47,487 teachers and 2,938,091 pupils; children of school age, 3,545,014. The *Gymnasias* and the *Realschulen*, which offer courses of eight years in preparation for the universities and technical schools, are supported by the communes, by the state, or partly by both. In 1894 there were 186 of these secondary schools, with a staff of 3230 instructors and 51,228 students. In 1910-11 there were 187 *Gymnasias*, with 3882 teachers and 63,544 students; and 42 *Realschulen*, with 1020 teachers and 14,072 students. The state maintains five universities, at Budapest, Kolozsvár (Klausenburg), Zág-ráb (Agram), Pozsony (Pressburg), and Debreczen, each with faculties of theology, law, medicine (except Zág-ráb), and philosophy. The universities of Pozsony and Debreczen were founded in 1912; the other three had, in 1911, 652 professors and 10,222 students (of whom 422 and 6858 at Budapest). Other institutions included the technical high school at Budapest, with 160 teachers and 1676 students; 49 theological colleges (29 Roman Catholic), 330 and 2153; numerous industrial schools, etc., with 9210 teachers and 143,290 students. The number of pupils in the elementary schools (included above in the primary schools) was 2,159,696. From 1903 to 1911 the number of periodicals increased from 1483 to 2019, of which 1493 were in Hungarian and 153 in German.

Government. The Austro-Hungarian monarchy is composed of the Empire of Austria and the Kingdom of Hungary (and Bosnia and the Herzegovina, former Turkish provinces annexed in 1908); it is a loose union of two independent states. The essential bond between them is their possession of a common ruler; the crown of both is hereditary in the House of Hapsburg-Lorraine, and the Emperor of Austria is at the same time

Apostolic King of Hungary. He is crowned at both Vienna and Budapest. The present dual system was adopted by the *Ausgleich* (agreement) of 1867, when the two countries, while retaining their complete independence in domestic affairs, agreed to establish a common administration for certain matters of state. Also by this *Ausgleich* (which is a general name for several treaties dealing with different subjects adopted at about the same time) Austria and Hungary were constituted a customs union, pledged to a common commercial policy, with a common coinage and system of weights and measures, a joint bank of issue, and a uniform control of monopolies and interstate railways. The departments of state common to both countries are those of finance, war, and foreign affairs, and in the functions delegated to the last two, there is apparent a general tendency to grant as little as possible to the common administration and to keep as much as possible for the national executive. The Minister of Foreign Affairs is charged with the supervision of the Emperor-King's household and with the maintenance of the diplomatic and consular service. The Minister of War is concerned chiefly with the organization and training of the troops, since recruiting and the regulation of the terms of service are left to the two parliaments. The duties of the Minister of Finance are confined to the administration of the customs, the balancing of accounts for the two other ministries, and the administration of the dependent territory of Bosnia and the Herzegovina. The proportion of the common expenses to be borne by the two countries is determined, according to the *Ausgleich*, every 10 years. In 1907 the agreement was renewed for 10 years, providing that the net proceeds of the common customs be applied to the common expenditure, and the remaining expenditure be satisfied by Austria in the proportion of 63.6 per cent and by Hungary 36.4 per cent. The former proportion was 65.6 for Austria and 34.4 for Hungary.

Practically all legislation necessary to render the work of the common departments efficacious, rests with the Austrian and Hungarian parliaments, but the ministries are controlled directly by two bodies known as the delegations, representing the parliaments of the two countries. Each delegation consists of 60 members, 20 of whom are elected by the Upper House and 40 by the Lower House. The delegations assemble at Vienna and at Budapest in alternate years, and deliberate apart, communicating only in writing. If they arrive at no agreement after three interchanges, they meet as one body and vote without debate. Evidently the system of dual government is not only cumbersome, but precarious, in that it depends for its continuance on the mutual good will of two contracting parties, each of whom keeps a jealous watch against the least ascendancy on the part of the other. The activity of the common ministries is dependent on concurrent legislation by the Austrian and Hungarian parliaments; a refusal on the part of either to vote its proportion of the common expenses or its quota of troops may instantly paralyze the financial and defensive powers of the monarchy; and that such action is not at all improbable was shown in 1897, when that part of the *Ausgleich* establishing a customs union failed of renewal and was replaced by a reciprocity treaty later.

The Austrian Empire comprises the 17 crownlands represented in the Reichsrat (Parliament) at Vienna. Of these territorial divisions, diverse in race, language, and history, some, like Bohemia, Galicia, and Dalmatia, are titular kingdoms of which the Austrian Emperor is King; some, like Styria, Carniola, Upper Austria, and Lower Austria, are duchies or archduchies; the rest (except the free city of Trieste) are variously designated principalities. As a result of this combination of sectionalism, based on ethnographical distinctions, with the personal rule of one man, the Empire partakes at the same time of the character of a federal state and of a centralized monarchy. The element of racial diversity influences also the relations between the crown and the legislative bodies. Parliamentary government, in spite of presenting practically all the outward forms it bears in England, for instance, has not attained anything like full development, for the reason that the various parties in the Parliament have not as yet been able to unite permanently in either supporting or opposing the crown. By playing off the different factions against each other, the Emperor has succeeded in retaining the balance of power, and in making the ministers his servants, though in law they are responsible to the Parliament. At the same time such incidents as the blocking of all legislation for months at a time—a thing which happens frequently in the strife of parties—afford him an opportunity for exercising his extra-constitutional powers in the matter of promulgating ordinances and decrees.

The constitution of Cisleithania is based, among other statutes, on the Pragmatic Sanction of 1713, on the patents of 1860 and 1861, and chiefly on the Fundamental Law of Dec. 21, 1867. It may be suspended at any time by a two-thirds vote of both houses of the Reichsrat. The Emperor is the source of law and justice; he legislates concurrently with the Reichsrat for Cisleithania and with the provincial diets (*Landtage*) for the crownlands. He has the power to make treaties, issue ordinances, grant pardons, appoint officials, and to summon, prorogue, and dissolve the legislatures. Through his ministers he may initiate legislation. In case of necessity he may suspend the constitution and legislate provisionally by ordinance. Every act of his, however, must be countersigned by a minister, and his extra-constitutional decrees must be countersigned by the entire ministerial Council.

The Reichsrat consists of a House of Lords (*Herrenhaus*) and a House of Representatives (*Abgeordnetenhaus*). The House of Lords, or Upper House, consisted in 1911 of 15 members of the Imperial family, 81 persons holding their seats by hereditary right, 5 archbishops and 8 bishops of princely rank, 5 untitled archbishops and 169 life members. The Lower House consists of 516 members, elected (under the law of 1907) by the equal and direct suffrage of all male citizens over 24 years of age. The representation of the different provinces in the Lower House of the Reichsrat is as follows: Lower Austria, 64; Upper Austria, 22; Bohemia, 130; Bukowina, 14; Carinthia, 10; Carniola, 12; Dalmatia, 11; Galicia, 106; Görz and Gradisca, 6; Istria, 6; Moravia, 49; Salzburg, 7; Silesia, 15; Styria, 30; Tirol, 25; Trieste, 5; Vorarlberg, 4.

The Reichsrat assembles annually. The con-

sent of both houses is necessary to all treaties relating to commerce or necessitating the imposition of taxes as well as to all statutes and appropriations. Bills may originate in either house, but the annual budget and the recruiting bill fixing the quota of troops for the year must be presented to the Lower House first. Concerning the position of the Reichsrat in respect to the executive, something has been said above; its relation to the provincial diets may be summed up in the statement that the latter are vested with the power of legislation on all subjects not reserved to the Reichsrat, and that the matters so reserved are very numerous, including any interest that may concern two or more crownlands in common. In greater detail, the scope of the Reichsrat includes, in addition to those mentioned, the subjects of customs, coinage, communications, banking, corporations and trade, citizenship, domicile and census, religion and the right of association, the press and copyright, the general policy of public instruction, judicial legislation, and the organization of the executive and judicial departments.

The administrative work of the general government is divided into nine departments, comprising the ministries of the Interior, Finance, Defense, Agriculture, Railways, Justice, Commerce, Instruction and Worship, and Public Works. The heads of the nine departments, together with the premier and a minister without portfolio, constitute the ministerial Council. The civil service in Austria is characterized by its freedom from politics, elaborate automatism, and its marked tendency to intrude on the private life of the citizen. Though the Austrian constitution embodies a comprehensive bill of rights, acts which in their nature are serious limitations of the rights of the citizen are frequently justified as being embraced within the legitimate exercise of the police power. The constitutional restraints on the freedom of speech and of the press, and the right of association, are considerable, and their interpretation is left largely to executive officials.

Provincial Diets and Local Government.—The provincial diets of Cisleithania are in many cases the ancient assemblies, established in the different provinces before they were brought under one rule; the diets, therefore, are the rallying grounds of national parties, and in a way the internal political condition of Austria is affected as much by the attitude of the various provincial legislatures towards the general problems of government as by the relations of parties in the Reichsrat. The diets are unicameral, and comprise (1) the archbishops and bishops of the Roman Catholic and Greek Orthodox churches and the rectors of the universities within the crownland, and (2) the representatives of landed proprietors and the Chambers of Commerce, and the members elected by the rural communities and the towns. The size of the diets varies from 242 members in Bohemia to 26 members in Vorarlberg. The president of the assembly is appointed by the Emperor, who through this officer, as well as through the exercise of the right of prorogation and dissolution, exerts very considerable influence on the legislative bodies. The authority of the provincial assembly extends to questions of local government and local taxation, agriculture and public works, the control of the territorial domains, and the management of secondary schools and chari-

table institutions. The executive power is vested in a committee (*Landesausschuss*), consisting of a president appointed by the Emperor and a certain number of members elected by the diet.

For administrative purposes, each crownland constitutes a department (*Landesregierung*) under a governor (*Statthalter* or *Landespräsident*) appointed by the Emperor. The *Landesregierung* is subdivided into districts (*Bezirkshauptmannschaften*) and communes (*Gemeinden*). The police, as well as the civil power, is vested in the governor. He presides over the boards of education and of health and controls directly the magistrates of the towns and the heads (*Bezirkshauptmänner*) of the districts. There is no uniform municipal code in Austria, each provincial diet having the power to model the municipal government after its own fashion. But within each crownland there is perfect uniformity of administration except for some of the largest cities, such as Vienna, Prague, etc., which are governed under special charters. The common features of all the municipalities in Austria include a *Gemeindeausschuss*, or municipal council, elected generally for a period of three years by the members of the commune, and a *Gemeindevorstand*, or executive board, elected by the council. This board consists of a small number of men under the presidency of the burgomaster and carries out the decisions of the council.

Justice is administered in the first instance by 962 district courts, which try minor offenses and misdemeanors and hold prisoners for the higher tribunals. For the trial of more serious charges, there are 71 provincial and circuit courts of original jurisdiction. Cases involving severe penalties, or concerned with political and press offenses, are brought before the jury courts. Appeals are taken to the higher provincial courts, 9 in number. The court of last resort is the Supreme Court of Justice and Court of Cassation at Vienna. There are also numerous courts for the trial of special matters, such as commercial, revenue, and military cases. The Court of the Empire at Vienna decides questions of jurisdiction and cases involving conflict of laws. Before the High Court of Administration are brought all controversies between private citizens and public officials.

The *Kingdom of Hungary* comprises Hungary proper and Croatia and Slavonia. (Transylvania was formerly, and is still sometimes, not regarded as a part of "Hungary proper.") The constitution of the Kingdom is based on a series of statutes beginning with the Golden Bull of 1222, the charter of Hungarian liberties. The fundamental law of June 8, 1867, confirmed the sweeping reforms which the Revolutionists of 1848 had effected in abolishing old feudal privileges, extending the suffrage, and reconstructing institutions on a modern basis. Subsequent legislation has modified the constitution only in matters of detail and procedure. The King is bound by the same constitutional limitations as in his Austrian dominions; but, by reason of the greater homogeneity of the Lower House of the Hungarian Parliament, does not exercise so great an influence in its deliberations as over those of the Austrian Reichsrat. As in Austria, decrees must be countersigned by a responsible minister to acquire validity. The Hungarian Parliament is composed of an Upper House—the Table of Magnates—and a

Lower House—the House of Representatives. The Table of Magnates in 1906 consisted of 15 members of the royal family, 38 archbishops, bishops, and other dignitaries of the Roman Catholic and Orthodox Greek churches, 12 representatives of the Protestant churches, 229 hereditary peers, 60 life peers, 17 high officers of state, holding their seats *ex officio*, and 3 delegates from Croatia and Slavonia. The House of Representatives, which is chosen by the entire male population over the age of 20 (the qualifications being the payment of a small direct tax or the possession of a certain income), consists of 453 members (413 from Hungary and 40 from Croatia and Slavonia), elected for a period of five years. In the parliamentary scheme the Table of Magnates plays an important part. The majority of its members are great land-owners, possessing extensive influence in the country, and as such often enter into opposition to the popular chamber. In the Parliament as a whole, the Magyar element is strongly predominant, and of the Magyars it is the gentry, or minor nobility, that make up the bulk of the House of Representatives and are the controlling political power of the country. The establishment of the Magyar supremacy has been steadfastly pursued in all walks of public life, and the Magyar language is the only recognized language in the courts and schools of Hungary proper, in the army, etc. Although the other races combined outnumber the Magyars, the only race that has received recognition from the Magyars is the Slavic race of Croatia and Slavonia. The Hungarian Parliament legislates for Hungary and for all affairs that are common to Hungary and Croatia and Slavonia. For purposes of local legislation—i.e., for such matters as agriculture, education, police, and many features of civil and criminal law—Croatia and Slavonia have a diet consisting of 7 ecclesiastical dignitaries, 26 peers and officers of state, and 90 representatives of the rural communes and towns.

The executive power in the Kingdom of Hungary is vested in a cabinet consisting of 9 ministers and a minister-president. The 9 ministers are those of (1) Finance, (2) Interior, (3) Agriculture, (4) Industry and Commerce, (5) Defense, (6) Justice, (7) Education and Public Worship, (8) Minister for Croatia and Slavonia, (9) Minister *ad latus*—i.e., near the person of the King. The ministers are responsible to Parliament. The chief executive in Croatia and Slavonia is the *Ban*, who stands under the control of the Hungarian ministers. Hungary proper (including Transylvania) is divided into 63 counties, at the head of each of which is a governor (German *Obergespan*), and 27 independent municipalities ("cities with municipal rights," or the "royal free cities"). The counties are subdivided into 111 incorporated towns, governed by magistrates, and 410 presidencies (*Stuhlrichteramtler*), and the presidencies are further portioned out into greater and smaller communes. In these ultimate units the representative body is composed, half of deputies, elected by all males over the age of 20, paying a small tax, and half of the highest taxpayers in the communes. The executive power rests with a council appointed for varying terms in the rural and town communes. The presidencies have no legislatures, but are mere administrative divisions.

Local Government. The legislative bodies

in the counties are elected by the qualified parliamentary electors of the district, and the *Obergespan* is assisted by a committee or council appointed for 10 years. In the degree of self-government the municipalities rank with the counties. Their representative bodies are created in the same manner as those of the communes, and they have their councils and magistrates. Croatia and Slavonia contain 8 counties, 4 cities with municipal rights, and 13 free cities. The counties are subdivided into communes, rural and urban, similar in their government to those of Hungary proper. The county legislatures are composed of representatives chosen by the parliamentary electors, of committees representing the municipalities and communes, and of the higher county officials.

Justice. In Hungary the tribunals exercising original jurisdiction comprise 458 district courts for the trial of misdemeanors, 76 circuit courts for the hearing of criminal charges and important civil cases, and 15 jury courts for the trial of press offenses. Appeals from the lower courts rest with the 12 Royal Tables of Justice, and in the final instance with the Royal Curia at Budapest, in Hungary, and the Supreme Court of Justice at Agram, in Croatia and Slavonia. There are besides a tribunal of Commerce and Exchange at Budapest, a Court of Admiralty at Fiume, a Central Court of Land Registry, and a Supreme Court of Discipline for military cases.

Finance. The cost of the administration of the "common affairs" of the Austro-Hungarian monarchy is borne by both states in a proportion agreed on by the two parliaments and sanctioned by the Emperor-King. According to the constitution, the agreement is renewable every 10 years. It expired in 1897, without an understanding having been reached. An arrangement, however, was finally effected whereby the proceeds of the common customs were applied to the common expenditure, and the remainder covered by Austria and Hungary in the proportion of 65.6 per cent and 34.4 per cent respectively. In 1907 the agreement was renewed for 10 years by the parliaments, Austria paying 63.6 and Hungary 36.4 per cent of the common expenses after the application of the proceeds of the common customs. Of the total charges 2 per cent is first debited to Hungary on account of the incorporation with it of the former military frontier. In 1905 the common expenditure was 438,070,000 kronen; in 1907, 433,529,000; in 1908, 514,376,000; in 1909, 643,578,000. Net receipts in the two latter years were 169,931,000 and 197,380,000 kronen; the net expenditure for 1908 was satisfied by Austria in the sum of 219,067,000 kronen and Hungary 125,378,000 kronen; for 1909, Austria 283,481,000, and Hungary 162,198,000. The provisional budget for 1913 showed an estimated expenditure of 503,974,188 kronen (of which 404,754,769 for the army and 74,757,210 for the navy); estimated net receipts from customs, 197,704,169 kronen.

In Austria revenue and expenditure have been as follows, in thousands of kronen:

	1907	1908	1909	1910
Revenue . . .	2,253,052	2,388,384	2,883,648	2,895,492
Expenditure .	2,209,093	2,373,894	2,795,703	2,901,364

For 1912 the Austrian budget showed a revenue of 2,916,685,263 kronen (2,770,393,164 ordinary, and 146,597,180 extraordinary; expenditure 2,916,685,263 kronen (2,668,097,637 ordinary and 248,007,626 extraordinary). The larger items of estimated revenue were: railways, 822,584,010 kronen; excise, 391,947,100; direct taxes, 379,790,000; tobacco monopoly, 318,258,100; posts and telegraphs, 201,305,500. The larger estimated expenditures for 1912: railways, 637,566,780 kronen ordinary and 124,617,930 extraordinary; finance, 861,085,365 and 5,441,700 (including 505,797,962 for the public debt); common expense of the monarchy, 338,107,811 and 8,080,126; posts and telegraphs, 162,072,820 and 17,211,720; worship and public instruction, 105,117,244 and 8,196,440.

In Hungary revenue and expenditure have been as follows, in thousands of kronen:

	1907	1908	1909	1910
Revenue	1,395,711	1,531,368	1,750,783	2,074,549
Expenditure	1,399,477	1,616,245	1,721,564	1,901,666

In 1910 the ordinary revenue in Hungary amounted to 1,543,102,641 kronen; ordinary expenditure, 1,418,776,584; and total expenditure included 149,444,732 kronen for sinking fund. The budget for 1912 showed revenue 1,852,747,661 kronen (1,667,091,211 ordinary and 185,656,450 extraordinary); expenditure, 1,852,694,998 kronen (including 1,580,378,496 ordinary and 168,877,261 kronen for sinking fund). The larger items of estimated ordinary revenue for 1912 were: railways, 427,000,000 kronen; direct taxes, 287,010,000; excise, 270,000,000; tobacco monopoly, 185,267,000; posts and telegraphs, 95,545,000. The larger estimated ordinary expenditures, 1912: Ministry of Commerce, 430,221,650 kronen; Ministry of Finance, 249,592,018; Hungarian debt, 219,642,197; Ministry of the Interior, 101,112,054.

The public debt of Austria-Hungary is extremely large. By the agreement of 1867 the separate debts of the two countries were consolidated into a common debt of the monarchy. Since 1868 the new debts contracted by the two countries have been kept distinct, and interest paid out of the separate revenues of Austria and Hungary. While the common debt has been somewhat decreased, although very slowly, the separate debts have gone on increasing from year to year, until now they have grown to tremendous proportions, proving a great drain on the resources of the people. In 1887 the total indebtedness of the monarchy exceeded \$2,114,000,000; in 1905 it had increased to \$2,840,300,000; and in 1912 to about \$3,746,000,000. On Jan. 1, 1912, the common debt amounted to 5,179,043,911 kronen. The Austrian debt on the same date was 7,061,628,314 kronen (of which 6,711,294,746 consolidated). Hungarian debt in 1910, 6,245,326,119 kronen (of which 4,083,872,000 consolidated). It should be noted that a considerable part of the Austrian and Hungarian debts has been incurred in the purchase or construction of railways and telegraphs.

Army. Since 1866 the armies of Austria-Hungary have been organized on what is practically a Prussian basis. The dual character of

the Austro-Hungarian monarchy has greatly influenced the formation of the imperial army, since each state enjoys its own peculiar constitution and system of representation. Military service is universal in both Austria and Hungary. The forces are organized into the regular or common army, which may be reinforced by the Austrian Landwehr and the Hungarian Honvédség, followed by a Lausturm or levy-en-masse of each state, under the provisions of the Act of July 5, 1912, and earlier laws providing for compulsory service from the nineteenth to the end of the forty-second year. By the new law 2 years instead of 3 are spent with the colors, except in the case of cavalry, and 10 years in the reserve. Both common army and auxiliaries possess an *Ersatz*, or supplementary reserve, which includes conscripts not required for the regular army. Here the men are called out for varying short periods of training annually. The imperial ministry of war is the supreme nucleus of the entire military power. It is divided into 4 sections, which comprise 15 departments, and in which are united the different branches of the personnel of the organization, distribution of troops, administration, etc. Bosnia and the Herzegovina are organized similarly to Austria and Hungary. The yearly contingent of recruits, as provided under the law of 1912, was as follows: for the common army, 159,500 (of which 6000 were for the navy), for the Austrian Landwehr, 26,996; Tirol, 1023; for the Hungarian Honvédség, 25,000, and for the Bosnian troops, 7763, or a total of 220,282 men. From an annual enrollment of about 500,000 in 1912 about 170,000 recruits were put under training. The peace strength as stated in the budget for 1912 was as follows:

Peace strength	Officers	Men
Common army	23,256	313,081
Austrian Landwehr	4,650	45,397
Hungarian Honvédség	4,092	33,329
Bosnian-Herzegovinian forces	406	6,212

The application of the law of 1912 would, it was believed, provide for a war strength as follows:

War strength	Men
Common army	1,360,000
Austrian Landwehr	240,000
Hungarian Honvédség	220,000

In addition there would be the Landsturm, raising the total to over 4,000,000. The infantry is armed with the Mannlicher magazine rifle. The army is divided into 16 army corps, corresponding to appropriate territorial commands, with headquarters as follows: (1) Cracow; (2) Vienna; (3) Graz; (4) Budapest; (5) Pozsony; (6) Kassa (Kaschau); (7) Temesvár; (8) Prague; (9) Josefstadt; (10) Przemyśl; (11) Lemberg; (12) Nagyszeben (Hermannstadt); (13) Zágráb (Agram); (14); Innsbruck; (15) Sarajevo; (16) Ragusa. The following table gives the strength of the army on peace footing for 1912:

PEACE ESTABLISHMENT

COMMON ARMY, AUSTRIAN LANDWEHR, AND
HUNGARIAN HONVÉDSÉG

Common army—	Officers, Officials	All other ranks	Horses
Staff and Establishments.	6,420	13,302	1,005
Infantry—102 reg'ts of 4 battalions and 102 depot cadres.	10,806	158,194	2,395
4 reg'ts of Tyrolese Jägers of 4 battalions, and 4 depot cadres, and 26 independent Jäger battalions.	1,239	16,130	242
4 Bosnian-Herzegovinian reg'ts of 4 battalions and 1 Jäger battalion.	441	6,785	42
Total infantry	12,486	181,109	2,679
Cavalry—42 reg'ts of 6 squadrons and 42 depots	2,049	43,915	40,909
Field artillery (including horse, howitzer, and mountain batteries)	2,339	31,413	16,724
Fortress artillery—6 reg'ts (14 batt's) and 7nd batt's	544	8,149	27
Pioneers (Engineers) 15 batt's	525	8,506	15
Railway and other technical troops	136	1,591	4
Medical corps	106	3,039	
Train 16 independent divisions and 16 depot cadres	517	5,202	3,895
Total common army	25,172	296,126	65,258
Austrian Landwehr—			
Infantry, 40 regiments	4,415	37,454	1,737
Cavalry, 6 reg'ts and 5 squadrons	379	3,946	3,155
Artillery, 16 battalions	162	1,964	923
Total	4,956	43,364	5,815
Hungarian Honvédség—			
Infantry, 28 regiments and depot cadres	3,721	24,063	599
Cavalry, 10 regiments and depot cadres	469	4,517	4,872
Total	4,190	28,580	5,471
Total peace establishment	34,318	368,070	76,544

Weights, Measures, and Money. The metric system is in vogue throughout the monarchy. The monetary system is on the gold basis. The unit of value is the krone (crown)—equal to one-half of the old gulden or florin—and worth 20.263 cents United States money. A krone has 100 heller, the heller being equal to one-half kreuzer, the coin formerly in vogue.

Population. The growth of population from 1850 to 1910 was as follows:

Year	Austria	Hungary	Total
1850 . . .	17,534,950	13,191,533	30,726,483
1857 . . .	18,224,500	13,768,513	31,993,013
1869 . . .	20,394,980	15,509,455	35,904,435
1880 . . .	22,144,244	15,695,184	37,839,428
1890 . . .	23,895,413	17,463,791	41,359,204
1900 . . .	26,150,708	19,254,559	45,405,267
1910 . . .	28,571,934	20,886,487	49,458,421

(For figures of population by crownlands, see first table of this article.)

In Austria the 1910 census returned the number of Roman Catholics at 22,530,169 (78.85 per cent of the total population); Greek Catholics, 3,417,223 (11.96); Jews, 1,313,687 (4.60); Greek Orthodox, 666,458 (2.33); Evangelicals (Augsburg), 444,307 (1.55); Evangelicals (Helvetian), 144,379 (0.50); Old Catholics, 21,288. In Hungary (exclusive of Croatia and Slavonia)

Roman Catholics numbered (1910) 9,010,305 (49.3 per cent); Reformed, 2,603,381 (14.3); Greek Orthodox, 2,333,979 (12.8); Greek Catholics, 2,007,916 (11.0); Evangelicals (Augsburg), 1,306,384 (7.1); Jews, 911,227 (5.0); Unitarians, 74,275 (0.4). Roman Catholics in Croatia and Slavonia numbered 1,877,833 (71.6 per cent); Greek Orthodox, 653,184 (24.9); Evangelicals (Augsburg), 33,759 (1.8); Jews, 21,231 (0.8); Reformed, 17,948 (0.7); Greek Catholics, 17,592 (0.7). In the monarchy (including Bosnia and the Herzegovina) in 1910, the total number of Roman Catholics was 33,952,368; Greek and Armenian Catholics, 5,453,019; Greek Orthodox, 4,479,357; Evangelicals (Helvetian), 2,766,568; Jews, 2,258,013; Evangelicals (Augsburg), 1,790,304; others and without confession, 790,594 (the last figure includes in Bosnia and the Herzegovina 33,758 military not classified by religion and 612,137 Mohammedans).

In 1910 there were but five cities in Austria-Hungary having a population of over 200,000: Vienna, Budapest, Prague, Trieste, Lemberg. The census of Dec. 31, 1910, showed the following populations for the larger cities: in Austria—Vienna, 2,031,498; Trieste, 229,510; Prague, 223,741; Lemberg, 206,113; Graz, 151,886; Brunn, 125,737; Czernowitz, 87,128; Pilsen, 80,343; Königliche-Weinberge, 77,120; Žižkow, 72,173; Pola, 70,499; Linz, 67,817; Przemyśl, 54,562; Innsbruck, 53,194; Smichow, 51,791; in Hungary—Budapest, 880,371; Szeged, 118,328; Szabadka (Maria-Theresiopel), 94,610; Debreczin, 92,729; Zágráb (Agram), 79,038; Pozsony (Pressburg), 78,223; Temesvár, 72,555; Kecskemét, 66,834; Nagy-Várád (Grosswardein), 64,169; Arad, 63,166; Hódmező-Vásárhely, 62,445; Kolozsvár (Klausenburg), 60,808; Újpest (Neupest), 55,197; Miskolcz, 51,459; Pécs (Fünfkirchen), 49,822; Fiume, 49,806.

Birth and Death Rates. Both show the same tendency to decrease that is so prevalent throughout the civilized world, the former due to increased uncertainty of occupation and greater willingness on the part of the population to check births, and the latter due to improved sanitation and higher standards of living. In Austria the (living) birth rate in 1860 was 38.4 per 1000, death rate 27.0, excess of births over deaths 11.4; in 1870, 40.0, 29.6, and 10.4; in 1880, 38.0, 30.0, and 8.0; in 1890, 36.9, 29.6, and 7.3; in 1900, 37.4, 25.5, and 11.9; in 1909, 33.3, 22.9, and 10.4. The marriage rate was 8.29 in 1900 and 7.54 in 1909. The percentage of illegitimacy in 1890 was 15; in 1900, 13.7; in 1909, 12.3. In Hungary (including Croatia and Slavonia) the (living) birth rate in the period 1891–95 was 41.7, death rate 31.8, and average annual excess of births over deaths, 9.9; in 1896–1900, 39.4, 27.9, and 11.5; 1901–05, 37.4, 26.4, and 11; in 1905, 36.1, 28.1, and 8.0; in 1906–10, 36.8, 25.1, and 11.7; in 1910, 35.6, 23.5, and 12.1. The marriage rate was 8.8 in 1901 and 8.6 in 1910. The percentage of illegitimacy in 1891–95 was 9.0; in 1906–10, 9.7; in 1910, 9.6.

Emigration and Immigration. In the 20-year period of 1879–1898 about 900,000 people emigrated from Austria-Hungary to North and South America, of whom 818,310 went to North America, 41,210 to Brazil, and 25,000 to Argentina. During the five years from 1899 to 1903 the total number of emigrants was 766,168, the greater part (747,638) going to the

United States, and the remainder to Canada, Argentina, Brazil, etc. For 1906 the oversea emigration of Austria and Hungary (and, in parenthesis, of Austria) is stated at 313,167 (136,354); 1907, 386,528 (177,354); 1908, 102,795 (57,734); 1909, 250,530 (129,808); 1910, 267,831 (138,867). The emigrants leave chiefly for the United States—in 1909, 170,191; in 1910, 258,737. Immigration is small and principally comes from Germany, Rumania, and Servia.

Nationalities. The population of the Austro-Hungarian monarchy embraces a greater number of races, distinct in origin and language, than that of any other European country except Russia. The Slavs are the most numerous race, amounting to over 47 per cent of the whole population. Next in order come the Germans (over 23 per cent), then the Magyars (nearly 20 per cent), while the Rumanians (over 6 per cent) occupy the fourth place. The Slavs form the bulk of the population of Bohemia, Moravia, Galicia, Carniola, Dalmatia, Croatia, Slavonia, and the north of Hungary. The Slavs are split up into a number of nationalities, differing greatly in language, religion, culture, and manners; so that their seeming preponderance in the monarchy is lost. These nationalities include the Czechs (the most numerous of all) in Bohemia and Moravia, the Poles in Galicia, the Ruthenians in Galicia and northern Hungary, the Croats and Serbs in Croatia and Slavonia, the Slovaks mainly in northwestern Hungary, the Slovenes in Carniola, Styria, Görz and Gradisca, etc., and the Morlaks in Dalmatia. The Slavs constitute about 59 per cent of the population of Cisleithania, the Germans nearly 35 per cent. Germans are dispersed over the monarchy, predominating numerically in Upper and Lower Austria, Salzburg, Tirol and Vorarlberg, Styria, and Carinthia. The Magyars, or Hungarians proper, constitute slightly less than 20 per cent of the population of the monarchy, less than 55 per cent of that of Hungary proper, and less than 49 per cent of the Hungarian Kingdom. Over 14 per cent of the population of the Hungarian Kingdom consists of Rumanians, who constitute about 55 per cent of the people of Transylvania. In Bukowina the Rumanians constitute over 34 per cent of the population. The other Romanic peoples of Austria-Hungary are the Italians, inhabiting the south of Tirol, Istria, Trieste, and Dalmatia; the Ladins, occupying some valleys in Tirol; and the Friauls about Görz, north of Trieste. The number of Jews in the monarchy is stated at 2,258,013 (1910), or about 18 per cent of the total Jewish population of the globe. The Gypsies are estimated to number about 100,000. There are more than 10,000 Armenians scattered over the eastern half of the monarchy.

The statutes regulating the relations of state and church insure the sovereign certain rights arising from the dignity of his office, but the law insures religious liberty and the independence of the church from the state. There is no religious test as a qualification for the possession of civil and political rights, and liberty of conscience is secure. The religious bodies have a legal right to manage their own affairs and to possess funds, estates, or endowments for the purposes of worship, instruction, or charity. But they must first secure their legal recognition from the Minister of Ecclesiastical Affairs, which is granted to all sects whose doctrines and practices are not inimical to the laws of the state.

HISTORY

The nucleus of the dual monarchy was that part of the archduchy of Austria that lies south of the Danube and east of the Enns. In the earliest times, what is now the Archduchy of Austria was inhabited by the Taurisci, a Celtic people, and later by the Norici. After the conquest of the latter by the Romans (14 B.C.), the land south of the river became the Roman provinces of Noricum and Pannonia, in the latter of which was the municipal city of Vindobona (Vienna). Tirol formed part of Rætia. All these boundaries were swept away by the irruption of the northern peoples, and the regions in question were occupied in succession, during the fifth and sixth centuries, by the Boii, Vandals, Suevi, Herules, Gepidæ, Goths, Huns, Longobards, and Avars. After the Longobards had settled in Italy, the Enns came, about 568, to be the boundary between the tribes of German origin and the Avars, a people who had come from the East. The Avars in 788 crossed the Enns and fell upon Bavaria, then part of the Frankish Empire; but Charlemagne drove them back (796) as far as the Raab and brought the district from the Enns to that river under his rule. He sent colonists, mostly Bavarians, into the new province and appointed a margrave over it. As the Franks gradually lost their power, the country was again invaded. It came into the possession of the Hungarians before 900, but was reconquered by Otho I in 955 and reunited with the German realm. See HUNGARY.

In 976 the Emperor Otho II appointed Leopold of Babenberg margrave of the reconquered province, and his dynasty ruled this frontier region of the Holy Roman Empire for 270 years. Their possession came to be known as Oesterreich, or Eastern Realm, a name Latinized into Austria. Under Henry Jasomirgott (1141-77) the Mark above the Enns was annexed to the lower Mark, the enlarged province raised to a duchy, and important privileges were conferred on the new Duke and his heirs. Duke Henry removed his capital from the Leopoldsberg to Vienna. He beautified the city, and began the building of the cathedral of St. Stephen. Under his successors Styria was united with Austria. Under Leopold VI, the Illustrious (1198-1230), the Austrian realm reached a high stage of prosperity. The Babenberg line became extinct with his successor, Frederick, who fell in battle with the Magyars (1246). An interregnum ensued. The Emperor Frederick II treated the duchy as a lapsed fief of the Empire, but claims to its possession were set up while the Empire was distracted by the contests between rival emperors. The states of Austria chose Ottakar, son of the King of Bohemia, as Duke in 1251; he became King of Bohemia in 1253, and in 1261 this powerful monarch made himself master of Styria. He subsequently, in 1269, came by inheritance into possession of Carinthia. Ottakar refused to acknowledge Rudolph of Hapsburg as Emperor, and a war ensued in which he was vanquished. He was compelled to give up Austria, Styria, and Carinthia to Rudolph. The struggle was soon renewed, and Ottakar lost his life in the battle on the Marchfeld (1278). Shortly afterward the Emperor (1282) conferred the duchies of Austria and Styria on his sons, Albert and Rudolph.

Fostered by the Hapsburg family policy, which was maintained for centuries without regard to its effect upon Germany, the power of Austria and the Hapsburgs grew together. Albert, while attempting to subdue the rebellious Swiss, was murdered near Rheinfelden (1308) by his nephew, John of Swabia, whom he had deprived of his hereditary possessions. Frederick the Handsome, one of his sons, was chosen (1314) by a party to the Imperial throne, but the election was contested, and he was defeated (1322) by his rival, Louis of Bavaria. The house of Hapsburg was already so powerful that it excited the jealousy of the German princes. Another of the sons of Albert, Leopold, was defeated at Morgarten (1315) in his attempt to reduce the Swiss cantons which had thrown off their allegiance under Albert I. At last, on the death of all his brothers, Albert II reunited the Austrian possessions. After his death (1358), two sons, Rudolph and Albert III successively followed in the Duchy of Austria. Another son, Leopold, held the other lands, but lost his life at Sempach (1386), in seeking to regain the Hapsburg possessions in Switzerland. From Albert and Leopold were derived the two dual lines of Austria and Styria (the latter afterward subdivided into the lines of Styria and Tirol). During Albert III's reign, Tirol and other districts were acquired by Austria. After his death (1395) the dukedom was held by his son, Albert IV. Albert V, who succeeded his father in 1404, and who married the daughter of the Emperor Sigismund, was chosen successor to that monarch in Hungary and Bohemia and was at the same time raised to the dignity of Holy Roman Emperor, as Albert II (1438). The Imperial dignity was henceforth uninterruptedly held by the Hapsburgs, with the exception of one brief interval, down to the end of the Holy Roman Empire in 1806. With Ladislas, Albert's son, the Austrian line of the house became extinct (1457), and its possessions went to the Styrian line. To this line belonged the Emperor Frederick III, who made Austria an archduchy, of which he came into full possession after the death of Ladislas and of his own brother, Albert, in 1463.

In 1477 his son, Maximilian I, married Mary of Burgundy, daughter of Charles the Bold, and thus acquired the opulent provinces of the Netherlands. Becoming Emperor on the death of his father (1493), he gave the government of the Netherlands to his son Philip, added to the Hapsburg patrimony by districts annexed from Bavaria and Venice, and quickly made Vienna an important centre of German art and science. The marriage of the Emperor's son, Philip, with Joanna of Spain placed the house of Hapsburg on the throne of Spain and the Indies. Philip died in 1506; and on the death of Maximilian I, in 1519, Philip's son, Charles I of Spain, more powerful by his hereditary possessions than any other monarch in Europe, was elected German Emperor as Charles V. On account of his large interests outside of Germany, Charles was required by the electors to sign an agreement (*Wahlkapitulation*) to the effect that he would not further the interests of Spain at the expense of the Empire; and this practice was continued with his successors. In 1521 Charles relinquished the sole sovereignty over the bulk of the old hereditary possessions of the house of Austria to his brother, Ferdinand (originally joint possessor with him), the founder of the Austrian

branch of the house of Hapsburg, as distinguished from the Spanish. In 1556 Charles V abdicated the Imperial throne of Germany and was succeeded by Ferdinand I. Ferdinand had married the sister of Louis II of Hungary and Bohemia, and after the death of that King on the field of Mohács, where the Turks laid low the power of Hungary, Ferdinand was chosen to succeed him in Bohemia, and was also elected King by a part of the nobles in Hungary. John Zápolya, Waywode of Transylvania, was chosen King of Hungary by the National party, and was supported by Sultan Solyman the Magnificent, who established the Turkish sway over a great part of Hungary, and whose forces laid siege to Vienna in 1529. After contests extending over 20 years, Ferdinand was allowed to retain possession of Upper Hungary on condition of paying an annual tribute to the Sultan. On the death of Ferdinand I, in 1564, his eldest son, Maximilian II, received the Imperial crown, together with Austria, Hungary, and Bohemia; a second son, Ferdinand, received Tirol; a third, Charles, obtained Styria and Carinthia. Maximilian II was fond of peace, tolerant in religion, and a just ruler. He died in 1576, and of his five sons, the eldest, Rudolph II, who had been crowned King of Hungary and of Bohemia, succeeded him as Roman Emperor. Under him the possessions of the Archduke Ferdinand of Tirol, who had married Philippine Welsper, the beautiful daughter of an Augsburg burgher, reverted to the other two lines, Ferdinand's children not being considered noble. Rudolph II adhered to the old feudal usages, and was an incapable sovereign, leaving everything to his ministers and the Jesuits. His war with the Porte and Transylvania brought him little credit; and the Protestants of Bohemia, oppressed by the Jesuits, extorted from him a charter of religious liberty. He died Jan. 20, 1612, having already relinquished Hungary, the Archduchy of Austria, and Moravia, in 1608, and Bohemia, in 1611, to his brother Matthias, who succeeded him as Roman Emperor. Matthias concluded a 20 years' peace with the Turks and had his cousin Ferdinand, son of the Archduke Charles of Styria, third son of Maximilian II, chosen King of Bohemia, Hungary, and of the Romans. Bohemia refused to acknowledge the new King, who was a fervent Catholic, and chose the Elector Palatine, Frederick V, the head of the Protestant Union, as King. The States of Austria and the Hungarians were also refractory. Matthias died March 30, 1619, and Ferdinand II became Roman Emperor. Ferdinand conquered Bohemia and suppressed Protestantism there with a relentless hand. The events of the reign of Ferdinand II will be found treated in the article on the Thirty Years' War. Bohemia's right of election of its king and its patent of religious liberty were withdrawn. The war closed (1648) under Ferdinand's son, Ferdinand III (1637-57), a more politic prince and a better financier. At the Peace of Westphalia (1648) Austria had to cede her possessions in Alsace to France. Ferdinand III's son and successor, Leopold I, provoked the Hungarians to rebellion by his severity. Tökölyi received aid from the Porte, and Kara Mustapha besieged Vienna (1683), which was rescued only by an army of Poles and Germans under John Sobieski and Charles of Lorraine, who inflicted a crushing defeat upon the Turks. In 1687 Leopold I forced the Hungarians to make their

kingdom hereditary in the Hapsburg family. Prince Eugene compelled the Porte (1699) to give up the country between the Danube and the Theiss and, in 1718, to cede other important territories to Hungary. On the death of Charles II, the last of the Hapsburg sovereigns in Spain, the Archduke Charles, second son of Leopold I, claimed the crown in opposition to Philip V, grandson of Louis XIV. This led to the war of the Spanish Succession, during which Leopold died, May 5, 1705. He was of sluggish, phlegmatic character and wholly under the influence of the Jesuits.

His eldest son and successor, Joseph I, continued the war. He died childless, April 17, 1711, and was succeeded by his brother, Charles VI. The Peace of Utrecht (1713) secured to Austria the Spanish Netherlands, Milan, Mantua, Naples, and Sardinia (exchanged for Sicily in 1720). A curtailment of territory, however, soon ensued. At the Peace of Vienna (1735), which ended the War of the Polish Succession, Charles VI had to give up Naples and Sicily to Don Carlos of Spain, and part of Milan to the King of Sardinia, receiving only Parma and Piacenza instead. He also lost at the Peace of Belgrade (1739) a great part of the fruits of Eugene's conquests, giving back to the Porte Belgrade and the adjoining Servian territories, as well as the parts of Wallachia and Bosnia that had belonged to Austria. The Emperor conceded all these points with a view of securing adhesion to the Pragmatic Sanction, conferring the succession on his daughter, Maria Theresa, an object to which his whole policy for years had been directed.

With his death (Oct. 20, 1740) the male line of the Hapsburgs was extinct, and Maria Theresa assumed the government. Counter-claimants appeared, and the War of the Austrian Succession broke out. Frederick II of Prussia revived an old claim of the Hohenzollerns to Silesia and conquered it. The Elector of Bavaria, who was supported by the power of France (England taking the part of Austria), assumed the title of Archduke of Austria, was crowned King of Bohemia at Linz and Prague, and elected Emperor as Charles VII (1742). A long period of warfare now followed. The Hungarians rallied to the support of their Queen; Maria Theresa's rival, Charles VII, died; her husband, Francis, Duke of Lorraine, was elected Emperor, and the Hapsburg monarchy remained. But Maria Theresa lost various Italian provinces to Spain, and at the close of the Seven Years' War Prussia retained Silesia. At the death of Francis (1765), his son, Joseph II, became Emperor and joint-regent with his mother, of the hereditary states. Collateral branches of the house of Austria were planted by the younger sons of Maria Theresa, the Archduke Leopold of Tuscany and the Archduke Ferdinand, who married the heiress of Este (see *MODENA*). In the first partition of Poland (1772) Austria acquired Galicia and Lodomeria, and Bukowina was ceded by the Porte in 1777. Maria Theresa died on Nov. 29, 1780. Her administration had been distinguished by unwonted unity and vigor, both in home and foreign relations.

Joseph II, now sole ruler, was an active reformer in the spirit of the enlightened despotism of the times, though often rash and violent in his mode of proceeding. He introduced economy into every department, mitigated the censorship

of the press, granted liberties and rights to Protestants, abolished 900 convents, and revised the school system. But his reforming zeal and passion for uniformity in the diverse countries composing his scattered realm excited opposition; the Netherlands rose in insurrection, and other disturbances broke out, which hastened his end (1790). He was succeeded in the hereditary Hapsburg dominions, as well as in the German Empire, by his brother, Leopold II, who pacified the Netherlands and Hungary. When the progress of the French Revolution had begun to threaten the political stability of Europe, Leopold entered into an alliance with Prussia against the Republican propaganda, but he died March 1, 1792, before the war began. This was declared by his son and successor, Francis, in the same year. (See *FRANCE*.) By the treaty of Campo Formio (1797) Austria lost Lombardy and the Netherlands, but received most of the territory of the extinguished Republic of Venice (including Venetian Istria and Dalmatia). The war with France was renewed in 1799 and ended by the Peace of Lunéville (1801). In 1805 Austria engaged in a fresh struggle with Napoleon, who vanquished her forces and those of Russia at Austerlitz, on December 2. In the Peace of Pressburg, December 26, Francis had to give up his Venetian dominions and to cede Tirol to Bavaria. On the establishment of the Confederation of the Rhine, Francis laid down the dignity of Roman Emperor, which his family had held for nearly 600 years. In 1809 Austria once more defied the might of Napoleon, but the battle of Wagram broke her power, and in the Peace of Schönbrunn (Vienna) she had to part with a large portion of the old hereditary dominions of the Hapsburgs.

The humiliating Peace of Vienna was followed (1810) by the marriage of Napoleon with the Archduchess Maria Louisa, daughter of the Emperor Francis; and in March, 1812, Napoleon and Francis entered into an alliance against Russia. This unnatural alliance ceased abruptly, when the Russian campaign of 1812 had broken the power of the French Emperor. In August, 1813, Austria joined the anti-Napoleonic coalition of England, Russia, Prussia, and Sweden. Francis I took an active part, and Austria obtained full indemnity for her losses at the close of the war. In the remodeling of the map of Europe that took place at the Congress of Vienna (1815), Austria was reinstated in the possession of Lombardy, the Venetian territories, Tirol, and the territories wrested from her by Napoleon in 1809. Belgium was constituted part of the Kingdom of the Netherlands. Ferdinand, the Emperor's uncle, was restored to the Grand Duchy of Tuscany, of which he had been dispossessed by Napoleon.

During the period of the Restoration, and until the Revolution of 1848, Austria, her course guided by the subtle and reactionary statesmanship of Prince Metternich, exercised a powerful influence in European affairs. The Holy Roman Empire had ceased to be even a name, but the presidency of the reorganized German Confederation had fallen to Austria, and her policy toward the Germanic States was that of "divide and rule." Austria, Russia, and Prussia were closely allied in the interests of reaction. Every constitutional movement was stifled, and every aspiration toward nationality by the peoples composing the heterogeneous Austrian domains

was rigidly repressed. But under his superficial calm, the internal condition of the Empire was approaching a crisis. The bureaucratic system of government and police supervision produced only irritation and discontent. The strife of nationalities became keener; but the policy of playing these nationalities off against one another no longer succeeded. The Polish insurrection, which led to the incorporation of Cracow with the monarchy (November, 1846), had turned into a frightful rising of the peasantry in Galicia against the nobles. In the meantime the opposition to Austrian rule in Italy and Hungary was becoming uncontrollable, while discontent was rife among the Slavs of Bohemia, and even the states of Lower Austria insisted on some share in the management of the realm. Francis I had been succeeded in 1835 by his son, Ferdinand I, but there was no change of policy. The revolutionary movement was already in full swing in Italy, when the fall of Louis Philippe shook Europe to its foundation (February, 1848). A host of petitions and addresses was followed, March 13, by a popular movement in Vienna, to which the government and military, after a feeble resistance, succumbed. Metternich resigned: the right of citizens to bear arms and the freedom of the press were granted; the Emperor promised to convoke a consultative assembly from all parts of the Empire. At the same time the opposition in Hungary had carried their demand for an independent and responsible ministry, and the Emperor was not in a position to withstand it. On March 18 the insurrection broke out at Milan, and Radetzky, the military commander, was forced to retire on Verona. Venice rose and drove out the Austrians. In Vienna the power passed into the hands of the National Guards and the Students' Legion, the court finding it necessary to take refuge at Innsbrück. An insurrection broke out in Prague, which was repressed with bloody severity by Prince Windischgrätz (June).

The power of Austria began to recover first in Italy. Radetzky thoroughly routed Charles Albert, King of Sardinia, at Custoza (July 25) and reconquered Lombardy. The next success met with was in Croatia. The opposition carried on by the Croats under their *Ban*, Jellachich, to Magyar domination, produced a conflict of nationalities which the Imperial government was able to use in the traditional Hapsburg way. On September 28 the Imperial Commissioner, Count Lamberg, who was sent by the Emperor to dissolve the Hungarian National Assembly, was murdered at Budapest. The Assembly continued its sittings, and appointed Kossuth president of the committee of defense. The advance of Jellachich, who had been made Imperial commander in Hungary, upon Budapest, was successfully met by the Hungarians. On October 6 a bloody insurrection broke out in Vienna. The arsenal was stormed, and the war minister, Latour, murdered; the court fled to Olmütz, a committee of safety was appointed, the armed populace organized, while the Diet wavered between loyalty and revolution. In the meantime the military forces had withdrawn from the capital, and joined Jellachich, in order to meet the Hungarians, who were advancing to the aid of the Viennese. Windischgrätz now approached with an army and declared Vienna in a state of siege. The attack began on October 23, and after a resistance of eight days the city was taken by storm. A number of revolutionary

leaders were condemned and shot. The Diet met at Kremsir, in Moravia, and a new ministry was formed, headed by Prince Schwarzenberg. But the vigorous policy thought to be necessary for the restoration of order and advocated by the Archduchess Sophia (mother of Francis Joseph) was foreign to the easy nature of Ferdinand I. The Emperor abdicated, December 2, and his brother, the Archduke Francis Charles, renounced his claims to the throne in favor of his son, Francis Joseph, who was declared Emperor. The Diet, proving intractable, was dissolved in March, 1849, and a constitution was granted providing for two elective chambers and a responsible ministry. The monarchy was reconstituted into a unified realm and the national autonomy of Hungary abrogated. At the same time, in the German National Parliament at Frankfort, Austria opposed the project of a confederated state or an empire under the leadership of Prussia. In Italy, on March 23, 1849, Radetzky inflicted upon Sardinia the decisive defeat of Novara, which was followed by the abdication of Charles Albert. The struggle in Italy was terminated in the following August by the surrender of Venice to the Austrians.

During the winter of 1848-49 the Hungarians had been gathering strength beyond the Theiss to meet the attack of Windischgrätz, who had entered Hungary in December, and whose advance had compelled the Hungarians to evacuate Budapest in January. On the opening of the spring campaign they took the offensive and were at first successful. Windischgrätz was succeeded in command by Welden, but the Imperial cause was not improved. The Diet at Debreczin proclaimed Hungary a republic, with Kossuth as governor; but Russian assistance at last enabled the Austrians to turn the tide. Kossuth resigned the civil and military power into the hands of Görgei, who laid down his arms to the Russians at Világos (Aug. 13, 1849). The surrender of Komorn, in September, completed the subjugation of Hungary, which was treated as a conquered country, and the captured patriots were dealt with by Haynau, who had succeeded Welden, with bloodthirsty rigor.

This completed the subjugation of the nationalities, and the spirit of the restoration soon showed itself. One important fruit only of the revolution remained—the abolition of feudalism. For a time the forms of the constitution of March, 1849, were retained; but the rigorous military government, and the surveillance exercised over the press, showed the real spirit of the new régime. Ultramontane influences were rampant. Finally, Jan. 1, 1852, it was announced that the constitution and the fundamental rights were abolished, trial by jury set aside, and the old press law revived. This was followed by still greater concessions to the clergy. For 10 years Austria persisted in her policy of reaction, undeterred by its paralyzing effect on the economic life of the nation or by the signs of impending revolution.

When the Eastern war broke out (1853-56), Austria's peculiar relations to Russia led her to remain neutral during the contest; but it was an armed neutrality, which silently warned Russia against aggressions on the Danube.

The unceasing movements in Germany and Italy toward national unity finally forced Austria out of her unyielding attitude. The government of Austria in Lombardy and Venetia was far from satisfactory. By means of secret

treaties Austria obtained a predominant influence in Parma, Tuscany, Modena, the States of the Church, and in the Kingdom of the Two Sicilies. That influence was exercised in the interests of despotism, and in opposition to the welfare of the people, whose wishes their rulers, backed by Austrian troops, were enabled to set at defiance. The question of Austria's position in Italy was brought by Cavour before the European Congress at Paris in 1856, but nothing direct resulted from the discussions. Sardinia, after all remonstrances of a peaceful kind had failed, began to arm. Austria demanded her immediate disarmament, on pain of war; but Sardinia, whose army was swelled with volunteers from every part of the peninsula, and who had previously entered into a treaty, offensive and defensive, with France, refused. Austria accordingly commenced hostilities by crossing the Ticino on April 29, 1859. On May 3 France, as the ally of Sardinia, formally declared war against Austria. The Austrian army was overthrown, and on July 11 Francis Joseph and Napoleon met at Villafranca and agreed on terms of peace, the chief condition of which was the cession of Lombardy to Sardinia. (See ITALY.) Immediately after this war the Emperor Francis Joseph began to turn toward schemes of a more liberal internal policy. The constitutional régime inaugurated in 1861 failed, however, to be acceptable to the Hungarians, and the antagonism of the Czechs of Bohemia, as well as of the Poles of Galicia, tended further to paralyze the efforts of the government.

Prussia, which since the Restoration had been content to remain in her subordinate position with regard to Austria in the German Confederation, now entered upon a new and energetic policy after the accession of King William I in 1861 and the calling of Bismarck into the ministry. A steady effort was made to draw the North German States close to Prussia. Austria was entangled in the complications of the Schleswig-Holstein affair (see SCHLESWIG-HOLSTEIN), and in 1864 she found herself involved with Prussia in a war against Denmark for the liberation of the two duchies. The convention of Gastein, in 1865, with respect to the government of the duchies was a makeshift not calculated to relieve the strain on Austria and Prussia. Austria sought to force the hand of Prussia by referring the settlement of the Schleswig-Holstein question to the German Diet. Prussia made a move by occupying Holstein, and the German Diet thereupon summoned the States to mobilize the federal army of execution against Prussia. The latter declared the confederation dissolved, invaded simultaneously Austria and the States that had joined Austria, and in the brief seven weeks' campaign that followed triumphed completely. The victory of the Prussians at Sadowa was followed by the Peace of Prague, which dissolved the old confederation, allowing reorganization without Austria. Italy had been the ally of Prussia, and although the Italian army and navy were defeated at Custoza and at Lissa, Prussia was able to exact the surrender of Venetia by Austria, which thus ceased to be either a German or an Italian power. See GERMANY; SEVEN WEEKS' WAR.

The catastrophe of Sadowa made it evident to the Austrian government that a radical change in the internal constitution of the Empire was necessary. Above all, the demands of Hungary, as formulated by her great spokesman, Francis

Deák, had to be met. Under the influence of Chancellor von Beust, Francis Joseph effected a reconciliation with the Magyars on the basis of the restoration to them of their constitutional liberties. This settlement, known as the *Ausgleich* of 1867, established the Austro-Hungarian monarchy on the present dualistic basis. Under the guidance of her able foreign minister, Count Andrassy, Austria-Hungary took an important part in the settlement of the situation growing out of the Russo-Turkish War of 1877-78. The Congress of Berlin allowed her to occupy Bosnia and Herzegovina, which was effected only after a bloody struggle (1878). With the adoption of the *Ausgleich*, parliamentary government in Vienna was firmly established. The dual constitution of the monarchy, however, was far from putting an end to dissensions among the nationalities in the Austrian Empire. The Poles, the Slavs, and the Germans were equally clamorous in their demands for recognition. But concession to any one nationality served only to arouse bitter resentment among the other discordant elements and inspired demands for the official recognition of the local language and the erection of national institutions of learning. Parliamentary government was brought to a standstill for long periods by systematic obstruction. A new question was injected into the political sphere in 1905, when, largely as a result of conditions in Hungary and Russia, a formidable agitation for the establishment of universal suffrage took its rise. National party lines were obliterated for the time in this general movement of the lower classes for political recognition. The government, confronted by the difficulties of the Hungarian situation, yielded, and in 1907 enacted a law which provided for general manhood suffrage. The immediate result in the election of 1907 was a vast influx of new members with socialistic tendencies, a result which in the next succeeding election was yet more marked.

In recent years Austria has taken the aggressive in foreign affairs: Bosnia and the Herzegovina were annexed, Oct. 13, 1908; a policy of extensive naval expansion has been entered upon; and in the settlement of the Balkan imbroglio Austria has taken a prominent part. Within the country questions of race and nationality have remained in the foreground; a persistent demand has been made for an Italian university at Trieste; in Bohemia the Czechs are still objecting vigorously against the use of the German language; and the Serbs within the dual monarchy have been plotting for a union with Serbia.

AUSTRIAN LIP. The thick lower lip which was characteristic of the Hapsburgs and survives to some extent to this day among some princes of that dynasty.

AUSTRIAN POLITICAL PARTIES. See POLITICAL PARTIES, *Austria-Hungary*.

AUSTRIAN WOMAN, THE. A contemptuous name for the French Queen, Marie Antoinette, at the time of the Revolution.

AUTEUIL, ô'té'y'. Formerly a country village at the entrance of the Bois-de-Boulogne, now a western quarter of Paris. It is known as the residence of famous literary men, such as Boileau and Molière.

On the Butte Montmartre rise the grand stands of the race course where steeple chases are held from February to December. The *Grand Prix d'Auteuil* (\$25,000), on the second last Sunday in June, inaugurates the summer season.

AUTO- (Gk. *αὐτός*, *autos*, self), a combining form, as the first part of many English words, meaning *self*, *one's self*, *by one's self*, *one's own*; as, e.g., *autobiography*, one's biography, written by one's self; *autograph*, writing in one's own hand; *automobile*, a self-propeller.

AUTOCHTHONES, a-tòk'thò-nēz (Gk. nom. pl. *αὐτόχθονες*, *autochthones*, sprung from the earth itself, from *αὐτός*, *autos*, self + *χθών*, *chthón*, earth). A Greek name for the original inhabitants—not immigrants—of a land, who, according to various local legends, sprang from the earth, rocks, or trees. The Athenians seem to have been especially proud of this name (see *ATTICA*), as indicating that they had always been in possession of their land, though the statement that the ancient nobles wore a golden cicada in their hair, to show their origin from the soil, seems to be due to a grammarian's misunderstanding of the *τέττιγες* (*tettiges*), which were probably golden spirals used to secure the hair. Some writers also spoke of the Arcadians and the early inhabitants of Italy as *autochthones*. (See *ABORIGINES*.) Earth-born *γῆγενεις* (*gêgeneis*), though not properly *autochthones*, were the Greek giants, sons of Earth, who fought against the gods, and the Sparti of Thebes, who sprang from the dragon's teeth sown by Cadmus (q.v.). The name "autochthones" is now frequently applied to the original inhabitants of a

country, like "aborigines." Consult Preller, *Ausgewählte Aufsätze* (Berlin, 1864).

AUTOCHTHONOUS, a-tòk'thò-nūs (for derivation, see *AUTOCHTHONES*). A term employed in the sciences of botany, zoölogy, and paleontology to indicate such plants, animals, or fossils as are indigenous to the places in which they are found. In botany and zoölogy the term is opposed to "naturalized." In paleontology such fossils as are of the remains of animals that have lived in the immediate vicinity of the deposits in which they afterward became entombed are said to be *autochthonous* to those deposits. On the other hand, such fossils as have been entombed in an earlier deposit (a) having been *autochthonous* to it, and through erosion and transportation have become separated from (a) and been reentombed in a second deposit (b), are then said to be *heterochthonous* to the latter deposit (b).

AUTOCRAT OF THE BREAKFAST-TABLE, THE. A serial contribution to the *Atlantic Monthly*, by Oliver Wendell Holmes, in 1857-58. It is the narrative of alleged conversations at the breakfast-table of a Boston boarding house. Dr. Holmes is himself the autocrat and the chief talker, others being allowed to talk simply for the sake of variety. Subsequently published in book form (1858), the work has long been a popular favorite. Its flashes of wit, its excellent philosophy, and its graces of style give its author deserved rank with the most delightful essayists of our literature.

AUTO DA FÉ, ou'tò dü fā (Portug. *auto*, act, from Lat. *actus* + *da*, of the + *fé*, faith, from Lat. *fides*, Sp. *auto de fe*). The name given to the procession or ceremony which used to take place in Spain and Portugal at the execution of those condemned to death by the Inquisition. It was generally held on some great national holiday or in connection with the celebration of a royal marriage, the accession of a king, or the birth of a prince. At dawn the dismal tolling of the great bell of the cathedral gave the signal to begin the drama of the day, for as such it was looked upon by the people, who thronged to it in troops, believing that they did a good work in merely looking on. Men of the highest rank reckoned it prudent to give their countenance to the holy tribunal at these processions, and even grandees of Castile did not disdain to make themselves familiars of the Inquisition. The procession was led by the Dominicans, carrying the flag of their order and that of the Inquisition; next followed the penitents, on whom only penance had been laid; behind them, and separated by a great cross, which was borne before, came those condemned to death—barefoot, clad in the *sanbenito* (a yellow shirt inscribed with a list of the victim's crimes and painted over with pictures of damnation), and wearing a pointed cap on the head; then effigies of the fugitives, and lastly the bones of dead culprits, in black coffins, painted with flames and hellish symbols. The train was closed by the army of priests and monks. The procession went through the principal streets to the church, where, after a sermon on the true faith, the sentence was announced. In the meantime the accused stood before a crucifix, with extinguished torches in their hands. After the sentence had been read to them an officer of the Inquisition gave each one of the condemned a blow on the breast with his hand, as a sign that they were given over by that tribunal to the secular power:

on which a secular officer took them in charge, had them fettered, and taken to prison. A few hours afterward they were brought to the place of execution. If they made profession of the Catholic faith at the last moment, they were so far favored as to be first strangled; otherwise they were burned alive, and with them the effigies of the fugitives and the bones of the dead culprits. As a rule, the King, with his whole court, had to exalt by his presence the solemnity of the awful transaction. The celebration of the *auto da fé* began as early as 1257, though the death penalty was first imposed in 1481. Between 1481 and 1808 more than 340,000 persons suffered punishment at the *auto da fé*. Of these 32,000 were burned. Heresy was not the only crime thus punished, as is generally supposed, but all grave sins coming under ecclesiastical jurisdiction. The most elaborate *auto da fé* took place at Madrid, under Charles II, in 1680. America also has had its *autos da fé*, Mexico celebrating one as late as 1815—the latest recorded. See INQUISITION.

AUTOGAMY (Gk. *αὐτός*, *autos*, self + *γάμος*, *gamos*, wedding, marriage). Self-pollination, i.e., a transfer of the pollen of a flower to its own pistil. It is the opposite of allogamy (q.v.). See also POLLINATION.

AUTOGRAPH (Gk. *αὐτός*, *autos*, self + *γράφειν*, *graphein*, to write). That which is written in one's own hand. It commonly refers to the signature. A holograph is a writing or inscription entirely in the hand of one person. It is not necessarily in written letters or inscribed characters: an original drawing by Rembrandt or a musical score by Mozart is a holograph. On account of the personal interest with which handwriting is invested, as well as the historical value of documents actually written by famous men, the accumulation of autographs has been a favorite pursuit of collectors from very early times. There were large collections among the Greeks and Romans. One of the Ptolemies bargained with the starving Athenians, giving wheat for the privilege of copying holographs of Æschylus, Sophocles, and Euripides. He returned the copies and retained the originals. Pliny the Elder speaks of seeing in the collection of Pomponius Secundus autographs of famous men written two centuries previously. Among the Chinese also autographs were preserved with great respect in early times. During the sixteenth century, in Europe, rich collections were made, of which one, brought together as early as 1578, is in the British Museum. Even before this, the custom of inscribing autographs merely for collections had been developed, and there had appeared (first in Germany in the fourteenth century) the *Album Amicorum*—an octavo book, bound lengthwise, in which names and sentiments were inscribed. Such books were first used by travelers, who were thus enabled to bring home records of the eminent personages whom they had met during their journeys. Among the Egerton manuscripts in the British Museum is an album dated 1554. Afterward autograph albums came into general use and, indeed, were in fashion until the latter part of the nineteenth century.

The value set upon autographs by collectors has developed a class of dealers all over the civilized world who sell them either privately or at auction. Autographs are described in their catalogues as a.l.s. (autograph letter signed); l.s. (letter signed); d.s. (document signed);

a.l.3 (autograph letter, third person); s. (signature cut from document or letter). The high prices paid for good signatures have encouraged forgeries. Sometimes forgeries take the form of fabricating literary matter, as when Chatterton produced the poems of Rowley, or when Ireland "discovered" an original play of Shakespeare. Generally these forgeries purport to be letters or documents written or signed by famous personages. In America and in England there have been several notable forgeries; but perhaps the most remarkable instance of deceit occurred in France. In 1867 M. Michel Chasles, the first geometrician of France, laid before the French Académie des Sciences letters ostensibly by Pascal, Rabelais, Galileo, and others. When seen by experts, these were recognized as forgeries. It was then discovered that Chasles had bought of a certain Vrain Lucas 27,000 pieces, among which were letters of Mohammed to the King of the Franks, Alexander the Great to Aristotle, Judas Iscariot to Mary Magdalen, and others, written in French, on French paper, bearing a *fleur-de-lys* water-mark. A skillful forger selects the guard-folios of old books, washing the ink with a weak solution of muriatic acid, oxalic acid, or an oxalate of potassium, after which the paper is creased and smudged.

The most notable collection of autographs in England is that of the British Museum. The most valuable autograph in this collection is that of Shakespeare, affixed to a deed; his signed will is preserved in Doctors' Commons. The most valuable private collection in England was formed by the late Alfred Morrison. The gems of the collection are considered to be a holograph letter of Americus Vesputius addressed to his father, and a letter of Mary, Queen of Scots, written to Henry III of France, six hours before her execution and confiding to him the care of her son "as much as he deserves it." In the French archives the earliest autograph is a document signed by Thierry III, Sept. 12, 677. One of the largest and most important collections in France was that formed by Benjamin Fillon.

In Germany one of the largest collections was formed by Alexander Meyer Cohn, of Berlin. In the United States the collections of Thacher, Gratz, Gunther, and others, covering both domestic and foreign fields, compare favorably with the best in Europe. In the first of these the kings of England are represented in an unbroken line from Henry V; and the kings of France from Charles V, mostly in holograph form. The finest collection of American autographs was formed by Dr. Emmet and is now in the New York Public Library. It contains the best set of the signers of the Declaration of Independence, including the only known holograph letter of Thomas Lynch, which was sold for over \$5000. Dr. Emmet possessed autographs of nearly every member of the Continental Congress from 1774 to 1789.

The value of autographs depends not only upon the degree of fame of the writers, but also to some extent upon the rarity of the signatures. Among the rarest desirable names are those of Da Vinci, Raphael, the younger Bach, Gluck, and Charlotte Corday. Sir Francis Drake, Sir Thomas More, and Milton are exceptionally rare names. Shakespeare is unobtainable. The 29 Columbus autographs are owned exclusively by his descendants. The rarest names among American explorers are those of Champlain, La Salle, and Marquette. Among the signers of the

Declaration of Independence, Lynch, Gwinnett, Hart, Morton, Heywood, and Middleton, somewhat in the order named, are difficult to secure. A good holograph set of the "signers," with no cut signatures, would be worth \$25,000. There are not more than 10 or 12 good sets now in private hands. The rarest President is Johnson, with Taylor coming next.

A respectable collection of autographs will contain from 5000 to 10,000 pieces. It is wise, for those who desire to begin a collection, to study the catalogues of dealers published during the last 40 years. Consult Scott and Davey, *Historical Documents* (London, 1891), which contains a bibliography on the subject of autographs. See HANDWRITING.

AUTOGRAVURE, αὐτο-γράφω. See AUTOTYPE.

AUTO-INTOXICATION. A form of chronic poisoning from the absorption of toxins resulting from disordered metabolic processes in the patient's own body. Auto-intoxication may arise from the altered functioning of certain organs; e.g., uremia from nephritis, or Addison's disease from affections of the suprarenal capsules. But, as commonly used, the term applies to a toxæmia having its origin in the absorption of the poisonous by-products of incomplete digestion in the intestinal tract; and caused by a deficiency, either in quality or quantity, of the digestive secretions, or excessive bacterial fermentation, or both. There is a failure to carry on the digestion, especially of nitrogenous substances, to its completion, and bacterial fermentation, with the generation and absorption of poisonous substances, results. The disorder usually has its beginning in incomplete mastication (people with bad teeth are very prone to suffer from auto-intoxication), overeating, particularly of meats and the so-called "rich" foods, together with a sedentary life. Among a myriad of symptoms which have been traced to or attend auto-intoxication, the following may be mentioned: indigestion, constipation, a depression of spirits, a sallow complexion, anæmia, headache, various neuralgic affections, hemi-crania, and nasal catarrh. Many individuals who complain of "malaria" or "biliousness" are really suffering from intestinal poisoning. When symptoms such as the above arise and the cause is not obvious, and when on examination of the urine excessive amounts of indican, urobilin, and phenol are found, a diagnosis of auto-intoxication is reasonably certain.

Cure is often brought about simply by correcting dietic errors, reducing the amount of proteid food, substituting therefor cereals and fruits, and taking exercise in the open air. Metchnikoff fathered the theory that the infirmities of old age were largely due to intestinal auto-intoxication, and introduced the sour-milk treatment on the supposition that the lactic acid bacillus drove out and displaced many of the pathogenic bacteria. This treatment was widely adopted, but fell into disrepute largely because of the unreliability of milk-souring cultures put on the market. Metchnikoff found the Bulgarian bacillus the most potent, and to overcome the disagreeable odor given by this bacillus to milk, combined with it the *Bacillus acidi lactis aerogenes*. Brewers' yeast has been administered with the same end in view; and intestinal disinfectants or antiseptics such as salol, betanaphthol, and cresote are frequently used.

AUTOLYCUS (Gk. Αὐτόλυκος, *Autolykos*).

A mythological character who lived on Mount Parnassus, father of Anticlea, the mother of Odysseus. Hermes had given him superior skill as thief and perjurer. Later writers represented him as the son of Hermes, and as possessing the power to metamorphose all that he stole; this led to his contest with the more wily Sisyphus (q.v.), who alone outwitted him, and became, according to one story, by Anticlea father of Odysseus. The contest of wits between two clever thieves is a common folk-tale among many peoples.

AUTOLYCUS (c.330 B.C.). A Greek astronomer and mathematician of Pitane in Æolia. He wrote works on the revolving sphere, *Περὶ κινουμένης σφαίρας* (*Peri kinoumenēs sphairas*), and on the rising and setting of the fixed stars, *Περὶ ἐπιτολῶν καὶ δύσεων* (*Peri epitolōn kai dyseōn*). There is an edition, with Latin translation and scholia, by Hultsch (Leipzig, 1885).

AUTOLYCUS. A waggish thief in Shakespeare's *Winter's Tale*, who robs the Bohemian shepherds under cover of selling them trinkets. By his petty villainies he effects the *lusus* of the play.

AUTOMATIC TRAIN STOP. See BLOCK-SIGNAL SYSTEM.

AUTOMATISM (Gk. αὐτόματος, *automatos*, self-willed, self-acting, from αὐτός, *autos*, self + μάειν, *maein*, to wish eagerly, to strive). A term variously defined in various departments of knowledge. 1. In philosophy, it is the equivalent of determinism (q.v.). 2. In psychology it is used specifically for the doctrine that the animals are unconscious automata (see ANIMAL PSYCHOLOGY), and also generally to cover all manifestations of involuntary bodily movement—reflex and secondary reflex movement, concomitant movements. (See ACTION.) 3. In pathology it denotes the simulation of voluntary actions by involuntary movements, consequent upon certain forms of brain disease. Consult W. B. Carpenter, *Mental Physiology* (Boston, 1891).

AUTOMATON (Lat. from Gk. αὐτόματος, *automatos*, self-moving). A piece of mechanism constructed to represent human or animal figures and actions. The construction of automata has occupied men's attention from very early times. As early as 400 B.C. the invention of a mechanical dove which could fly is credited to the Greek mathematician, Archytas, and there are numerous reports of curious automata having been invented at various times and by various persons from the thirteenth to the seventeenth century, most of which are open to considerable doubt. In 1738, however, it is authentically reported that Vaucanson, a Frenchman, exhibited in Paris an automaton representing a flute player which placed its lips against the instrument and produced the notes with its fingers exactly as a human being does. In 1741 this same mathematician exhibited a flageolet player which with one hand beat a tambourine, and in the same year he produced a duck which swam, dived, ate, drank, dressed its wings, etc., as naturally as its animated companion. Droz, a Swiss, is reported to have invented a sheep which would bleat and a dog guarding a basket of fruit which would bark if any of the fruit was removed, ceasing only when it was replaced. At the London Exhibition of 1851 Maillart exhibited a bullfinch which fluttered its wings and gave the note of the bird which it represented. Houdin, the famous conjurer,

made a writing and drawing automaton which was operated by clockwork. The chess player of Kempelen was long regarded as the most wonderful of automata. It represented a Turk of natural size, dressed in the national costume, and seated behind a box resembling a chest of drawers in shape. Before the game commenced, the artist opened several doors in the chest, which revealed a large number of pulleys, wheels, cylinders, springs, etc. The chessmen were produced from a long drawer, as was also a cushion for the figure to rest its arm upon. The figure, not being able to speak, signified when the queen of his antagonist was in danger by two nods, and when the king was in check by three. The automaton succeeded in beating most of the players with whom it engaged; but it turned out afterward that a crippled Russian officer, a very celebrated chess player, was concealed in the interior of the figure, and that he used this means to escape from Russia, where his life was in danger. In 1875 Mr. J. N. Maskelyne exhibited an automaton under the name of "Psycho" which represented a seated human figure. To show that the contrivance was not operated by electricity, it was insulated by being mounted on a glass cylinder. This figure moved its head, and from a rack in front of it selected the cards necessary for playing a hand at whist. It would also work out calculations up to 100,000,000, showing the entire total of each calculation by opening a sliding door in a box. Another automaton named "Zoe," similar in appearance to the first and insulated in like manner, was designed by Mr. Maskelyne. This figure would draw the likeness of any person chosen by the spectators from a list of 200 names. Various other automata have been contrived at different times.

In its broad meaning an automaton is any mechanism which, upon receiving an impulse, will perform a certain cycle of motions by itself. In this sense watches and clocks, and particularly such complicated clocks as that in the cathedral of Strassburg, are automata. For the best books relating to automata representing human and animal actions, consult: Brewster, *Letters on Natural Magic* (London, 1834); Houdin, *Secrets of Conjuring and Memoirs of Houdin* (London, 1891); Ozanam, *Mathematical Recreations*, trans. by Hutton (London, 1854).

AUTOM'EDON (Gk. *Ἀὐτομέδων*). A son of Diore; the friend and charioteer of Achilles in the *Iliad*, xvi, 145 ff.; *ibid.*, xvii, 536 ff. After the death of Achilles Automedon became the attendant of his son Pyrrhus.

AUTOMEDON (Gk. *Ἀὐτομέδων*). The name of two epigrammatists of the Greek Anthology—one an Ætolian, the other a native of Cyzicus; one of the two lived probably in the reign of Nerva, the date of the other is quite unknown.

AUTOMOBILE, ă'tô-mô'bĭl or ă'tô-mô-bĕl' (Gk. *auto*, self, + Lat. *mobilis*, movable). A term applied to a vehicle for use on roads or highways whose propulsive or tractive energy is supplied from a mechanical motor within the body of such vehicle and which should operate independent of any track. It is of French origin and is an adjective used as a noun; in its first uses it was applied only to pleasure vehicles or carriages. The term was created to meet the sudden demand for a word to describe a horseless or self-propelling vehicle, but the make-up was unfortunate, and the word is gradually being supplanted by less indefinite terms. The convenience, economy, capacity, speed, and other

advantages resulting from a substitution of mechanical power for animal traction has resulted in an enormous extension of the principle of the motor-propelled vehicle outside of its first uses in pleasure carriages. The commercial uses in carrying freight and passengers in an income-producing or industrial way, have made the term "motor vehicle," "motor car," or "motor truck" much more expressive and correct. The historical development of the motor vehicle will therefore be presented here, and the reader referred for the other divisions of the subject to the article **MOTOR VEHICLE**. The British never welcomed the term "automobile," but have adopted the term "motor car" for the pleasure vehicle or passenger carriage. American practice and terminology is rapidly turning in the same direction. The idea of the mechanically propelled vehicle for roads is as old as the early days of the steam engine. In 1680 Sir Isaac Newton proposed a steam carriage to be propelled by the reactive effect of a jet of steam issuing from a nozzle at the rear of the vehicle. In 1790 Nathan Read patented and constructed a model steam carriage in which two steam cylinders operated racks running in pinions on the driving shaft. In 1769-70 Nicholas Joseph Cugnot, a Frenchman, built two steam carriages. The larger of these is still preserved in Paris and was designed for the transportation of artillery. The engine of this vehicle consisted of two 13-inch single-acting cylinders, connected by means of pawls to the single front wheel of the wagon. In front of this wheel was suspended a tank-like boiler. In 1784 Murdock, an assistant of James Watt, constructed a model carriage, operated by a "grasshopper" engine, and in 1786 Oliver Evans, of the United States, suggested the use of steam road wagons to the Lancaster Turnpike Company of Maryland. In 1802 Richard Trevithick built a steam carriage, which was exhibited in London, having driven itself 90 miles from Camborne, where it was built, to London. This carriage brings us to the notable period of steam-coach construction in England, which lasted until about 1836.

First Period of Development. The most important of these early labors on the motor vehicle were undoubtedly those of Walter Hancock, an Englishman, and they were carried out during the period between 1824 and 1836. Hancock's first work was the invention of a rather remarkable design of boiler, which reached its final improved form and was patented in 1827. This boiler was first applied to an experimental vehicle which had three wheels, the single wheel in front being the driver and being driven by a pair of direct-acting, oscillating steam cylinders. The frame which carried the steam cylinders and the front wheel was jointed to the main frame of the vehicle so as to permit steering. Many hundred miles were run with this vehicle, which was succeeded by an improved model. This second Hancock steam wagon was named "The Infant." In it the two rear wheels were made the driving wheels. The oscillating cylinders operated directly a counter-shaft carrying a chain wheel and located just back of the rear wheels. From the chain wheel on the counter-shaft a chain drive was carried to a similar wheel on the rear axle. The boiler and other mechanism for motive purposes was carried substantially over the driving wheels. The front wheel was used for steering by being jointed to a swiveling frame. The chief objection

to this second vehicle was the trouble experienced from dust and dirt getting into the driving mechanism. The second "Infant" was then built, in which a vertical engine replaced the oscillating steam cylinders of the previous vehicles, and was placed near the middle of the vehicle, between the front and rear wheels. This engine drove a chain wheel with a chain drive extending back to the rear axle. The remaining parts of the vehicle were similar to the corresponding parts in the first "Infant." Hancock next built "The Era" on much the same designs as the second "Infant," and later "The Enterprise," both of which were designed for public traffic as steam-coaches. "The Autopsy," a second "Era," and "The Automaton" followed in rapid succession, and "The Automaton" ran as a coach on regular service between Stratford, Paddington, and Islington for 20 weeks, covering 4200 miles, and carrying 12,761 passengers during this period. Hancock's final motor vehicle was for his personal use.

Contemporary with Hancock, two fellow countrymen, Guldeworthy Gurney and Sir Charles Dance, conducted extensive experiments with a number of vehicles invented and improved by Gurney. For his vehicles Gurney used water-tube boilers and horizontal engines. The engine was placed underneath the body of the vehicle and drove the rear wheels by means of a connecting rod and axle crank, resembling much the driving gear of a modern locomotive. Gurney's water-tube boiler consisted of two cylindrical drums, placed one above the other and running transversely across the vehicle. The tubes connecting these drums were bent into the form of a letter U, placed horizontally, one free end of the U entering the lower drum and the other free end entering the upper drum, the furnace grate being formed by the lower tubes. This boiler was usually worked at pressures of from 70 pounds to 120 pounds. In passing from the boiler to the engine cylinders the steam pipe passed through the furnace casing, thus drying if not somewhat superheating, the steam. The fire was provided with forced draft by a fan operated by a small engine, and the exhaust of the main engine was employed to heat the feed water. Some idea of the size of Gurney's vehicles of the coach type is conveyed by the fact that their weight was nearly 8 tons, that the engine had 9 × 18-inch cylinders, and that the driving wheels were 5 feet in diameter. Gurney built a number of vehicles smaller than coaches, in some of which he substituted the engine exhaust for the original fan for producing draft. For one of Gurney's coaches Sir Charles Dance devised an improved form of boiler.

While the work of Hancock and Gurney perhaps takes precedence in these early experiments with the steam road vehicle, there were several other inventors who were active. In 1831 two steam carriages were built by William A. Summers and Nathaniel Ogle, capable of carrying from 16 to 18 passengers each. The boiler used in these vehicles was a vertical water-tube boiler with internal smoke tubes. The engines were coupled direct to the driving axle and had 8½ × 18-inch cylinders. In 1834-35 Macerone and Squire ran a steam coach having a capacity for 8 passengers, besides the driver and stoker, and weighing 3½ tons. The boiler was a vertical water-tube boiler and the engines had 7½ × 15¾-inch cylinders. Among others of this same period who developed inventions relating to steam ve-

hicles were Henry James, Dr. Church, Robert Griffith, and Scott Russell. One after another of these vehicles was abandoned, until in 1836 only those of Hancock were on the road; and soon after these also disappeared from service.

Second Period of Development. With the disappearance of Hancock's steam vehicles about 1836, all practical, continued effort in the development of the motor vehicle ceased until about 1894, when the period of modern development began. What may be called a second period of development occurred, however, about 1860, when Thomas Rickett, A. F. Yarrow, A. Pattison, H. P. Holt, and others built several steam vehicles. Quite generally these vehicles approached the traction engine in character, having heavy boilers and engines and large water and fuel space, but room for only a few, usually for not more than four, passengers. They were, in fact, hardly more than self-moving boilers and engines with a few seats attached.

Modern Period of Development. Turning now to the modern period of development, in 1884 Gottlieb Daimler invented his small high-speed gas engine, followed in 1885 by his invention of a single-cylinder, inclosed-crank and fly-wheel engine. In 1885 the latter engine was applied to a bicycle. In 1886 Carl Benz invented his single horizontal cylinder, water-jacketed engine, which he applied to a three-wheel carriage. In 1889 M. Léon Serpollet invented his water-tube boiler, which he applied to a motor vehicle in 1894. About the same time also electric vehicles began to be developed in France and America. Modern motor vehicles, therefore, may be classified, according to the motive power used, into (1) steam vehicles, in which steam is generated in a boiler receiving heat from the external combustion of a coal, coke, or compressed fuel, or some form of oil, and is supplied to a steam engine; (2) oil or liquid-fuel vehicles, using internal-combustion engines with petroleum, kerosene, gasoline, or naphtha; (3) electric vehicles, using electric motors supplied with current from a storage battery. (See MOTOR VEHICLE.) Other forms of motive power, such as liquid air and compressed gases, have been suggested, but they are not practically employed, because not economically nor commercially successful.

Selden Patent. An important factor in the commercial and industrial history of the motor vehicle in the United States has been the Selden patent. An American patent was granted in 1895 to George B. Selden of Rochester, N. Y. (U. S. Patent No. 549,160). It covered the idea (novel at the time of his original application in 1872) of applying an internal combustion engine to the propulsion of a vehicle. It included the combination of such a motor with a clutch or similar engaging and disengaging device in the train of mechanism by which the motor drove the propelling wheels, and the use of reducing gear by which the propelling wheels could be driven at speeds lower than that of the motor shaft. The patent covered also means for throwing the clutch in and out and for adjusting the gearing. The wording of the claims at so early a stage of the art of making motor vehicles was so broad and inclusive that the existence of such a document gave its originator a dominating power over the industry. No successful motor vehicle could be made or operated without the elements combined in the Selden patent. Hence a powerful association was formed of the licensees under the patent; these

manufacturers agreed for self-protection to uphold the monopoly which it created during its life and to combat infringements by any not in the licensed class. All licensees paid a royalty on each machine sold, although this was not enough to affect the cost of manufacture and sale. The Association of Licensed Automobile Manufacturers (abbreviated into the A. L. A. M.), rallying around the basic patent agreement, were also interlocked on many other matters of commercial policy and technical and engineering development, whereby a wise tendency toward a standardization in non-essentials was secured, and an interchange of knowledge on tests and the properties of materials was made the custom of the industry. Rivals in business drew from this common stock. A mechanical branch was formed along the lines of the societies of engineers, and a testing laboratory was organized. A *Digest of Current Literature* was published weekly, which is still a mine of most valuable information on engineering facts and researches pertinent to the motor vehicle, and a monument to its compiler and editor, Coker F. Clarkson. As time went on, there arose a group of manufacturers who refused to recognize the right of the Selden patent to monopolize the field which it claimed. They insisted on their right to employ mechanical units which were generally in use elsewhere, without payment of royalties to a patent which had combined the same units for a particular purpose and claimed this combination as invention. Selden had also included in his claims a special type of internal combustion motor, in which the heating of the working charge of air and gas was to be effected at a constant temperature and pressure, or in accordance with the philosophy of the Brayton cycle, while the prevailing type of motor-vehicle engines work under the Otto cycle, where the heating is done at neither constant temperature nor pressure nor volume. These manufacturers resisted at law the charge that they were infringers of the patent as it should be properly interpreted, and were led in this contention by Henry Ford of Detroit, Mich., in the suit which resulted. Experts were secured by both parties in suit, and the record is one of the most voluminous in its class, and the litigation most costly. Testimony was taken from 1904 to 1908. The decision of the first trial under Judge Hough was in favor of the validity of the patent, and that those making motor vehicles without license and using the Selden elements were infringers. An appeal was at once taken, and on a retrial, by a decision written by Judge Noyes, the first decision was reversed, and the necessity for a license was denied in 1911. This decision ended the monopoly previously existing, but its good effects continued, and after the life of the patent had ended, an Automobile Board of Trade was organized to have a general oversight of matters of universal interest to the industry, which in turn was superseded by an Automobile Chamber of Commerce, which combines the activities of all the national automobile manufacturers' organizations.

AUTONOMY (Gk. *αὐτονομία*, *autonomia*, self-government, from *αὐτός*, *autos*, self + *νόμος*, *nomos*, law). The power of self-government possessed by the citizens of the state, or enjoyed within certain limits by the inhabitants of some subdivision of a state, as well as by the members of civil and religious corporations. *Autonomy* is often used to designate the political

condition of ancient Greece, where every town community claimed the right of independent sovereign action. At the present day the term is employed less frequently in the sense of independence than to describe the condition of a country which exercises complete control over its own affairs under the suzerainty of another power. It is in the latter sense that *autonomy* is used to characterize the status of such territories as Canada.

AUTOPHYTE (*auto* + Gk. *φύειν*, *phyein*, to bring forth, generate). A plant (usually a green plant) which is independent, because it is able to obtain all necessary food materials directly from inorganic sources, as from the air and the soil, and subsequently to convert them into food. The dependent plants are either parasitic or saprophytic and are called "heterophytes" (q.v.). See **SYMBIOSIS**; **SAPROPHYTE**.

AUTOPLASTY (Gk. *αὐτοπλαστός*, *autoplastos*, self-formed, from *αὐτός*, *autos*, self + *πλάσσειν*, *plassein*, to form). Any surgical operation for repairing one portion of the body with tissues taken from another part of the same individual. The defect may be due to a lack of development, as in harelip; to injury, as in scalds, burns, or mutilations; or to disease, as in lupus and syphilis. The skin is most frequently employed. It can be used as (1) a flap from the immediate vicinity carried over to the deficient area, but still receiving its original blood supply through a pedicle; (2) by totally separating and transplanting the flap; (3) by removing in small bits (Reverdin's method) or in strips of considerable size (Tiersch's method) only the superficial layers of the skin, and placing these grafts upon the denuded area. Autoplasty was practiced in India centuries ago, and there are references to it by Celsus, and later, by the Calabrian surgeons of the fifteenth century. About this period a favorite method of punishment in Italy and Sicily consisted in mutilation, cutting off the ears, nose, etc., and the Italian surgeons became famous for their skill in restoring members thus lost to their former situation; in fact, so skillful did they become that executioners were compelled to destroy the tissues removed. The subject is discussed in modern surgical treatises under the head of **PLASTIC SURGERY**.

AUTOPSY (Gk. *αὐτοψία*, *autopsia*, a seeing with one's own eyes, from *αὐτός*, *autos*, self + *ὄψις*, *opsis*, look, sight). A personal observation. The word is most frequently used to denote the examination of a dead body, for the purpose of determining the cause of death or the alterations resulting from disease or injury. An autopsy is usually held by a medical examiner or coroner, in case of a person found dead, or dying without medical attention, or suspected of having been poisoned or otherwise murdered; or by physicians, in the course of studying diseases, or verifying a diagnosis in an obscure case.

AUTOSUGGESTION. Self-suggestion; a man's acceptance, for himself, without command or direction from any other person, of an idea that shall presently issue in action. Autosuggestion may be induced voluntarily or involuntarily—voluntarily, if we fix our attention upon the idea in question and impress it on our minds by attentive consideration; involuntarily, if we are unconsciously influenced by our surroundings. Many persons, e.g., can awake at a certain hour in the morning by suggesting to themselves, the night before, that they will do so; and it is

probable that every one can, with practice, attain some degree of accuracy in such a "setting" of the mental machinery. The mechanism of arousal in these cases is not wholly clear. The cue for waking is, however, in all probability, given either by a definite amount of illumination of the sleeping room by the growing daylight, by certain constant noises of the environment, or by the pressure of water in the bladder of the sleeper. For the possibility of inducing hypnosis by autosuggestion, see HYPNOTISM.

Involuntary autosuggestion often plays an important part in psychological experimentation. It is sometimes desirable to make tests or experiments while the observer is, so far as possible, kept in complete ignorance of the object and arrangement of the investigation. (See PSYCHOPHYSICS.) The whole purpose of the "procedure without knowledge" may, in certain cases, be defeated by autosuggestion. As the work progresses, the observer involuntarily formulates an opinion as to its design—suggests to himself that he is expected to see this, and not that; to judge thus, and not otherwise: so that he is presently observing under a strong self-created bias. The tendency is perfectly well known and can be guarded against. Experimental psychologists have, indeed, classified laboratory observers as "objective" and "subjective" in type, upon the basis of the amount of self-suggestion to which they are liable.

Good instances of autosuggestion are to be found in the literature of suggestive therapeutics. One person is cured by a so-called "electric belt," another is invigorated by a band of unknown material fastened to the ankle, a third reads a faith-cure pamphlet and his rheumatism ceases. It is, however, in the hypnotic and other abnormal phases of mind—the hysterical consciousness, the religious ecstasy, the mind of the individual in the mob—that the phenomena of autosuggestion are most striking. Many phenomena which at their first appearance were regarded as evidence of supernormal powers and manifestations are reducible (fraud and trickery being eliminated) to autosuggestion. To quote from Jastrow: "The transportation of the senses discovered by Pététin (1787), the hypnotized subjects who, in Braid's day (1850), proved the location of the phrenological organs by the appropriateness of their actions when certain portions of the head were pressed; the sensitiveness to magnets and hermetically sealed drugs asserted by Reichenbach (1845), and later by Bourru and Burot (1885), and Dr. Luys's (1890) absurd trifling with puppets, and probably, too, Charcot's sharp differentiation of distinct hypnotic conditions (1882),—one and all furnish illustrations of the subtle possibilities of unconscious suggestion."

Bibliography. J. Jastrow, *Fact and Fable in Psychology* (Boston, 1900); Bernheim, *Suggestive Therapeutics* (Paris, 1889); Lipps, *Zur Psychologie der Suggestion* (Munich, 1897).

AUTOTROPISM. The internal tendency of a plant organ to straighten after it has curved from whatever cause, as from geotropism, heliotropism, etc.

AUTOTYPY (*auto* + Gk. *τύπος*, *typos*, impression, type). A photographic print obtained by a gelatin process. Gelatin, when mixed with an alkaline bichromate, as that of ammonium or potassium, becomes insoluble after exposure to light, so that if a photograph be made on a gelatin film, only those portions which have been

acted on by light will be retained. This fact has been made the basis of several photo-engraving processes. In the so-called autotype process the picture is printed directly from the gelatin, which is mounted on a ground-glass plate. In another process the gelatin film is used as a matrix for a plaster cast, from which in turn an electrotpe is made, which then may be used for printing a photo-engraving. In Germany and Austria the word "autotype" is also applied to the ordinary photo-engraving or half-tone print.

AUTRAN, ô'trân', JOSEPH (1813-77). A French author, born at Marseilles. He first achieved celebrity by an ode dedicated to Lamar-tine and entitled *Le départ pour l'Orient* (1832). In the collections of verses entitled *Ludibria Ventis* (1838), and *Les poèmes de la mer*, he reveals the influence of classic models. A martial epic, entitled *Milianah*, celebrating the exploits of the French soldiery in Algiers, appeared in 1842, and a tragedy entitled *La fille d'Eschyle*, performed in the Paris Odéon, in March, 1848, met with great success and secured to its author (together with Augier's *Gabrielle*) the famous Montyon prize. (See MONTYON.) In 1868 he became a member of the Academy. His collected works have been published in 8 vols. (Paris, 1875-81).

AUTREFOIS ACQUIT, ô'tr-fwâ'â'kê' (Fr. formerly acquitted), **AUTREFOIS CONVICT**, kôn'vé' (Fr. formerly convicted). The common-law names of pleas in bar to a second indictment for an offense of which the defendant in a criminal prosecution has previously (Fr. *autrefois*) been regularly acquitted or convicted. It is a time-honored principle of English criminal law, that a person who has once been lawfully acquitted or convicted of any offense must not be put in peril a second time for the same offense; and this, notwithstanding the existence of circumstances of aggravation which, if known, would have justified an indictment of a different or more serious crime, or the discovery of fresh evidence not disclosed at the time of the former trial. The fact that there is a substantial variance between the former and the second indictment will not defeat the plea, so long as the original accusation or indictment was sufficient in law to sustain a conviction for the offense subsequently charged. But a previous trial for assault or arson will be no bar to a subsequent trial for murder, manslaughter, or rape resulting from or connected with the offense previously charged. The prior acquittal or conviction pleaded may have been had in any court of competent jurisdiction, domestic or foreign; and the common-law doctrine is not limited, as is generally believed, to capital or other grave offenses. It is in the latter form that it has found expression in the provision of the United States Constitution, that no person shall "be subject for the same offense to be twice put in jeopardy of life or limb" (Amendment V). Similar provisions are found in most, if not all, of the State constitutions. See JEOPARDY.

Autrefois Atteint is a similar plea, attended with the same effects as a former judgment in attainder (q.v.) offered in bar to an indictment or appeal for the same or any other felony. It has become obsolete with the practical abolition of the penalty of attainder. Consult the *Commentaries* of Blackstone and of Kent, and the authorities referred to under CRIMINAL LAW; CONSTITUTIONAL LAW.

AUTUMN (Lat. *autumnus*). Astronomically, the third season of the year, in the northern hemisphere covering the period from the sun's crossing the equinoctial, at the autumnal equinox, about September 22, till it is on the tropic of Capricorn, at the winter solstice, December 22. Popularly the autumn in America is the three months of September, October, and November; and in England August, September, and October. The American autumn is often considered the most agreeable part of the year. South of the equator the seasons are, of course, reversed, and autumn extends from about March 22 to June 22.

AUTUN, *ô'tên'* (Lat. *Augustodunum*, from *Augustus* + Gael. *dun*, hill fort; AS. *dun*, hill; Eng. *down*). A town of France, in the department of Saône-et-Loire (Burgundy), picturesquely situated at the foot of Mont-Jeu (Map: France, N., K 6). It is the see of a bishop, and has a cathedral of remarkable beauty, built in the eleventh and twelfth centuries. The spire belongs to the fifteenth century. Autun has a college, a diocesan seminary, several museums, a library, and is a busy manufacturing centre. Cloth, carpets, machinery, furniture, leather, and paper are some of the principal products. Autun arose near the site of the ancient Bibracte, the chief city of the *Ædui*. Under the Romans it was famous for its school of rhetoric. The town was pillaged by the Saracens in 725 and nearly destroyed by the Normans in 888. There still exist at Autun many ruins of Roman structures; most remarkable are the Roman gates, now called *Porte d'Arroux* and *Porte Saint-André*. At the Council of Autun (1094) King Philip I was excommunicated for divorcing his Queen, Bertha. Pop., 1901, 13,605; 1906, 15,479; 1911, 15,498. Consult Lewis, "The Antiquities of Autun," in vol. xl, *Archæological Journal* (London, 1883).

AUTUNITE. A hydrous phosphate of uranium and calcium, crystallizing in tabular orthorhombic crystals which are lemon-yellow or sulphur-yellow in color. Autunite occurs principally in granitic rocks and is found in Connecticut, North Carolina, and in the Black Hills of South Dakota.

AUVERGNE, *ô'vârn'y'* (Lat. *Arvernia*, from Gael. *Ar-fearaun*, high land, from *ard*, high). Formerly a province of south-central France, now included in the departments of Puy-de-Dôme, Cantal, and part of Haute-Loire. The mountains of Auvergne are the highest elevation in the interior of France, with summits over 6000 feet above sea level. They represent former volcanic activity on a grand scale, rising in huge conical peaks, which present a scene of wild desolation. The inhabitants are a simple and laborious people and are accustomed to emigrate each year after the harvest in large numbers to the neighboring regions, or to flock to the great industrial centres of France in search of employment, returning to their homes with their earnings in spring. The region was inhabited in ancient times by the powerful tribe of the Arverni, who ruled over a large part of Aquitania. In the Middle Ages Auvergne was a county. It was permanently united with the French crown in 1532. Consult *La Revue d'Auvergne*, vols. i-xiv (Clermont-Ferrand, 1884-97).

AUWERS, *ou'vêrs*, ARTHUR (1838-). A German astronomer, born at Göttingen. In 1859 he became assistant at the Astronomical

Observatory of Königsberg; between 1862 and 1866 he carried on his astronomical work at the Observatory of Gotha and in the latter year was made astronomer to the Berlin Academy of Sciences. In 1878 he became perpetual secretary of the section of physics and mathematics of the Academy. He was chosen on the staff of editors of the *Vierteljahrsschrift* of the German Astronomical Society. Auwers's most important work was in connection with the Venus transits of 1874 and 1882, and he edited the results of German observers, whose work he organized. Among Auwers's numerous other contributions may be mentioned his completion of Sir William Herschel's nebular observation, his heliometric investigations in stellar astronomy, his observations of the proper motion of fixed stars, and the part he took in determining the positions of stars, based on the investigations of Argelander. From 1882 to 1903 he published *Neue Reduction der Bradley'schen Beobachtungen aus den Jahren 1750 bis 1762* (3 vols.). In 1903 was printed *Vierzehn unbekannt gebliebene Königsberger Zonen und Catalog von 1309 darin beobachteten sternern für das Äquinoctium 1825*.

AUXANOMETER (Gk. *αὐξάνειν*, *auxainein*, to make large, to increase + *μέτρον*, *metron*, measure). A device for observing or recording the growth of plants during intervals too short

AUXANOMETER.

for direct measurement. The simpler forms of the auxanometer consist of a very light, balanced lever, whose fulcrum is so placed that the length of the long arm is a multiple of the length of the short arm. To the latter a thread from the growing plant is attached. The growth is thus magnified in the ratio of the long arm to the short, usually 10 to 20 times. The long arm traverses a graduated arc, from which its movement may be read, or it may be so placed as to trace its path on a moving smoked surface.

The more elaborate forms consist of a wheel with fine bearings and an accurately balanced rim, about 20 centimeters in diameter, grooved

to carry a thread. The same hub has a smaller wheel with a grooved rim, whose diameter is one-tenth or one-twentieth that of the larger. The wheel is supported on a suitable stand, and the plant to be studied is set beneath it. To the plant a silk thread is attached, carried around the small wheel, and weighted just enough to take up the slack by rotating the hub as the plant grows upward. Over the rim of the large wheel a similar thread is passed, carrying on one end a marker and on the other a counterpoise. The recording apparatus consists of a cylinder driven by clockwork and carrying smoked paper, the marker bearing against the smoked surface. The cylinder may be rotated continuously by clockwork. In that case once in 12 hours the marker describes a spiral line of steep or of low pitch, according to the rate of growth. The best forms, however, release the cylinder by means of an electromagnet, the circuit being closed by a clock, at intervals, when the cylinder is allowed to rotate a short distance (2 to 4 millimeters). This gives a broken line, whose vertical parts represent the growth during the intervals of rotation, and the horizontal parts the distance through which the cylinder turned. A great variety of forms embodying the foregoing principles have been devised and described.

AUX CAYES, ô' kâ'. A seaport town of Haiti, situated on the south coast of the island (Map: West Indies, D 3). Its harbor is good and its export trade important, coffee being the principal commodity. It has several domestic industries. In 1816 at this port Bolívar fitted out his expedition to liberate the Spanish colonies in South America. Pop., about 25,000. It is the seat of a United States consular agent.

AUXERRE, ô'sâr' (anciently, *Autissiodorum*). The capital of the department of Yonne, France, on the Yonne, 90 miles southeast of Paris (Map: France, N., J 5). It was originally the see town of a bishop, but the bishopric was abolished by the Napoleonic Concordat, and its fine episcopal palace is used for the prefecture. It is situated on the slope of a hill, in a rich and beautiful district abounding in vineyards. The city is irregularly built; the streets are narrow and dirty; but its aspect from a distance is very imposing, the most prominent feature being the cathedral church of St. Etienne, a remarkably beautiful and imposing structure—one of the most important Gothic buildings in France, which dates from the thirteenth century. The Chapter of Auxerre was once one of the richest in France. The churches of St. Germain and of St. Pierre (sixteenth century) are interesting buildings. There is a curious old clock tower over a gatehouse, "with an ugly skeleton spire of iron bars." The ancient walls of the city have been converted into boulevards. It has a communal college, a hospital in the ruins of the old abbey of St. Germain, a museum of antiquities, and a botanic garden. The principal products are wine, calico, serge, woolen cloths, earthenware, and leather. The Yonne becomes navigable here, and large quantities of Burgundy wines are sent down it to Paris; there is also a considerable export trade in timber and charcoal. Auxerre was a flourishing town before the Roman invasion of Gaul. It successfully resisted the Huns under Attila, who only ravaged its suburbs. Clovis took it from the Romans. After his death it became part of the Kingdom of Burgundy. The English

took it in 1359, but it was retaken by Du Guesclin. Charles VII gave it up to the Duke of Burgundy, and it was finally united to the kingdom of France by Louis XI. The Germans bombarded it in 1870. It is the birthplace of the famous Jacques Amyot, once bishop of the see, whose translation of Plutarch is a French classic. Pop., 1901, 16,291; 1906, 20,931; 1911, 21,929. Consult Freeman, "Sens and Auxerre," in vol. xxxix, *Archæological Journal* (London, 1882).

AUXILIARY VERBS. See VERBS; CONJUGATION.

AUXONNE, ô'sûn' (for Fr. *Au Saône*, on the Saône; ML. *Aussonia*). A French fortress of the second class, in the department of Côte-d'Or, on the Saône, 17 miles southeast of Dijon (Map: France, N., L 5). The town has a sixteenth-century castle, now used as barracks; an arsenal, a school of artillery, a large powder magazine, and the church of Notre Dame, dating from the fourteenth century. Manufactures of cloth, plaster of Paris, bricks, leather, etc., are carried on, and there is a lively trade in these articles as well as in grain, vegetables, and lumber. Pop., 1901, 6135; 1906, 6307; 1911, 6303. The fortress was built by Vauban in 1673.

AUX/OSPORES (Gk. *αὔειν*, *auxein*, increase + *σπόρος*, *sporos*, seed). The peculiar spores of diatoms which increase in size. See DIATOMS.

AUZOUX, ô'zô', THÉODORE LOUIS (1797-1880). A French anatomist and physician. He is known as the inventor of the method of making permanent models of anatomical preparations, which are exceedingly important in teaching medicine and are used at present all over the world. He published *Leçons élémentaires d'anatomie et de physiologie* (1839).

AVA, ä'vâ (for derivation see below). A ruined city of Burma, and repeatedly its capital; the honor having fluctuated at various times between it and Monchobo, Sagaing (on the opposite bank of the river), Amarapura, and Mandalay, the present capital. It stands in lat. 21° 51' N., 10 miles southwest of Mandalay, on the left bank of the Irrawaddy. The river at this point is about 4000 feet broad, and receives two affluents, which are joined by a canal, rendering the city circumnavigable. The name is a Hindu and Malay corruption of *Ængwa* or *Æn-ua*, meaning *fish pond*, as it was built where there were formerly fish ponds, of which some still remain; in official documents it is designated as Ratnapura, i.e., 'City of Pearls.' The city, which was 8 or 10 miles in circumference, is surrounded by walls and ditches and is almost a desert, having been reduced to ruins by an earthquake in 1839. The population, at one time estimated at 50,000, is very small. Several Buddhist temples, with gilded domes, give the city a deceitful appearance of grandeur. Consult Trant, *Two Years in Ava* (London, 1827).

AVA, ä'vâ, more commonly KAVA (*Piper methysticum*). A plant of the family Piperaceæ, possessing narcotic properties. The ava is a shrubby plant, with heart-shaped, acuminate leaves and very short, solitary, axillary spikes of flowers. It is a native of many of the South Sea islands, where the inhabitants intoxicate themselves with a fermented liquor prepared from its root, or (more accurately) rhizome. The rhizome is thick, woody, rugged, and aromatic. The intoxicating liquor is prepared by macerating it in water. It is often prepared

much as the Indians of the Andes prepared *chica*, or maize beer—by chewing the root, depositing it in a bowl, straining through coconut husk, and mixing with water or coconut milk, after which fermentation speedily ensues. The taste is unpleasant to those unaccustomed to it. The intoxication is not like that produced by ardent spirits, but rather a stupefaction like that caused by opium. It is succeeded by a copious perspiration. The habitual use of *ava* is said to cause a whitish scurf on the skin. The leaf of the *ava* plant is in some places used with the betel nut, instead of that of the betel pepper.

AVADHUTA, āvād-hōō'tā. A member of the mendicant sect of self-torturing Saivites in the south of India. They abandon all worldly restraints and religious observances and have their passions under complete control.

AVAL, ā'vāl. The most important of the Bahrein Islands.

AV'ALANCHE (Fr. *avalier*, to swallow; originally, let fall down, from Lat. *ad*, to + *vallis*, valley). A mass of snow or ice that slides or rolls down the declivities of high mountains and often occasions great devastation. Avalanches are given various names, according to their nature. Drift or powder avalanches (*Staublawinen*) consist of snow which, loose and dry from strong frost, once set in motion by the wind, accumulates in its descent and comes suddenly into the valley in an overwhelming dust cloud. Avalanches of this kind occur chiefly in winter and are dangerous on account of their suddenness, suffocating men and animals, and overturning trees and houses by the wind driven in front of them. Another kind of avalanche resembles a landslide. When the snow begins to melt in spring, the soil beneath becomes loose and slippery, and the snow slides by its own weight down the declivity, carrying with it soil, trees, and rocks. This is also called a landslide and is often the cause of great disasters in mountainous regions. The greatest danger is where elevated tracts of moderate declivity are separated from the valleys by precipitous walls of rock; the softened snow of spring, beginning to roll or slide on these slopes, is hurled over the precipice with fearful force into the valleys. Ice avalanches are those that are seen and heard in summer thundering down the steepes, as those of the Jungfrau. They consist of masses of ice that have become detached from the glaciers in the upper regions, and are most common in July, August, and September. In the mountainous regions of the western United States avalanches are commonly termed "slides," and this term is also used to describe the mountain-side denuded of its vegetation by the avalanche. See LANDSLIP.

AVALENAU, THE (Welsh, of the apple-trees). A poem of uncertain authorship, though accredited to Merlin, notwithstanding reference to events of the twelfth century. Morley quotes Stephens to the effect that the foundation of the poem is the tradition of 140 knights being changed into spirits in the Wood of Celyddon. The significance of the name becomes apparent when it is known that the Celtic heaven is an "island of apples." See AVALON.

AVALLON, ā'vāl'lon' (anciently Aballo). The capital of an arrondissement in the department of Yonne, France, 26 miles southeast of Auxerre (Map: France, N, J 5). It is built on a steep hill of red granite, nearly surrounded

by the Cousin. A broad terrace walk, shaded with lime trees, extends around the town, about 500 feet above the bed of the river. The town is generally well built and has broad and clean streets. There are several fine edifices, among which is the church of St. Lazare, remarkable for its handsome Romanesque portals. Manufactures of various kinds are actively carried on, particularly of woollens, pastry, and paper; and there are distilleries, tanneries, glassworks, etc. There is also a considerable trade in wine and the produce of the neighborhood. Avallon is of Celtic origin. It was sacked by the Saracens in 731 A.D., and by the Normans in 843; taken by Charles VII in 1433, retaken by Philip the Good, Duke of Burgundy, in 1455, and pillaged by the troops of the League in 1593. Pop., 1901, 5906; 1906, 5848; 1911, 5900.

AV'ALON, variously written *Avallon*, *Avelion*, and *Avilion* (Welsh *Ynys yr Afallon*; see below). The name of the legendary island to which King Arthur was supposed to have been conveyed after being wounded in his last battle. It has been identified with various places, notably with Glastonbury, in Somersetshire. But it seems clear that in the first instance Avalon was nothing but the Celtic Paradise, or Happy Other-World, the abode of the fairies, which was visited by a number of heroes of Welsh and Irish saga. From it Arthur was expected to return ultimately, healed of all his wounds. The origin of the name is doubtful. *Ynys yr Afallon* is commonly understood to mean the 'Island of Apples,' with reference to the fruit that was often described as growing in the land of the blessed. But it is not to be assumed that the name had this meaning from the beginning. Perhaps it was at first not a local name at all, but rather personal. There is evidence of the existence of Avalloc (Welsh, *Afallach*), a King of the Other-World. Consult J. Rhys, *Studies in the Arthurian Legend* (Oxford, 1891), and F. Lot, in *Romania* (Paris, 1899). For the conception of the Happy Other-World as portrayed in the Irish Saga, consult Meyer and Nutt, *The Voyage of Bran* (2 vols., London, 1895-97).

AV'ALON. A peninsula forming the eastern part of Newfoundland, bounded by Trinity Bay on the north, and Placentia Bay on the south (Map: Newfoundland, G 5). Its coasts are highly indented, forming numerous bays and harbors. It contains the capital, St. Johns, and was the place of the first English settlement in Newfoundland in 1621.

AVALON. A borough in Allegheny Co., Pa., 6 miles by rail west of Pittsburgh, on the Pittsburgh, Ft. Wayne, and Chicago Railroad, and on the Ohio River. It is a purely residential city. Pop., 1890, 804; 1900, 2130; 1910, 4317.

AVALOS, ā'vā-lōs', FERNANDO FRANCESCO D', MARQUIS OF PESCARA. See PESCARA.

AVARE, L', lā'vār' (Fr. The Miser). One of Molière's comedies, based on the *Aulularia* of Plautus, first performed at Paris in 1668. In it the folly and shame of avarice are satirized in the ridiculous situations into which the leading character gets himself. The miser is Harpagon, who keeps his wealth in a casket of gold and rivals his son, Cléante, in the affections of Mariane. Cléante gets possession of the casket and gives his father the choice of it or of Mariane. Harpagon prefers gold to wife, and thus the two young lovers are happily married.

AVARIS (Egyptian *Hat-we'ret*, Lake city). A city of ancient Egypt, situated in the eastern part of the Delta; perhaps to be identified with Tanis, the modern Sân. Avaris was the stronghold of the Asiatic Hyksos, or Shepherd Princes, who invaded and subdued a portion of lower Egypt. The princes of Thebes resisted their encroachments, and a prolonged war ensued. Finally, about 1600 B.C., Aahmes I, the founder of the Eighteenth Dynasty, forced the foreigners to take refuge in Avaris, which he closely invested by land and by water. After a long and brave resistance the city was captured, and the Hyksos were driven into southern Palestine. Through this victory the independence of Egypt was secured, and Aahmes united the whole land under his sway. See **AMASIS**; **TANIS**.

AVARS, ä'värz, or **AVA'RI**. A tribe of eastern origin, which made its appearance a century later than the Bulgarians in the countries about the Don, the Caspian Sea, and the Volga. One part of them remained at the Caucasus, another part pressed forward (about 555) to the Danube and settled in Dacia. Here they served in Justinian's army and assisted the Lombards to overturn the kingdom of the Gepidæ, and about the end of the sixth century, under the mighty Khan Bayan, they conquered Pannonia. Later they made themselves masters of Dalmatia; pressed devastating incursions into Germany, as far as Thuringia, and into Italy, where they warred with the Franks and Lombards; and extended their dominion over the Slavs living on, and southward from, the Danube, as well as over the Bulgarians as far as the Black Sea. These nations at last rose against them and in 640 drove them out of Dalmatia. Confined to Pannonia, they were subdued by Charlemagne (in 791), and well-nigh extirpated by the Moravians, so that after 827 they disappear from history, those remaining becoming absorbed in the general European population. Keane, in his *Ethnology* (London, 1896), recognizes Avar traces in "the somewhat coarse Mongoloid features" of the so-called "Szeklers" of Transylvania (p. 309). They usually surrounded their settlements with fortifications of stakes driven into the ground, some traces of which, under the name of "Avarian rings," are yet found in the countries formerly occupied by them. The Avars belonged to the same great Finno-Tatar stock as the Huns, Magyars, etc., whose original habitat was somewhere in central Siberia.

AVARS. One of the Lesghian tribes of Daghestan, in the Caucasus, estimated to number about 100,000. They profess Mohammedanism and possess a written language with Arabic characters. They are noteworthy from the fact that the great Lesghian warrior and patriot, Schamyl (d.1871), who led the peoples of the Caucasus in their struggle against Russia, was an Avar. Deniker (1900) classes the Avars-Andi with the Dido, as one of the five great linguistic divisions of the Lesghian stock. Slight Mongolian resemblances, exaggerated by some authorities, do not indicate real relationship. See **LESGHIAN**; **CAUCASUS**.

AVARY, ä'vä-rî, MYRTA LOCKETT. An American author and social worker, born in Halifax, Va. For several years after completing her education she did editorial work on various New York magazines and contributed to the secular and religious press. She made special studies in social conditions in New York and became

identified with fresh air and settlement work and with various metropolitan charities. She was afterward engaged in sociological and historical work in the South. In addition to contributions to periodicals on sociological subjects, she wrote: *Diare after the War* (1906); *Joel Chandler Harris and his Home* (1913), and edited *A Diary from Dixie*; *A Virginia Girl in the Civil War* (1903); *Letters and Recollections of Alexander H. Stephens* (1910).

AVATAR, äv'a-tär' (from Skt. *avatāra*; *ava*, down + *tar*, to pass over). A term which primarily signifies, in Sanskrit, 'a descent,' but is specially applied to the descent of a Hindu deity upon the earth in a manifest shape, either for beneficent or for retributive ends. It is thus almost synonymous in its signification with the Christian term *incarnation*. The word is sometimes rhetorically employed in English literature. The ten avatars of Vishnu (q.v.), who has descended for the good of the earth, are the most famous in Hindu mythology.

AVATCHA, ä-vii'chá. A bay on the south-east coast of Kamchatka in lat. 52° N., affording the best harbor on the coast. Its shore line is 30 miles long. The Avatcha River flows into it, and the town of Petropavlovsk stands on it.

AVATCHA. A volcano, with two craters, on the Kamchatka Peninsula, in lat. 53° 18' N. and long. 158° 47' E. (Map: Asia, P 3). In many respects it resembles Vesuvius. Its larger crater is several hundred yards in circumference, its height is estimated at from 8360 feet to 10,840 feet, and its most violent recorded eruptions occurred in 1827, 1837, and 1855.

AVEBURY, FIRST BARON. See **LUBBOCK**, SIR JOHN.

AVEBURY, ä'bër-i, or **ABURY**. A small village in Wiltshire, England, 25 miles north of Salisbury and 6 miles west by north of Marlborough. It is the site of megalithic structures of ancient date. An earthen rampart 40 feet in height originally inclosed a circle about 1100 feet in diameter, outlined by stones averaging 16 feet in height. Within the large circle were two smaller double circles, with monuments at the centre. An avenue of similar stones led from the outer ring in a southeasterly direction to Silbury Hill, the largest artificial hill in Europe, supposed to be a British barrow. Avebury Circle is popularly conjectured to be the remnant of a Druid temple, but its real date or character has not been ascertained. It gives its name to the title of the scientist, Sir John Lubbock (Lord Avebury). Pop., 1911, 636.

AVEIRO, ä-vê'ê-rôö. A seaport and seat of a bishopric in Portugal, in the province of Beira, 31 miles northwest of Coimbra (Map: Portugal, A 2). It is situated at the mouth of the Vouga, on the Rio d'Aveiro, a salt lake or lagoon, extending 5 leagues to the north, is separated from the sea by a narrow bar of sand, and is intersected by numerous canals. It has a brisk export trade in salt, oil, wine, fish, timber, glass, and oranges. Kaolin and quicksilver are mined. Pop., 1900, 10,000.

AVÉ-LALLEMANT, ä'vä' läl'män', FRIEDRICH CHRISTIAN BENEDICT (1809-92). A German criminologist. He was born in Lübeck, studied at Jena, became advocate at Lübeck in 1834, and was a police magistrate in that city from 1851 to 1868. His chief work is *Das deutsche Gaunertum* (4 vols., Leipzig, 1858-62), a study of the history of crime in Germany, with interesting researches into the dia-

lect of criminals. Among his other works are *Die Krisis der deutschen Polizei* (Leipzig, 1861) and *Die Reform der Polizei in Hamburg* (Hamburg, 1862). He also wrote a series of detective stories.

AVÉ-LALLEMANT, ROBERT CHRISTIAN BERTHOLD (1812-84). A German physician and traveler, brother of Friedrich Christian Benedict Avé-Lallemant. He practiced medicine for many years at Rio de Janeiro. His principal works are *Reise durch Südbrasilien* (2 vols., 1859); *Reise durch Nordbrasilien* (2 vols., 1860); *Fata Morgana* (1872), and *Wanderungen durch die Pflanzenwelt der Tropen* (1880).

AVELLANEDA, á-vā'lyā-nā'pā, ALONZO FERNANDEZ DE. The pseudonym of the author of a spurious second part of *Don Quixote*, published a year before Cervantes's own sequel appeared. The real name of this writer is not definitely known, but his work has been ascribed to 9 or 10 different writers. The appearance of this second part is supposed to have impelled Cervantes to greater industry in completing *Don Quixote*. See CERVANTES.

AVELLANEDA Y ARTEAGA, GERTRUDIS GÓMEZ DE. See GÓMEZ DE AVELLANEDA Y ARTEAGA, GERTRUDIS.

AVELLANUS, ARCADIUS. See MOGYOROSSY.

AVELLINO, á-vél-lé'nó. An episcopal city, and the capital of the province of Avellino, south Italy, on the southern Naples-Benevento Railway, 18 miles south of Benevento (Map: Italy, J 7). The ruins of the ancient Abellinum are nearly 3 miles distant. Near by is the famous convent of Monte Vergine, founded in 1119, on the ruins of a temple of Cybele, and visited every year by tens of thousands of pilgrims, many of whom ascend the mountain barefoot and crawl on their hands and knees from the church door to the altar. Avellino has a market place containing beautiful obelisks, an academy, and a theatre. It has numerous mills and shoe factories and manufactures cloth, hats, and chairs. The country has been famous for chestnuts and hazel nuts since Pliny's time. Pop. (commune), 1881, 20,000; 1901, 23,760; 1911, 23,926.

AVELLINO, á-vél-lé'nó, FRANCESCO MARIA (1788-1850). An Italian archaeologist, born at Naples. He was educated at Rome, and was professor of Greek literature at the university of his native city, and private tutor of the children of Murat (1809-15). In 1820 he was appointed to the chair of political economy at the University of Naples and afterward to that of institutions and codes. Besides his catalogue of the valuable collection of coins in the Museo Borbonico, (1820), of which institute he became director in 1839, he published a large number of writings under the title of *Opuscoli diversi* (1826). He founded the *Bolletino Archeologico Napolitano*.

AVE MARIA, á'vá má-ré'á (Lat. hail Mary, from *avere*, to be well, fare well), also ANGELIC SALUTATION. A form of address to the Virgin Mary, expressing honor to her and requesting her intercession; among Roman Catholics in universal and frequent use, generally coupled with the recitation of the Lord's Prayer. The first part, "Hail [Mary], full of grace, the Lord is with thee," is the salutation of the Archangel Gabriel (Luke i. 28) to Mary; the second the address to her of her cousin Elizabeth (verse 42), "Blessed art thou among women, and blessed is the fruit of thy womb"; the prayer

which forms the third part, "Holy Mary, mother of God, pray for us sinners now and in the hour of our death," was added in substance in the fifteenth century. The form at present in use appears first c.1514, and probably comes from Italy. The daily use of the whole prayer was ordered by Pope Pius V in 1568. See ROSARY.

AVEMPACE, á'vám-pā'thā (ABU BEKR MOHAMMED IBN JAHYA, surnamed Ibn Sayigg and Ibn Bajja, which was later given by the scholastics as Avempace). An Arabic philosopher, physician, and poet. He was born in Saragossa toward the end of the eleventh century, and died at Fez in 1138 as a result of poison administered by an envious physician, Abul 'Ala ibn Zuhr. At Saragossa he held a high official place, but his philosophical and religious opinions lost him his position. In 1119 we find him in Seville, where he composed his works on logic. From there he traveled to Granada, and then to Fez, where he gained the favor of the Almoravide court. The importance of Avempace lies in the fact that he introduced the Peripatetic philosophy into Andalusia. Besides commentaries on the works of Aristotle, Avempace composed a work mentioned by Averroës, *Fi tadbir al-mutawahhid* ('Conduct of the Individual'), in which he points out methods necessary for the perfection of the individual who lives surrounded by so many hindrances to development. By speculation and intellectual effort, and not by mysticism, as Ghazali taught, man is enabled to reach the divine intellect, of which Avempace teaches the individual intellect is a part. He is said to have rejected the Koran and denied immortality. He wrote works also on medicine and music and composed poems. Consult Brockelmann, *Geschichte der arabischen Litteratur* (Weimar, 1899), vol. i, p. 460.

AVENA. See OAT.

AVENARIUS, Ger pron. á'fe-nā'rē-us, FERDINAND (1856-). A German æsthetic philosopher, art critic, and lyric poet, nephew of Richard Wagner, born at Berlin and educated at the universities of Leipzig and Zurich. He devoted himself to the philosophy of art, and in 1887 became the founder of the *Kunstwart*, an art journal of reformatory tendencies, which publication, after many reverses and antagonisms, became the foremost organ of its class. He is the editor of a popular and extensive collection of art reproductions. The poetic works of Avenarius are the idyl *Die Kinder von Wohldorf* (1886; 6th ed., 1910); *Lebel* (1897, 8th ed., 1909); and the collections entitled *Stimmen und Bilder* (1897; 7th ed., 1910) and *Hausbuch deutscher Lyrik* (10th ed., 1910). His critical works comprise the anthology, *Deutsche Lyrik der Gegenwart* (2d ed., 1884) and *Max Klinger's Griffelkunst* (2d ed., 1907); *Balladen Buch* (1907, 1910); *Das fröhliche Buch aus deutscher Dichter und maler Kunst gesammelt* (1910). For criticism, consult G. Heine, *Ferdinand Avenarius als Dichter* (Leipzig, 1904).

AVENARIUS, RICHARD (1843-96). A German philosophical writer. He was born in Paris and studied philosophy at the universities of Zürich, Berlin, and Leipzig. From 1877 until his death he filled the chair of philosophy at Zürich and acted as co-editor of the *Vierteljahrsschrift für wissenschaftliche Philosophie*. His principal original contribution to philosophy was a theory of experience, which is embodied in

his *Kritik der reinen Erfahrung* (2 vols., Leipzig, 1889, 1907). He also wrote on Spinoza's pantheism and on other philosophical subjects. Consult O. Ewald, *Richard Avenarius als Begründer des Empiriokritizismus* (Berlin, 1905), and W. T. Bush, *Avenarius and the Standpoint of Pure Experience* (New York, 1905).

AVENBRUGGER, ä'f'en-brug'ër. See AUENBRUGGER.

AVENCHES, ä'vânsh'. A village in the canton of Vaud, Switzerland, 7 miles northwest of Freiburg, and 1½ miles south of Lake Morat, on the ancient shore of which it was located (Map: Switzerland, B 2). It is interesting as the Roman Aventicum, the capital of the Helvetii, and its remains include those of an amphitheatre, walls, and a Corinthian column (39 feet high) of a temple of Apollo. This column, celebrated by Byron in *Childe Harold* (3d canto, 65th line), is known as Le Cicognier, from the fact that for centuries storks have used it as a nesting place. Avenches is the German Wilisburg (castle of Wilis, a Count of Burgundy of the seventh century). The castle is built on the site of the Roman Capitol, and there is a museum in the amphitheatre. During the Roman period Avenches had 60,000 inhabitants. Pop., 1910, 1802.

AVENEL, JULIAN. A character in Scott's novel, *The Monastery*, who has seized Avenel Castle at the opening of the story. He is the uncle of Mary Avenel.

AVENEL, MARY. The daughter of Lady Avenel and, ultimately, the wife of Halbert Glendinning, in Sir Walter Scott's novels, *The Monastery* and *The Abbot*.

AVEN'GER OF BLOOD. In primitive society the person, usually the next of kin of the murdered man, charged with the duty of avenging the crime of murder by slaying the murderer. The legal recognition of this duty and its regulation by law are really the beginnings of a system of criminal law. The crimes with which primitive law concerns itself are crimes of violence—man-killing, wounding, and robbery. Their punishment, however, is not, as with us, a matter for the state, but is left to the injured person or to his kinsman. This legalized right of private vengeance, called the blood feud (see BLOOD FEUD), was, in course of time, mitigated by the doctrine of sanctuary (q.v.), which held the vengeance of blood in abeyance until passions had time to cool and the justification of the deed could be made to appear (see ASYLUM); and by the institution of the wergild (q.v.), whereby the wrongdoer was permitted to commute the natural penalty of his crime for a money payment. This wergild went to the avenger of blood, and the barbarous codes of the early Middle Ages contain elaborate provisions for determining the amounts to be paid and the persons entitled, as avengers of blood, to share in the payment.

The Mosaic law (Num. xxxv.) recognized this institution of primitive society, but placed it under regulations, prohibiting the commutation of the penalty of death for money, and appointing "cities of refuge" for the manslayer who was not really a murderer. (See CITY or REFUGE.) The Koran sanctions the avenging of blood by the nearest kinsman, but also sanctions the pecuniary commutation for murder. The primitive custom subsists in full force among the Arabs at this day. The hereditary feuds of families, clans, and tribes in bar-

barous and semi-barbarous countries are survivals of this institution.

AVEN'NIO. A Roman town in Gallia Narbonensis, now Avignon.

AVENS. See GEUM.

AVENTINE. The southernmost of the hills of Rome, east of the Tiber. It was included in the city by Servius Tullius, and settled by the plebs in 455 B.C. Of many temples and edifices no traces remain. (See ROME.) Consult Platner, *Topography and Monuments of Ancient Rome* (New York, 1911).

AVENTINUS, JOHANNES (1477-1534). A German historian, born at Abensberg, Bavaria. His real name was Turmair. He studied at Ingolstadt and at Paris, and taught Greek and mathematics at Cracow and poetry and forensics at Vienna. In 1509 the Duke of Bavaria called him to Munich and intrusted him with the education of his sons. Here he wrote his valuable history of Bavaria (*Annales Boiorum*), which occupied him 16 years. This work was not published until 20 years after his death, and then only with large portions adverse to the Roman Church excised. These, however, were all restored in Cisner's edition (1580). Among his other works are *Chronicon sive Annales Schirceses* (1600) and *Vita Henrici IV* (1518). Consult Döllinger, *Aventinus und seine Zeit* (Munich, 1877).

AVENTURINE, ä-vën'tû-rîn (from It. *avventurino*, from *avventura*, adventure, chance; refers to its accidental discovery). A transparent to opaque variety of quartz, either red, yellow, or brown, with iridescent spangles of mica, hematite, or other minerals scattered through it. The specimens found at Cape de Gata in Spain have been cut and used as gems; also those found at Glen Fernat in Scotland. A few localities have been reported in the United States. The name "aventurine" is also given to certain varieties of feldspar, as orthoclase and oligoclase, which have the property of reflecting light in various colors from points inside the mineral. The best specimens are from Swedestrand, Norway, and excellent varieties have been found in Statesville, N. C. These are cut and sold as gems, under the name of sunstones. A similar effect was produced by the Venetian glass makers, who are said to have discovered the method of artificially producing this effect by accidentally dropping brass filings into melted glass.

AVENZOAR, ä'vën-zō'är (ABU'L MABWAN ABD AL MALIK IBN ZUHR) (c.1072-1162). An eminent Spanish-Arabian physician, born at Seville. A close student of such medical works as had been translated from Greek into Aramaic and Arabic, and especially a great admirer of Galen, Ibn Zuhri insisted upon the importance of the experimental method. His remarkable knowledge of anatomy and his careful diagnosis of disease in himself as well as in others led him to propose and to try many experiments. He prescribed the introduction of food into the stomach by a silver tube, and suggested in cases of obstruction tepid baths of nutritive liquids taken by cutaneous imbibition. Ibn Zuhri influenced by his scientific method the great philosopher Averroes (q.v.), who, according to Leo Africanus, attended some of his lectures. A book of his on *The Method of Preparing Medicines and Diet* was translated first into Hebrew (1280) and then into Latin (1490).

AVERAGE (OF., Low Lat. *averagium*, pos-

sibly from OF. *aver*, property, cattle; literally, to have, Lat. *habere*). A medium; any medial amount obtained by comparison of a number of specific cases; e.g., three persons have the respective ages 20 years, 30 years, 50 years; their average is $\frac{1}{3}$ (20 + 30 + 50) years, or 33 $\frac{1}{3}$ years. The average of two quantities is called their arithmetic mean. (See MEAN.) The process of averaging is of importance in the comparison of statistics, as the average yield of staple products per acre or per year for a period of years, the average monthly shipment of gold to foreign countries, the yearly average of emigration, or the average monthly rainfall. In the case of physical measurements the items are not generally of equal accuracy. Hence the items are given different weights, the process of averaging becoming more complicated, and the method of least squares (see LEAST SQUARES, METHOD OF) is commonly employed.

AVERAGE, IN MARITIME LAW. The generic sense of this term in maritime law appears to be: the loss of property while embarked upon a maritime adventure. *Particular average* denotes a loss which is borne by the party whose property is injured or destroyed and towards which others are not bound to contribute. Examples of this are: Carrying away of masts by storm; accidental stranding or collision of the vessel; capture of the ship or cargo by an enemy. *Petty average*, or *customary average*, is applied to certain expenditures, such as pilotage, anchorage, and towage charges in port, which were formerly apportioned among the owners of ship and cargo, but which are now generally provided for in bills of lading.

General average was defined by the International Congress at Brussels in 1888 as follows: "An extraordinary expenditure, or a sacrifice voluntarily made by the captain or pursuant to his orders, for the common good and safety of the ship and cargo." For the adjustment of general-average losses, a body of regulations was adopted by the Association for the Reform and Codification of the Law of Nations, at Antwerp, in 1877, and amended by the Association at Liverpool in 1890. It is known as the York-Antwerp Rules, and is often agreed upon by parties to shipping articles as the measure of their duties and liabilities. In the observance of such an agreement these rules have no binding force upon litigants and are of value only as a careful statement of the views of experts. The law of general average is a part of the maritime law, or law of the sea, as distinguished from the municipal law, or law of the land. It was introduced into English jurisprudence from the Roman law, which, in turn, had adopted its principles from the laws of Rhodes. A person's right to general-average contribution does not depend upon an express contract, although it may be modified by agreement. It rests upon mercantile custom; but a custom so definite and so well understood that every mercantile adventure is entered upon with the actual or presumed knowledge on the part of all interested that the right accompanies, and forms a part of, the transaction. Accordingly some eminent judges have declared that the right now arises from an implied contract.

In order to constitute a case of general average, three things must concur, viz.: 1. "A common danger; i.e., a danger in which ship, cargo, and crew all participate; a danger imminent and apparently inevitable, except by voluntarily

incurring the loss of a portion of the whole to save the remainder. 2. There must be a voluntary jettison, or casting away of some portion of the joint concern, for the purpose of avoiding this imminent peril; or, in other words, a transfer of the peril from the whole to a particular portion of the whole. 3. This attempt to avoid the imminent peril must be successful." It will be noticed that this statement of the principles by the United States Supreme Court is not broad enough to include every case where one's property is destroyed for the purpose of saving the property of another. The sole object of the sacrifice must be that of saving a ship, its cargo, and crew from a common peril. If the ship or its cargo is sacrificed to save another ship, or other property not included in the common adventure, it is not a case of general average. Again, if the loss is involuntary, it is not the subject of general average. For example, if a ship is attacked by pirates or by an enemy, anything voluntarily sacrificed by the master of the ship in buying off or getting rid of the assailant is a general-average loss, while anything captured is not. So, if a vessel lying at its dock, or its cargo, is injured or destroyed by local authorities, as incidental to the extinguishment of a fire or the preservation of outside property, it is not a case of general average; but it is such a case if the injury or destruction is authorized by the master, and, therefore, is voluntary. When it is said that the attempt to avoid the peril must be successful, all that is meant is that some portion of the common adventure must be saved from the peril. It is not necessary that the voyage be accomplished, or even that the property saved from the first peril be brought to its destination; its destruction from a second and distinct peril does not affect the general average arising from the first.

There are two exceptions to the rule that sacrifices or expenditures made for the preservation of the whole adventure are made good to the owner of the injured interest by contribution levied on the whole adventure: First, when the loss is due to the fault of the injured owner. Second, when the injured or sacrificed goods were carried on deck; unless such deck cargo was permitted either by the established custom of navigation or by the assent of the owners of the general cargo. The second exception rests upon the general rule of maritime law that the deck of a ship is an improper place for cargo, as its stowage there interferes with the safe navigation of the vessel.

In the absence of a special agreement to the contrary, all the imperiled property saved must contribute to make good the loss of that which was voluntarily sacrificed by the master, or common agent of all. The owner of the sacrificed interest is not reimbursed for his entire loss. On the other hand, he is bound to contribute to his own loss proportionally with his co-adventurers. In other words, the owners of the saved property contribute that percentage of its value which the value of the lost property bears to the value of all that was imperiled. As a rule, the value of a saved interest upon which it must pay contribution is the same as the value upon which it would have received contribution had it been sacrificed. In the case of the ship, this is her fair value to her owners at the time and place of adjustment; in the case of freight, its net value at that time; in the case of cargo,

the market value of the goods at the end of the voyage, less charges for freight, duties, and the like. While the ordinary place for adjusting general-average contributions is the port where the voyage was to end, the adjustment may be made elsewhere, either upon the assent of all parties interested, or by reason of necessity as in case of a disaster which prevents the completion of the voyage. When made in accordance with the law of the proper place, the adjustment is binding everywhere.

While the rules relating to general average were established many centuries before insurance was practiced, they are associated quite closely now with marine insurance. See MARINE INSURANCE, and consult the authorities referred to under INSURANCE.

A'VERELL, WILLIAM WOODS (1832-1900). An American soldier, famous as a cavalry leader during the Civil War. He was born in Cameron, N. Y.; graduated at West Point in 1855; and from 1857 to 1859 was engaged in frontier duty against the Indians. During the Civil War he took part, as first lieutenant in a cavalry regiment, in the first battle of Bull Run; and as colonel of volunteers in the Peninsular campaign; was raised to the rank of brigadier-general of volunteers in September, 1862; and in March, 1863, began the series of cavalry raids for which he became famous. On these raids, in 1863-64, he fought numerous battles and skirmishes, destroyed many miles of railroad, captured large quantities of supplies, and did much to disconcert the Confederates and assist Federal commanders in carrying out their plans of campaign. In March, 1865, he was brevetted brigadier-general, for "gallant and meritorious services" during the war, and major-general for gallantry in the battle of Moorfield, Va., and in May resigned from the service. From 1866 to 1869 he was United States Consul General to British North America. He then became president of a large manufacturing company, and on Aug. 17, 1888, was reappointed captain in the United States army; but retired on the 31st of the same month. He invented a form of asphalt pavement now in general use, the Averell insulating conduits for wires and conductors, and a method for manufacturing cast steel direct from the iron ore in one operation.

AVER'NUS (Lat., Gk. *Ἀορνος*, *Aornos*, usually derived from *ἀ*, *a*, priv. + *ορνις*, *ornis*, bird), now LAGO D'AVERNO. A small, nearly circular lake in Campania, Italy, situated between Cumæ, Puteoli, and Baïæ. It is about a mile and a half in circumference and occupies the crater of an extinct volcano. The sulphurous and mephitic vapors arising from the lake were believed in ancient times to kill the birds that flew over it. Owing to its gloomy aspect, it became the centre of many ancient fables of the world of shades. Here was situated Homer's Nekyia, or entrance to the underworld; here the Cimmerians are said to have dwelt—a people who lived in deep caverns, without ever coming into the light of day, and imparted oracles learned beneath the earth; here also were placed the grove of Hecate and the grotto of the Cumæan Sibyl. Agrippa caused the dense woods to be thinned, by which the place lost most of its wildness; he transformed the lake into a naval headquarters, known as the Portus Julius, which he connected by a canal with the Lacus Lucrinus. By his orders, too, Cocceius constructed the famous tunnel through the mountain to Cumæ.

VOL. II.—20

The lake was also connected in ancient times with the Gulf of Baïæ.

AVERROËS, á-vér'ô-ëz (ABU 'L WALID MOHAMMED IBN AHMED IBN ROSHD) (c.1126-98). A famous Spanish-American philosopher and jurist, born at Córdoba. His father and grandfather had been great jurists. At Córdoba he studied theology and philosophy under Tofail and medicine under Ibn Zuhr. By Ibn Tofail he was introduced to Abu Yakub Yusuf, the Caliph of Morocco. Averroes, however, did not stay long in Morocco. In 1169 he was appointed judge in Seville, and then at his native town, Córdoba. In 1182 he was appointed physician to the Caliph of Morocco, but again he left to take a judgeship in Córdoba. Being accused of doctrines contrary to orthodox Mohammedanism, he was deprived of his office and exiled to Lucena, where he lived in great poverty. Again he was called to Morocco, where he died. He had several sons, one of whom expounded his father's theory of the intellect. Averroes regarded Aristotle as the greatest of all the philosophers; his commentaries on the works of Aristotle (extant in Hebrew and Latin translations) exerted a great influence on the scholastic school in Europe. He opposed the orthodox school, and insisted that the Koran must be explained in the light of reason and not along mystical lines, as had been done by Ghazali (q.v.). The latter's work, *The Destruction of Philosophy*, was answered by Averroës in *The Destruction of the Destruction*, which was translated into Latin by Locatellus (1497-1520). Works of his criticising the positions of Avicenna and Farabi are extant in manuscript. In medicine Averroës sided with Aristotle as against Galen; his medical work, *Colliget*, appeared in Latin (Venice, 1482, 1514). His complete works were published in 1552 at Venice. For more extended bibliography, consult Renan, *Averroës et l'averroïsme* (Paris, 1852, 2d ed., 1860); Brockelmann, *Geschichte der arabischen Litteratur*, vol. i, p. 461 (Weimar, 1899); De Boor, *History of Philosophy in Islam* (Leyden, 1903).

AVERSA, á-vér'sá. An episcopal city in the province of Caserta, south Italy, 12 miles north of Naples (Map: Italy, J 7). It has a cathedral and monasteries, a famous insane asylum, and an excellent asylum for foundlings. It is famous for *asprino*, a sparkling white wine, and for oil, silk, and fruit. It is near the site of the ancient Atella, whence came the *Atellanæ fabula*, coarse farces that in time developed into comedy. The new town was founded in 1029 by the Normans. Pop. (commune), 1881, 21,000; 1901, 23,477; 1911, 23,203.

AVERULINO, á-vá'rôo-lé'nó, ANTONIO. See FILARETE.

A'VERY, ELROY MCKENDREE (1844-). An American author, born at Erie, Mich. He fought in the Civil War and retired with the rank of sergeant-major, graduated at the University of Michigan in 1871, taught in various Ohio schools, and from 1893 to 1897 was a member of the State Senate. Among his many publications are elementary text-books in physics and chemistry, which, in various editions, have been much used in the public schools throughout the United States. He also wrote *Words Correctly Spoken* (1887), *The Town Meeting* (1904), *Elementary Physics* (1906), and *The Groton-Avery Clan* (1911). In 1910 he had published seven of 15 volumes under the title *A History of the United States and its*

People. A monograph on *John Humphrey, Massachusetts Magistrate*, appeared in 1912.

AVERY, SAMUEL (1865-). An American chemist and educator, born at Lamoyille, Ill., and educated at Doane College, the University of Nebraska, and Heidelberg. After 1896, with the exception of three years as professor at the Agricultural Experiment Station of the University of Idaho, he served continuously on the faculty of the University of Nebraska until 1908. At that time, when head professor of chemistry, he was appointed acting chancellor, and in the following year was made chancellor. He became known as a popular lecturer on educational subjects, and, besides preparing numerous bulletins of interest to chemists, wrote jointly with H. H. Nicholson *Exercises in Chemistry* (1899).

AVERY, SAMUEL PUTNAM (1822-1904). An American connoisseur and dealer in art. He was born in New York City, where he studied engraving and was extensively employed by leading publishers. He began business as a dealer in art in 1865. In 1867 Mr. Avery was appointed commissioner in charge of the American art department of the Exposition Universelle in Paris. He was a founder, and for long a trustee, of the Metropolitan Museum of Art and was a life member of important scientific, artistic, and educational associations. He founded the Avery Architectural Library at Columbia University in memory of his son, Henry Ogden Avery, an architect of note, who died in 1890. In 1912 Avery Hall, in memory of father and son, was erected on the Columbia campus. Its first floor houses the Avery Library, now rated the richest collection in the country of works on architecture and the allied arts. See COLUMBIA UNIVERSITY.

AVERYSBORO, ā'vēr-iz-bûr'ō. A village in Harnett Co., N. C., about 20 miles northeast of Fayetteville. Here, on March 16, 1865, during the Civil War, a Confederate force under Hardee made a stand against Slocum's wing of Sherman's advancing army, but was quickly driven back and during the night retreated upon Smithfield. The Union loss was 77 killed and 477 wounded; the Confederate about 700, including over 200 prisoners.

AVES, ā'vêz (Lat., pl. of *avis*, bird). A class of the phylum Chordata, the birds most distinctly characterized by their exclusive possession of feathers as a covering and by their structural adaptations to flight. See BIRD.

AVES, Los, lôs ā'vâs, or **BIRD ISLANDS**. A group of small islands off the north coast of Venezuela, South America, belonging to that republic. They lie east of the Dutch island Buen Ayre and have guano deposits.

AVESNES, ā'vân'. The capital of an arrondissement in the department of Nord, France, on the Helpe, 50 miles southeast of Lille (Map: France, N., J 2). The church of St. Nicholas is a fine building dating from the thirteenth century. Also noteworthy are the Communal College, a public library, and museum. Manufactures of woollens and hosiery are the chief industries. Avesnes was prominent as a centre of conflict during the fifteenth century and was fortified during the reign of Louis XIV according to the system of Vauban. It was bombarded after the battle of Waterloo and for some time was occupied by the allied troops. Pop., 1901, 6217; 1906, 6013; 1911, 5829.

AVESTA, or ZEND-AVESTA. The name

under which, as a designation, are comprised the bible and prayer-book of the Zoroastrian religion. The Avesta forms to-day the sacred books of the Parsis, or Fire Worshipers, as they are often termed, a small community living now in India or still scattered here and there in Persia. The original home of these worshipers and of their holy scriptures was ancient Iran, and the faith they profess was that founded many centuries ago by Zoroaster (q.v.), one of the great religious teachers of the East.

The Avesta is therefore an important work, as it preserves the doctrines of this ancient belief and the customs of the earliest days of Persia. It represents the oldest faith of Iran, just as the Vedas do of India. It stands as the law of ancient Media, and later of Persia, and apparently also of Bactria. The religion which the Avesta presents was once one of the greatest, and it has left ineffaceable traces upon the history of the world. It flourished fully six centuries before the Christian Era; it certainly became the religion of the later Achaemenian kings, if it was not already the creed of Cyrus, Darius, and Xerxes; but its power was weakened by the conquest of Alexander, and many of its sacred books were lost. It revived again during the first centuries of our own era, but was finally broken by the Mohammedans in their victorious invasion. Most of the Zoroastrian worshipers were then compelled, through persecution, to accept the religion of the Koran; many, however, fled to India for refuge and took with them what was left of their sacred writings. A few of the faithful remained behind in Persia and, though persecuted, they continued to practice their religion. It is these two scanty peoples—perhaps 80,000 souls in India and 10,000 in Persia—that have preserved to us the Avesta in the form in which we now have it.

The designation *Avesta*, for the scriptures, is adopted from the term *Avistāk*, regularly employed in the Pahlavi (q.v.) of the Sassanian time. But it is quite uncertain what the exact meaning and derivation of this word may be. Possibly *Phil. Avistāk*, like the Skr. *Veda*, signifies 'wisdom, knowledge, the book of knowledge.' It may, however, mean 'the law.' The designation *Zend-Avesta*, though made current by Anquetil-Duperron, as described below, is not an accurate title. It arose by mistake from an inversion of the oft-recurring Pahlavi phrase, *Avistāk va Zand*, 'Avesta and Zend,' or 'the Law and Commentary.' The term *Zand* in Pahlavi (cf. Av. *āzavānti*), as the Parsi priests now rightly comprehend it, properly denotes 'understanding, explanation,' as opposed to the *Avesta* itself, which some maintain signifies 'the unknown' text that needed explanation in order to be understood. It is certain that *Zand* is the name of the later version and commentary of the Avesta texts, the paraphrase which is written in the Pahlavi language. The proper designation for the scriptures, therefore, is *Avesta*; the term *Zend* should be understood as the Pahlavi version and commentary. It is noteworthy that the Greeks never mention the Zoroastrian writings in discussing the Persian faith, while Arabic authors frequently allude to the "Avesta."

Discovery and History of Research of the Avesta.—Of the religion, manners, and customs of ancient Persia which the Avesta preserves to us, we had but meagre knowledge until about

a century ago. What we did know up to that time was gathered from the more or less scattered and unsatisfactory references of the classic Greek and Latin, from some allusions in Oriental writers, or from the later Persian epic literature. To direct sources, however, we could not turn. Allusions to the religion of the Magi, the faith of the Avesta, are to be found in the Bible. The Wise Men from the East who came to worship the Saviour, the babe in Bethlehem, were Magi. Centuries before that date, however, it was Cyrus, the ancient Persian King, whom God called his anointed and his shepherd (Isa. xlv. 1, 13; xlv. 28; 2 Chron. xxxvii. 22, 23; Ezra i. 1-11), and who gave orders that the Jews be returned to Jerusalem from captivity in Babylon. Darius, moreover (Ezra v. 13-17; vi. 1-16), the worshiper of Ormazd, favored the rebuilding of the Temple at Jerusalem, as decreed by Cyrus. Allusions to the ancient faith of the Persians are perhaps contained in Ezek. viii. 16; Isa. xiv. 7, 12. The classical references of Greek and Roman writers to the teachings of Zoroaster, which we can now study in the Avesta itself, may be said to begin with the account of the Persian religion given by Herodotus (450 B.C.). To this account may be added references and allusions, though often preserved only in fragments by various other writers, including Plutarch, "On Isis and Osiris," and Pliny down to Agathias, about 560 A.D. The Armenian writers, Eznik and Elisæus, of the fifth century A.D., also refer to the Zoroastrian religion. After the Mohammedan conquest of Persia we have an allusion by the Arabic writer, Masudi (940 A.D.), who tells of the *Avesta* of Zeradusht (Zoroaster), and its commentary called *Zend*, together with a *Pazend* explanation. The *Abasta* (Avesta) is also mentioned several times by Al-Biruni (about 1000 A.D.). The later Mohammedan author, Shahrastani (1150 A.D.), sketches in outline the creed of the Magi of his day. An interesting reference is found in the Syriac-Arabic Lexicon of Bar-Bahlul (903 A.D.) to an *Avastak*, a book of Zardosht (Zoroaster), as composed in seven tongues—Syriac, Persian, Aramaean, Segestanian, Marvian, Greek, and Hebrew. In an earlier Syriac MS. Commentary on the New Testament (852 A.D.) by 'Isho'dad, Bishop of Hadatha, near Mosul, mention is made of the Abhāstā as having been written by Zardosht in 12 different languages. These latter allusions, though late, are all of them important, as showing the continuity during ages of the tradition of such a work as the Avesta, which contains the teachings of Zoroaster, the Prophet of Iran. All these allusions, however, it must be remembered, are by foreigners. No direct Iranian sources had been accessible.

From this time, moreover, till about the seventeenth century, we find there was little inquiry into the sacred books of the Persians. One of the first series of investigations into the Greek and Roman sources seems then to have been undertaken by a European, Barnabé Brisson, *De Persarum Principatu* (Paris, 1590). The Italian, English, and French travelers in the Orient next added some information as to the religion and customs of the Persians. Among them may be mentioned the works of Pietro della Valle (1620), Henry Lord (1630), Mandelslo (1658), Tavernier (1678), Chardin (1721), Du Chignon. Most important, however, was the work of the distinguished Oxford scholar,

Thomas Hyde (1700). It was written in Latin and entitled *Historia Religionis Veterum Persarum*. Hyde resorted chiefly to the later Parsi sources; the original texts he could not use, although an Avesta MS. of the Yasna seems to have been brought to Canterbury as early as 1633. Hyde appealed earnestly, however, to scholars to procure MSS. of the sacred books of the Parsis and aroused much interest in the subject. In 1723 a copy of the Vendidad Sādah was procured by an Englishman, George Boucher, from the Parsis in Surat, and deposited as a curiosity in the Bodleian Library at Oxford. No one, however, could read the texts. To a young Frenchman, Anquetil-Duperron, belongs the honor of first deciphering them. The history of his labors is interesting and instructive. Happening, in 1744, to see some tracings made from the Oxford MS. and sent to Paris as a specimen, Anquetil-Duperron at once conceived the spirited idea of going to Persia or India and obtaining from the priests themselves the knowledge of their sacred books. Though fired with zeal and enthusiasm, he had no means or aid to carry out his plan. He seized upon the idea of enlisting as a soldier in the troops that were to start for India, and in November, 1754, behind the martial drum and fife, this youthful scholar marched out of Paris. The French government, however, recognizing at once his noble purpose, gave him his discharge from the army and presented him his passage to India. After countless difficulties he reached Surat, and there, in spite of almost insurmountable obstacles, he succeeded in winning the confidence and favor of the priests, with whom he was able to communicate after he had learned the modern Persian. He gradually induced the priests to impart to him the language of their sacred works, to let him take some of the manuscripts, and even to initiate him into some of the rites and ceremonies of their religion. He stayed among the people for seven years, and then, in 1761, he started for his home in Europe. He stopped at Oxford before going directly to Paris, and compared his MSS. with that of the Bodleian Library, in order to be assured that he had not been imposed upon. The next 10 years were devoted to work upon his MSS. and translation, and in 1771, 17 years after the time that he had first marched out of Paris, he gave forth to the world the results of his untiring labors. This was the first translation of the Avesta, or, as he called it, *Zend-Avesta* (*Ouvrage de Zoroastre*, 3 vols., Paris, 1771), a picture of the religion and manners contained in the sacred book of the Zoroastrians.

The ardent enthusiasm which hailed this discovery and opening to the world of a literature, religion, and philosophy of ancient times was, unfortunately, soon dampened. Some, like Kant, were disappointed at not finding the philosophical or religious ideas which they had looked for; while others missed the high literary value they had expected. They little considered how inaccurate, of necessity, such a first translation must be. Though Anquetil-Duperron had learned the language from the priests, still, people did not know that the priestly tradition itself had lost much during the ages of persecution or oblivion into which the religion had fallen. They did not take into account that Anquetil-Duperron was learning one foreign tongue, the Avesta, through another, the modern Persian; nor did they know how little accurate and sci-

tific training he had had. A discussion as to the authenticity of the work arose. It was suggested that the so-called Zend-Avesta was not the genuine work of Zoroaster, but a forgery. Foremost among the detractors was the distinguished Orientalist, Sir William Jones. He claimed, in a letter published in French (1771), that Anquetil-Duperron had been duped; that the Parsis had palmed off upon him a conglomeration of worthless fabrications and absurdities. In England Sir William Jones was supported by Richardson; in Germany he was supported by Meiners. In France the genuineness of the book was universally accepted, and in one famous German scholar, Kleuker, it found an ardent supporter. He translated Anquetil-Duperron's work into German (Riga, 1776), for the use of his countrymen, especially the theologians, and he supported the genuineness of these scriptures by classical allusions to the Magi. For nearly 50 years, however, the battle as to authenticity still raged. Anquetil-Duperron's translation, as acquired from the priests, was supposed to be a true standard to judge by; little or no work was done on the texts. The opinion that the books were a forgery was gradually, however, growing somewhat less positive. It was the advance in the study of Sanskrit that finally won the victory for the advocates of the authenticity of the sacred books. About 1825—more than 50 years after the appearance of Anquetil-Duperron's translation—the Avestan texts themselves began to be carefully studied by Sanskrit scholars. The close affinity between the two languages had already been noticed by different scholars; but in 1826 the more exact relation between the Sanskrit and the Avesta was shown by the Danish philologist, Rask, who had traveled in Persia and India, and who had brought back with him to the Copenhagen Library many valuable MSS. of the Avesta and of the Pahlavi books. Rask, in a small monograph on the age and authenticity of the Zend language (1826), proved the antiquity of the language, showed it to be distinct from Sanskrit, though closely allied to it, and made some investigation into the alphabet in which the texts were written. About the same time the Avesta was taken up by the French Sanskrit scholar, Eugène Burnouf. Knowing the relation between the Sanskrit and the Avestan, and taking up the reading of the texts scientifically, through his knowledge of Sanskrit, he found at once philological inaccuracies in Anquetil's translation. Anquetil, he saw, must often have misinterpreted his teachers; the tradition itself necessarily must often have been defective. Instead of this less trustworthy French rendering, he turned to an older Sanskrit translation of a part of the Avesta. This was made in the thirteenth century, by the Parsi Neryosangh and was based on the Pahlavi version. By means of this Sanskrit rendering and by applying his philological learning, Burnouf was able to restore sense to many passages of which Anquetil had often made nonsense, and he was thus able to throw a flood of light upon many an obscure point. The employment of Sanskrit introduced a new method. This discovery and gain of vantage ground practically settled the question of authenticity. The testimony, moreover, of the ancient Persian inscriptions deciphered about this time by Grotefend, Burnouf, Lassen, and by Sir Henry Rawlinson, showed still more by their contents and languages, so closely allied to the Avesta, that

the work must be genuine. The foundation laid by Burnouf was now built upon by other scholars—Bopp, Haug, Westergaard, Spiegel, Roth, Justi, and later by De Harlez, Mills, Hübschmann, Bartholomæ, and especially Geldner and Darmesteter, in addition to some hardly less-known names, Parsis among them. These scholars, using partly the Sanskrit key for the interpretation and meaning of words, and partly the Parsi tradition contained in the Pahlavi translation, have now been able to give us a clear idea of the Avesta and its contents, so far as the books have come down to us. Upon minor points of interpretation, of course, there are, and always will be, individual differences of opinion.

Contents, Arrangement, Extent, and Character.—The Avesta, as we now have it, is but a small remnant of a once great literature. It has come down in a more or less fragmentary condition; not even a single manuscript contains all the texts that we now have; whatever we possess has been collected together from various codices. All that survives is commonly classed under the following divisions or books: (1) The Yasna, (2) the Vispered, (3) the Yashts, (4) a collection of minor texts, (5) the Vendidad, (6) Fragments. Among these divisions, not counting the Fragments, two groups are recognized. As used in the service of worship, the Vendidad, Vispered, and the Yasna are traditionally classed together for liturgical purposes and form the Avesta proper. In the manuscripts these three books appear in two different forms. If they are kept separate as three divisions, each part is then usually accompanied by a Pahlavi version. On the other hand, since these three books are not recited each as a whole, but the chapters of one book for liturgical purposes are mingled with another, on this account the MSS. often present them in their intermingled form, portions of one inserted with the other, and arranged exactly in the order that they are to be used in the service. In this latter case the Pahlavi translation is omitted, and the collection is called the Vendidad Sādah, or Vendidad pure—i.e., text without commentary. The second group, the minor prayers and the Yashts, which the MSS. often include with these, is called the *Khordah Avesta*, or 'Small Avesta.' Of the greater part of the latter there is no Pahlavi rendering. The contents and character of the several divisions may now be taken up in detail.

1. The *Yasna*, 'sacrifice, worship,' is the chief liturgical work of the sacred canon. It consists principally of ascriptions of praise and prayer, and in it are inserted the *Gāthās*, or 'hymns,' verses from the sermons of Zoroaster, which are the oldest and most sacred part of the Avesta. The *Yasna* (Skt. *yajña*) comprises 72 chapters, called *Hā, Hāiti*. These are the texts recited by the priests at the ritual ceremony of the *Yasna* (*Izashne*). The book falls into three nearly equal divisions. The first part (chap. i-xxvii) begins with an invocation of the god Ormazd and the other divinities of the religion; it gives texts for the consecration of the holy water, *zaōthra*, and of the *baresma*, or 'bundle of sacred twigs,' for the preparation and dedication of the *Haoma*, the juice of a certain plant—the Indian Soma—which was drunk by the priests as a sacred rite, and the offering of blessed cakes, as well as a meat offering, which likewise were

partaken of by the priests. Interspersed through this portion, however, are a few chapters that deal only indirectly with the ritual; these are Ys. 12, the later Zoroastrian creed, and Ys. 19-21, catechetical portions. Then follow the *Gāthās*—literally 'psalms,' or 'songs' (chap. 28-53), metrical selections or verses containing the teachings, exhortations, and revelations of Zoroaster. The Prophet exhorts his followers to avoid the evil and choose the good, the kingdom of light rather than that of darkness. (For the theology of the *Gāthās*, see ZOROASTRIANISM.) These *Gāthās* are written in metre, and their language is more archaic than that used elsewhere in the Avesta. The *Gāthās*, strictly speaking, are five in number, and are arranged according to the metres; they comprise 17 hymns (Ys. 28-34, 43-46, 47-50, 51, 53), and they must have been chanted during the service. In their midst (chap. 35-42) is inserted the so-called *Yasna* of the Seven Chapters (*Haptanghāiti*). This is written in prose, and consists of a number of prayers and ascriptions of praise to Ahura Mazda, or Ormazd, the archangels, the souls of the righteous, the fire, and the earth. Though next in antiquity to the *Gāthās* and in archaic language, it represents a somewhat later and more developed form of the religion which in the *Gāthās* proper was just beginning. The third part (chap. 52, 54-72) of the latter *Yasna* (*saparō yasno*) consists chiefly of praises and offerings of thanksgiving to different divinities.

2. The *Vispered* consists of additions to portions of the *Yasna*, which it resembles in language and in form. It comprises 24 chapters (called *Karde*, literally, 'sections'), and it is about one-seventh as long as the *Yasna*. In the ritual the chapters of the *Vispered* are inserted among those of the *Yasna*. It contains invocations and offerings of homage to 'all the lords' (*vīspē ratavō*); hence the name "Vispered."

3. The *Yashts* (*yešti*, 'worship by praise') consist of 21 hymns of praise and adoration of the divinities, or angels, *Yazatas* (Izads), of the religion. The chief of these are Ardvī-Sūra, the goddess of waters (Yt. 5), the star Tishtrya (Yt. 8), the angel Mithra, the divinity of truth; the Fravashis, or departed souls of the righteous, and the genius of victory, Verethraghna, and of the Kingly Glory (Yt. 19). They are written mainly in metre, have some poetic merit, and they contain much mythological and historical matter that may be illustrated by Firdausi's later Persian epic, the *Shāh-Nāmāh*.

4. The minor texts, *Nyāishes*, *Gāhs*, *Strozahs*, *Afringāns*, consist of brief prayers, praises, or blessings recited daily or on special occasions.

5. The *Vendidad*, or 'law against the daevas, or demons' (*vidāva dāta*), is a priestly code of 22 chapters (*Fargard*), corresponding to the Pentateuch in our Bible. Its parts vary greatly in time and in style of composition. Much of it must be late; some of it even as late, perhaps, as the first or second century of the Christian Era; but much of the material is very old. The first chapter (Farg. I.) is a sort of Avestan Genesis, a dualistic account of creation. Chapter 2 sketches the legend of Yima, the Golden Age, and the coming of a destructive winter, an Iranian flood. Chapter 3 teaches the blessings of agriculture; chapter 4 contains legal matter—breaches of contract, assaults, punishments; chapters 5-12 relate mainly to the impurity from the dead; chapters 13-15 deal chiefly with the

treatment of the dog; chapters 16, 17, and partly 18, are devoted to purification from several sorts of uncleanness. In chapter 10 is found the temptation of Zoroaster and the revelation; chapters 20-22 are chiefly of medical character. In the ritual, the chapters of the *Vendidad* are inserted among the *Gāthās*.

6. Besides the above books, there are a number of fragments, one or two among them from the *Hādihokht Nask*. There are also quotations or passages from missing *Nasks*; likewise glosses and glossaries. Here belong the *Nirangistān*, *Aogemadaŋca*, *Vīstāsh*, *Yāst*, *Frahang-i-oīm*, and other fragments. These are all written in the Avesta language and are parts of a once great collection. In Zoroastrian religious literature, though not written in the Avestan language, must also be included the works in Pahlavi, many of which are translations from the Avesta, or contain old matter from the original scriptures.

From the summary given, it will be seen that our present Avesta is rather a prayer book than a bible. The *Vendidad*, *Vispered*, and *Yasna* were gathered together by the priests for liturgical purposes. It was the duty of the priests to recite the whole of these sacred writings every day, in order to preserve their own purity and to perform the rites of purification or give remission of sins to others. The solemn recitation of the *Vendidad*, *Vispered*, and *Yasna* at the sacrifice might be compared with our church worship. The selections from the *Vendidad* would correspond to the Pentateuch when read; the preparation, consecration, and presentation of the holy water, the Haoma juice, and the offering of the *Yasna* and *Vispered* would answer to our communion service; the metrical parts of the *Yasna* would be hymns; the intoning of the *Gāthās* would somewhat resemble the Lesson and the Gospels, or even the sermon. In the *Khordah Avesta* the great *Yashts* might perhaps be comparable to some of the more epic parts of our Bible; but as being devoted each to some deity and preserving much of the old mythology, they really have hardly a parallel, even in the Apocrypha.

Such, in brief outline, are the contents of our books known as the Avesta to-day; but, as implied above, this is but a remnant of a literature once vastly greater. This we can judge both from internal and from historical evidence. The character of the work itself, in its present form, sufficiently shows that it is a compilation from various sources. This is further supported by the authority of history, if the Parsi tradition, going back to the time of the Sassanids, be trustworthy. Pliny (*Hist. Nat.*, 30, 1, 2) tells of 2,000,000 verses composed by Zoroaster. The Arab historian, Tabari, describes the writings of Zoroaster as committed to 12,000 cowhides (parchments); other Arabic references by Masudi, and Syriac allusions to an Avesta, which must have been extensive, have been noted above. The Parsi tradition on the subject is contained in the *Rivāyats*, and in a Pahlavi book, the *Dēnkart*. The *Dēnkart* (bk. iii) describes two complete copies of the Avesta. These each comprise 21 *Nasks*, or *Nosks* ('books'). The one deposited in the archives at Persepolis perished in the flames when Alexander burned the palace in his invasion of Iran. The other copy, it is implied, fell into the hands of the Greeks and by them was translated into the Greek language. From that time the scriptures, like the religion under the Græco-Parthian sway, lived on, partly

in scattered writings and in the memories of the priests, for nearly 500 years.

The first attempt again to collect these writings seems to have been begun under the reign of the last Arsacidæ, just preceding the Sassanian dynasty. Pahlavi tradition, preserved in a proclamation of King Khōsrū Anushirvan, or Chosroes I (531-579 A.D.), says it was under King Valkash that the collection was begun of the sacred writings, as far as they had escaped the ravages of Alexander or were preserved by oral tradition. The Sassanian dynasty (226 A.D.) next came to the throne. This house were genuine Zoroastrians and warm supporters of the faith, and they brought back the old religion and raised it to a height it had hardly reached even in its palmiest days. The first Sassanian monarchs, Artakshīr Pāpākān (Ardashīr Bābagān, 226-241) and his son, Shāhpūhr I, or Sapor (c.241-272), eagerly continued the gathering of the religious writings, and the Avesta again became the sacred book of Iran. Under Shāhpūhr II (c.309-380) the final revision of the Avesta texts was made by Atīrpāt Mārāspend, and then the King proclaimed these as canonical, and fixed the number of the Nasks, or books.

Of these Nasks, 21 were counted, and a description of them, as noted, is found in the Rivīyats and in the Dēnkart; each received a name corresponding to one of the 21 words in the Ahuna Vairya (Honovar), the most sacred prayer of the Parsis. Three groups or classes, moreover, were recognized in subdividing these 21 books: First, the *Gāthā* or *Gāsān* group, a theological series; second, the group of the law, *Dāt*; and third, a miscellaneous class, *Hadha-Māthra*, partly metaphysical. Each of these Nasks contained both Avesta and Zend—i.e., original scripture and commentary. This tradition is too important to be idly rejected. Its contents give an idea of what may have been the original extent and scope of the books of the Avesta. The subjects said to have been treated in the 21 Nasks may practically be described, in brief, as follows: Nask 1 (22 sections), on virtue and piety; 2 (likewise 22 sections), religious observance; 3 (21 sections), the Mazdayasnian religion and its teachings; 4 (32 sections), this world and the next, the resurrection and the judgment; 5 (35 sections), astronomy; 6 (22 sections), ritual performances and the merit accruing; 7 (50 sections before Alexander, 13 then remaining), chiefly political and social in its nature; 8 (60 sections before Alexander, 12 remaining), legal; 9 (60 sections before Alexander, 15 preserved), mainly religious wisdom and advice; 11 (60 sections before Alexander, 6 preserved), religion and its practical relations to man; 12 (22 sections), physical truths and spiritual regeneration; 13 (60 sections), virtuous actions, and a sketch of Zoroaster's infancy; 14 (17 sections), on Ormazd and the Archangels; 15 (54), justice in business and in weights and measures, the path of righteousness; 16 (65 sections), on next-of-kin marriage, a tenet of the faith; 17 (64 sections), future punishments, astrology; 18 (52 sections), justice in exercising authority, on the resurrection, and on the annihilation of evil; 19, the Vidēvdād, or Vendidad (22 sections), on pollution and its purification; 20 (30 sections), on goodness; 21 (33 sections), praise of Ormazd and the Archangels.

During the five centuries after the ravages of

Alexander much, doubtless, had been lost, much forgotten. The Parsi tradition acknowledges this itself when it says above, for example, that the seventh Nask consisted originally of 50 sections, but only 13 remained "after the accursed Iskander [Alexander]." So says the Dēnkart and so the Rivīyats. Like statements of loss are made of the eighth, ninth, tenth, eleventh Nasks. The loss in the five centuries from the invasion of Alexander till the time of the Sassanian dynasty was but small in comparison with the decay that overtook the scriptures from the Sassanian times till our day. The Mohammedan invasion and the inroads made by the Koran proved far more destructive. The persecuted people lost or neglected many portions of their sacred scriptures. Of the 21 Nasks that were recognized in Sassanian times as surviving from the original Avesta, a single Nask—the nineteenth, the Vendidad—has come down to us in its full form. Even this shows evidence of having been patched up and pieced together. We can, furthermore, probably identify our present book of the Yasna and Vispered with the Staot Yasht (*staota yesnya*), or Yasht (*yasnya*), as it is also called. The two fragments, Yt. 21 and 22 (as printed in Westergaard's edition) and Yt. 11, in its first form, are recognized by the MSS. as taken from the twentieth, or Hādhōkht Nask. The Nirangistān, a Pahlavi work, contains extensive Avestan quotations, which are believed to have been taken from the Hūspāram, or seventeenth Nask. Numerous quotations in Pahlavi works contain translations from old Avestan passages. The Pahlavi work, Shāyast-lā-Shāyast, quotes briefly from no less than 13 of the lost Nasks; the Būndahishn and other Pahlavi books give translations of selections, the original Avesta text of which is lost. Grouping together all the Avesta texts, we may roughly calculate that about two-thirds of the total scriptures have disappeared since Sassanian times.

The present form of the Avesta belongs to the Sassanian period. Internal evidence shows that it is made up of parts most varied in age and character. This bears witness to the statement that during that period the texts, so far as they had survived the ravages of Alexander, and defied the corrupting influence of time, were gathered together, compiled, and edited. The character of the texts, when critically studied, shows the method that must have been adopted. According to the record of Khōsrū Anushirvan (531-579 A.D.), referred to above, King Valkash ordered that all the writings which might have survived should be searched for, and that all the priests who preserved the traditions orally should contribute their share to restoring the original Avesta. These texts, as collected, were recited under successive rulers, until, under Shāhpūhr II (c.309-380 A.D.), the final redaction was made. It is manifest that the editors used the old texts as far as possible; sometimes they patched up defective parts by inserting other texts; occasionally they may have added or composed passages to join these or to complete some missing portion. In this respect the textual criticism by means of metrical restoration is most instructive. Almost all the oldest portions of the texts are found to be metrical; the later, or inserted portions, are, as a rule, but not always, written in prose. The grammatical test is also useful; the youngest portions generally show a decay of clear grammatical knowledge. The metrical Gāthās in this respect are remarkably pure.

They are, of course, the oldest portion of the text, dating from Zoroaster himself, despite the view of Darmesteter, who wished to bring the date of their completion down to the first Christian century. The longer Yashts, and the metrical portions of the Yasna, contain much that is very old; in point of time these parts would probably fall but a few centuries later than the Gāthās. The Vendidad in this respect is most incongruous. Some parts of it are doubtless of great antiquity, though corrupted in form; other parts of it, like the younger portions also of the Yashts, may be quite late. The same is true of formulaic passages throughout the whole of the Avesta, and of some of the ceremonial or ritual selections in the Vispered and Nyāishes, etc. Roughly speaking, the chronological order of the texts would be somewhat as follows: I. Gāthās (Ys. 28-53), including (II.) the Yasna Haptanghaiti (Ys. 35-42), and some other compositions, like Ys. 12; Ys. 58 in the Gāthā dialect. III. Metrical Yasna and Yashts, Ys. 9-11; Ys. 57, 62, 65; Yt. 5, 8, 9, 10, 14, 15, 17, 19; portions of Vd. 2, 3, 4, 5, 18, 19, and scattered verses in the Vispered and Afringāns, etc. In such cases it is generally, but not always, easy to discover, by style and language, where old material failed and the hand of the redactor came in with stupid or prosaic additions. Considerable portions of our present Avesta, especially the entire Gāthās, we may regard as coming directly from Zoroaster himself; still, additions from time to time must have been made to the sacred canon from his time on till the invasion of Alexander. The so-called copy of the Zoroastrian Bible, which it is claimed was destroyed by that invader, doubtless contained much that was not directly from the founder of the faith, but was composed by his apostles and later followers. The Parsis, however, generally regard the whole work as coming directly from Zoroaster; this is a claim that even the Avesta itself hardly makes. The Gāthās, however, undoubtedly came directly from the Prophet; the Avesta itself always speaks of them as "holy," and especially calls them the "five Gāthās of Zoroaster." We may fairly regard many other portions of the Avesta as direct elaborations of the great teacher's doctrines, just as the Evangelists have elaborated for us portions of the teachings of Christ.

In regard to the locality in which we are to seek the source of the Avesta and the cradle of the religion, opinions have been divided. Some scholars would place it in the west, in Media; others would still maintain that we are to look to the east of Iran, to Bactria, as its source; or again to Afghanistan or Khorassan for the home of the Avestan language. Each of these different views probably has some right on its side, and we shall perhaps not go far astray if we regard the Avesta as coming partly from the east and partly from the west. We know that a number of its scenes may be placed in the east or southeast of Iran; but other scenes are best ascribed to the west, where Zoroaster first appeared. On the question of his original home, see ZOROASTER. The language itself of the texts, as used in the church, became a religious language, precisely as did Latin, and therefore was not confined to any place or time. We may regard the Avesta as having been worked upon from Zoroaster's day down to the time of the Sassanian redaction.

The Pahlavi Version of the Avesta.—To the period of the Sassanian editing of the texts be-

longs the Pahlavi translation and interpretation of the Avesta. At the date when the texts were compiled and edited, the general knowledge of the language of the Avesta and the understanding of the sacred texts was far from perfect. The preparation of a translation or version became necessary. Accordingly, the great body of the texts was rendered into Pahlavi, the language used by Persia at the time of the Parthian Arsacids and the Sassanids. The Pahlavi version and interpretation of the Yasna, Vispered, and Vendidad, each entire, with some portions of the other texts, has been preserved. We have not yet so thorough an understanding of the Pahlavi version of the old texts as might be wished; but as our knowledge of this translation increases, we shall see more and more its importance. Owing to the somewhat imperfect knowledge of the Avestan texts at the time when the version was made, and owing to the unskillful and peculiar method in which the Pahlavi translation is made, it abounds in numerous errors and inaccuracies. It is often, however, of the greatest value in interpreting allusions, and particularly in giving hints for the meanings of obscure words, and in such matters is our best and only guide. When more fully understood and used in connection with the "comparative method," referring to the Sanskrit, in interpreting the sacred texts, the "traditional method" or native explanation is destined to win great results. The "traditional" and the "comparative" methods must go hand in hand.

Manuscripts of the Avesta.—The oldest manuscript that we possess dates from the middle of the thirteenth century. From that date onward we have a considerable number of codices still extant. They come to us from India and from Yezd and Kerman, in Persia. The Parsi priests, especially the Dasturs, Dr. Jamaspji Minocheherji, and Peshotan Behramji, and their friends have shown princely generosity in aiding western editors by putting valuable MSS. in their possession. It is thus that it was possible for the new edition of the Avesta texts, by Professor Geldner, of Berlin, to be presented in so critical a manner.

The importance of the Avesta lies not alone in the field of philology, ethnology, and early literature, but also in the investigation of comparative religion. Resemblances to Christianity in its teachings become significant when we consider the close contact between the Jews and the Persians during the Babylonian Captivity.

Language of the Avesta.—The language in which the Avesta is written may be best termed *Avestan*, or simply *Avesta*. The designation *Avesta* for the language, as well as the book, is in keeping with the Pahlavi *Avistāk*, which is used both of the tongue and of the scriptures. The term *Avestan*, both for the language and as an adjective, is to be in some respects preferred, in order to distinguish the speech from the work itself. The term *Zend* for the language, as noted above, is a misnomer. The designation *Old Bactrian*, sometimes used for this tongue, has little to recommend it. The language of the Avesta belongs to the Iranian group. With the ancient Persian inscriptions it makes up the Old Iranian division. The later Iranian languages, New Persian, Kurdish, Afghan, Ossetish, Baluchi, Pamir, and other dialects, complete the younger division. The intervening Pahlavi with its Pāzand, and Parsi, does not quite complete the link between the divisions. See IRANIAN LANGUAGES.

The alphabet in which the Avesta is written is far younger than the language it presents. The characters are derived from the Sassanian Pahlavi, which was used to write down the oral tradition when the texts were collected and edited under the dynasty of the Sassanids. The writing is read from right to left. What the original Avestan script was we do not know.

Two dialects may be recognized in the Avesta: one, the "Gāthā dialect," or the language of the oldest parts of the Gāthās; the other, "younger Avestan," or the "classical dialect." This latter is the language of the great body of the Avesta. The Gāthā dialect is more archaic, standing in the relation of the Vedic to the classical Sanskrit, or the Homeric Greek to the Attic. Possibly the Gāthā language may also owe some of its peculiarities noticed below to an original difference of locality. The Gāthā dialect was the speech of Zoroaster and his followers. Its grammatical structure is archaic and remarkably pure. The younger Avesta, in its very latest compositions, owing to decay, shows many corruptions and confusions in its inflections. All that is written in metre, however, is old and is generally correct and accurate. Inaccuracies that have crept in we must generally attribute to the carelessness of the scribes. In its forms, as a rule, the Avesta is extremely antique; in general it stands on the same plane as the Vedic Sanskrit, and occasionally, though not often, it shows even more ancient forms.

The language of the Avesta is most closely allied to the Sanskrit, though individually quite distinct from the latter. Together they may be classed as making up an old Indo-Iranian group. Almost any Sanskrit word may be changed at once into its Avestan equivalent, or vice versa, merely by applying certain phonetic laws. As an example may be taken the metrical stanza Ys. 10, 8, in the Avesta:

*yō yabā puθrēm taurunēm
haomēm vandačta mašyō
frā ābyō tanubhyō
haomō vīsāite bačšazai.*

'Whosoever kindly welcomes Haoma, even as a tender stripling, to such person Haoma approaches bringing health'—becomes when rendered word for word in Sanskrit:

*yō yāthā putrām taurunām
sōmam vandāta mārtyah
prā ābhyas tanubhyah
sōmō vīsātē bhēṣajāya.*

In its phonology the Avesta agrees with the Sanskrit in its vowels, but the Avesta shows a greater variety in its *e*- and *o*- sounds instead of *a*. Final vowels, except *ō*, are shortened as a rule. The Skt. diphthong *ē* appears in Av. as *aē*, *ōi*, *ē* (final); Skt. *ō* as Av. *ao*, *ēu*, *ō* (final). A striking peculiarity in Av. is the introduction of epenthetic vowels and help sounds, giving rise to improper diphthongs, *bavaiti*, 'he becomes'=Skt. *bhāvati*; Av. *haurva-*, 'whole'=Skt. *sārva-*; Av. *vakhadhra-*, 'word'=Skt. *vaktra-*; Av. *hvara-*; 'sun'=Skt. *svā-*. The Skt. voiceless stops, *k*, *t*, *p*, generally become spirants, *kh*, *th*, *ph* (i.e., *x*, *θ*, *f*) in Av. before consonants. The original voiced aspirates *gh*, *dh*, *bh*, became in Av. simply voiced stops *g*, *b*, *d*. They are so preserved in the old Gāthā dialect; the younger dialect commonly resolves the latter before consonants and between vowels into spirants *y*, *s*, *w*. The sibi-

lant *s* in Skt. initial becomes Av. *h*, as in Greek. Thus, Av. *hapta*, 'seven'=Skt. *saptā*. When internal, Skt. *s* may also appear as *ṣh*. Thus Av. *vaṣhana-*, 'vesture'=Skt. *vāsana-*. Final *-as* of Skt. appears regularly as *-ō*. Thus Av. *aspō*, 'horse'=Skt. *āśvas*. Sanskrit *rt* is often represented by *ṣ*. Thus, Av. *aṣm*, 'righteousness'=Skt. *ṛtām*.

The Gāthā dialect regularly lengthens all final vowels. It frequently inserts the anaptyctic vowels: G Av. *forā* Y Av., *frā*, 'forth'=Skt. *pra*. Original *ns* appears as *ng*; G Av. *daēvāng* (acc. pl.), Y Av. *daēvān*, 'denoms'=Skt. *dēvān*.

In inflection the Avesta shows nearly the richness of the Vedic Sanskrit. There are three genders—masculine, neuter, feminine; likewise three numbers—singular, dual, plural. The dual is not extensively used. There are eight well-developed cases of the noun and the adjective; the normal endings are: *Sing.*, *Nom.*, *s*; *Acc.*, *-m*; *Instr.*, *-ā*; *Dat.* *ē*; *Abl.* *-at*; *Gen.* *-ō* (*-as*); *Loc.* *-i*; *Voc.* —. *Dual*, *Nom.*, *Acc.*, *Voc.* *-ā*; *Instr.*, *Dat.*, *Abl.* *-byā*; *Gen.* *ās*; *Loc.* *-ā*, *-yō*. *Pl. Nom.* *Voc.* *-ō* (*-as*), *-ā*; *Acc.* *-ō* (*-as*), *-ā*; *Instr.* *bī*; *Dat.* *-byo* (*byas*); *Gen.* *am*; *Loc.* *-su*, *-hu*, *-šva*. The classes of declension agree exactly with the Sanskrit; the method of forming comparison of adjectives likewise corresponds. The numerals answer to Skt. forms, except Av. *aēra-*, 'one,' but Skt. *eka-*, and Av. *baēvar*, '10,000,' but Skt. *ayūta*. The Av. pronouns closely resemble the Skt., but show also individual peculiarities. Noteworthy is the remote demonstrative Av. *ava*, *hāo*, 'that, yonder,' contrasted with Skt. *amū*, *asau*. The verbal system in Av. and in Skt. is in general identical. The roots are chiefly monosyllabic and are subject to similar modifications in both. In voice, mode, and tense, and in their conjugation system the two languages quite agree. The endings show equal antiquity with the Sanskrit. The primary active endings in Av. are: *Sing.* 1, *-mi*, 2, *-hi*, 3, *-ti*; *Dual*, 1, *-vahi*, 3, *-tō*, *-thō*; *Pl.* 1, *-mahi*, 2, *-tha*, 3, *-nti*. The Av. possesses like facility with the Skt. in forming words by means of prefixes, and by adding suffixes of primary and secondary derivation. The same classes or compounds may be recognized in both tongues. The rules of Sandhi, or joining together of words in a sentence, so universal in Skt. are almost wanting in Avestan. The Avesta separates every word, the vowels are fully expressed as in Greek, etc., by individual letters. No diacritical points or accents are written in the texts. The metres in which the Gāthās are composed have analogues in the Veda. Almost all the metrical parts of the younger Avesta are in 8-syllable lines. The syntax, however, differs in a number of points from the Sanskrit, and shows certain marked individualities, especially in the later portions.

The best information in general will be found in the contributions by various scholars in Geiger and Kuhn, *Grundriss der iranischen Philologie* (Strassburg, 1895–1904). A new and complete edition of the Avesta texts has been published by Geldner (Stuttgart, 1885–96). The first full editions were by Westergaard (Copenhagen, 1852–54), and by Spiegel (Vienna, 1853–58). The latter is complete only for the Avesta in its narrower sense (Ys. Vsp. Vd.), the Khordah Avesta being omitted; but it gives the Pahlavi version.—Translations: Best for reference is the translation by Darmesteter and Mills in the *Sacred Books of the East* (3 vols., Oxford, 1880

et seq.), and especially the French version by Darmesteter, *Le Zend-Avesta* (Paris, 1892-93); F. Wolff, *Avesta, die heiligen Bücher der Parsen* (Strassburg, 1910).—Lexicons and Grammars: F. Justi, *Handbuch der Zendsprache* (Leipzig, 1864); De Harlez, *Manuel de l'Avesta* (Paris, 1882); Kanga, *Avesta Dictionary* (Bombay, 1899); Bartholomæ, *Altiranisches Wörterbuch* (Strassburg, 1904); Schuyler, *Index of Avestan Fragments* (New York, 1902); Bartholomæ, in *Grundriss der iranischen Philologie* (Strassburg, 1895); Jackson, *Avesta Grammar* (Stuttgart, 1891); Geldner, *Metrik der jüngeren Avesta* (Tübingen, 1877); Reichelt, *Avestisches Elementarbuch* (Stuttgart, 1911).—Readers: Jackson, *Avesta Reader* (Stuttgart, 1893); Reichelt, *Avesta Reader* (Strassburg, 1911).—Literature and Antiquities: Anquetil-Duperron, *Zend-Avesta, Ouvrage de Zoroastre*, etc. (Paris, 1771); Haug, *Essays on the Parsis*, new ed., by E. W. West (London, 1884). See also the introduction of De Harlez, *Avesta* (Paris, 1881); F. Spiegel, *Iranische Altertumskunde* (Leipzig, 1871-78); Sanjama-Geiger, *Civilization of Eastern Iran* (London, 1886); *The Spiegel Memorial Volume*, ed. by J. J. Modi (Bombay, 1908).

AVEYRON, a'vâ'rôn'. A department in the south of France, named after the river which traverses it from east to west (Map: France, S., G 4). It has an area of 3386 square miles and is one of the most mountainous parts of France, being situated between the highlands of Auvergne and the Cévennes. The principal rivers, of which the Lot alone is navigable, flow through the department from east to west. The climate is healthful, but cold and raw, especially in the north and east. North of the Lot, only rye and oats are grown; in the west grape culture is carried on. Coal is mined at Aubin and Milau, and slate and marble are quarried. Other leading industries include the manufacture of woolen goods, leather, and machinery. Pop., 1896, 386,393; 1901, 382,074; 1906, 377,299; 1911, 369,448. Capital, Rodez.

AVEYRON. A river in the south of France, rising near Séverac-le-Château and flowing west across the department of Aveyron. It receives the Viour and enters the Tarn below Montauban, in the department of Tarn-et-Garonne. Entire length, 155 miles; navigable for the last 30.

AVEZAC-MACAYA, a'v'-zâk' mâ'kî'yâ', MARIE AMAND PASCAL D' (1799-1875). A French geographer. He was born at Bagnères de Bigorre and studied law, but after the appearance of his *Essais historiques sur le Bigorre* (2 vols., Bagnères, 1823), devoted himself entirely to geography. He was secretary of the Geographical Society of Paris from 1833 to 1835, and afterward became president of that body, being five times reëlected to the office. The following are his principal works: *Etudes de géographie critique sur une partie de l'Afrique septentrionale* (1836); *Esquisse générale de l'Afrique* (1837); *Description et histoire de l'Afrique ancienne* (1845); *Les voyages d'Américo Vespuce* (1860); *Le livre de Fernand Colombe* (1873).

AVEZZANA, ii'vêt-sii'nâ, GIUSEPPE (1789-1879). An Italian patriot and politician, born at Chieri, in Piedmont. He was an officer in the Piedmontese army, and for participation in the rising of 1821 was condemned to death, but escaped to Spain, where he fought for the Constitutional party. He was finally made prisoner by

the French and deported to Cayenne. He succeeded in making his way to New Orleans and settled at Tampico, in Mexico, where he engaged in trade and took part in the political strife of the times. He received from Santa Anna the command in the three eastern states. Coming to the United States in 1834, he married, engaged in mercantile business with great success, but returned to Italy at the outbreak of the Revolution, in 1848. He was Minister of War of the short-lived Roman Republic, in 1849. After the taking of Rome he went to America. He joined Garibaldi in the Sicilian expedition and was a radical deputy in the new Italian Parliament. At the time of his death he was the active leader of the Irredentists. He died at Rome, Dec. 25, 1879.

AVEZZANO, ii'vêt-sii'nô. A city in the province of Aquila, south Italy, 67 miles east of Rome (Map: Italy, H 5). It has a castle belonging to the Barberini. In the office of the estate of Prince Torlonia is a collection of objects found in the Lago di Fucino, the draining of which was attempted in ancient times, but accomplished only in 1875. When the Marsi complained of its frequent overflow, Cæsar elaborated a plan for constructing a channel, 3½ miles long, through Mount Salviano to the Liris (or Garigliano), which, at Capistrello, is 80 feet below the bottom of the lake. At one point the channel was 300 feet underground. The plan was imperfectly executed under Claudius, and improvements were made under Trajan and Hadrian; but in the Middle Ages Frederick II tried in vain to reopen the blocked-up passage. Finally Prince Torlonia, after an expenditure of over \$8,000,000, succeeded where his imperial predecessors had failed, and now a road 35 miles long runs around the 42,000 acres of reclaimed ground, which are cultivated in modern fashion. Vine culture and farming are the principal occupations of the inhabitants of the district. Pop. (commune), 1881, 7380; 1901, 9442; 1911, 11,279.

A'VIA'NUS, FLAVIUS. A Roman fabulist, of the end, perhaps, of the fourth century A.D. He published a collection of 42 Æsopic fables in elegiac verse. These were translated into English by Caxton, and published with his *Subtyle Histories and Fables of Esope* (1483). There are editions by Lachmann (1845) and Ellis (1887). Consult L. Müller, *De Phædri et Aviani Fabulis* (Leipzig, 1875).

A'VIARY. A suitable inclosure, within which living birds may be kept, usually out of doors, in a state of comparative freedom. An aviary is really only a large bird cage and is often seen in warm countries, especially in southeastern Europe, and many exist in England. In the United States, however, the extremes of climate make an outdoor aviary less practical for most private owners, and very few exist. They are increasing, however, and in the vicinity of our larger eastern cities many are erected each year. Indoor rooms devoted to birds are in effect simply large bird cages, and the care of such an aviary is essentially like that of a bird-cage; but care should be taken not to put together birds that are not inclined to dwell peaceably with the others. The largest aviary known is the flying cage in the park of the Zoological Society of New York. It is a wire cage, supported by a steel-pipe frame, in the form of a Gothic arch, situated among trees, several of which are growing within it; and it measures

153 feet long, 72 feet wide, and 55 feet high. It is the home of herons, gulls, pelicans, and similar large forms, together with many smaller species in summer. Similar smaller aviaries exist for other classes of birds in this, and in the zoological gardens of Europe and India, and by the natural conditions and freedom for exercise they afford, have enabled many species to be kept in health and beauty which otherwise would hardly survive continual captivity, and certainly would not breed there as they constantly do in these huge cages.

The chief dangers which must be guarded against in the establishment of an aviary in the United States are heat, cold, rain, mice, owls, and cats. Abundant shade bushes and especially evergreens on the north side will regulate the extremes of sun and bitter winds and will enable the birds to avoid direct drenching rains. The size of the mesh should be as small as possible to keep out vermin, and if the cage cannot be covered at night, all perches should be placed near the centre and as far as possible away from the wire, to enable the birds to avoid direct attack from cats and owls. See CAGE BIRDS and bibliography, and the two monthly periodicals published in England, *The Avicultural Magazine* and *Bird Notes*.

AVIATION. See AERONAUTICS.

AVICEBRÓN, ä-vé'thá-brón', SALOMON BEN GABRIOL (c.1020-1070). A Jewish poet and philosopher, born at Malaga and educated at Saragossa, where, in 1045, he published a treatise on the correction of customs. His *Fons Vita*, or *Sapientia*, written in Arabic, was known to the scholastics in the Latin translation of Gondisalvi, and affected the teaching of Erigena, Amaury de Bène, David de Dinan, Roger Bacon, and Giordano Bruno. It was considered the work of a Christian philosopher, and as such his theory of the universality of matter there presented was ably upheld by Duns Scotus, but was severely attacked by Albertus Magnus and Thomas Aquinas. Avicebron belonged to the Jewish school of Jehuda Halevi and Kalis la Sarde, and some of his poems are preserved in the Jewish liturgy. After an unhappy life of wandering, he died at Valencia. Consult Guttman, *Die Philosophie des Salomon ibn Gabirol* (Göttingen, 1889); Stephen S. Wise, *The Improvement of the Moral Qualities: An Ethical Treatise of the Eleventh Century by Solomon ibn Gabirol* (New York, 1901); M. Wittmann, *Zur Stellung Avencebrol's im Entwicklungsgang der arabischen Philosophie* (Münster, 1905).

AVICENNA (ABU ALI AL HUSAIN IBN ABDALLAH IBN SINA (980-c.1037). A great Arabic physician and philosopher. He was born at Efsenc, a village in the neighborhood of Bokhara, in the month of Safar, in 980. His father held office under the Samanid ruler, Nuh ibn Manzur. Avicenna studied medicine and philosophy at Bokhara, and on account of a cure he received a post in court at the early age of 17. At his father's death Avicenna went to Nasa, Tos, Dahistan, Gurgan, Rai, and Hamadan. At this latter place he gained the favor of Shams al daula and was made vizier; but the opposition of the soldiery compelled him to relinquish this position. Under the successor of Shams al daula, Taga al daula, Avicenna was imprisoned in a fortress, but he managed to escape and fled to Ispahan. Here he spent the remainder of his days as court physician to Ala al daula, whom

he accompanied even on his military campaigns. Avicenna led a very arduous life. Although he traveled a great deal, he still found time to write. He died about 1037.

Avicenna is of importance, not only in the history of Arabic medicine and philosophy, but also in the general history of medicine and philosophy. His great work, *Kanun fi'l Tibb*, a system of medicine, based on the Arabic translation of the Greek medical works, long held first place both in the Orient and Occident as a text-book in medicine. In the Orient it is still very highly regarded. The work is characterized by systematic classification, sometimes even running to excess. A Hebrew version appeared in 1491. The Arabic text was published in 1593, at Rome, and again at Bulak. A Latin translation by Cremonensis appeared in Venice in 1595. In philosophy Avicenna teaches Aristotelianism, tinged, however, with Neo-Platonic ideas. He tries to reconcile philosophy and religion, an attempt often met with in the later Arabic and Jewish philosophers. His metaphysics appeared in a Latin translation in 1493; his logic in 1495, Venice; 1556, Basel. For an extended bibliography consult Brockelmann, *Geschichte der arabischen Litteratur* (Weimar, 1899); Carra de Vaux, *Avicenne*, vol. 1, pp. 452 ff. (Paris, 1900); Wistenfeld, *Geschichte der arabischen Aerzte* (1840); Ibn Khallikan, *Bibliographical Dictionary* (trans. by De Stone, 1842).

AVICULIDÆ. A family of large, thin, pseudolamellibranchiate bivalve mollusks, typified by the genus *Avicula*, the wing shells, so called because of their expansive method of growth. The family is numerous in all warm seas and goes back to Devonian times. It includes the pearl oysters and many queerly shaped forms, both fossil and recent, such as the hammer oysters and pinnae. See WING SHELL and Plate of ABALONE, ETC.

AVIENUS, ä-vi-ē-nūs, RUFUS FESTUS. A Roman poet and official, who flourished during the latter half of the fourth century A.D. He is believed to have been proconsul, first in Africa (366), and afterward in Achaia (372), and was a pagan in religion. The works which have come down to us under his name are *Descriptio Orbis Terrarum*, which is a Latin paraphrase, in hexameters, of the *Periegesis* of Dionysius, a translation, also in hexameters, of the *Phænomena* and *Prognostica* of Aratus, and a portion, amounting to 702 lines, of a poem called *Ora Maritima*. The last-named piece was a description, in Iambic trimeters, of the coasts of the Mediterranean, Caspian, and Black Seas. His style is superior to that of contemporary writers. The best edition of Avienus is that of Holder (Innsbruck, 1887).

AVIGLIANO, ä-vé-lyä'nò. A city in the province of Potenza, south Italy, on the Foggia-Potenza Railway, 65 miles south of Foggia (Map: Italy, K 7). It stands on a mountain, is surrounded by fir forests, and has marble quarries and mineral springs. Dynamite is manufactured. Pop., 1881, 13,000; 1901, 18,313; 1911, 17,413.

AVIGNON, ä-vé-nyôn' (Lat. *Avonio*, either from *avena*, oats, or from Celt. *avon*, water, referring to the rivers surrounding it). A French town and the seat of an archbishopric in the department of Vaucluse, of which it is the capital. It is situated on the left bank of the Rhône, on a lofty plateau, at a distance of 30

miles from the Mediterranean (Map: France, S., J 5). It presents a most striking appearance upon this wall-girdled height, on the summit of which rises the cathedral, and the impressive mass of the old papal palace; but the streets, as in most walled towns, are crooked, narrow, and often steep; the houses mean and dirty. There are, however, two fine promenades and some pleasant squares. The famous old bridge of Avignon still exists in part. The principal buildings are the venerable cathedral, Notre Dame des Doms, a grand and gloomy Romanesque structure, dating mainly from the time of the Crusades; the papal palace, a Gothic structure of the fourteenth century, with six towers, used for nearly a century as barracks, now a museum; the conservatory of music; the ancient archbishop's palace, now used as a seminary; the Musée Calvet, which contains Roman and other antiquities; and a picture gallery which is one of the best in the provinces. The public library contains 140,000 printed volumes and 32,000 manuscripts, and autographs. Avignon has a lyceum, two theological seminaries, the famous Académie de Vaucluse, and a botanical garden. The industries of the town comprise cotton spinning, paper making, distilling, tanning, the manufacture of agricultural implements, tin, copper, and hardware, chemicals, oil, velvet, taffeta, etc., and there is considerable trade in silk, wine, brandy, olive oil, truffles, grain, and flour; in fact, Avignon is the central wheat market of Provence. Pop., 1906, 48,312; 1911, 49,314. Avignon was a flourishing city under the Romans. Early in the Middle Ages it was part of the Burgundian Kingdom, upon whose dissolution it became a republic or commune, ruled by consuls. The city was the seat of the papal court, from 1309, when Clement V took up his residence there, until 1376, when Gregory XI left it to make Rome once more the papal metropolis. In the period immediately following, the antipopes, Clement VII and Benedict XIII, lived there. The city was the property of the papal see from 1348 to 1791, when it was seized by France. Petrarch, who lived there several years, first saw Laura at Avignon, in 1326. It is the chief seat of the Felbrige Brotherhood, organized about the middle of the nineteenth century to promote the revival of Provençal language and literature. Consult: Müntz, "La cour pontificale d'Avignon," in vol. xxii, *Revue des questions historiques* (Paris, 1899); Peujon, *Avignon; La ville et le palais des papes* (Avignon, 1905); O'Key, *Story of Avignon* (London, 1911).

ÁVILA, á'vê-là. A city of Spain, capital of the province of Avila and seat of a bishopric (suffragan to the arch-see of Valladolid), in Old Castile, 53 miles northwest of Madrid (Map: Spain, C 2), on the Adaja River. It stands on the slope of the bleak Castilian hills, surrounded by gray granite walls and castellated towers in perfect preservation, and is one of the most remarkable inland fortress cities in Spain. The walls are 40 feet high and 13 feet thick. There are 86 towers and 9 gates. The city is built largely of granite. There is a cathedral (which is one of the architectural glories of Spain), a military school, a seminary, a hospital, and royal woolen yarn factory. Pop., 1900, 11,885; 1910, 12,060. In the fourth century, the city was called Abula. It is the birthplace of St. Teresa, monastic reformer, and founder of the barefooted Carmelites. Outside the ancient walls, but within the precincts of the city, are the beauti-

ful and interesting churches of Santo Tomás (with its superb marble monument to Prince John, only son of Ferdinand and Isabella, who died in 1497), and San Vicente (with its highly carved marble sarcophagus of the thirteenth century, which serves as a tomb for St. Vincent and his sisters, St. Sabina and St. Christeta, all of whom were martyred by having their heads cut off). Consult: Mélida, "Ávila: Iglesias ojiuales," in vol. cxxi, *La España moderna* (Madrid, 1899); Wilson, "Ávila Cathedral," in vol. lxxxiii, *The Churchman* (New York, 1901); L. Ariz, *Historia de las grandezas de la ciudad de Avila* (Alcalá de Henares, 1607); Picatoste, *Tradiciones de Avila* (Madrid, 1888).

ÁVILA, GIL GONZÁLEZ DE. See GONZÁLEZ DÁVILA, GIL.

ÁVILA Y ZÚÑIGA, á'vê-là é thoo'nyé-gá, LUIS DE (1500-64). A Spanish diplomatist and chronicler of the wars of Charles V, born at Plasencia, in Extremadura. He seems to have stood high in favor with the Emperor, whom he accompanied on his expeditions to Africa and on his campaign against the Schmalkald League, and who intrusted him with embassies to the Popes Paul IV and Pius IV. His *Comentarios de la guerra de Alemania, hecho por Carlos V en 1546 y 1547* (written after Charles V had retired to Yuste, where Ávila frequently visited him from his own retirement at Plasencia) is valuable as the record of an observant eyewitness; but its evident spirit of partiality justifies the Emperor's own comment: "Alexander's achievements surpass mine, but he was less lucky in his chronicler." The latest edition is that of Madrid, 1852. The work has been translated into several languages.

AVILÉS, á'vê-lás'. A seaport of some importance in the province of Oviedo, Spain (Map: Spain, C 1). It is situated 19 miles north by west of the city of Oviedo, at the mouth of the chief branch of the Río de Avilés, which is here crossed by a noteworthy bridge, and is navigable at high water for vessels of the largest size. It has several good squares, handsome buildings, and gardens. In addition to the castle, the two churches, three monasteries, and a hospital, there is a naval academy. Pottery and weaving are the industries of the town. There are copper mines in the vicinity, and a considerable trade is carried on in articles of copper, as well as in coal, which is obtained not far from the town. Pop., 1900, 12,763; 1910, 13,661. The *Fuero de Avilés* (second half of the twelfth century) is the oldest city charter to be drafted in the vernacular. Its exact date is in dispute. Consult A. Fernández-Guerra y Orbe, *Fuero de Avilés* (text and discourse, Madrid, 1865), and for the opposite side, J. Arias de Miranda, *Refutación al discurso del . . . Sr. D. Aureliano Fernández-Guerra y Orbe* (Madrid, 1867). Consult also Baist in Gröber's *Grundriss der romanischen Philologie*, vol. ii, 2, p. 387 (Strassburg, 1897). The city took a prominent part in the War of Independence and in the first Civil War.

AVISON, CHARLES (1710-70). An English composer. He was born at Newcastle, England, where, after having studied in Italy, he became organist in 1736. He wrote an *Essay on Musical Expression* (1752), in which he ranked the French and Italian composers above the Germans, and which created a considerable stir in the musical world of the time. He composed

sets of concertos and sonatas which were very popular. He figures in Browning's *Parleyings with Certain People*.

AVITUS, ALCIMUS ECDICIUS (?-c.525). A French ecclesiastic. He became Bishop of Vienne in Burgundy and was of very considerable prominence in the Church at that time. At a conference held in 499 between Arian and Roman theologians, he was the chief representative of the Romans, and by his influence there, together with his subsequent conversion of King Sigismund of Burgundy, did much to check the spread of Arianism in that kingdom and throughout Gaul. He also presided in 517 at the Synod of Epaone, which established 40 canons in definition of the relations of the Church in Burgundy toward the civil power and more especially toward heretics. Of his extant writings, comprising homilies, epistles, and poems, the most important is the didactic epic, *De Spiritalis Historiae Gestis* (wrongly known as *De Mundi Principio*). His collected works were edited by Sirmond, *Bibliotheca Maximorum Patrum*, vol. ix (1643). Consult: Binding, *Geschichte des burgundischen Königreichs* (Leipzig, 1868); P. N. Frantz, *Avitus von Vienne als hierarch und politiker* (Greifswald, 1908); Henri Goelzer, *La latin de Saint Avit, évêque de Vienne* (Paris, 1909).

AVIZ, ä-vësh'. An order of knighthood, instituted by Alfonso I of Portugal in the middle of the twelfth century in order to aid in the defense against the Moors. In 1162 the order was organized by the Pope, and soon after the seat was removed to Aviz, which had recently been captured from the Moors and from which it took its present name. From 1213 to 1385 it was practically united with the Order of Calatrava. Later the grand mastership was united with the crown. In 1789 the order was secularized and membership bestowed as a reward of merit either upon natives of the country or foreigners for marked service to Portugal. The order was extended to Brazil in 1823 and has since become recognized as a national order in Brazil. The Emperor was formerly the grand master.

AVLONA. See VALONA.

AVO'CA. A borough in Luzerne Co., Pa., 10 miles northeast of Wilkesbarre, on the Central of New Jersey, the Erie, the Delaware and Hudson, and the Lehigh Valley railroads (Map: Pennsylvania, K 4). It has important coal-mining interests and manufactures silk. Avoca has an opera house, a theatre, and churches of several denominations. Pop., 1900, 3487; 1910, 4634.

AVOCADO, äv'ô-kā'dô, *Sp. pron.* ä'vô-kä'ôb (from Mex. *ahuacatl*), or ALLIGATOR PEAR (*Persea gratissima*). In old times it was known to sailors as "Midshipman's butter." One of a genus of plants of the family Lauraceæ, comprising 100 species or more, all natives of sub-tropical Asia or America. It is a native of the West Indies and Central America and is the only species of this order cultivated for its fruit. The flowers are green, about half an inch across. The leaves are elliptical, narrow toward the base, about 6 inches long. The fruits vary in shape from oblate, through spherical and pyriform, to long bottle-shaped, and in color from light green to dark green, purple, brown, and red. The flesh of the fruit when properly ripened is of the consistency of firm butter and in flavor somewhat rich and nut-

like. The fruit is very unusual in that the flesh has a high fat content, 10 per cent on an average. The water content is 81 per cent, and the carbohydrates 7 per cent. The fuel value is high, 512 calories per pound. In regions where it grows avocado fat is sometimes recovered for industrial uses. It is primarily a salad fruit to be served with salad dressing, but is also used as a dessert with sugar and cream, wine, and lemon or orange juice. In the tropics it is often eaten in soup. It finds a ready sale in the large cities of the United States and is cultivated chiefly in the southern part of Florida, in Hawaii, and in southern California. For illustration, see ALLIGATOR PEAR on ABUTILON Plate.

AVOCET (Fr. *avocette*, Sp. *avoceta*, of unknown origin). A limicoline bird, one of a group of four species. Avocets are united with the stilts in the family Recurvirostridae and are related to the snipe and sandpipers. Avocets are about a foot and a half in length, with long, very slender wading legs, short webbed toes, and remarkably long, thin, and upcurved bill. They frequent marshes and search shallow water with their sensitive beaks for crustaceans, snails, and

BEAK OF AN AVOCET.

similar small prey. The several species dwell in summer in the temperate parts of both the Old and the New World, migrating to the tropics in winter. They form simple nests upon the ground in marshy places and lay four olive or buff eggs, thickly spotted with dark brown. The principal American species (*Recurvirostra americana*) has whitish plumage, with the wings black, and the head, neck, and breast light cinnamon. It is common in the western States and shot as game. Consult Coues, *Birds of the Northwest* (Washington, 1874).

AVOGADRO, ä'vô-gä'drô, AMADEO, CONTE DI QUADREGNA (1776-1856). An Italian physicist. He was born at Turin and became professor of physics there in 1820. He was the author of a large number of scientific memoirs and first published his celebrated rule in the *Journal de Physique*, in a paper entitled "Essai d'une manière de déterminer les masses relatives des molécules élémentaires des corps, et les proportions selon lesquelles elles entrent dans les combinaisons." See AVOGADRO'S RULE.

AVOGADRO'S RULE. One of the fundamental principles of chemistry. It is usually formulated as follows: Under the same conditions of temperature and pressure equal volumes of gases and vapors contain equal numbers of molecules. It may appear strange, at first sight, that an idea of this nature should be incorporated in the very foundation of an exact science like chemistry. For the very conception of matter as made up of molecules is nothing but an hypothesis; and even if this conception is correct, the number of particles in a given mass of matter could of course never be actually counted. The following considerations, however, will show at once the real significance of Avogadro's rule. An immediate consequence of the rule is, that comparing equal volumes of substances in the

gaseous state, as to weight, composition, etc., is the same as comparing single molecules. Following the rule, chemists have therefore adopted as the standard quantity for investigation, not a unit of weight, but a unit of volume, and have for many years now been comparing, not equal weights of substances, but equal volumes. Now, this practice has led to the acquirement of a stupendous amount of purely empirical information that forms a solid part of the science of chemistry, the original rule merely explaining *why* comparing equal volumes should lead to so many excellent results. If, therefore, the atomic hypothesis should sometime be discarded as no longer necessary, the hypothetical form of Avogadro's rule would of course go with it; but its corollary, the expediency of comparing equal volumes of substances, would still remain a great guiding rule in the science of chemistry.

The rule was originally proposed as an addition to the atomic theory, the purpose being to account for a remarkable general fact then recently discovered by Gay Lussac; viz., that when two gases react with each other chemically, their reacting volumes bear to each other a ratio that can be expressed by small integral numbers. Thus, when hydrogen and chlorine unite to form hydrochloric acid, the volumes of the reacting gases are equal, i.e., their ratio is $1 \div 1$. Similarly, equal volumes of hydrochloric-acid gas and ammonia combine to form sal-ammoniac; i.e., the ratio is again $1 \div 1$. In the formation of water from hydrogen and oxygen, these two gases unite in the simple ratio of $2 \div 1$. Gay Lussac's law holds equally good in the case of gaseous products of chemical decomposition and with regard to the ratios of the volume of a gaseous compound to the volumes of its gaseous chemical components. Thus, 3 volumes of hydrogen and 1 volume of nitrogen are produced by the decomposition of 2 volumes of ammonia. This law, examined from the standpoint of the atomic hypothesis, indicates that some very simple relation must exist between the numbers of particles contained in the reacting volumes of gases. For according to that hypothesis all chemical reactions of substances take place really between their particles. The simplest relation that suggests itself to the mind is expressed by Avogadro's rule; viz., that equal volumes of gases contain equal numbers of molecules. If, then, the reacting volumes of hydrogen and chlorine are equal, it is because every single molecule of chlorine reacts with one single molecule of hydrogen. Although it thus formed a plausible explanation of Gay Lussac's law, the idea, when first advanced by Avogadro in 1811 and resuggested by Ampère in 1814, was not accepted by the scientific world. The scanty stock of experimental knowledge of the time did not warrant the incorporation in science of a general theoretical principle of this nature.

The practical importance of the rule is mainly in the fact that it permits of ascertaining the relative weights of molecules ("molecular weights"), these weights being represented, according to the rule, by the relative weights of equal volumes of substance in the gaseous state. The substance with which all other substances are usually compared is hydrogen, to which chemists assign the molecular weight 2, since its molecule is supposed to consist of two atoms of unit atomic weight (the unit is of course

arbitrary and is chosen merely for convenience sake). Comparing equal volumes of hydrogen and oxygen, the latter is found to weigh 16 times as much as the former. The molecular weight of oxygen is, therefore, in accordance with Avogadro's rule, said to be 32. In a similar manner the molecular weight of any other substance in the gaseous state may be ascertained by multiplying the density (i.e., its relative weight with respect to hydrogen) by 2. Thus, the density of ammonia gas being about 8.5, its molecular weight is 17; the density of hydrochloric-acid gas being about 18.25, its molecular weight is 36.5, etc.

Now, equal volumes of ammonia gas and hydrochloric acid combine to form ammonium chloride (sal-ammoniac, NH_4Cl) and nothing else. Both the chlorine of hydrochloric acid and the nitrogen of ammonia represent the smallest relative weights of those elements found in any compound; or, in the language of the atomic theory, hydrochloric acid contains only one atom of chlorine, and ammonia only one atom of nitrogen. Hence, one entire molecule of hydrochloric acid (molecular weight = 36.5) and one entire molecule of ammonia (molecular weight = 17) must be combined in one molecule of ammonium chloride; for otherwise the latter compound could not, as it does, contain both chlorine and nitrogen. Consequently the molecular weight of ammonium chloride could not possibly be less than $17 + 36.5 = 53.5$, and hence its density could not, according to Avogadro's rule, be less than $53.5 \div 2 = 26.75$. When, however, ammonium chloride is heated and its vapor studied experimentally, the density is found to be only about one-half as great. This fact was for a long time regarded as proving that Avogadro's rule is incapable of general application, although in most other cases the molecular weights obtained with the aid of the rule were found to agree thoroughly with the chemical behavior of the compounds. But even in the case of ammonium chloride, the exception was finally shown to be only apparent. Pebal and Than, namely, demonstrated that when ammonium chloride is evaporated, it breaks up into its constituents, ammonia gas and hydrochloric acid, the dissociation naturally causing an increase of volume, and hence a decrease of density. As long as the products remain mixed in a vessel, or are allowed to escape together, it is impossible to prove directly that the vapor is a mixture of ammonia and acid, the reaction with litmus paper being of course neutral. But Pebal and Than proceeded as follows: They divided a glass tube into two parts by a porous partition and heated a lump of ammonium chloride in one part of the tube; the ammonia gas produced, diffusing through the partition more rapidly than the hydrochloric acid, soon filled the other part of the tube and showed the ordinary alkaline reaction with red litmus paper (i.e., turned it blue). The case of ammonium chloride thus changed from an exception into an additional indication of the correctness of Avogadro's rule.

The principal arguments in favor of the rule may be briefly summed up as follows:

1. Avogadro's rule furnishes the chief method of ascertaining the atomic weights of the chemical elements, and there are very strong reasons for believing that the atomic weights thus obtained represent the true numbers characterizing the elements. See PERIODIC LAW.

2. The modern theories of the chemical constitution of compounds could not have come into existence and could not be applied in individual cases, if the molecular and atomic weights to which the rule leads were unknown. Avogadro's rule is at the very foundation of those theories; and hence, conversely, the correctness of the theories, as indicated by the numerous triumphs achieved by them for both pure and applied chemistry, is to be considered as strong proof in favor of the fundamental rule.

3. The strongest argument in favor of Avogadro's rule in its hypothetical form lies in the fact that it follows, by mathematical deduction, from the kinetic theory of gases. (See GASES, PROPERTIES OF.) The correctness of this theory, on the other hand, is strongly indicated by the fact that it also leads to those laws of gases which have long been established experimentally.

Avogadro's rule can evidently hold good only in those cases in which the gases or vapors in question behave very nearly in accordance with the laws characteristic of matter in the perfectly gaseous state; i.e., if at constant temperature the volume varies inversely as the pressure, and if under constant pressure the volume varies as the absolute temperature. For if under equal pressures and temperatures different gases did not always occupy equal volumes, then equal volumes could not always contain equal numbers of molecules.

The rule is sometimes spoken of as the law of Avogadro and Gerhardt, the latter chemist having done much toward establishing it on a firm scientific basis. Gerhardt's pupil, Cannizzaro, continued his researches, and finally succeeded in demonstrating to the scientific world its great importance. In 1886 Van't Hoff showed the rule to be applicable not only to gases and vapors, but also to substances in solution, and, as a consequence, the rule is also often referred to, especially by German authors, as the rule of Avogadro-Van't Hoff. Consult: Avogadro's original memoir on the molecular theory, German trans., *Ostwald's Klassiker der exakten Wissenschaften*, No. 8; and Cannizzaro, "Abriss eines Lehrganges der theoretischen Chemie," *Ostwald's Klassiker*, No. 30. See also ATOMIC WEIGHTS; MOLECULES—MOLECULAR WEIGHTS; SOLUTION; CHEMISTRY.

AVOID'ANCE. See **BENEFICE.**

AVOIRDUPOIS, *äv'ër-dô-poiz'*, or **AVERDUPOIS'** (ME. *aver de peis*, OF. *avoir de peis*, equivalent to ML. *averia ponderis*, goods of weight). The name given to the system of weights and measures applied in Great Britain and America to all goods except the precious metals, precious stones, and medicines.

The grain is the basis of the avoirdupois system as well as of the troy. A cubic inch of water weighs 252.458 grains. Of the grains so determined, 7000 make a pound avoirdupois, and 5760 a pound troy. (See WEIGHTS AND MEASURES.) The avoirdupois pound is divided into 16 ounces and the ounce into 16 drams. A dram, therefore, contains 27 11-32 grains, and an ounce 437½ grains.

TABLE OF AVOIRDUPOIS WEIGHT

27.34375 grains	are 1 dram.	
16 drams or		
drachms	" 1 ounce	= 437½ grains.
16 ounces	" 1 pound	= 256 drams = 7000 grains.
28 pounds	" 1 quarter	= 448 ounces.
4 quarters	" 1 hundredwt	= 112 pounds
20 hundredwt.	" 1 ton	= 80 q'rs = 2240 pounds.

A cubic foot of water weighs 997.14 ounces avoirdupois, or nearly 1000 ounces, which gives an easy rule for determining the weight of a cubic foot of any substance from its specific gravity. Avoirdupois is the weight used in the United States, where, however, in most places, the hundredweight contains only 100 pounds, and the ton, 2000 pounds.

AVOLA, *ä'vô-lä*. A city in Sicily, 20 miles southwest of Syracuse (Map: Italy, K 11). The chief industries of the town are sugar refining and the manufacture of straw matting. Fine almonds are grown in the vicinity. Pop., 1901, 16,264; 1911, 17,711.

AVON, *ä'vön* (Celt. *aron*, Welsh, *afon*, Gael. *abhain*, *abhuinn*, water, river, probably akin to Lat. *aqua*, water). The name of several rivers in England and Scotland. The more important are: the Upper Avon (93 miles long), which rises in Northamptonshire and flows through Stratford, the birthplace of Shakespeare ("the Swan of Avon"), entering the Severn at the northern boundary of Gloucestershire (Map, England, D 4); the East Avon, which rises in Wiltshire and flows in a southerly direction, entering the English Channel at Christchurch (Map: England, E 6); the Lower Avon, which rises in Gloucestershire, flows through Wiltshire and Somersetshire, and enters the Bristol Channel 6 miles below Bristol.

AVON. A village in Livingston Co., N. Y., 18 miles south by west of Rochester, on the Erie Railroad and the Genesee River (Map: New York, C 3). The village has pea and corn canneries, a bean-shipping plant, and owns its water works. It is noted for its mineral springs. Pop., 1900, 1601; 1910, 2053.

AV'ONDALE. Formerly a city in Jefferson Co., Ala.; now incorporated with Birmingham, which is 2 miles east. Avondale was settled in 1884 and has manufactures of cotton gins and building materials. See **BIRMINGHAM.**

AVOW'RY (OF. *avouerie*, from *avouer*, to avow, from Lat. *ad*, to + *vocare*, to call). The technical name of the pleading interposed by the defendant to the plaintiff's declaration, or complaint, in an action of replevin (q.v.). By this plea the defendant avowed or acknowledged his seizure of the chattels claimed by the plaintiff, and justified the act by setting up the facts upon which he relied to show that he was entitled to make the seizure complained of. Under modern practice the action of replevin has largely lost its technical character, and its procedure has become assimilated to that of the more common and simple forms of action; but the plea of the defendant, under whatever name, retains substantially the character of the avowry. Consult the authorities referred to under **PLEADING.**

AVRANCHES, *ä'vränsh'* (anciently, *Abrinca*, capital of the *Abrincatui*, a nation of Gaul). An old town in the department of Manche, France, near the left bank of the Sée, 33 miles east of Saint-Malo (Map: France, N., D 4). It is beautifully situated on a high hill, which extends in a long ridge and is ascended by zigzag roads built on terraces. This hill commands a very wide and beautiful view of a finely wooded and cultivated district, with a winding river, which attracts summer visitors in great numbers. There are a public and a botanical garden, and a public library containing among other things several ancient manuscripts. There are considerable manufactures of lace, calico, and cloth, as well as tanneries, machine shops, planing mills,

and breweries. Many of the inhabitants are engaged in fishing, and there is an active trade in farm produce. Pop., 1906, 7360; 1911, 7174. Avranches was formerly a bishop's see, and its cathedral, which was destroyed in 1790, was one of the most magnificent in Normandy. A stone still preserved on its site is said to be that on which Henry II of England knelt before the papal legate to receive absolution for the murder of Thomas à Becket. It was a place of importance during the Roman period, and some of the old Roman ramparts are still standing. It was afterward a frequent object and scene of strife during the wars between the French and the English. Consult Le Héricher, *Avranchin monumental et historique* (Avranches, 1845-46).

AVULSION (Lat. *avulsio*, a tearing off, Fr. *a*; from + *vellere*, to tear away). The sudden transfer by natural forces of a portion of one man's land to the soil of another. The term is applied as well to the result of a sudden change in the course of a boundary river, the reliction or encroachment of the sea, as to an actual tearing away of a portion of A's land and its deposit upon or against the land of B, as the result of a flood. The title to the soil so carried away or transferred is not affected by the physical change in its situation, and the owner is entitled to recover the possession thereof from the person to whose soil it has become annexed. In this respect it differs from accretion, or a gradual and imperceptible addition to the land of a riparian proprietor by the action of the water. (See ACCRETION.) Thus, if the sea permanently recedes so rapidly that the reliction of the water is perceptible in its progress, the case is one of avulsion, and the land exposed continues to be the property of the State, as when it was still covered by the sea. This rule may be varied by custom, however, as in the case of the river Severn, below Gloucester Bridge, which (says Lord Hale) "is the common boundary of the manors of either side, what course so ever the river takes," and in the case of the Missouri River, as to which a similar doctrine has been laid down by the United States Supreme Court, to cover the effect of the rapid current of the river upon the loose soil composing its banks (*Nebraska v. Iowa*, 143 U. S. 359). Even here, however, the court is careful to distinguish the case of the cutting of the new channel above Omaha in 1873, which is described as an avulsion and as leaving the land titles on either side up the stream unaffected. See ALLUVION; RIPARIAN RIGHTS; RIVERS; SEA SHORE.

AWAJI, ū'wā-jē. The largest island in the Inland Sea of Japan, at its eastern entrance, and pertaining to Hiogo Ken. It is 34 miles long, contains 218 square miles, and has a population (1898) of 188,908. In mythology Awaji was the first island created by Izanagi and Izanami; the name in legend meaning 'my shame,' but actually the 'way of Awa.' It is famous for its wonderful scenery and noted for a peculiar grade of pottery.

AWANTIBO, ū'wān-tē'bō, or **ANGWANTIBO**, ūn'gwān-tē'bō (native name in west Central Africa). A small light-brown lemur (*Perodicticus* or *Arctocebus calabarensis*), also called the Calabar potto, and distinguished by the absence of any visible tail, and by the rudimentary condition of the index finger of the hand, while the thumbs on all the feet are greatly enlarged and separated from the fingers, forming of the feet powerful grasping organs.

The animal is rare, and its habits are little known.

AWARD (OF. *eswarder*, look at, consider, decide, from *es* (Lat. *ex*) + *warder*, observe, guard, from OHG, *warten*, to watch). The formal adjudication of a matter in dispute by arbitration or by referees to whom it has been referred. An arbitration being an extra-judicial proceeding, the award does not have the force of a judgment; but it may, if made by official or judicial referees, be the basis of a judgment, and, if made by private arbitration, it becomes legally binding upon the parties thereto. The submission to arbitration involves an agreement to abide by the result thereof, and thus the award becomes a term of the contract, enforceable as such. In order to be binding, however, it must be consonant with the submission, must be limited to the parties agreeing thereto and to the matters in dispute, and must be final, certain, and specific. See ARBITRATION.

AWATA, ū'wā-tā. A village in the suburbs of Kioto, Japan, famous for its yellow faience. Awata pottery was invented in the seventh century, is decorated, and by the Japanese is called "Tamago Yaki" ('egg-ware'). It is largely exported to the United States.

AWE, ā, Loch (Gael. *abh*, water). A lake in the centre of Argyllshire, Scotland, 23 miles long and 1 mile broad (Map: Scotland, C 3). Its surroundings are very picturesque and in some parts even striking. It is covered with numerous wooded islands, and its northern end is shadowed by a rocky mountain chain over 3000 feet high. It is drained by the river Awe, which enters the Loch Etive. Its largest feeder is the Orchy, from the northeast. There are numerous castles on several islands in the loch, some of them dating from the thirteenth century. The loch is traversed by steamers, and there is a railway station on its northern shore.

AWN. See GRAMINEÆ; GRASSES.

AWOMORI, ū'wō-mō'rē. See AOMAORI.

AXAYACATL, ū'chā-yā-kā't'l (Mex. *face-in-the-water*) (?-1477). An Aztec chief, styled, in contemporary narratives, Emperor of Mexico. He is reported to have been the father of Montezuma, whom Cortés conquered. About 1467 he led his Aztecs to the conquest of Tehuantepec, and afterward crushed a rebellion that threatened his capital, the City of Mexico. He died suddenly, about 1477. Half a century later the soldiers of Cortés occupied Axayacatl's "palace," which was the large communal dwelling of the section of the tribe to which Axayacatl belonged. In one of the rooms they found an immense treasure of gold and silver in ore and bars, with jewels, and many curious articles of manufacture.

AXE (Ger. *Ax*, *Axt*; Lat. *ascia*; Gk. *ἀξίς*, *axine*). An instrument used for felling trees and chopping wood. The axe is one of the earliest tools used by man, being found among the relics of the Stone, Bronze, and Iron ages. It was fashioned sometimes of syenite or black sandstone, as by the lake dwellers of Europe; of jade, as by ancient peoples of Asia and Asia Minor and by the modern Maoris; of flint or bone, as by the American Indians; of mixed copper and tin, as by the Romans, ancient Mexicans, and South Americans; of copper, as by the Druids. To this day stone axes are used in some of the South Sea Islands. The American axe usually consists of a head or butt of wrought iron, heated to a white heat, cut to the desired length, and then, after the eye for the handle is punched through,

reheated and pressed between concave dies into proper shape. Again heated, it is grooved on the edge; with borax as a flux, the arched edge piece of steel is inserted, projecting an inch or more; the iron and steel are then welded at white heat, and after it is hammered, ground to a fine edge, tempered and polished, the head is varnished to prevent rust. Forms and weights vary according to the use to which the tool is to be put. For very hard timber the edge is narrow and the whole axe heavy. Common forest axes weigh from 3 to 7 pounds. The handle is generally made of hickory, which is not only strong, but elastic. The pickaxe, used for breaking up hard ground, is not strictly an axe. The hatchet (Fr. *hachette*, a little axe) is for use with one hand only. The "francisca," at one time the national weapon of the Franks, was a hatchet for throwing, and the tomahawk (q.v.) of the North American Indians was, as is well known, used in a similar manner and in hand-to-hand combat. The adze, a tool used for the chipping or rough planing of horizontal surfaces by carpenters, has its blade at right angles to the handle, and so curved that the plane of the cutting edge, as the instrument is swung into contact, is horizontal. Broadaxes, formerly much used for hewing logs into square timbers, are axes with very broad blades, and the cutting edge much less curved than the edge of the regular axe for chopping.

AXEL, or **ABSALON** (c.1128-1201). Archbishop of Lund, after 1178, and minister and general of Waldemar I and Canute VI of Denmark. He was descended from a distinguished Danish family and in his youth studied at Paris. Axel distinguished himself by wisdom, uprightness, and valor. He drove the Wendish pirates from the Danish coast, attacked them in their own settlements on the island of Rügen, and annexed the island to Denmark. He defeated the Pomeranian fleet in 1184. In the wise legislation of Waldemar and of his son he had a great part. He promoted learning and art, and to his encouragement we owe the first connected history of Denmark by Saxo Grammaticus. In building a fortified castle for defense against the pirates he laid the foundation of the future city of Copenhagen, then an insignificant village inhabited only by fishermen. Owing to this origin, Copenhagen has sometimes been called Axelstadt. Axel lies buried in the church of Sorö, where he founded a monastery.

AXHOLME, äks'ölm, or **AXELHOLM** (AS. *holm*, island in a river; Eng. *holm*, hill, islet). An island in the northwest of Lincolnshire, England, formed by the rivers Trent, Don, Idle, and Vicardyke. Area about 74 square miles. It incloses various parishes, of which Epworth is the chief. Abundant crops are raised by small landowners. Formerly a marsh which succeeded an ancient forest, it was reclaimed in 1634, after five years' labor, by Vermuyden, a Dutchman, under contract from Charles I. The land became very fertile under Dutch and French Protestant immigrants, the introduction of which antagonized the local peasantry. Litigation which ensued ended in 1691, the natives receiving 10,532 acres and the settlers 2868. The accent and physical characteristics of the settlers exist in the present inhabitants. Pop., 1911, 6815. Consult Peck, *Isle of Axholme* (1815), and Peacock, in *Anthropological Review* (1870).

AXTL. See **LEAF**.

AXIM, ä-shéng' or äks'im. A seaport in the

British Gold Coast colony, 70 miles west of Cape Coast Castle (Map: Africa, D 4). It was built by Portuguese, and its harbor is the best on the Gold Coast. The town is picturesque, and is an important point because of large exports of mahogany. Gold is found in small quantities. In 1642 it was taken by the Dutch, who in 1872 ceded it, with the whole of their possessions in Guinea, to the English. Pop., 2189.

AXINITE (Gk. *ἀξίνη*, *axinē*, axe; referring to its edged crystals). An aluminum and calcium borosilicate, with some of the calcium replaced by varying amounts of iron and manganese, which crystallizes in the triclinic system. It is found in the form of brown, bluish, or yellow crystals, edged like an axe, in various localities in Europe, notably Dauphiné, France, and Scopi, Switzerland, where the crystals are cut into beautiful brown gems. It has been found in the United States near Bethlehem, Pa., and in Maine, but in crystals that are too small for cutting.

AXINOMANCY (Gk. *ἀξίνη*, *axinē*, axe + *μαντεία*, *mantēia*, divination). A kind of divination practiced in ancient times by means of an axe. The ancients tell us nothing with regard to its method or its use. See **SUPERSTITION**.

AXIOM (Gk. *ἀξίωμα*, *axiōma*, that which is thought worthy, fit, self-evident). A general statement, the truth of which is accepted without proof. Plato probably limited it to geometric propositions, but Aristotle applied it to statements of a more general nature. Euclid followed Aristotle's use of the term, regarding axioms as "common notions" not limited to geometry, and applying the term *postulate* to a premise specifically geometric in character. The early English translators of Euclid failed to consult the most trustworthy sources, and hence the terms *axiom* and *postulate* have come to be confused. Heiberg, the latest and best editor of the *Elements*, has made clear the distinction which Euclid recognized, and has shown that he gave five axioms and five postulates. Euclid regarded as an axiom that, "If equals be added to equals, the sums are equal"; as a postulate that (stated in simpler language than his), "Through a given point only one line can be drawn parallel to a given line." The first statement is general, the second is specifically geometric. Mathematicians formerly sought to limit the list of axioms and postulates to the smallest number upon which the subject in question, as geometry, could be built; the modern tendency is rather to seek a list, however extended, of the really independent properties of space. To the followers of Kant seems due the common definition of axiom as "a self-evident truth," a definition no longer recognized as valid. See **A PRIORI**; **GEOMETRY**.

AXIS (Lat. *axis*, axle). In geometry, a line (usually straight) such that the points of a given figure are symmetrically situated on opposite sides of it; as, for example, a diameter or diagonal of a square, the perpendicular from the vertex to the base of an isosceles triangle, a diameter of a circle or sphere. The axis bisects at right angles the line joining any two corresponding points of the figure. In this connection the axis is called an *axis of symmetry* of the figure. *Axes of coordinates* are the lines of reference from which the coordinates are measured. (See **ANALYTIC GEOMETRY**.) The *radical axis* of two circles is the line joining their points of intersection; the

AXOLOTL

1. LARVAL AXOLOTL (*Ambystoma tigrinum*).

2. ADULT FORM.

AYE-AYE

1. AYE-AYE (*Chiromys madagascariensis*).
2. HEAD IN PROFILE (enlarged).

3. SKULL.
4. RIGHT AND LEFT HANDS, showing attenuated digits.

line is real, even when the circles cut in imaginary points. The *transverse* (or *major*) *axis* of a conic is the diameter which passes through the foci. The *conjugate* (or *minor*) *axis* is the line through the centre perpendicular to the transverse axis.

In physics, the *optic axis* of a lens is the straight line passing through its optical centre and perpendicular to its surfaces. The *axis* of a telescope is the straight line joining the centres of its lenses (objective and ocular). In mechanics, the *axis of rotation* of a body is a straight line about which the body rotates, as the *polar axis* of the earth.

In architecture, axis is either the temporary central line used in making drawings or the imaginary central line of a building. Sometimes buildings have a curved axis, sometimes several have a common axis. The relation of the axis of neighboring monumental structures has always been a matter of careful study in architectural history.

AXIS. The second vertebra of the spinal column, so called because it forms the pivot upon which the first bone (atlas, q.v.) rotates, carrying the skull. A strong tooth-like process extends perpendicularly upward, interlocking with the atlas, to prevent dislocation.

AXIS, IN BOTANY. See STEM.

AXIS (Lat. of unknown origin). A species of deer (*Cervus axis*) abundant throughout India and in many islands of the Eastern Archipelago. One of its Indian names is *chittra*, and by British sportsmen in India it is generally called the spotted hog deer. It was known to the ancients as *axis*. The axis resembles in size and color the European fallow deer; it is generally of a rich fawn color, beautifully spotted with white, nearly black along the back, the under parts snow-white. The horns are slender, sharp-pointed, little branched, and not at all palmated. The female has no horns. The axis frequents thick jungles in the vicinity of water and feeds during the night. It is commonly found in herds of 15 or 20, of which three or four are males. Its sense of smell is remarkably acute, and it is generally very shy and timid, so that sportsmen find it difficult to get within shot. The male, however, sometimes exhibits great courage in defense of the young. It is very easily domesticated, is gentle in its manners, and breeds freely in captivity, so that it is commonly seen in zoölogical parks. See Colored Plate of DEER.

AXLE (Ger. *Achse*[t], dim. of form found in Lat. *axis*). The bar of metal or wood which carries the wheel or wheels of vehicles or of machinery, and around which the wheel or wheels revolve, sometimes with the axle and sometimes upon it. Axles for wagons are made of iron, steel, or wood and are fixed, the wheels revolving around them. Axles of railway cars have the wheels keyed to them and revolve with the wheels, the ends of the axle projecting outside of the wheels, and turning in journal boxes on which the body of the car rests. Railway axles are forged from steel of high quality and have the wheels forced upon a taper wheel fit by hydraulic pressure. The projecting ends or journals are turned and finished smooth. Standard dimensions of axles for cars of different weights have been adopted in the United States by the American Master Car Builders' Association. See SHAFTEING.

AX-LES-THERMES, äks'lä-tèrm'. A town in the department of Ariège, France, on the

Ariège River, about 20 miles southeast of Foix (Map: France, S., F 6). It is situated 2350 feet above sea level, and is a noted health resort because of its warm sulphur springs. There are over 60 of these, and the water is used for drinking and bathing purposes. Each of four bathing establishments is fed by a different group of springs. There is here a hospital founded for leprous soldiers in 1260. Pop., 1911, 1624.

AXMINSTER (AS. *Axan Mynster*, minster of the [river] Axe). A market town in Devonshire, England, on the Axe, 24 miles east-northeast of Exeter (Map: England, D 6). Axminster was once famous for the manufacture of a superior grade of carpets. The industry has been removed to Salisbury, and the town has now numerous minor manufactories, an iron foundry, and lumber yards. Pop., 1901, 2906; 1911, 3009.

AXOLOTL, äks'ò-lòt'l (Mex.). Any of several species of larval salamanders of the genus *Amblystoma*. They inhabit certain lakes of Mexico and the Rocky Mountain region of the United States. Their eggs resemble frogs' eggs, being laid in strings formed by a viscous covering and attached to water plants. They hatch in from two to three weeks. The young axolotl has external bushy gills, much like those that are retained throughout life by the mud puppy (q.v.). It may become sexually mature while still bearing the external gills, and before its life history was known it had been given the name *Siredon lichenoides*. The passage of the axolotl into an *Amblystoma* first became known to science in 1865 and has since been confirmed. Recent experiments on captive specimens have shown that young axolotls can easily be made to change into the adult form if they are compelled to breathe air more frequently than usual, as when kept in vessels of shallow, poorly aerated water. This metamorphosis can be checked, the shrinking gills then undergoing fresh development, when they will remain axolotls indefinitely. Cutting off the gills produces no effect, as they are quickly renewed. The change involves the loss of the gills, the closing of the clefts, the disappearance of the back and tail fins, and the general broadening of the head. Perpetual submergence or a permanently dry saline shore prevents the transformation in nature, while it is favored by an alternation of wet and dry conditions, such as are found on a wave-washed shore or in slowly drying lakes or ponds. The Colorado form (*Axolotl tigrinum*) delays its metamorphosis for a long time, but it always occurs eventually in nature, while the black Mexican (*Axolotl maculatum*), which is much prized as food by the natives, has never been known to make the change.

AX-STONE. A variety of nephrite of greenish color, which is hard, tough, and more or less translucent. It is found in primitive rocks in Saxony, Greenland, New Zealand, and other South Pacific islands, and is used by the natives for making hatchets, whence its name.

AXUM, or **AKSUM**, äk-sòom' (Gk. *Ἀξούμ*, *Ἀξούμ*, *Arroumis*, *Aurumis*, Lat. *Aurumis*). Once the capital of the Ethiopian kingdom of the same name, now capital of the modern Abyssinian province of Tigré, situated in lat. 14° 7' N., and in long. 38° 43' E. Even before the Christian Era Axum seems to have become the capital of an Ethiopian kingdom, whose chief port was Adule, about 100 miles distant, through which it carried on an extensive trade with Egypt and the Roman world. The kingdom

of the Axumites seems to have been gradually extended from the borders of Roman Egypt to the south, as far as the Straits of Bab-el-Mandeb, or even Cape Gardafui, and its kings claimed also dominion over the Homerites (or Himyarites) on the Arabian coast of the Red Sea. These kings were acquainted with Greek culture, as is shown by the inscriptions at Adule and Axum. One of those in the latter place was also written in the Geez language, sometimes called Ethiopic, but in the Sabæan characters used in southern Arabia. Christianity was introduced by Ædeseus and Frumentius early in the fourth century, and in 356 A.D. the Emperor Constantius wrote to King Aizanes, asking his assistance against the teachings of Athanasius. The kingdom later lost its power and wealth with the advance of Mohammedanism, which gradually hemmed it in, though the country has always kept its Christian faith. Axum is regarded now as a sacred city by the Abyssinians, and still contains memorials of its greatness in a large number of curious obelisks connected, apparently, with Semitic sun worship, and the remains of an imposing Christian church. The population of the town at present is only about 5000. Consult: Dillmann, *Abhandlungen der Berliner Akademie* for 1879 and 1880; Mommsen, *Provinces of the Roman Empire*, vol. ii (Eng. trans., New York, 1886); Bent, *The Sacred City of the Ethiopians* (London, 1893); Glaser, *Geschichte Arabiens* (Berlin, 1885-90); id., *Die Abessinier in Arabien und Afrika* (Munich, 1895).

AYACUCHO, á'yá-koo'chó. A department of Peru, bounded by the department of Junin on the north, Cuzco and Apurimac on the east, Arequipa on the south, and Ica and Huancavelica on the west (Map: Peru, C 6). Area, 18,185 square miles. The surface is mountainous, well watered, and there are pasture lands on which sheep and cattle graze. The soil is well adapted for agricultural purposes and grain, coffee, cocoa, cacao, and cotton are produced. The precious metals, nickel, and cobalt, are mined and, with the chief agricultural products, are exported. Among the chief manufactures are spirituous liquors, hats, and flannel and leather goods. The latest official population figures are for 1896, when an estimate returned 302,469 for the department. Capital, Ayacucho (q.v.).

AYACUCHO (Indian, "corner of death," referring to a bloody battle once fought on this spot). An episcopal city, capital of the department of Ayacucho, Peru, situated 240 miles southeast of Lima, on a small tributary of the Mantaro River, 7900 feet above sea level (Map: Peru, C 6). The town is the seat of a university established in 1677. The surrounding district is chiefly devoted to cattle breeding and agriculture, an active trade in their products being carried on with Lima. The town manufactures wool, hats, and articles of silver. Pizarro founded the town in 1539, calling it San Juan de la Victoria de Guamanga, but the city has been called by its present name since 1825 to commemorate a great victory achieved by General Sucre over the Spaniards on Dec. 9, 1824, on the plateau of Ayacucho. This battle assured the independence of Peru. Pop., 1908, 14,346; 1912 (est.), 20,000.

AYALA, á-yá'lä, ADELARDO LÓPEZ DE (1829-79). A Spanish poet and politician, born at Guadalcanal in Badajoz. He studied law at Seville, but later devoted himself to poetry. In behalf of the Revolution of 1868 he composed the

Manifesto of Cadiz; but on the restoration of the monarchy he reestablished his relations with his former colleague, Canovas, and became Secretary of the Colonies in the first ministry of Alphonso XII. His writings include: *El hombre de estado* (1851); *Culpa y perdón* (1851); *Los dos Guymanes* (1851); *El tijado de vidrio* (1854); *El tanto por ciento* (1861); *Los comuneros*; *El nuevo Don Juan* (1863); *Consuelo* (1878). His "Obras completas" were published as the seventh volume of the *Colección de escritores Castellanos* (1881-87).

AYALA, PEDRO LÓPEZ DE. See LÓPEZ DE AYALA, PEDRO.

AYAMONTE, á'yá-món'tá. A city of Andalusia, Spain, on the left bank of the Guadiana, near its mouth, where it forms the boundary between Spain and Portugal (Map: Spain, B 4). It is picturesquely situated on the slope and at the foot of a hill. The upper part of the town consists of narrow and irregular streets; those of the lower part are regular and wide. There are three public squares. The principal occupation of the inhabitants is fishing, shipbuilding, and coast trading. Pop., 1900, 7530; 1910, 9471.

AYAPANÁ, á'yá-pá'ná. See EUPATORIUM.

AYE-AYE, á'yá' (native Malagasy name; from its cry). A small, brownish, squirrel-like lemur (*Chiromys* or *Daubentonina madagascariensis*), of Madagascar, remarkable for its rodent-like dentition. It is the sole representative of its genus and of the family Chiromyidae, which, with the family of the true lemurs, forms the sub-order Lemuroidea. It is arboreal and nocturnal in habits, living alone or in pairs in the bamboo jungle, constructing ball-like nests of dried leaves, and feeding on juicy vegetables, such as sugar cane, and upon the grubs of wood-borers, to which its slender and curiously distorted fingers (see Plate of AXOLOTL and AYE-AYE) seem especially adapted. The fact that, until recently, this creature was considered upon the verge of extinction is due partly to its shy, nocturnal character, but chiefly to the superstitious veneration in which it is held by the natives, who object to capturing it. They think that if a person sleeps in the forest the aye-aye will bring him a pillow; if for the head, the person will become rich, if for the feet, he will succumb to the fatal power of the animal. Consult *Knowledge* (London, December, 1901) for an illustrated account of its characteristics.

AYER, ar. A town in Middlesex Co., Mass., 36 miles by rail west of Boston, on the Boston and Maine Railroad (Map: Massachusetts, D 3). It has a public library, tannery, saw mill, machine shop, and factories for vinegar and preserves. The water works are owned by the town. Pop., 1900, 2446; 1910, 2797.

AYESHAH, á-yé'shá, or **AISHA**, á'í'shá. The favorite wife of Mohammed, and the daughter of Abu-Bekr. See MOHAMMED.

AYLESBURY, álz'bér-i. A market town and the county-seat of Buckinghamshire, England, about 38 miles northwest of London (Map: England, F 5). Aylesbury contains the only convict prison for women in England. It is chiefly an agricultural centre and has an industry in lace making and straw plaiting. Its ducks, raised for the London market, are justly famous. Pop., 1901, 9250; 1911, 11,048. Aylesbury is very ancient, having been taken from the Britons by the Saxons in 571.

AYLESBURY. A breed of large domestic white ducks. See DUCK.

AYLESFORD, älz'fërd. A village in Kent, England, picturesquely situated on the Medway, 39 miles southeast of London. Remarkable ancient remains occur here, comprising an extensive cromlech, or burying place, known as Kits-Coity, and, in the neighboring chalk hills, large circular sepulchral pits. Pop., 1911, 2569.

AYLESWORTH, älz'wörth, SIR ALLEN BRISTOL (1854-). A Canadian lawyer and statesman. He was born at Newburgh, Ontario, and was educated at Newburgh Academy and at Toronto University, where he graduated in 1874. He was called to the bar in 1878 and soon became prominent in the legal profession. His knowledge of electoral and constitutional law made him sought as counsel in many cases of public importance. Frequently he appeared in London before the Judicial Committee of the Privy Council, notably in 1904 in behalf of the old Provinces of Canada, when, as a result of the census of 1901, an effort was made to reduce their representation in the House of Commons. In 1903 he was appointed one of the two Canadian members of the Alaska Boundary Tribunal, and, with Sir Louis Amable Jetté, the other member, refused to sign the award of the Tribunal for reasons assigned in the minority report. (See ALASKA.) He was elected to the House of Commons in 1905, and in the same year became Postmaster-General in the cabinet of Sir Wilfrid Laurier. In 1906 he was appointed Minister of Justice, an office which he retained until 1911, when he retired from political life. In 1910 he rendered signal service as British agent in preparing the colonial case argued before The Hague Tribunal in the dispute between the United States and Great Britain regarding the Atlantic Fisheries. (See FISHING LAWS.) In 1911 he received the honor of knighthood.

AYLLON, i-lyón', LUCAS VASQUEZ DE (c. 1475-1526). A Spanish adventurer. He came to America, became a member of the Superior Court of Hispaniola (Santo Domingo) and in 1521 sent Gordillo to explore the coast of the present Florida. He himself visited James River and Chesapeake Bay in 1524 and, liking the country, applied for and received a grant to the surrounding territory from Charles V. In 1526 he brought about 600 colonists to the site of Jamestown, Va. (q.v.), and with the help of a large number of negro slaves, probably the first ever employed within the present limits of the United States, endeavored to build a town, which he called San Miguel. Before the end of the year, however, he died of fever, and his colony soon afterward was broken up by sickness, civil strife, and a negro insurrection. Many of the survivors were shipwrecked on their way back to Hispaniola, and only 150 reached their destination in safety. Consult Woodbury Lowery, *Spanish Settlements within the Present Limits of the United States, 1513-65* (New York, 1901).

AYLMER, älmër. The name of two Canadian lakes. 1. Lake Aylmer, 80 miles north of Great Slave Lake, is about 50 miles long by 30 miles broad (Map: British Columbia, H 2). 2. Lake Aylmer, in Wolfe Co., Quebec, lies 69 miles south of Quebec (Map: Quebec, G 5). Its outlet is the St. Francis River.

AYLMER. A village of Elgin Co., province of Ontario, Canada, situated on the Grand Trunk, Michigan Central, and Wabash railways, 12 miles east of St. Thomas (Map: Ontario, D 8). It lies in a productive farming and dairying

district, and its manufacturing interests include saw and planing mills, shoe and leather factories, hoop and stave works, scale and pump works, a candy factory, foundries, and a condensed milk factory. Pop., 1911, 2102.

AYLMER. A village in Wright Co., province of Quebec, Canada, on Lake Deschaines, at the foot of steam navigation for the upper Ottawa, and on the Canadian Pacific Railway (Map: Quebec, C 5). It is a favorite summer resort, connected with Ottawa by an electric railway. Pop., 1901, 2291; 1911, 3109.

AYLMER, or ELMER, JOHN (1521-94). An English theologian. He was born at Aylmer Hall, Norfolk; graduated B.A. at Cambridge, 1541, and immediately thereafter became tutor to Lady Jane Grey. In June, 1553, he was made Archdeacon of Stow, but on Mary's accession, October, 1553, he fled the country lest his pronounced Protestantism should bring him into trouble, and lived on the Continent till Elizabeth's accession (1558). In 1562 he became Archdeacon of Lincoln, and in 1576 Bishop of London, in which position he showed a very arbitrary temper and was most unpopular. He died in London, June 3, 1594. His only literary production of note is his reply to John Knox's *Monstrous Regiment of Women*, entitled *An harborowe for faithfull and trewe subjects, against the late blowne blast concerning the government of women* (Strassburg, 1559). For his biography, consult J. Strype (new ed., Oxford, 1820).

AYLMER, MATTHEW, LORD (c.1643-1720). A British naval officer, born in the county of Meath, Ireland. He entered the navy in 1678 and served until 1688 on the Algerian coast and in the Mediterranean. At the battle of Beachy Head (1690) and at Barfleur (1692) he commanded the *Royal Katherine*. He was made rear-admiral in 1693, vice-admiral in 1694, and admiral in 1698. In the latter year he was sent to the Mediterranean to arrange the treaties with Tunis, Tripoli, and Algiers. He was commander-in-chief of the fleet from 1709 to 1711, and was suspended because of a dubious engagement, but was reinstated upon the accession of George I (1714).

AYLOFFE, ä'löf, SIR JOSEPH (1709-81). An eminent English antiquary. He attended St. John's College, Oxford, for a time and at an early age evinced considerable interest in antiquities. In 1731 he was elected a fellow of the Royal Society and in the following year a fellow of the Society of Antiquaries. In 1763 he was made one of the commissioners for the preservation of the state papers, and in 1772 published a valuable work entitled *Calendars of the Ancient Charters and of the Welch and Scottish Rolls now Remaining in the Tower*. He also wrote several useful papers for the publications of the Society of Antiquaries and at the time of his death was engaged on the work known as Gough's *Sepulchral Monuments* (1799), which he had projected.

AYMARÁ, i'mä-rä'. The name commonly applied to a former confederacy or group of semi-civilized tribes centring in the high plateau about Lake Titicaca, in Peru and Bolivia. They number now, including mixed bloods, more than half a million. At the time of the discovery they were subject to the Incas, but there is considerable ground for the opinion held by some writers that they are themselves the originators of the Inca (Quichua) civilization. Physically they

are distinguished for their great chest development, due to the rarefied air which they breathe. The mysterious cyclopean ruins of Tiahuanaco are within their territory and are probably, in part at least, of Aymará origin, as are possibly also other pre-Incan remains in southern Peru. Much light has been shed upon some of the problems of the Aymará region by the recent archaeological and ethnological investigations, of Uhle and Bandelier (consult this author's *The Islands of Titicaca and Coati*, New York, 1910). The language constitutes a distinct linguistic stock, although considerably influenced by Quichua. Consult Middendorf, *Die Aymará-Sprache* (Leipzig, 1891) and Dorsey, *A Bibliography of the Anthropology of Peru* (Chicago, 1898).

AYMON, ā'mon. The surname of four brothers, called respectively Alard, Richard, Guichard, and Renaud, sons of Aymon, or Haimon, Count of Dordogne, who figure among the most illustrious heroes of the chivalric poetry of the Middle Ages. The story belongs to the cycle of romances in which Charlemagne is the central figure. Possibly Huon de Villeneuve, a French poet of the time of Philip Augustus (1180-1223), was the author of the poem entitled *Les quatre fils Aymon*; Ariosto later conferred poetical immortality on the family by the publication of his *Orlando Furioso*, in which Renaud, or Roland, the bravest of the four brothers, plays the most distinguished part. Caxton printed, about 1489, an English translation of the story, and in 1884-85 the Early English Text Society reprinted Caxton's work, under the title *The Four Sons of Aymon*. Tieck, the popular German writer, edited and published the story, but seems to have taken it from a different source. Consult Gautier, *Les Epopées françaises* (Paris, 1880), and Steele, *Renaud of Montauban and the four Sons of Aymon* (London, 1897). Also see ROLAND, THE SONG OF.

AYR, ár. A seaport, summer resort, and the county-town of Ayrshire, Scotland, situated on the Firth of Clyde, at the mouth of the river Ayr, 40 miles south-southwest of Glasgow by rail (Map: Scotland, D 4). Ayr is a clean and well-built town. It is connected by three bridges with the suburbs of Newton-on-Ayr and Wallace-town, which have constituted a part of the city since 1873. A harbor is formed by the estuary of the river and is protected by piers and a breakwater. In 1874 and succeeding years many improvements were added, including the construction of a large wet dock. Flannel, woolen, and leather goods, boots and shoes, and carpets are manufactured, and there are ship-yards, lumber mills, and foundries. The coasting trade is considerable, exports including agricultural products, iron, and coal from the Ayrshire collieries, the latter being the most important. A considerable quantity of grain, timber, and manure is imported. At one time much wine was imported from France. The town has an excellent water supply, obtained from Loch Finlas. It owns and operates an electric light plant, and maintains an asylum, a hospital, industrial schools, markets, slaughter-houses, and a cemetery. The race course, owned by the town, is the scene of the "Western Meeting," held each year in September. Part of the tower of the old church of St. John, built in the twelfth century and turned into a fort by Cromwell, is still standing. The neighborhood of Ayr is rich in associations with the poet Robert Burns. About 2 miles to the south is the

cottage in which he was born, and a little farther on Auld Alloway Kirk, and the Auld Brig of Doon of Tam o'Shanter fame. Near the river is the Burns Monument, in the style of a classic temple, containing relics of the poet and two excellent figures of Tam and Souter Johnny, by Thom, a native sculptor. Pop., 1901, 28,697; 1911, 32,986.

AYRER, ȳ'rēr, JAKOB (c.1560-1605). A German dramatist. He was born at Nuremberg and, next to Hans Sachs, was the most prolific dramatic poet of the sixteenth century in Germany. He wrote, largely under the inspiration of English traveling comedians and in the interest of the Protestant Reformation, more than 100 plays between 1595 and 1605. The *Opus Theatricum* (Nuremberg, 1618) contains 30 of his tragedies and comedies and 36 of his Shrovetide plays and vaudevilles. They were sensational in their effects, coarse in language, pedantic sometimes in form, but they helped to turn the popular religious drama of the sixteenth century to the service of the new spiritual and national life. Consult: Keller, in *Bibliothek des litterarischen Vereins*, vol. lxxvi, and "Select Dramas of Jacob Ayres," in *Deutsche Dichter des XVI. Jahrhunderts*, vol. clxxxvi, with a valuable introduction by Tittmann (Leipzig, 1868); also Th. Wolff, *Zur kenntnis der Quellen von J. Ayres Schauspielern* (Berlin, 1875); J. G. Robertson, *Zur Kritik Jacob Ayres* (Leipzig, 1892). Two of his dramas were translated into English by A. Cohn, *Shakespeare in Germany* (1885).

AYRES, árz, ALFRED. See OSMUN, THOMAS EMBLEY.

AYRES, BROWN (1856-). An American college president and scientist, born at Memphis, Tenn. After an early education obtained from private schools, he took engineering courses at Washington and Lee University and at the Stevens Institute of Technology. Following two years as a fellow of Johns Hopkins, he was appointed in 1880 professor of physics at Tulane University. This chair he held for 24 years, at various times acting also as dean of the College of Technology, dean of the academic department, and president pro tempore. In 1904 he was chosen president of the University of Tennessee. He became a member of many learned societies and in 1910 was president of the National Association of State Universities. Honorary degrees were conferred on him by several institutions.

AYRES, LEONARD PORTER (1879-). An American educator, born at Niantic, Conn. He received his college and graduate training at Boston, Harvard, and Columbia universities. He began teaching in 1902 as one of the first to carry American ideas and methods to Porto Rico. There he was appointed superintendent of schools in the districts of Caguas and San Juan, and later general superintendent of all the public schools on the island. He was also chief of one of the Porto Rico summer school expeditions to the United States. Having returned to live in this country, he was made head of the division of statistics in the Playground Association of America. Beginning in 1908, he became prominently identified with the work of the Russell Sage Foundation, especially as chairman of the committee in charge of the Backward Children Investigation. In 1908-09 he lectured on education at New York University. His writings on educational subjects, besides reports and contributions to periodicals, are: *A Course of Study for*

the *Schools of San Juan* (1905); *Medical Inspection of Schools*, with Luther H. Gulick (1908); *Laggards in our Schools* (1909, 1913); *Open Air Schools* (1910); *Seven Great Foundations* (1911); very many of his articles in educational journals have been reprinted, among them, *The Effect of Promotion Rate on School Efficiency* (1913).

AYRES, ROMEYN BECK (1825-88). An American soldier. He was born in Montgomery Co., N. Y., graduated at West Point in 1847, and was at once attached to the artillery in the Mexican War. He became a captain in 1861, took part in the first battle of Bull Run, and was chief of artillery in Gen. W. F. Smith's division from October, 1861, to November, 1862, and of the Sixth Army Corps from November, 1862, to April, 1863. He served with the Army of the Potomac in the Peninsular Campaign, and afterward in the battles of South Mountain, Antietam, Fredericksburg, Chancellorsville (where he commanded a brigade), and Gettysburg (where he commanded a division of the Fifth Army Corps). In August, 1863, his division was ordered to New York to aid in suppressing the draft riots. General Ayres afterward took a prominent part in Grant's Richmond campaign, was wounded at the siege of Petersburg, and from August, 1865, to April, 1866, when he was mustered out of the volunteer service, was in command of the Shenandoah valley. At the close of the war he was brevetted brigadier-general and major-general in both the volunteer and the regular service, and afterward, until his death, served on garrison duty as lieutenant-colonel and colonel in the regular army at various military stations.

AYRSHIRE, ar'shēr. A maritime county in the southwestern division of Scotland, bounded north by Renfrewshire, west by the Firth of Clyde and the North Channel, south by Wigton and Kirkeudbright, east and northeast by Dumfries and Lanark (Map: Scotland, D 4). Area, 1132 square miles. The county is undulating and hilly, the land attaining no great elevation, except a small portion in the north and some considerable tracts in the south and southeast, which are mountainous. It is rich in valuable minerals, especially coal, ironstone, limestone, and freestone, and one-fifth of the population are engaged in the mining industry. Agriculture is in an advanced state, and dairy husbandry is carried to high perfection, the breed of milch cows, of which it rears a great number, are highly esteemed in the kingdom for the quantity and quality of their milk. (For illustration, see Plate of DAIRY CATTLE under CATTLE.) The breed of horses is also excellent. Among the leading manufactures are iron, textiles, and lace. There are valuable fisheries and shipyards on some parts of the coast. The most important towns are Kilmarnock, Stevenston, Ardrossan, Dundonald, and Ayr, the capital. Pop., 1801, 84,200; 1851, 189,860; 1891, 226,386; 1901, 254,400; 1911, 268,337. Consult Paterson, *History of Ayrshire* (Edinburgh, 1863-66).

AYRTON, ar'ton, WILLIAM EDWARD (1847-1908). An English physicist and electrical engineer, born in London. After finishing his course at the University College, London, he was appointed to the telegraph service of the Indian government (1868), and in 1873-79 was professor of natural philosophy and telegraphy in the Imperial College of Engineering at Tokio,

Japan. In 1879 he was appointed professor of applied physics in the City and Guilds of London Institute, South Kensington, and in 1904 he became dean of the Central Technical College, after 20 years of service there as professor of electrical engineering. He was at various times president of the Mathematics and Physics Section of the British Association, of the Physical Society, and of the Institution of Electrical Engineers. With Professor Perry he invented an ammeter, voltmeter, electric power meter, etc. His works include *Practical Electricity* (rev. ed., 1911).

AYSCUE, ās'kū, SIR GEORGE (?-1671). An English admiral. He was knighted by Charles I, but held no command until 1646. Two years later, the neutrality which the navy had preserved while the Civil War raged on land terminated, and a large part of the fleet set sail for Holland. It was chiefly the influence of Ayscue, who sided with Parliament, that prevented the remainder of the fleet from leaving the English coast, and his services were rewarded by an appointment as admiral. In this capacity he reduced Barbadoes (after a stubborn resistance by the Royalist Governor, Willoughby), Antigua, Nevis, St. Christopher, and the settlements on the Virginia coast (1651). During the following years he was engaged in repeated naval conflicts with the Dutch under Tromp and Ruyter. In 1666 his flagship, the *Royal Prince*, ran aground and was captured. He himself was seized and carried to Holland, where he was paraded through the towns and exhibited to the populace. He returned to England in 1667.

AYSHA. See **AYESHAIL**.

AYTON, ā'ton, SIR ROBERT (1570-1638). A Scottish poet. He was born at the castle of Kinaldie, Fifeshire, and was educated at St. Andrews, where he took the degree of M.A. in 1588. From France, where he went for study, he addressed, in 1603, a panegyric in Latin hexameters to James I. This poem, intended for a somewhat pedantic king, was the making of Ayton's fortune, for he was soon appointed one of the gentlemen of the bedchamber and private secretary to the Queen. These honors were continued by Charles I. Ayton was on terms of familiarity with the most eminent men of his time, poets, wits, and philosophers alike, among them Hobbes and Ben Jonson. He was a poet of slight merit. He has, however, the distinction of being one of the first Scotchmen to write in the English of the court. To him have been without good evidence attributed the originals of two songs by Burns, one of which is "Auld Lang Syne." He died in Whitehall Palace in 1638. Consult Rogers, *Poems*, with memoir (Edinburgh, 1871).

AYTOUN, ā'tūn, WILLIAM EDMONSTOUNE (1813-65). A Scottish poet, born in Edinburgh, June 21, 1813. He received his education at the university there, and was called to the Scottish bar in 1840. In 1845 he was appointed professor of rhetoric and belles-lettres in the University of Edinburgh, and after the formation of the Derby ministry in 1852 he was promoted to the shrievalty of Orkney. He married a daughter of John Wilson. During many years Aytoun devoted himself to literary work. His first important work was *The Life and Times of Richard I* (1840)—a subject well treated and singularly in consonance with his romantic na-

ture. He was also a master of caricature and parody, and many of the *Bon Gaultier Ballads* were from his pen. In 1848 he published the popular *Lays of the Scottish Cavaliers and Other Poems*, which established his reputation as a poet of the school of Scott, and were regarded as offsetting the Puritan ballad poetry of Macaulay. Among his subsequent writings are: *Firmilian: A Spasmodic Tragedy* (1854), and *Bothwell* (1856), a narrative poem of considerable length, in the measure and manner of Scott. His edition of the *Scottish Ballads* (2 vols.) appeared in 1858. In the following year he issued, in conjunction with Sir Theodore Martin, translations of various minor poems of Goethe. He was for many years one of the most frequent and brilliant contributors to *Blackwood's Magazine*. Aytoun was distinguished at once as poet and humorist. His poems exhibit a ballad-like simplicity and a fiery flow of narration, while his tales—the best known and appreciated of which are *The Glenmutchkin Railway* and *How I Became a Yeoman*—possess a certain robust humor and farcical abandonment which made them widely popular. Aytoun died Aug. 4, 1865. His life was written by Sir Theodore Martin (London, 1867).

AYUB KHAN, ʾy-ʾoḥbʾkân (1855–). The youngest son of Shere Ali, Ameer of Afghanistan. He was Governor of Herat under his father and his brother, Yakub. After Yakub's abdication he actively opposed the English, and on July 27, 1880, he overwhelmed General Burrows's command at Kushk-i-Nakhud, after which he laid siege to Kandahar. General Roberts hastened from Kabul, performing a memorable march, to relieve Kandahar, and on September 1 dispersed the forces of Ayub Khan, who fell back on Herat. In 1881 Ayub Khan captured Kandahar, but he was unable to maintain himself against the new Ameer, Abd-ur-Rahman. After the loss of Herat he went to Persia, where he was under the espionage of the Persian government, acting for the English. During the insurrection of the Ghilzais, in 1887, he formed a conspiracy to capture Herat, but was detected and again driven into exile. Becoming dissatisfied with his wandering existence in Persia, he at last handed himself over to the British agent at Meshed, whereupon the government provided for him as a state prisoner at Rawal-Pindi, in the Punjab.

AYUNTAMIENTO, á-yoon'tá-myán'tó (Sp. from *yuntar*, Lat. *iungere*, to join; cf. *junta*). The name given to communal councils in Spain. Villages of less than 30 inhabitants combine with others of the neighborhood and elect a common council; its number varies from 4 to 48, depending on the size and importance of the community; the members are elected by manhood suffrage and hold office for four years. Every two years the terms of half the members expire. They choose from among their number the *Alcalde*, or mayor, and his subordinates the *tenientes* and control the disbursal of communal revenues as well as the direction of all purely municipal affairs. As a rule, the councils are not free from the interference of the central government. The Ayuntamiento is a very ancient institution, probably dating from Roman times. It gained great prominence in the wars against the Moors, but after an unsuccessful uprising against Charles I in 1521, it lost most of its powers. These were further curtailed under the

Bourbons, and in 1815 they were abolished by Ferdinand VIII, only to be re-established by the Cortes in 1821. For the next 50 years their power varied with the party in power, but in 1877 they assumed the position which they occupy to-day.

AYUTHIA, á-yoot'hé-á. A city of Siam on an island in the Menam, about 45 miles north of Bangkok (Map: Siam, D 4). The river is broken up into a network of creeks to whose banks are moored the floating houses in which most of the inhabitants live. Pop., about 50,000. Ayuthia is the chief town of the important agricultural monthon (circle or division) of Krung-Kao and is situated on the main line of the state railway. Its trade consists chiefly in large shipments of paddy to Bangkok and imports therefrom of clothing and other supplies. Founded in 1351, it was the capital of Siam until 1767. The old city is now largely in ruins, which possess great archaeological interest; overgrown with vegetation may be discerned bronze statues, sculptured masses, and the remains of palaces, pagodas, temples, and fortifications. In the days of its glory it was 9 miles in circumference, and within its walls were different quarters, in which dwelt foreigners, who came for trade from many countries—Chinese, Malays, Portuguese, Japanese, and various Asiatics. The most conspicuous structure, built in the form of a pyramid and surmounted by a domed spire, is called the "Golden Mount." Ayuthia was destroyed by the Burmese in 1555 and again in 1767. It was also the scene of the missionary labors of the Portuguese, and of a bloody battle between the Dutch and the English—one of the incidents which led to the naval wars of the seventeenth century.

AYVAZOVSKI, ʾvâ-zôf'skê, IVAN KONSTANTINOVITCH. See AIVAZOVSKI.

AYYUB IBN SHADI, áy-yoḥbʾ b'n shâ'dê (?-1173). The father of Saladin. He was a Kurd and a member of the tribe of Rawadiya. With his two sons he went to Bagdad and thence to Tikrit, which he made his home, and where his body lies in an elaborate tomb surmounted by a cupola. He won high military rank in Syria and Mesopotamia and lived to see his famous son subjugate the Fatimides and establish the Ayyubid Dynasty in Egypt and Syria. This dynasty was called after him, as that established by Mu'niya was named after Ummaya and the one founded by Ibrahim ibn al Aghlab was called the Aghlabid Dynasty. That Ayyub, who came with other members of the family to Egypt after Saladin had overthrown the last Fatimid ruler, exercised considerable influence, is shown by the story Ibn Athir tells concerning his public advice in the council to submit to Nureddin, and his private counsel to his son afterward to resist the ruler of Aleppo. See NUREDDIN-MAHMUD.

AZALEA (Gk. ἀζαλέος, *azaleos*, dry, so called because supposed to grow best in dry ground). A genus of plants belonging to the family Ericaceæ (heath family). Some botanists unite the genus *Azalca* to *Rhododendron*. One of the species best deserving of notice is *Azalea pontica*, a shrub from 3 to 5 feet high, a native of the countries around the Black Sea, with large obovate or oblong, lanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands

and are very fragrant. It covers many mountain slopes, but does not ascend to great elevations, giving place to the more alpine *Rhododendron ponticum*. It is common in gardens and shrubberies in Great Britain, and varies with orange, red, and almost white flowers. The whole plant is narcotic and poisonous. North America abounds in azaleas as well as in rhododendrons, and some of the species have been long cultivated in Great Britain, particularly *Azalea nudiflora* and *Azalea viscosa*, which, with *Azalea pontica*, have become the parents of many hybrids. The former has pink, the latter pure white flowers, of delightful fragrance. *Azalea viscosa* has the flowers covered with glutinous hairs like *Azalea pontica*; but the flowers of *Azalea nudiflora* are nearly destitute of them. Both species abound from Canada to the southern parts of the United States (the latter is sometimes known by the common name of honeysuckle). *Azalea arborescens*, a mountainous species, from 3 to 10 feet high, has large rose-colored flowers. *Azalea calendulacea*, a native of the southern parts of the United States, is described as frequently clothing the mountains with a robe of living scarlet. India and China produce several species of azalea, of which one of the finest is *Azalea indica*, well known as a greenhouse shrub. Its flowers exhibit great brilliancy of colors. Many hybrids exist between it and the more hardy species. Another extremely beautiful species is *Azalea liliflora*, an evergreen introduced from China. The wholesale propagation of azalea plants for winter forcing in greenhouses is an important industry in Holland, Belgium, and parts of Germany.

AZANA. See AIZANI.

AZANCHEVSKY, á'zán-chyé'ské, MICHAEL VON (1839-81). A Russian composer. He was born in Moscow, studied under Richter and Hauptmann at Leipzig, and was director of the Conservatory at St. Petersburg from 1870 to 1876. He was the owner of a noteworthy musical library and was an acknowledged authority in general music. Among his many compositions are a *Sonata in B Minor* for pianoforte and violoncello; a *Fest Polonaise*, for two pianofortes; two trios; two quartets; the Twelfth Psalm; and a concert overture.

AZARA, á-thá'rá, FELIX DE (1746-1811). A Spanish soldier, naturalist, and traveler. He was born at Barbuñales, in Aragon, was educated at the universities of Huesca and Barcelona, obtained a commission in the Spanish army, and rose to the rank of brigadier-general. He was severely wounded in the attack upon Algiers. In 1781 he was appointed one of the commissioners for fixing the boundaries of the Spanish and Portuguese possessions in South America. He did not return to Spain till 1801, when he published an account of his travels in his *Voyage dans l'Amérique méridionale* (1809), and an important work on quadrupeds and birds, under the modest title of *Notes on the Natural History of Paraguay and La Plata* (1802). His *Geografía Física y Esférica de las provincias del Paraguay y Misiones guaraníes*, composed in 1790, remained inedited in the National Library of Montevideo until published by Dr. R. R. Schuller in 1904. Consult also LUIS MARIA TORRES, *Les études géographiques et historiques de Félix d'Azara* (Buenos Ayres, 1905).

AZARA, JOSÉ, NICOLÁS DE (1731-1804). A Spanish diplomat, born at Barbuñales, Aragon, a

brother of Felix de Azara. He studied at the universities of Huesca and Salamanca, and in 1765 was appointed Spanish envoy at the papal court. Here he exercised a very considerable influence, and was concerned with the suppression of the Jesuit Order in 1773 and with the election of Pius VI. Subsequently he was sent on missions to Paris and Barcelona. He was known as a patron of art, edited the works of his friend Mengs, with a biography (1780), and translated (1792) Middleton's *Life of Cicero*. Consult Paul Besques, "La première ambassade de D. José Nicolas de Azara à Paris (mars, 1798-août, 1799)" in *Bulletin hispanique*, vol. iii (1901). Consult also J. Gómez de Arteche, "Reinado de Carlos IV," in the *Historia General de España*, published by the Royal Academy of History (Madrid, 1892).

AZARA'S DOG (or **FOX**). See FOX-DOG.
AZ/ARI/AH (Heb. Yahwe helps). The name of a number of biblical personages, no less than 24 being found. (1) One of these is Azariah the son of Oded, a prophet who, by his exhortation of Asa, King of Judah, is said to have brought about a religious reform (2 Chron. xv. 1-8). Of the same name were at least four high priests at various times, living (2) in the reign of Solomon (1 Kings iv. 2); (3) in the reign of Asa (1 Chron. vi. 10); (4) in the reign of Uzziah (2 Chron. xxvi. 16-20); (5) in the reign of Hezekiah (2 Chron. xxxi. 10). (6) Azariah, of the tribe of Ephraim, was one of four who sided with the prophet Oded when he preached against the Israelites for attempting to make captives of Judah (2 Chron. xxviii. 12). (7) Azariah is the name most frequently used in Kings of Uzziah (q.v.). (8) Azariah, also called Abednego, was one of the three men thrown into the fiery furnace (Dan. i. 11). In addition to these persons mentioned in the Bible, the Assyrian King Tiglath-pileser IV (745-728) refers in an inscription to an Azriyau or Azariah of Yaudi who was long supposed to be identical with the King of Judah known also as Uzziah. It is now held, however, by most scholars that this Azariah ruled over the N. Syrian Yaudi known to us through the Zenjirli inscriptions.

AZAROLE, áz'a-ról. See CRATÆGUS.

AZAZEL, áz'a-zél'. A name occurring in connection with the services on the Day of Atonement (Lev. xvi. 8, 10, 26). Two goats were taken by the high priest, one of which was slaughtered, and the other, after the sins of all Israel had been confessed over its head, was led out by some one to the wilderness and thrown over the rocks. The symbolism conveyed by the act is evident. All the sins of the people were handed over to Azazel. This name appears in later writings as the chief of the angels who married human beings and begat of them wicked men (Gen. vi.). In Enoch x. 8 Azazel causes all sin; in lxix. 2 he appears as the last of the 21 angels; in the Sibylline Oracles, ii, 215, the same angel is referred to as Azael. The name means 'God is strong.' Azazel was bound by angels and laid in the desert, at a place, Dudacl, identified by Schick with Bet-hudedun, a chalky cliff near Jerusalem, to await his punishment. It appears that the rite of Azazel is a remnant of an ancient demon-worship, which was changed and modified for the purposes of the Levitical writers.

AZCARRAGA Y PALMERO, áth'ká-rá'gá ē pāl-má'ró, MARCELO DE (1832-). A Span-

ish general and statesman, born in Manila. He received a military education at Madrid, and participated in the movement which established Alfonso XII on the throne (1874). As Under-Secretary in the Ministry of War he distinguished himself by his admirable organization of the Cuban forces. He became lieutenant-general, and after sitting in the first Chamber of Deputies under Alfonso XII was made a life Senator. He was Minister of War under Cánovas del Castillo in 1890-92 and 1895-97 and after the assassination of Cánovas in the latter year (August 8) was head of the cabinet till September 30. He was Minister of War under Silvela in 1899-1900, and Premier again from October of the latter year till February, 1901, and from December, 1904, to January, 1905. In 1909 he was President of the Senate. In 1871 he wrote *La libertad de comercio en las Islas Filipinas*, followed by other books on the subject of Spanish colonies. He was admitted to the Order of the Golden Fleece, received the collar of the Order of Carlos III, and was made a Knight Grand Cross of several other Spanish and foreign orders.

AZEGLIO, ád-zá'lyó, MASSIMO TAPARELLI, MARCHESE D' (1798-1866). An Italian statesman, author, and artist, the descendant of an ancient and noble Piedmontese family. He early went to Rome and devoted himself to art, winning a reputation in landscape and historical painting. After his father's death, in 1830, he went to Milan and married a daughter of Manzoni. Soon afterward he made his début in literature with the richly colored patriotic novels *Ettore Fieramosca* (1833) and *Niccolò de' Lapi* (1841); Fanfulla, one of D'Azeglio's burlesque characters, has become a proverbial type in Italy. The political affairs of Italy called forth his famous attack upon the papal government, *Degli ultimi casi di Romagna*, in which he urged upon the Italian princes the necessity of a national policy. After the election of Pope Pius IX, D'Azeglio went to Rome, and to him are to some extent ascribed the reforms with which Pius began his government. In the excitement that preceded 1848, he published *Il lutto di Lombardia*, and later took part in the campaign against Austria, both in Lombardy and in Venetia, and was severely wounded at the battle of Vicenza. He felt bitterly the failure of this war and vented his feelings in many polemical articles. On the opening of the Sardinian Parliament he was chosen a member of the Chamber of Deputies, and, after the unfortunate battle of Novara, March 23, 1849, was intrusted by Victor Emmanuel II with the task of forming a ministry. His careful and shrewd policy, especially toward France, dubbed by his enemies that of *playing 'possum* (*far il morto*) won him at the time as many enemies as later it gained him admirers. His unpopularity led in 1852 to the succession of Cavour, who was supported with great loyalty by D'Azeglio, in various foreign posts and with personal advice. At the close of the war, in 1859, D'Azeglio was appointed pro tempore general and commissioner extraordinary (purely military) for the Roman States. D'Azeglio's spiritual evolution has been discerningly outlined by De Sanctis in *Nuovi saggi critici* (Naples, 1898). A character noted for its poise and disinterestedness, D'Azeglio believed that Italian liberty must be accomplished by a series of orderly and progressive steps, for which he worked with a moderation equaled only

by his tenacity. He distrusted the more radical notions of the revolutionists and centred his whole policy simply on the expulsion of the foreigner. When independence was accomplished, he felt that his own work was done. He has left a charming story of his own life in *I miei ricordi* (Florence, 1873). Since his death, *L'Italie de 1847 à 1865: correspondance politique de Massimo d'Azeglio* (1866), and other writings have appeared. Consult other biographies by Camerini (Turin, 1861); Giuliani (Florence, 1866); Massari (Turin, 1867); Morozzo (Florence, 1884); also Visnara, *Bibliografia di Massimo d'Azeglio* (Milan, 1878); Déjob, *Un homme d'état spirituel et chevaleresque* (Paris, 1894); and Constance D'Azeglio, *Souvenirs historiques de M. D'A.* (Turin, 1884). Translations: *Ettore Fieramosca, The Challenge of Barletta* (anon., New York, 1850); *ib.*, by C. E. Lester (New York, 1845); *Ricordi*, by Maffei (London, 1868), and in Warner's *Library of the World's Best Literature*; *Niccolò de' Lapi*, by H. Hallet (New York, 1860).

AZERBAIJAN, ä'zër-bî-jân' (anciently, *Atropatene*). (See ATROPATENE.) The most northerly province of Persia, bounded on the south by Persian Kurdistan and Irak, east by Ghilan and the Caspian Sea, north by Russian Armenia, and west by Turkish Armenia and Turkish Kurdistan (Map: Persia, B 2). It has an area of about 40,000 square miles. The surface of Azerbaijan is very mountainous, many of the ranges rising from 7000 to 9000 feet in height. The peak of Savalan (an extinct volcano) reaches an elevation of 13,000 feet. Mount Ararat rises on the northwest border. The chief rivers are the Aras or Araxes, Kara-Su, and the Kizil-Uzen. The salt lake Urumiah, the largest in Persia, is situated in the western part of the province. The climate is not unhealthful, but is very unsteady. The principal products are grain, fruit, flax, hemp, cotton, tobacco, honey, and saffron. The province is very rich in minerals, and especially in marbles. Silver, lead, tin, copper, iron, coal, and oil are found. The population of the province is estimated between 1,500,000 and 2,000,000. The bulk of the natives are physically of the type of the Persians of the Teheran-Ispahan country, but speak a dialect of Turkish. The capital is Tabriz. For further description, see CAUCASIAN; TATARS.

AZEVEDO, ä'zá-vá'dó, MANOEL ANTONIO ALVARES DE (1831-52). A Brazilian poet, born at São Paulo. He studied law at the university there, and afterward published a volume of poems entitled *Lyra dos vinte annos* (5th ed., 1884), which consists chiefly of elegies and displays a high degree of talent. His *Obras* were first published in 1853; the *Obras completas* which appeared in three volumes in 1863, include, besides poems, a biographical notice by J. Monteiro, prose writings, and the dramatic sketches *Bohemios*, *Macario*, and *Noite na taverna*. Consult F. Wolf, *Le Brésil littéraire* (Berlin, 1863).

AZEVEDO Y ZUNIGA, ä'thá-vá'dó é thow'-nyé-gá, GASPARD DE, COUNT OF MONTEREY (1540-1606). Viceroy of Mexico and Peru (1595-1603). He sent out several expeditions in California and New Mexico for exploration and settlement. Monterey, founded in 1596, and the Bay of Monterey, were named in his honor.

AZILIAN. See PALEOLITHIC PERIOD.

AZIMUTH (Fr. *azimut*, from Ar. *as-sumut*, a way, or point in the horizon). In astronomy,

the azimuth of a heavenly body is the angle measured along the horizon between the north or south point, and the point where a circle passing through the zenith and the body cuts the horizon. Astronomers usually measure astronomical azimuth westward from the beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the north pole is elevated, the azimuth is measured from the south point, so that the east point, for instance, has an azimuth of 270°. Navigators and surveyors generally reckon azimuth from the nearest principal point of the compass. Thus, W. 24° S. would mean an azimuth 24° from west in the direction of south; and astronomically this would be simply 66°. See AMPLITUDE.

AZINCOURT, á-zân'kōōr'. See AGINCOURT.

AZOBENZENE, $C_6H_5.N=N.C_6H_5$. A valuable compound of carbon, hydrogen, and nitrogen. It is a red, crystalline substance, insoluble in water, but soluble in alcohol or in ether. When pure, it melts at 68° C. and boils, without being decomposed, at 293° C. It may be prepared by treating nitro-benzene with a solution of stannous chloride in soda, the precipitate thus produced being washed with water and recrystallized from petroleum-ether. By the reducing action of tin and concentrated hydrochloric acid, azobenzene is converted into the substance called benzidine ($NH_2.C_6H_4.C_6H_4.NH_2$), which is extensively used in making the so-called azo dyes. See COAL-TAR COLORS.

AZ/O COL'ORS. See COAL-TAR COLORS.

AZOIC, á-zō'ik (Gk. *ázōos*, *azōos*, lifeless, from *á*, *a*, priv. + *ζωή*, *zōē*, life). A name applied by Sir Roderick Murchison, in 1845, to the old crystalline rocks of the Scandinavian Peninsula, in recognition of the fact that they contain no traces of organic life. Later the name was adopted by both European and American geologists to designate similar rocks that lie at the bottom of the geological column beneath all the fossiliferous rocks of the earth's crust. Eventually a conflict arose between the advocates of the name "azoic" and those who preferred the term "primitive," the conflict being over the theories of origin involved in these names rather than in the use of the names themselves. With a view to terminating this discussion, J. D. Dana proposed, in 1872, the name "archæan," thus avoiding all theory of origin, with the result that the terms "azoic" and "primitive" shortly ceased to be applied by the leading geologists to rock formations. Azoic is, however, still employed in another sense (Dana's *Manual of Geology*, 4th ed., New York, 1896, p. 440), being applied to the second "æon" or great period of time, without organic life, through which the earth passed before the advent of those conditions that permitted the growth of living matter. Rocks of this æon have not as yet been definitely recognized in the earth's crust. For the description of the rocks originally considered as azoic, the reader is referred to the article on PRE-CAMBRIAN FORMATIONS; also to ALGONKIAN SYSTEM; and ARCHEAN SYSTEM.

AZORES, á-zōrz' (Portug. *Açores*, so called from *açores*, hawks, found there). A group of islands in the Atlantic Ocean, whose nearest point is 830 miles west of Portugal, to which they belong (Map: Africa, B 1). They extend over 400 miles from about lat. 37° to 40° N. and from long. 25° to 31° 16' W. and occupy an area of 922 square miles. Excluding the uninhabited reefs, the group numbers nine islands,

divided into three sub-groups—the southeastern, consisting of the islands of São Miguel, or St. Michael's (297 square miles), and Santa Maria, with Formigas (40 square miles); the central group, embracing the islands of Pico (176 square miles), Terceira (223 square miles), São Jorge (40 square miles), Fayal (64 square miles), and Graciosa (18 square miles); and the northwestern group, consisting of Flores (57 square miles) and Corvo (7 square miles). The entire archipelago is of volcanic origin and very mountainous, the highest volcanic summit being Pico Alto (7612 feet) on the island of Pico. The volcanic origin of the islands is shown by the large number of hot springs scattered all over the group, and by the earthquakes from which the islands have suffered even in comparatively recent times. Streams are abundant. The climate is mild, and snow is seldom seen. The highest temperature is about 86°, but the humidity is often excessive. The islands are popular as a winter resort. The flora resembles that of Spain; of the 478 species found in the islands, 400 are of European origin. The native fauna is limited to the bat and several rodents.

The soil is very fertile, and the mild climate allows of the cultivation of tropical fruits, such as olives, oranges, grapes, and bananas. Agriculture is greatly impeded by the unequal distribution of land, and the emigration of the landless population to British Guiana, West Indies, and South America is steadily increasing. A considerable trade in fruit is carried on with Portugal, England, Brazil, and North America. Oranges, formerly the chief article of export, are now gradually being replaced by pineapples. Imports come chiefly from Great Britain. There are only a few safe harbors, the chief among which is that of Angra, the capital of the archipelago, on the island of Terceira. Administratively the archipelago is considered a province of Portugal and is divided into the three districts of Angra do Heroísmo, Horta, and Ponta Delgada. The population (242,613 in 1911) is mainly of Portuguese origin with Moorish and Flemish admixtures. The remainder are negroes, mulattoes, and some settlers from Great Britain.

The discovery of Phœnician coins on the Island of Corvo would indicate that the Azores were visited by Carthaginian traders. They appear on the maps of the mediæval Arabian geographers, and on an Italian map of 1351. They were occupied by the Portuguese under Gonçalo Velho Cabral and others between 1431 and 1461 and were, before that time, uninhabited. In 1466 Alfonso V made a life grant of the island of Fayal to his aunt, the Duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders. During the next century the islands became a favorite stopping place for the Spanish fleets on their return from America, and in the neighboring waters several sharp encounters took place between the Spaniards and the English sea-rovers. Consult Ray, *The Azores* (Washington, 1892); Brown, *Madeira, Canary Islands and Azores* (Madeira, 1910).

AZ'OTH (Ar. *al*, the + *zāū*, Pers. *zhiwakh*, quicksilver). The panacea of Paracelsus, regarded by his followers as "the tincture of life." See PARACELSUS.

AZ'OTIN (Fr. *azote*, nitrogen, from Gk. *á*, *a*, priv. + *ζῆν*, *zēn*, to live). A nitrogenous

fertilizer prepared from meat refuse, practically identical with ammonite. See MANURES and MANURING.

AZOTURIA. A disease of the horse, also known as azotemia, hemoglobinemia, hemoglobinuria, etc. It is characterized by the loss of control of the hind limbs and the passage of ropy, dark, or coffee-colored urine.

The disease almost always occurs in horses which have rested for a day or more, during which time they have been kept on full rations. It is never seen at pasture and rarely under constant work, though the feeding be high. The attack is usually precipitated by taking the horse from the stable and subjecting it to exercise or work. Usually after being driven for half a mile or more the horse suddenly commences to stagger in the hind parts, the feet being raised only slightly from the ground, it knuckles at the pastern, perspires profusely, finally collapses, and cannot get up. When down, the body and limbs are moved convulsively, the pulse and breathing are accelerated, the excitement causes the temperature to rise to 102°-103° F. and the mucous membranes are congested.

The disease can be diagnosed with certainty only by the presence of its two cardinal symptoms: (1) the peculiar muscular affection, and (2) the hemoglobinuria. The affection may be mistaken for spinal meningitis, colic, and fractures, from which it must be differentiated.

While there are several theories as to the cause of the disease, the most tenable seems to be that of an autointoxication. It is believed that, during the functioning of previously rested muscles or in muscles which have worked to excessive exertion, some substance is formed which exerts a toxic action.

The affected animals are generally very uneasy, and in order to prevent further injury to the head and feet chloral hydrate is administered to quiet them. The disease may end fatally in a few hours or days, or recovery may follow, being usually more speedy and perfect if it has set in at an early stage.

Remedial measures which have been recommended include venesection, followed by the injection of a normal salt solution, administration of cathartics, cardiac stimulants, potassium iodide, fomentations of warm water over the loins, electricity to the affected muscles, etc. Attacks may be prevented by regular work or exercise and by the reduction of the grain feed when at rest.

AZOTUS. Same as Ashdod (q.v.).

AZOV, á'zôf. A fortified town and seaport in the Russian territory of the Don Cossacks, on the left bank of the river Don, about 25 miles east of Rostov, and within 5 or 6 miles of the Sea of Azov (Map: Russia, G 5). The principal industries are fishing and gardening. It carries on an extensive trade in grain, serving as an outlet for the southeastern part of Russia. Pop., in 1885, 16,600; in 1913, about 27,000. The flourishing trading colony of the Greeks, Tanaïs, on or very near the present site of Azov, was conquered by Mithridates (115 B.C.). Then it fell under the successive rule of the Sarmatians, Huns, Khazars, and the Petchenegs. In the tenth century it was captured by the Russian prince Vladimir I. When in the thirteenth century it was taken by the Genoese, Azov became the commercial centre and entrepôt for the Indo-Chinese trade, and the Genoese forti-

fied it by high walls and towers. In 1395 Tamerlane took the town and sacked it. In 1471 the Turks conquered it and called it and the neighboring sea Asak. The closing of the Black Sea by the Turks to all navigation, followed by the discovery of the sea route to India, brought about the speedy decline of the town. In 1696 Peter the Great took it. Captured later more than once by the Turks, it was finally ceded to Russia in 1774, by the Treaty of Kutchuk-Kainardji. In 1855 it was bombarded and greatly injured by an allied English and French squadron.

AZOV, SEA OF. A large gulf of the Black Sea, connected with it by the Strait of Kertch and inclosed by Russian territory (Map: Russia, G 5). Its greatest length is about 200 miles, its average width about 90 miles, and its area is 14,666 square miles of which islands cover 42 square miles. At its northeast extremity it becomes narrow and forms the Gulf of Taganrog. It has some islands, of which Berusch Island is the largest. The shores are mostly low and sandy, with only here and there, especially on the south, a short strip of rocks. Its waters contain very little salt—so little, indeed, that in the neighborhood of Taganrog it is used for drinking. The waters are freshened by the Don and four smaller rivers that empty into it. It is very shallow and but poorly adapted for navigation. The three ports on its shores are Taganrog, Mariupol, and Berdiansk, annually visited by about 2700 vessels, with a tonnage of about 500,000. The sea is remarkably rich in fish. A narrow strip of the sea on the west, cut off from the main body by a long tongue of land and bordering on the Crimea, is called Sivash, or 'Putrid Sea.'

AZPÉITIA, ás-pá'é-syá, Castilian Sp. pron. áth-pá'é-tyá. A district town in the Spanish province of Guipúzcoa, situated on the Urola, a short distance from San Sebastian. It contains interesting remains of ancient buildings, has mineral springs, and a short distance to the west, on the road to Azcoitia, is situated the Loyola Monastery, occupying the site of the house in which the founder of the Society of Jesus, St. Ignatius of Loyola (1491-1556), is said to have been born. Pop., 1900, 6066; 1910, 6692.

AZRAEL, áz-rá-él (Heb. help of God). In Mohammedan belief, Azrael, also called Izrail, is the angel of death (Koran, surah xxxii, 11), and is often called Malak-al-Maut. It is he who separates the soul from the body, doing this gently or harshly, as the case may be. When a man has been God-fearing, the soul leaves as gently as water from a bag; but the soul of an infidel is drawn out as a hot spit out of wet wool. The angel of death figures also in Jewish literature.

AZTEC (from Nahuatl *aztlan*, place of the heron, or the 'Heron' clan). A name frequently used to designate all the ancient semi-civilized tribes of Nahuatlan stock in central and southern Mexico, but properly applying only to a small group of seven cognate tribes occupying the valley of Mexico and its immediate vicinity. According to tradition they had migrated together from the north. The principal tribe fixed its capital at Tenochtitlan, now the City of Mexico, and by successive wars of conquest gradually acquired dominion over nearly all the tribes of southern Mexico, thus building up the Mexican Empire; which flourished for perhaps

two centuries until overthrown by Cortés in 1521. Although possessed of a high degree of culture, perhaps, derived from their predecessors in the country, the Aztecs were distinguished for their cruelty and the bloody character of their religious rites. Some of their descendants, still retaining their ancient language, reside in outlying villages in the neighborhood of the City of Mexico. See CORTÉS; MEXICO; MONTEZUMA; NAHUATLAN STOCK.

AZTEC CLUB OF 1847. A society formed to cherish the memories and traditions of the Mexican War. The club was founded in the City of Mexico, in 1847. Membership proceeds by primogeniture. The members number about 225.

AZUA, á-sûo'a, or **AZUA DE COMPOSTELLA**, dà kôm'pô-stêl'yâ. A town in Santo Domingo, in the island of Haiti, on the Bia River, 4 miles from Ocoa Bay, and 60 miles west of the city of Santo Domingo (Map: West Indies, E 3). It has sulphur springs, salt and asphalt deposits, extensive sugar plantations, and the horses of the neighborhood are greatly prized. The province of Azua affords excellent grazing land and abounds in mineral springs. Its population in 1900 was about 50,000. Pop., 2000.

AZUAY, ä'sûo-ä'. A province in the southwestern part of Ecuador, with an area of about 11,150 square miles. The surface is mountainous. Agriculture, cattle raising, weaving, and the making of pottery are the chief occupations of the inhabitants, who are mostly Indians. The cinchona tree is found in abundance on the mountain slopes. Pop., 132,400. Capital, Cuenca.

AZULEJO, ä'thûo-lä'üô (Sp. *azul*, blue; see AZURE). The name given, on account of its prevailing color, to a kind of painted glazed tile made originally by Mohammedan artists in Persia, Egypt, Spain, etc., and used for the decoration of wall surfaces. (See TILES.) Some patterns were repeated century after century, and the Spaniards, who inherited the art of making them from the Moors, modified the designs and colors so slightly that it is not always easy to distinguish a Renaissance from an early mediæval Spanish tile.

AZUNI, äd-zûo'nâ, DOMENICO ALBERTO (1749-1827). A distinguished Italian jurist and historian, born at Sassari, in the island of Sardinia. In his youth he began the study of law, devoting himself particularly to the maritime relationships of nations, on which he became a great authority. He was judge of the tribunal of commerce at Nice when that city was occupied by the French in 1792, and then retired to Florence, where in 1795 he published his *Sistema universale dei principi del diritto marittimo dell'Europa*, which appeared afterward in French as *Droit maritime de l'Europe* (trans. by J. M. Digéon, Paris, 1797), and in an English translation by William Johnson (New York, 1806). He was summoned to Paris to act as one of the commissioners for compiling the new commercial code, and in 1807 was appointed president of the court of appeal at Genoa. After the downfall of Napoleon he was made judge of the tribunal at Cagliari, and director of the university library. He also published the following: *Dizionario universale ragionato della giurisprudenza mercantile* (1786-88); *Histoire géographique, politique et naturelle de la Sardaigne* (1802).

AZURE (OF. *azur*, ML. *lazurius*, also *azura* with the loss of *l* due to confusion with the

article; from Pers. *lazward*, azure, *lājaward*, lapis lazuli). The name for blue in heraldry and hence also the blue color in coats of arms.

AZURINE (from the azure color). A variety of one of the European chubs or roach, the rudd, distinguished from the type by the slate-blue color of the back, the silvery white of the abdomen, the whiteness of the fins, and the fact that the iris of the eye is tinged with pale straw color, instead of the red of the rudd or "red-eye." Hence it is frequently called "blue roach," and is known in science as *Luciscus erythrophthalmus*, variety *cæruleus*. It is an inhabitant of the Swiss lakes and of the streams of the continent of Europe generally; and is said to have been introduced into Great Britain by Yarrell. It does not exceed a pound in weight, but is hardy, furnishes good sport for the angler, and breeds readily; nevertheless it has not spread far from Knowsley, the seat of the Earl of Derby, in whose park it was first acclimated. Its flesh is firm and of good flavor. See ROACH.

AZURITE (from its azure color). A basic copper carbonate, containing about 55 per cent of copper and crystallizing in the monoclinic system. It differs in composition from malachite only by containing more carbonic acid and less water. Azurite occurs in sharply defined crystals of a rich dark blue color and in columnar masses and velvet-like incrustations. It is usually found with malachite and other ores of copper, and the specimens from Chessy, near Lyons, France, are noted for their fine crystallization and are called *chessylite*. The azurite from Siberia is frequently cut in Russia into thin slabs and used as veneering for table tops and the like. Crystals of azurite, found in Arizona, are highly regarded as gems, although they are too small to be extensively used and too soft to wear well. Azurite is a valuable ore of copper; it occurs in great quantities in some of the Arizona mines, where it is actively wrought. In the Clifton district it is found in limestone and is accompanied by other ores of copper, including malachite, cuprite, melanconite, and native copper, and by limonite. The Copper Queen Mine in the Bisbee district has produced solid masses of azurite and malachite weighing several tons. The mineral in all cases is probably to be regarded as of secondary origin; i.e., it has been derived from other copper minerals by the natural processes of oxidation and hydration. The original sources of material are copper sulphides, which are still found in the deeper portions of the mines where the weathering agencies have not penetrated. Azurite has also been used as a pigment.

AZYGOS (Gk. *ἄζυγος*, *azygos*, unwedded, not paired, from *ἀ*, *a*, priv. + *ζυγόν*, *zygon*, yoke). A term used in medicine to describe a part or a structure which has no fellow of the opposite side of the body, as the sphenoid bone, certain single veins and arteries. The word is also applied to the muscle of the uvula, which was named the *azygos uvulae* under the mistaken idea that it was a single muscle with two origins, viz., at the posterior nasal spines of the palate bone, and running thence to the tip of the uvula. It is now known that these muscles occur in pairs. Their function is to raise the uvula. This pair is sometimes called the *azygos Morgagni*.

AZYMITES (*ä*, *a*, priv. + *ζύμη*, *zymē*, leaven). The opprobrious name given by the Eastern to the Western church, arising from the use by the latter, in the Lord's Supper, of unleavened bread. Michael Cærularius, Patriarch

of Constantinople (1043-59), made this one of his counts against the Western church, and ever since it has been so considered. The Western church retorted with "Pro-zymites," also "Fermentarians."

In the "Longer Catechism of the Eastern Church," prepared by Philaret, approved by the Holy Synod in 1839, and constituting the most authoritative doctrinal standard of the Orthodox Græco-Russian church, question 328 is: "Of what kind should be the bread for the Sacrament?" and the answer is: "Such as the name itself of the bread, the holiness of the Mystery, and the example of Jesus Christ and the Apostles all re-

quire; that is, leavened, pure, wheaten bread" (cf. Schaff, *Creeds of Christendom*, vol. ii, pp. 496).

The exact time when the Western church first employed unleavened bread in the Eucharist to the exclusion of the leavened is undetermined and, perhaps, undeterminable; but surely this use can be traced to the ninth century. The canons of earlier councils, e.g., of the Council of Toledo (693) and of Chelsea (787), upon the bread merely prescribe that it should be a specially prepared loaf, but not that it should be leavened or unleavened. Cf. art. "Elements," in Smith and Cheethan, *Dict. Christ. Antiq.*

B

B The second letter in the Græco-Roman alphabet, and the second in all European alphabets derived from it, except the Russian and others which go back to the mediæval Greek. Though the B has retained its position in the Russian alphabet, it has changed its pronunciation from *b* to *v*, a new symbol having been invented for the *b*-sound. The Græco-Phœnician character had a closed loop, which in the Aramaic alphabets opened out, assuming the shape seen in the square Hebrew and the Arabic letter. There were two complete loops in the Greek form, from which was developed the prevalent cursive form B. According to Flinders Petrie (*The Formation of the Alphabet*, London, 1912), the entirely closed form of the letter B begins as early as the twelfth dynasty in Egypt, continued later in the same country, and became the standard form of both Greece and Italy. The minuscule *b* of our alphabet is from the majuscule Latin of the mediæval manuscripts, of which it is a mere simplification. It is found as early as the first century of our era, scratched on the walls of buildings in Pompeii. In time the upper loop was lost, and the letter assumed practically its present form. (For the history of the minuscule *b*, consult Prou, *Manuel de paléographie*, 3d ed., Paris, 1910, p. 50, and Sir E. M. Thompson, *Introduction to Greek and Latin Palæography*, Oxford, 1912). The Hebrew name for the letter is *beth*, 'a house,' because the original pictographic form was the outline of a house or tent. This word appears as *βῆτα*, *bēta*, in the Greek alphabet, and is retained in our word *alpha-bet*. See ALPHABET; LETTERS.

Phonetic Character. B is the voiced or soft labial explosive. According to certain fixed laws, it may interchange with *p*, *v*, or *f*. (See PHILOLOGY; PHONETICS; GRIMM'S LAW.) Thus, Lat. *bibo*, I drink, Skt. *pib-āmi*, Old Irish *ibim*, Cornish *eve*, Breton *eva*; and Gk. *ἐπίσκοπος*, *episkopos*, bishop, AS. *biscōp*, Fr. *évêque*; again (orig. *bh*) Skt. *bhar-āmi*, I bear, Gk. *φέρω*, *pherō*, Lat. *fero*, Eng. *bear*. In Greek and late Latin *b* was softened to *v*, as is the case in modern Greek to-day. During the classical period of Latin the sound was that which we now have. But later it had the sound of *v*, which in many cases passed into French and Italian; for example, Lat. *habere*, It. *avere*, Fr. *avoir*; and Lat. *tabula*, It. *tavola*. In Spanish *b* has a bilabial sound produced by pronouncing *v* with the lips instead of against the teeth.

Before *s* or *t*, the *b* in Latin was sounded like *p*, as we know from inscriptions where *pleps* is written for *plebs* and *urps* appears for *urbs*. Thus we have *scripsi* for *scrib-si*, and *opsequor* for *ob-sequor*. The letter *b* is silent now in some words of Latin derivation, like *debt*, *doubt*, and also when excrecent, as in *limb* (AS. *lim*), *lamb*, *thumb*, and the like.

As Abbreviation. B is used also as a symbol and in abbreviations. The Greek β denoted 2, and B 2000. In general, it indicates the second of a series, as Company B of a regiment, etc. In chemistry B stands for *boron*, one of the elements. In music B denotes the seventh or "leading" tone of the diatonic scale of C. In nautical language the minuscule *b* signifies a "blue sky." In academic degrees B. is an abbreviation of *Baccalaureus*, *Bachelor*. See ABBREVIATIONS.

BAADER, bá'dēr, BENEDICT FRANZ XAVER VON (1765–1841). A German Roman Catholic theologian and philosopher. He was born in Munich, March 27, 1765, the third son of the court physician to the Elector of Bavaria. His elder brothers were distinguished, Clemens as an author and Joseph as an engineer. Franz studied medicine at Ingolstadt and Vienna, graduating in 1784; assisted his father in medicine, but disliked the profession; studied engineering in the mining districts, and lived five years in England (1791–96), where he became acquainted with rationalistic philosophy, which he thought little less than satanic. The religious speculations of Eckhart, St. Martin, and especially Böhme, were more to his mind. He was a friend of Jacobi, and, for a time, of Schelling. Though deeply interested in philosophy, he kept his engineering practice. On his return from England he was appointed consulting engineer of the Bavarian mines; won the prize of 10,000 gulden for the discovery that Glauber's salt, instead of potash, may be employed in making glass; was ennobled in 1813 for his valuable services, and was superintendent of mines, 1817–20. His first published work was *Fermenta Cognitionis* (Berlin, 1822–24, five parts; sixth part, Leipzig, 1825), in which he combated modern philosophy and recommended that of Böhme. In 1826 he was appointed professor of philosophy and speculative theology in the new University of Munich. Some of his lectures while occupying that chair have been published (*Vorlesungen über spekulative Dogmatik*, Münster, 1828–38). In 1838 he opposed the interference in civil matters of the Roman Catholic church, to which he belonged, for which opposition he was interdicted from

lecturing on the philosophy of religion during the last three years of his life. His criticism of the papacy and his desire to see it abolished no doubt contributed to his being silenced. Baader is considered to have been the greatest speculative Roman Catholic theologian of modern times, and his influence has gone beyond the bounds of his church. He also contrasted Eastern and Western Catholicism, to the detriment of the latter (Stuttgart, 1841); but ere he died he recanted. He died in Munich, May 21, 1841. His works were published in a collected edition (Leipzig, 1851-60, 16 vols.; vol. xv contains his biography, by F. Hoffmann). Consult: J. Claassen, *Franz von Baader's Leben und theosophische Werke als Inbegriff christlicher Philosophie: Vollständiger, wortgetreuer Auszug in geordneten Einzelsätzen* (Stuttgart, 1886-87); Otto Pfeiderer, *The Philosophy of Religion on the Basis of its History*, vol. ii (Eng. trans., London, 1887); for an elaborate article upon his teachings, consult Hoffmann, *Biographie und Briefwechsel* (Leipzig, 1887); Welzer and Welte, *Kirchenlexikon*, vol. i (Freiburg, 1877).

BAAL, bā'al. A word common to the Semitic languages, and signifying 'owner' or 'possessor.' It is applied to the ordinary social conditions. The owner of a house or a field is its *baal*, and similarly the husband is the *baal* to his wife. From such a usage the term came naturally to be applied to the patron deity of a place to whom, in a measure, the place belonged, since he presided over its destinies. This application of Baal is particularly appropriate in the case of people who had reached the agricultural stage, and who would naturally ascribe the ultimate ownership of the fields to the local deity, whose favor was shown by a rich return from the soil. Hence Baal became, among Canaanites and Phœnicians, the general term designating a local deity; and the complement, added to the term, would indicate what particular Baal was meant. Thus we have a Baal of Tyre, of Sidon, of Mount Hermon, of Peor, of Meon, of the Lebanon, etc. Again, a Baal might be distinguished by some special attribute, and this would then be added to the term; as, e.g., Baal-Berith, 'Baal of the Covenant'; and, lastly, we find Baal as a general term for "lord," used as a honorific adjunct to the real name of a deity,—as Baal-Gad,—in which case Gad is the name of a god. There were thus as many Baals as there were towns, or sanctuaries, or objects which have a religious significance. Still, it is natural that certain Baals should become more prominent than others, and it might even happen that one should become the Baal par excellence. Thus in Babylonia, the deity of Nippur, one of the most ancient cities, became identified with Marduk of Babylon, and in consequence of the growing power of this city was finally recognized as the Baal or Bel of Babylonia, and was known to later ages simply as Bel; and again, in the West, the Baal of Tyre, whose name was Melkart, assumed at one time such prominence that his worship was introduced among the Hebrews by Ahab, and he is sometimes referred to in the Old Testament simply as Baal.

Sometimes the Baal idea is not connected with any particular place on earth but with the realms above; this gives rise to such cults as that of Baal-Hamon and Baal-Shamem, which acquire prominence among the Phœnicians and their offshoots. The former is probably the personification of the sun god; the latter is the

god who dwells in heaven and bears analogies therefore to the Greek Zeus. In tracing the religious development of ancient nations in general, we must make allowance for this tendency to form conceptions of divine powers which seem to reach out into higher spheres. The Baal worship among the Hebrews, of which we hear so much in the Book of Kings and in the Prophets, represents the adoption on the part of the Hebrews of the Canaanitish cults. In dispossessing the Canaanites, the Hebrews wished to assure themselves of the good will of the numerous Baals; and since fertility of the soil was in the control of the Baals, as the Canaanites believed, the Hebrews, when they became agriculturists on Canaanitish soil, naturally took over the worship of the Baals at the various ancient sanctuaries of the land. In order to reconcile this departure with fidelity to the national deity, Yahwe himself was called Baal, and His name was thus associated with the cults at the altars and sanctuaries, which generally were erected on prominent spots, the so-called "high-places," or in groves. With Elijah, a movement to purify Yahwe's worship of its foreign elements begins, which, taken up vigorously by the prophets of the eighth and seventh centuries B.C., leads to tentative attempts in Judæa, such as the reforms of King Josiah, to stamp out the Baal rites; but it is not until the new conditions brought about by the destruction of the southern kingdom that the hope of the reformers to establish Jerusalem as the only legitimate sanctuary of Yahwe is realized, and in the Persian period a theocracy is established in which the once so popular Baal cult gradually disappears.

BAALBEK, bāl'bēk. The name of a ruined city in ancient Cœle-Syria, signifying the "city of Baal," the sun-god. The name was converted by the Greeks, during the Seleucidan dynasty, into its Greek equivalent, Heliopolis. It is situated in lat. 34° 1' N., long. 36° 11' E., in the plain of Bukā'a, "at the northern extremity of a low range of bleak hills, about one mile from the base of Antilibanon," in a well-watered and delightful locality, rather more than 40 miles northwest of Damascus. It was once the most magnificent of Syrian cities, full of palaces, fountains, and beautiful monuments. It is now famous only for the splendor of its ruins, which date from Roman times. The most imposing is that of the great Temple of the Sun, which was a rectangular building 290 feet by 160, having its roof supported by a peristyle of 54 Corinthian columns, "19 at each side and 10 at each end." Of these, 6 are yet standing. The circumference of these columns is about 22 feet, and the length of the shaft 58; with pedestal, capital, and entablature, they measure about 80 feet in height. The bases still show the names of Antoninus Pius and Julia Domna. The temple occupies a platform on the Acropolis, about 1000 feet by 450 feet, approached on the east by a broad flight of steps, which lead to a portico. Beyond this is a hexagonal court, through which a large gateway opens into the great square, at the west end of which is the temple, on a lofty stylobate. Except the columns mentioned, little of the great temple, or of the buildings in front of it, is left standing, but the ground is covered with their ruins. The vast size of the stones used in the substructures of the great platform is remarkable, some of them being over 60 feet long and 12 in breadth and thickness. South from the

BAALBEK
GENERAL VIEW OF THE ACROPOLIS

great temple is a smaller one, known as the Temple of Bacchus. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 227 feet in length by 117 feet in breadth, with 15 columns at the sides and 8 at each end. Both temples, as well as the surrounding structures, were built of limestone, in a richly decorated, somewhat fantastic Corinthian style. Besides these, there stands at the distance of 300 yards from the others a circular building, supported on 8 granite columns of mixed Ionic and Corinthian style. It was once used as a Christian church.

The early history of Baalbek is involved in darkness, but it is certain that from the most distant times it had been a chief seat of sun worship, as its name implies. Augustus made it a Roman colony and placed there a garrison. Baalbek had an oracle held in such high esteem that in the second century A.D. it was consulted by the Emperor Trajan prior to his entrance on his second Parthian campaign. Antoninus Pius (138-161 A.D.) built the great temple which the legend current among the modern inhabitants counts a work of Solomon; Septimius Severus dedicated the two temples. The platform and substructures are, however, of a much earlier date. This temple is said to have contained a golden statue of Zeus, identified with the Sun, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity under Constantine became the dominant religion, the temple became a Christian church. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A.D., the temple was turned into a fortress, the battlements of which are yet visible. The city was completely pillaged by Timur in 1400; in 1517 it came into the hands of the Turks. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pashas of Damascus, merely for the sake of the iron with which the stones were bound together. What the Arabs, Tatars, and Turks had spared was destroyed by a terrible earthquake in 1759. Baalbek is now an insignificant village, with a population of some 2000, of whom more than half are Christians. The Prussian government conducted, in 1902, extensive excavations on the Acropolis.

M. Thompson, *The Land and the Book*, vol. iii (New York, 1886); Baedeker, *Syria and Palestine* (Leipzig, 1898); Puchstein, in *Jahrbuch des deutschen Archäologischen Instituts* (Berlin, 1902); id., *Führer durch die Ruinen von Baalbek* (1905).

BAAL-ZEBUB, bā'al-zē'būb. Thé god of Ekron, according to 2 Kings i. 2 ff., to whom Ahaziah sent from Samaria for an oracle, an act for which he was severely censured by Elijah. Baal means 'lord'; it is not certain what "Zebub" refers to. It has been very generally translated 'fly,' and the god of Ekron understood to be a 'lord of flies.' Winckler plausibly suggests that Zebub was the name of the hill on which the temple stood in Ekron. The god is possibly referred to in the Assyrian inscription, K 3500, as Ba-al-za-bu (bi-i). See BEELZEBUB.

BAARLE, bār'le, or **BAERLE**, VAN. See BARLÆUS, KASPAR.

BAB, LADY. The name assumed by Kitty, the maid, in James Townley's *High Life below Stairs*. She has an exaggerated idea of her own breeding and never reads any book except "Shikspur." Her pseudonym is taken from the name of her mistress.

BAB, THE. See BABISM.

BABA, bā'bā. A Turkish word (*bāba*), which signifies 'father.' In Persia and Turkey it is prefixed as a title of honor to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons as Ali-Baba.

BABADAGH, bā'bā-dāg' (Turk. *bābā*, father, chief + *dagh*, mountain). A town in the district of Tultcha (Dobrudja), Rumania, situated in a marshy district, 31 miles southwest of Ismail (Map: Turkey in Europe, G 2). It has five mosques, of which the finest is the one built by Bajazet I, who founded the city. He peopled it with Tatars and named it after a saint, whose monument on a hill near by is a much-frequented pilgrim resort. Through the port of Kara-Kerman, lying a short way to the south, a considerable commerce is carried on with the Black Sea region. Many sheep graze in the district, and Babadagh is a centre for considerable trade in wool. Pop., in 1899 (latest report), 3100.

BAB'AGE, CHARLES (1792-1871). An English mathematician and inventor, born near Teignmouth, Devonshire. He early devoted himself to mathematics, particularly its analytical branches, and pursued his systematic education at Trinity College, Cambridge, from which he received his baccalaureate degree in 1814. Two years after graduating he published, jointly with Herschel and Peacock, a translation of Lacroix's *Calculus*, and four years later they published an excellent collection of mathematical problems. Meanwhile the idea of constructing a machine for calculating mechanically various tables of mathematics and astronomy had been ripening in Babbage's mind, and in 1820 he undertook the practical execution of this difficult task. The model of his machine was found eminently satisfactory by the Royal Society in 1823, and the government consented to aid him in carrying out the idea on a large scale. In order to familiarize himself with all the resources of mechanical art, he visited manufacturing and machine establishments in Great Britain and in 1827-28 traveled on the Continent. These investigations resulted in a number of highly valuable improvements in machinery and manufacturing processes, and although the completion of his main task was not yet in view, important service was rendered by the publication of his brilliant work, *On the Economy of Manufactures and Machinery*, the first edition in 1832, and several subsequent editions and translations into foreign languages. The government, however, fearing that the construction of his calculating machine was an impossibility, had refused to give him further aid; and thus Babbage was thrown upon his own resources, continuing his work until 1856, but never completing it. Yet the realization of his machine is even now considered as quite possible, and its inestimable value in case it were realized is appreciated by some of the best mathematicians of our time. While mainly de-

voted to his invention, Babbage also made a number of important contributions to pure mathematics. He invented a new and important branch of higher analysis, wrote on the applications of mathematics to questions of insurance and gambling, and did much to raise the standard of mathematical teaching in England. In recognition of his services to science, he was made a member of many learned societies, and from 1828 to 1839 was nominally Lucasian professor of mathematics at Cambridge. He was one of the founders of the Astronomical Society and to his writings was due in great measure the founding of the British Association. The list of his works includes as many as 80 titles, but most of his writings were left uncompleted. Among his works that deserve notice are his excellent *Table of Logarithms* (1827), and the autobiographical *Passages from the Life of a Philosopher* (1864).

BAB BALLADS, THE. A collection of doggerel verses by W. S. Gilbert, half nonsense, half satire, on various subjects, ranging from the shipwreck of corpulent admirals to the loves of the London "bobby." It was published in London in 1868, but the ballads had previously appeared separately in *Fun*.

BABBITT, IRVING (1865-). An American scholar and educator. He was born in Dayton, Ohio, and received his university education at Harvard, from which he graduated in 1889, and in Paris, where he studied in 1891-92. After a year as instructor in Romance languages at Williams College he was appointed (1894) instructor in French at Harvard, and later (1902) assistant professor in that department. His publications, besides literary articles in magazines and reviews, include *Literature and the American College* (1908); *The New Laokoon* (1910); *Masters of Modern French Criticism* (1912). Also he edited Taine's *Introduction à l'histoire de la littérature anglaise* (1898); Renan's *Souvenirs d'enfance et de jeunesse* (1902); Voltaire's *Zadig* (1905); Racine's *Phèdre* (1910).

BABBITT, ISAAC (1799-1862). An American inventor, born at Taunton, Mass. He became a goldsmith and manufactured at Taunton (1824) the first Britannia ware made in the United States. In 1839 he invented the alloy known as "Babbitt metal" (q.v.). This metal, and also soap, he afterward manufactured extensively.

BABBITT MET'AL. A soft, white, anti-friction alloy, invented by Isaac Babbitt in 1839. It is prepared by melting separately 4 parts of copper, 12 parts of tin, and 8 parts of antimony, to which, when it is completely melted, there are added 12 more parts of tin. The antimony is poured into the tin, and then mixed with the copper away from the fire, in a separate pot. The proportions vary somewhat, according to the purposes for which the alloy is intended. For this invention Babbitt received a gold medal from the Massachusetts Charitable Mechanics' Association in 1851 and later the sum of \$20,000 from Congress. It was patented in England and also in Russia.

BAB'COCK, JAMES FRANCIS (1844-97). An American chemist and scientific lecturer. He was born in Boston in 1844. After studying chemistry at the Lawrence Scientific School, he established in Boston an analytical laboratory. He was professor of chemistry at the Massachusetts College of Pharmacy and at Boston

University and for many years filled the positions of State assayer and inspector of liquors and city inspector of milk. He is known as the inventor of a fire extinguisher and as a scientific lecturer, and has published a number of official reports on sanitary topics.

BABCOCK, MALTRIE DAVENPORT (1858-1901). An American Presbyterian clergyman. He was born at Syracuse, N. Y., Aug. 3, 1858; graduated at Syracuse University in 1879 and at Auburn (N. Y.) Theological Seminary in 1882; became pastor of the First Presbyterian Church, Lockport, N. Y., in 1882; of the Brown Memorial Church, Baltimore, Md., in 1887; and of the Brick Presbyterian Church, New York City, 1899. On the very threshold of what promised to be an exceptional career, he died at Naples, Italy, May 18, 1901, as he was on his way home from a trip in the East. After his death his wife and Miss Sanford published some selections from his spoken and written words, including some admirable poems, under the title *Thoughts for Every-Day Living* (New York, 1901); and later appeared *Letters from Egypt and Palestine* (1902). Consult his life, by Robinson (New York, 1904); and Stone, *Footsteps in a Parish* (New York, 1908).

BABCOCK, ORVILLE E. (1835-84). An American soldier, born at Franklin, Vt. He graduated at West Point in 1861 and served in the Federal army throughout the Civil War. He was aid-de-camp to General Banks in July and August, 1861; served in the Peninsular campaign; was chief engineer for the Central District of Kentucky from April to June, 1863, and of the Department of Ohio from January to March, 1864; and, as lieutenant-colonel, was aid-de-camp to General Grant in the Richmond campaign. On March 13, 1865, he was brevetted brigadier-general of volunteers, for "gallant and meritorious services in the field." He afterward continued to serve as Grant's aid-de-camp until 1869, and from 1869 to 1877, during the latter's term as President, was his private secretary. After 1871 he also served as superintending engineer of public buildings. In 1870, as President Grant's unofficial representative, he negotiated with Santo Domingo a treaty of annexation, which, however, was rejected by the Senate. In 1876 he was accused of being implicated in the "Whisky Ring" frauds, but was acquitted on trial. He was drowned at Mosquito Inlet, Fla., on June 2, 1884.

BABCOCK, STEPHEN MOULTON, LL.D. (1843-). An American agricultural chemist, born at Bridgewater, Oneida Co., N. Y. He graduated at Tufts College in 1866 and studied chemistry at Cornell University and at Göttingen University. From 1882 to 1888 he served as chemist to the New York State Agricultural Experiment Station and in 1888 became professor of agricultural chemistry at the University of Wisconsin and chemist to the Wisconsin Agricultural Experiment Station. He also became assistant director of the station in 1901, but retired from all active service in 1913. He investigated especially the chemistry of milk, cheese, and other dairy products, but also worked on the chemistry of silage and the rôle of metabolic water. His best-known service was the invention in 1890 of the Babcock milk tester for ascertaining the amount of fat in milk, cream, etc. This test is now widely used for the purpose the world over, and has been of the utmost value to the dairy industry. The

Wisconsin Legislature presented him with a bronze medal in 1901 in recognition of this and other services to agriculture, and rewards of merit were granted him by the Paris and St. Louis expositions.

BABCOCK, WINNIFRED EATON. See WATTANNA, ONOTO.

BABEL, TOWER OF. The name given to the structure erected in the valley of Shinar in connection with which the confusion of tongues is said to have taken place (Gen. xi.). At a time when all men still formed a single united body and possessed the same speech, they came in the course of their wanderings to this valley, or plain, where they devised a plan of using clay as building material and bitumen as cement. They are represented as the first city builders; but in addition they are fired with the ambition to erect a tower which shall reach to heaven and which, being visible everywhere, shall prevent them from being dispersed over the face of the earth. But this plan arouses jealousy on high. While men are encouraging one another in this great enterprise, the gods in heaven, fearing this encroachment upon their own realm, exhort one another, saying, "Come, to this place, let us go down, and there the speech of all confound, so that no man shall understand the language that his neighbor speaks." They go down and carry out this preventive measure, and, as a consequence, men cease to build the city, and they are scattered in all directions. The name of the place where the confusion of tongues is brought about is called Babel, which is explained as though from a root *balal*, meaning 'to confuse,' whereas in reality Babel signifies 'gate of god,' from *bab*, 'gate,' and *ilu*, 'god.'

The story seems to presuppose the existence of Babylon as an important centre and of a great tower not carried as far up into the sky as had been intended, a cessation of building activities and political weakness in place of earlier power and world-wide ambitions, and an influx of foreign elements, not easily assimilated by the native population, whose multiplicity of speech made common enterprises difficult. There can be no doubt that the *zikkurat*, or temple tower, north of the Marduk temple *E-sagila*, is meant. This structure was called *E-temen-an-ki*, or 'house of the foundation of heaven and earth,' probably because it both celebrated the creative act of Marduk and illustrated by its form and orderly arrangement the heaven and earth created by the god. There may also have been the idea that this was the foundation stone of the whole world structure. Its site has been found by the German explorers. It is now called El Sahān and is nothing but an immense hole in the ground c.330 feet square. A nucleus of brick is still left in the middle of the hole. As late as 1887 this tower was used as a quarry, a vast amount of brick being carried away from it. Included in the walls four inscribed clay tablets were found. The tower itself consisted of six platforms, or stages, and a sanctuary rising on the sixth. The lowest stage was 330 feet in length and breadth and 121 feet in height; the second, 286 feet each side and 66 feet in height; the third, 220 feet each side and 22 feet in height; the fourth, respectively, 187 and 22 feet; the fifth, 154 and 22 feet; the sixth, 121 and 22 feet; and the shrine on top was 88 feet in length, 77 feet in width, and 55 feet in height. It is probable that, as in the case of the tower at Borsippa, each stage exhibited a different color—

that dedicated to Ninib black by a coating of bitumen, that to Marduk orange by the employment of brick of this hue, that to Nergal red, that to Shamash golden by a covering of thin plates of gold, that to Ishtar pale yellow by bricks of this color, that to Nabu blue by vitrification, and that to the moon a shining white by a covering of silver.

It is not known when the Tower of Babel was built nor by whom. It is likely to be as old as the *E-sagila* itself. After the destruction of the city by Sennacherib it was rebuilt again especially by Nabopolassar and Nebuchadnezzar, whose foundation tablets refer to "E-temen-an-ki . . . whose top should reach unto heaven." Some scholars think that a Jewish narrator living under Cyrus when they had ceased building the city some time after the fall of Nebuchadnezzar's world empire took these words literally and saw in them evidence of pride and blasphemy punished by the deity. But it is not necessary to descend to so late a period of history for this story and to assume that the author must have lived in Babylon after the deportation of Jews by Nebuchadnezzar. The *zikkurat* had been there since the earliest times; it was not a recent creation. The author looks back into remote antiquity when Babylon threatened to become the mistress of the world. That had been the case in the days of Hammurapi, remembered in Syria as Amraphel, and possibly long before his time. But this glory was in the past, when it was possible for a Hebrew poet to sing the Song of the Tower of Babel. On the other hand, the frank polytheism of the song shows that it is earlier than the great prophetic movement in Israel. The age of Solomon seems most probable. Towards the end of the eleventh century the power of Babylon was at a low ebb. Short-lived dynasties, most of them foreign, tried in vain to restore the prestige of the past. Even the Kassite domination had brought more wealth and influence to Babylon. An Elamite sat upon the throne from 1110 to 1004. All kinds of languages were spoken in the city—Sumerian, Akkadian, Amoritic, Kassite, Hittite, Mitannian, Chaldean, Aramaic, Iranian. Once the builders on a temple or tower in Babylon had all understood one another; it was no longer so, but a veritable confusion of tongues. It was not necessary for the Hebrew poet to go to Babylonia himself, though he may, of course, have been there, in order to learn or to invent the story of how Babylon lost its power. Nor would he have to dig for some inscribed foundation stone to hit upon the idea that this ancient sky scraper which every traveler would refer to was intended to reach to heaven. A sense of the divisive influence of the difference of language and its tendency to breathe hostility and to frustrate common enterprises is not too advanced for Solomon's time; and it is not impossible that a warning to the great Jewish temple and palace builder was intended. For a description of the tower, see Weissbach, *Das Stadtbild von Babylon* (1904); Koldewey, *Das wiedererstehende Babylon* (1912); for the Song of the Tower in Gen. xi., Schmidt, *The Messages of the Poets* (1911); Gunkel, *Genesis* (3d ed., 1910).

BAB-EL-MANDEB, bāb'el-mān'dēb (Ar. 'gate of tears,' or 'of sorrow'). The strait separating Arabia, at its southwest extremity, from the continent of Africa, and connecting the Red Sea with the Arabian Sea and the Indian Ocean (Map: Asia, D 7). It is bordered

on the east by the Cape of Bab-el-mandeb, which rises to a height of 865 feet, and on the west by the precipitous coast of Africa, which reaches in Ras-Sejan an altitude of 400 feet. The strait is divided by the island of Perim into two channels—the western, 13 miles wide and 185 fathoms deep; the eastern, only about 2 miles in width and from 8 to 12 fathoms deep, but preferred on account of its safe anchorage. The volcanic islets called the "Eight Brothers," lie close to the African coast. The strait derives its name from the perils it offers to small sailing vessels.

BABELSBERG (bā'bels-bĕrk) **PAL'ACE**. A picturesque English Gothic chateau near Potsdam, built in 1835-49, in the midst of a beautiful park. The interior is simple but homelike and contains the study and many personal relics of Emperor William I, with whom Babelsberg was a favorite resort during the summer months.

BABENBERG, bā'ben-bĕrk, **COUNTS OF**. A line of Frankish counts whose ancestral seat was at Castle Babenberg, near the present Bamberg, in northern Bavaria. Poppo of Babenberg was Margrave of Thuringia till 892. His three nephews, Adelbert, Adalhard, and Henry, are celebrated for the desperate feud they carried on against the family of the Conradins, whose territorial acquisitions in Thuringia threatened the ascendancy of the Babenbergs. The three brothers perished in the struggle. Luitpold of Babenberg—whose descent, however, from the Bavarian Babenbergs is not conclusively established—received from the Emperor Otho II in 976 the sovereignty over the East Mark. This his descendants ruled as margraves, and, after the Emperor Frederick I erected that territory into the Duchy of Austria (1156), as Dukes of Austria. Leopold III (ruled 1096-1136) refused the Imperial crown in 1125. He was afterward canonized and is the patron saint of Austria. It was one of the Babenbergs, Duke Leopold I (ruled 1177-94), who captured Richard I, King of England, on his return from Palestine and delivered him into the hands of the Emperor Henry VI. Duke Frederick II, the last of the Babenbergs, was killed in battle in 1246. See **AUSTRIA-HUNGARY, History**.

BABER, bā'bĕr, **BABAR**, or **BABUR**, ZAHIR UD-DIN MUHAMMAD (c.1482-1530). The first of the Great Moguls in India, a descendant of Timur and of Genghis Khan. He was barely 12 years of age when he succeeded his father, Omar Sheikh Mirza, in Ferghana, and he soon conquered the entire country between the Jaxartes and the Oxus. Later he was driven from Bokhara by the Uzbeys of Turkestan, and founded a new kingdom in Afghanistan. After making unsuccessful efforts to recover his realm in Turkestan, Baber turned his ambitious designs toward India. The weakness of Ibrahim Lodi, Emperor of Delhi, enabled him to carry out his schemes of conquest. After some preliminary incursions he crossed the Indus at the close of 1525, and in April, 1526, on the plain of Panipat, not far from Delhi, he fought a decisive battle with his enemy, whose army was far superior in numbers. The 100,000 men and 1000 elephants of Ibrahim Lodi were dispersed, Ibrahim himself fled and Baber made his entry into Delhi. In the following month Agra, the second city of the Empire of Delhi, surrendered. In 1527 Baber secured himself in the possession of his new realm by a great victory over the Rajputs. Thus was

founded the famous Empire of the Great Mogul, which under Baber's successors rose to extraordinary splendor. Baber's enjoyment of empire in India was short; he died in 1530, having had to contend, during the four years of his reign, with numerous conspiracies and revolts. To the talents of a general and a statesman, which he manifested in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, postal arrangements, etc., Baber united a taste for science and art. He wrote, in the Chaghatay Turkish language, the history of his own life and conquests, which was translated into Persian by Abd-ul Rachim, and later from the Persian into English by Leyden and Erskine in 1826. This work, called the *Bābar-Nāma*, has been reproduced in facsimile form and edited by Annette S. Beveridge (London, 1905). Baber was succeeded on the throne of Delhi by the eldest of his four sons, Humayun. Consult Caldecott, *Life of Baber, Emperor of Hindustan* (London, 1844), and Stanley Lane-Poole, *Babar* (London, 1899).

BABES IN THE WOOD. A nursery tale, and a ballad of unknown origin, preserved in Percy's *Reliques* and in other collections. Two children are left to perish in the forest by an uncle, who expects to profit by their death.

BABEUF, bā'bĕf', FRANÇOIS-NOËL (1760-97). A French political agitator, regarded commonly as the founder of revolutionary socialism. He was born at Saint-Quentin, Nov. 23, 1760. He was at first a land surveyor. He became an enthusiastic adherent of the Revolution, and established a paper (*Journal de la Liberté de la Presse*) which, in July, 1794, began its second series of numbers under the title *La Tribune du Peuple*. Absolute equality, communism of land and property, the sovereignty of the masses—these were the ideals for which he stood and which he advocated in violent language. He spoke of himself as Gracchus Babeuf. He proposed to found a national estate upon the confiscated property of the corporations, and to add to this the property of private persons through the abolition of inheritance. Distribution, in the scheme of Babeuf, was to be based on need. His participation as ringleader in a plot to overthrow the Directory and establish a communistic state resulted in his execution in 1797. Consult Ely, *French and German Socialism* (New York, 1883), and Advielle, *Histoire de Babeuf et du Babouvisme* (Paris, 1884). See **COMMUNISM; SOCIALISM**.

BABI, bā'bĕ. See **BABISM**.

BABINE (Athapaskan word, 'big lips'). Name applied to Athapaskan or Dene Indians, near Babine Lake, British Columbia. They are a branch of the Takulli and comprise the Nataotin and Hwotsotenne.

BABINET, bā'bĕ'pā', JACQUES (1794-1872). A French physicist, born at Lusignan, Vienne. He was appointed professor of physics at the Collège Saint-Louis at Paris and in 1840 was made a member of the Academy of Sciences. To him are due various improvements in the air pump, the hygrometer, and other apparatus. In general, however, he was known less as an investigator than as a clever expositor. His publications include: *Traité de géométrie descriptive* (1850); *Etudes et lectures sur les sciences d'observation et leurs applications* (1855-68); *Télégraphie électrique* (1861).

BAB'INGTON, ANTONY (1561-86). An Eng-

lish Roman Catholic gentleman and conspirator. He was born at Dethick, Derbyshire, October, 1561. At 10 years of age he was left an orphan with a rich heritage and became a page to Mary, Queen of Scots, during her imprisonment at Sheffield. In 1586 he was persuaded by Ballard and other Catholic emissaries to head a plot to murder Queen Elizabeth, to effect the release of Mary, and to organize a general uprising of the Catholics. Babington's conduct during the plot was foolish and vain. He insisted on keeping up a correspondence with Mary, in the hopes of some token of appreciation from her, and, through these letters, the conspiracy became known to Walsingham, Elizabeth's secretary, who at the right moment arrested Babington and his accomplices. They were condemned and executed by hanging and quartering in London, Sept. 20, 1586. Four months later, Mary, Queen of Scots, was beheaded, mainly on the evidence of a letter approving of the murder of Elizabeth, which she had written to Babington. She denied the authorship, and her friends maintained that the document was written by Walsingham himself, as a trick to implicate and entrap the conspirators; but the truth of this accusation is, at least, doubtful. On the day of his death Babington explained the cipher in which the letter was written; and there is other evidence, alleged to be satisfactory, of Mary's complicity in the plot. Consult *Maria Stuart's Briefwechsel mit A. Babington* (Munich, 1886), and Collier, "Fourteen Notable Traitors," in vol. i, *Illustrations of Early Popular Literature* (London, 1863).

BABINGTON, CHURCHILL (1821-89). An English clergyman and archaeologist, born at Roecliffe, Leicestershire. In 1839 he entered St. John's College, Cambridge, and there he held a fellowship from 1846 to 1867, being elected an honorary fellow in 1880. From 1865 to 1880 he was professor of archæology at Cambridge. He became an authority on Greek and Latin antiquities, especially manuscripts, pottery, and coins, of which he had a notable collection. His classical scholarship was demonstrated by his *editio princeps* of the orations of Hyperides that were contained in the papyri discovered in 1847 and 1856 at Thebes. These comprised the speeches *Against Demosthenes* (1850), *On Behalf of Lycophrone and Euxenippus* (1853), and the *Funeral Oration* (1858). He found opportunity also to publish many works on botany, ornithology, and conchology, in which subjects he was an authority. He was the author of a *Catalogue of Birds of Suffolk* (1884-86) and *Flora of Suffolk* (1889), and in 1842 prepared the appendixes for the departments of botany and ornithology in the *History and Antiquities of Charnwood Forest* (Potter). Ecclesiastical subjects received their share of his attention, for he published a defense of the clergy in *Mr. Macaulay's Character of the Clergy . . . Considered* (1842), and edited Bishop Pecoek's *Repressor of Overmuch Blaming of the Clergy* (1860). In 1885 he brought out an edition of *Benefizio della Morte di Cristo*, a rare book of the period of the Reformation, and in 1858 edited the first two volumes of *Polychronicon*. (See RANULF HIGDEN.) Besides, he catalogued the classical manuscripts in the library of Cambridge University and contributed to Smith's *Dictionary of Christian Antiquities* and numerous scientific periodicals.

BABIRUSSA, bāb'ī-rūs'sā (Malay *bābi*, hog + *rūsa*, deer). An East Indian wild hog (*Babi-*

rusa alfurus), inhabiting Celebes and Buro, called also "horned hog" and "pig deer." It is nearly naked, slender-legged, and active, and feeds upon fallen fruits instead of rooting in the ground. The boar is remarkable for his long, exposed canine teeth. "The tusks of the lower jaw are very long and sharp; but the upper ones, instead of growing downward in the usual way, are completely reversed, growing upward per-

TUSKS OF BABIRUSSA BOAR.

sistently out of long sockets through the skin on each side of the snout, curving backward to near the eyes, and in old animals often reaching 8 or 10 inches in length." It is difficult to understand the use of these teeth, which are not possessed by the sows. A. R. Wallace offers, as explanation, that they probably were once useful and were then kept worn down by constant use, but that changed conditions of life have rendered them unnecessary, and they now develop into monstrous form, as will the persistently growing teeth of beavers and rabbits when distorted so that the opposite teeth do not wear them away.

BABISM, bāb'iz'm. A term applied to the beliefs of a sect in Persia, founded by Mirza Ali Muhammad ibn Radhik, born about 1824, who assumed the name of Bab-ud-Din, i.e., 'gate of the faith.' On returning from a pilgrimage to Mecca in 1843, the Bab appeared in his native city of Shiraz with a new commentary on the Koran, and soon became engaged in controversy with the regular priests, or *mullahs*, who, exasperated by his free criticism of their conduct, obtained an order forbidding him to teach in public and confining him to his house. He taught privately, however, but increased his pretensions, until he declared he was the Nuqtah, 'the point,'—an epithet of Mohammed as well. He thus claimed to be not merely the recipient of a new divine revelation, but the focus in which all preceding dispensations converged. He gained proselytes rapidly. Among these was a woman—a remarkable circumstance in any country of the East—known as Gurrad-ul-Ain ('consolation of the eyes'), because of her surpassing loveliness, which was enhanced by her intelligence and purity. The sect made rapid progress with their new religion, but they were not molested until the accession of Nasr-ed-Din (Nasiru'd-Din) in 1848. At this juncture the Babis, in fear of persecution by the new Shah, arose in rebellion and proclaimed the Bab as a universal sovereign, when a civil war ensued. Hussein, one of the disciples, was made prisoner, after defeating several expeditions sent against him, and was put to death in 1849; and the next year Baliurushi, another leader, was slain in battle. The Bab himself, who had taken no active part in the rebellion, was imprisoned and executed at Tabriz, in 1850, after a long incarceration; but his death did not discourage his followers. They recog-

nized Mirza Yahya, a youth of noble descent, and son of the Governor of Teheran, as his successor, who established himself in Bagdad. An attempt, in 1852, of some zealous Babis to assassinate the Shah led to a terrible persecution in which the beautiful "consolation of the eyes" perished.

The Babi doctrines are essentially a system of pantheism, with additions from gnostic and other sources, and they may be regarded as a development of the mystic or Sufiistic movement against the orthodox Mohammedanism of the Sunnis, which has lasted with great persistence since the first introduction of Islam into Persia. All individual existence is regarded as emanating from the Supreme Deity, by whom it will ultimately be reabsorbed. Great importance is attached to the number 7, as indicating the attributes supposed to be displayed in the act of creation; and to the number 19, which mystically expresses the name of the Deity himself and is, moreover, the sum of the prophets among whom the latest incarnation of the divine nature is conceived to be distributed in the present dispensation, and of whom the Bab himself is the chief. The sacred college cannot become extinct until the final judgment, the death of any of its members being immediately followed by a re-incarnation. Moses, Christ, and Mohammed are considered to be prophets, but merely precursors of the Bab and inferior to him. The morals of the sect are good; polygamy and concubinage are forbidden; and the equality of sex is so far recognized that at least one of the 19 prophets must always be a woman. Women join in social intercourse and are freed from many of the degradations to which orthodox Mohammedanism subjects them, such as the extreme facility of divorce on the part of the husband. Asceticism is discountenanced, mendicancy forbidden; abstinence from intoxicating liquors and drugs and tobacco, as well as prohibition of slave dealing, are taught and practiced. The Babis live in outward conformity to the religion of Mohammed. The faith of the Bab has found a few adherents in America.

BABOO, bāb'boō, or **BABU** (Hind. *bābū*; Canarese *bābū*, father). A Hindu title of respect equal to "Mr." or "master" in English, given in India to educated and wealthy natives or persons of distinction, but used nowadays by Anglo-Indians in a slightly disparaging sense, implying merely superficial cultivation, or simply intended to designate a native clerk who writes English.

BABOON, bāb-ōōn' (OF. *baboin*, Fr. *babouin*, ML. *babewynus*; cf. Ger. *Pavian*; origin unknown). An African or Arabian cercopithecoid monkey of the "dog-faced" genus *Cynocephalus*. Baboons are of large size, covered with long, dark hair, and have very large, brilliantly colored callosities upon the buttocks; but are chiefly distinguished by the elongated, blunt muzzle, with the nostrils in the end, giving the profile a resemblance to that of a dog. This is heightened

by the prominence of the canine teeth, which in adult males become most formidable tusks, effective against the largest of their enemies among the wild beasts. This physiognomy, often gaudily colored, is repulsive and fear-inspiring and seems to indicate the fierceness of their character; yet baboons rarely, if ever, have attacked human beings unprovoked. The fore and hind limbs in this group are of similar size, so that they walk easily and gallop swiftly on the ground and move about rocks with extreme agility; they climb trees with greater difficulty, and as a rule keep on the ground and away from forested regions. All the species are gregarious, assembling in large troops, conducted and guarded by the elders, who are exceedingly watchful against danger. They feed mainly on fruits, berries, buds, roots, and the soft wood of certain trees, but vary this fare with insects, grubs, snails, bird's eggs, lizards, etc. By raiding plantations in troops they may do immense damage to crops, ruthlessly destroying more than they eat, and stuffing their capacious cheek pouches full of food to carry away. Such bands are too formidable to be easily driven away by half-armed natives. Baboons are rarely hunted for sport, and still less often captured, though partly domesticable when young; and the ancient Egyptians seem to have trained them to pick fruit, etc. Nevertheless, no monkeys are less tractable or fierce than these; and in the safety of large troops they will resist and sometimes vanquish even the leopard. In fighting they usually stand erect, but otherwise keep always upon all fours. Of the various species the following are best known:

ARABIAN, or SACRED BABOON, or HAMADRYAD (*Cynocephalus* or *Papio hamadryas*). This is the great ashy-gray baboon, represented upon Egyptian monuments and supposed to have been the monkey to which divine honors were paid under the name Anubis. The worship of baboons, according to Petrie, was due to the solemn faces of these animals, which gained them credit for great wisdom, and also to their habitual activity at sunrise, leading to the supposition that they were then adoring the sun god. The body was frequently embalmed, and baboon mummies are still found. It lives in Arabia, but more commonly in Abyssinia and the Sudan, where, in open rocky regions, it congregates in herds sometimes numbering 250, and where its habits have been described at length by Sir Samuel Baker. The huge grizzled mane so characteristic of this species belongs to the old males alone. A closely allied species or variety of Abyssinia (*Cynocephalus* or *Papio doguera*) is yellowish-olive in color.

THE CHACMA (*Cynocephalus* or *Papio porcarius*) of South Africa is even larger, being about the size of a mastiff and exceedingly strong; it is still common on the mountain and sea cliffs of the wilder parts of Cape Colony, going in troops, which might be dangerous to humanity were they not so timid. This species is dark-brown, with long shaggy hair, but without any mane, and the naked part of the face is purplish. The tail is rather more than half the length of the body and is terminated by a tuft of long black hair. Their food is as miscellaneous as that of other species, but they are especially fond of an iris-like bulb known as *izia*, which they dig and peel before eating. This is the species most often seen in menageries, but all

BABOONS

1. ARABIAN OR SACRED BABOON (*Papio hamadryas*).

2. MANDRIL (*Papio sphinx*).

3. CHACMA (*Papio porcarius*).

4. GELADA BABOON (*Theropithecus gelada*).

5. ANUBIS BABOON (*Papio anubis*).

6. DRILL (*Papio leucophaeus*).

the others endure captivity well. Several of them are usually to be seen in the New York Zoölogical Park.

Five other species of baboons are limited in their range to West Africa. One is the olive-green ANUBIS (*Cynocephalus anubis*), which is the species reported by Hanno, about 500 B.C., under the name "gorilla"; another is the edible YELLOW BABOON (*Cynocephalus babuin* or *Papio cynocephalus*); a third the reddish-brown GUINEA BABOON (*Cynocephalus sphinx* or *Papio papia*), long familiar in the hands of showmen, yet almost unknown in its native state; the others are the hideous, short-tailed drills.

The MANDRILL (*Cynocephalus mormon* or *Papio sphinx*) is the largest of all baboons, has comparatively short limbs, a mere stump of a tail carried erect above scarlet callosities, and a massive and powerful body. The head is of enormous size, crested and bearded, and there is scarcely any forehead, while the deeply sunken eyes give a morose expression. The fur about the head, rising into a crest upon the occiput, is greenish black, but the beard is orange-yellow, and between them is a huge nose, vastly swollen on each side, folded into ribs colored light blue and divided and tipped with scarlet. The ugliness of its aspect is borne out by the disposition of this brute, which is one of the most formidable and ferocious creatures of the Gaboon forests. Another West Africa baboon is the DRILL (*Cynocephalus leucophaeus*), which is somewhat less in size than the mandrill, and lacks the colors and great swellings of the nose, but is otherwise similar to it.

The GELADA "baboon" is a large maned monkey (*Theropithecus gelada*), of southern Abyssinia, which has the appearance of a black, clipped French poodle, and the habits and temperament of a true baboon. See APE; MONKEY; and Plate of BAROONS. Consult Elliot, *A Review of the Primates* (New York, 1913).

BABRIUS. A Hellenistic fabulist. He was probably of Italian origin, as his name and Latinisms indicate, but he seems to have lived in the East, perhaps in Syria. He lived, apparently, in the third century A.D. He worked over, in choliambic metre, a large collection of Æsopic fables. In the later centuries of antiquity and the earlier Byzantine period this compilation was very popular and supplanted all previous collections. Suidas, about the tenth century, possessed the work in 10 books, but his text was more corrupt than that we now have. During the Renaissance and modern times the work existed only in paraphrases and fragments, which were current under the name of *Æsop's Fables*. In 1697 Bentley found in the current fables of Æsop verses which he ascribed to Babrius. Tyrwhitt, in his *Dissertatio de Babrio* (1776), published a number of verses recovered from the prosaic paraphrases of Suidas; and in 1842 a Greek, Minoides Minas, discovered a manuscript in the monastery of St. Laura on Mount Athos which contained 123 fables, arranged in alphabetical order, showing that at least one-third the original collection had been lost. This manuscript is now in the British Museum. Fifteen years later Minas brought out 95 additional fables, which he claimed to have discovered in another manuscript; they are, however, now universally recognized as forgeries.

In 1877 Knöll recovered more new fables from a manuscript in the Vatican Library; and in 1891 Van Assendelft secured in Palmyra seven wax tablets containing fables not hitherto known. These are now in the library at Leyden. Of editions the best is by Crusius (Leipzig, 1897); another is by Rutherford (London, 1883). Consult: Conington, *Miscellaneous Writings*, vol. ii (London, 1872); Fusei, *Babriano* (1901); Christoffersson, *Studia de Fabulis Babriani* (1901).

BABSON, ROGER WARD (1875-). An American statistician, born in Gloucester, Mass., and educated at the Massachusetts Institute of Technology, from which he graduated in 1898. He organized and became president of a statistical organization with branch offices in the largest cities of the United States and in London. In addition, he undertook the publication of *Moody's Manual of Railroad and Corporation Securities*. The Massachusetts Institute of Technology appointed him lecturer on statistics and economics, and as a writer on these subjects several newspapers and weekly journals employed his services. His writings in book form include: *Business Barometers* (1909); *Selected Investments* (1911); *Bonds and Stocks* (1912); *Commercial Paper*, with Ralph May (1912); *The Future of the Working Classes* (1913).

BABU. See BABOO.

BABUR. See BABER.

BABUYAN (bā'bu-yān') ISLANDS (Malay, "pig" islands). A group of islands in the Pacific, forming a portion of the northern part of the Philippine archipelago (Map: Philippine Islands, F 2). They are situated between Luzon and the Batan group, between 18° 40' and 19° 40' N. lat. and 121° and 122° E. long. The chief islands are Kamiguin, 65 square miles; Babuyan Claro, 38 square miles; Calayan, 30 square miles; Dalupiri, 20 square miles; and Fuga, 21 square miles. They are of volcanic origin, and indicate comparatively recent activity. Including the Batan group, the population, according to the latest available estimate, was 12,000. The natives, Ibanags or Cagaynes, are the finest races of the Philippines. Tobacco, grain, rice, and tropical products are grown. There are some pineapples and wild grapes. The inhabitants are concerned chiefly with the raising of cattle, hogs, and horses, which, with lard, form the principal articles of export. Musa, on the south shore of the island of the same name, is the most important town.

BAB'YLAS, or BAB'YLLUS, SAINT (?-250). A Bishop of Antioch, from about 237 to 250. He refused to admit to public worship the Emperor Philip, who, to obtain the throne, had murdered the young Gordianus. In the persecutions under Decius he was cast into prison and there died. His day in the Roman calendar is January 24, and in the Greek, September 4.

BABYLON (Gk. Βαβυλών, Bab. *Babilu*, Heb. *Babel*, Eg. *B-b-l*, Arab. *Babil*). The capital of Babylonia from the time of Hammurapi (2124-2081 B.C.) to the end of the Chaldean Empire (539 B.C.). Its Sumerian name was *Ka-dingir-ra*, of which the Akkadian equivalent was *Babilu* (*bab*, 'gate,' and *ilu*, 'god'). It was also called *Tin-tir*, 'grove of life,' and *E-ki*, 'dwelling place.' The ending on may be of Greek origin, as in *Καρχηδών*, *Karchēdōn*, 'Carthage,' or possibly go

back to a local pronunciation, *Bab-ilani*, 'gate of the gods.' In Gen. xi. 9 Babel is explained as derived from *balal*, 'confound,' a name supposed to have been given to the city because the confusion of tongues took place there; but this folk etymology has no scientific value. (See BABEL, TOWER OF.) The ancient site of the city is represented by the villages of Kuwairish and Jimjima, on the eastern bank of the Euphrates, and Sanjar, on the western, as well as by the mounds named Babil, Kasr, Mujelliba, Ishan Amr ibn Ali, Ishan al Aswad, Ishan al Hamra, and Markaz, all on the eastern bank (Map: Turkey in Asia, L 6). Its exact location is 32° 34' 30" N. lat. and 44° 23' 30" E. long.

The city existed already in the time of Sargon of Agade (c.3790-3750 B.C.), who cleared the land around the *Tuna*-gate, built a palace, introduced the Anunit cult, and seems to have given to the place its Akkadian name, Babilu. For some centuries it must have had a prevaillingly Akkadian population, since the Semitic god Nabu appears to have established for himself a position of such strength that it had to be recognized even in later times, when the Sumerian god Marduk had become the chief deity of the city. It is possible that a dynasty from Eridu established itself in Babylon, between the third dynasty of Uruk and Ur Engur of Ur, with Marduk, the son of Ea of Eridu, as its god. The Amoritic dynasty of Sumuabu seems to have come from Sippara. During his successors Babylon grew in importance until in 2094 B.C. Hammurapi's conquest of Larsa made it the capital of all Babylonia. The city was captured by Gandash in 1671, by Tiglath Ninib c.1262, by Tiglath-pileser I (1140-05), by Shalmaneser III in 851, and by Tiglath-pileser IV in 729. It was destroyed by Sennacherib in 689. After razing the palaces, temples, and other buildings, he let loose the waters of the Euphrates through the Arachtu Canal over the city so as to make it uninhabitable. It was rebuilt by Esarhadon (681-668) and Samassumukin (668-648), but suffered at least partial destruction when Asurbanipal captured it from his rebellious brother. Babylon was enlarged and beautified by Nabopolassar (625-605) and Nebuchadnezzar (605-562). It became one of the capitals of the Achaemenian Empire, and Seleucus I Nicator resided there until he deemed it expedient to remove the seat of government to a place nearer the Mediterranean, and it soon yielded in importance not only to Seleucia and Antioch on the Orontes, but also to the Seleucia that grew up on the Tigris. Babylon was taken by the Parthian King Mithridates VII c.150 B.C., and Ktesiphon became a new formidable rival. The remains of a Greek theatre under the mound Al Hamra show that the city continued to flourish in the Hellenistic period. The Sasanid kings are said to have resided there at times. Even after the founding of Bagdad Babylon remained the capital of a district, as Ibn Serapion testified c.900 A.D. Later it became simply a village. The name remained attached to what at present is the northernmost mound, while the town of Hilla, which now has a population of c.20,000, grew up farther south.

Pietro della Valle, in 1616, recognized the ruins north of Hilla and near Jimjima as those of Babylon. They were visited by Beauchamp in 1784, by Rich frequently between 1811 and 1817, and by Robert Ker Porter in 1818. Layard began the work of excavation in 1850, but he continued

only a few weeks; Fresnel and Oppert remained over three years (1851-54), Hormuzd Rassam in 1880 only a short time. The real work has been done by the Deutsche Orient Gesellschaft, under the leadership of Koldewey, since 1899. He was able to trace the outermost wall, showing that the city extended over an area of about 12 square miles, consequently was far smaller than Herodotus (i, 178-187) represents it when he gives it a circumference of 480 stadia, i.e., about 55 miles, and had very nearly the extent assigned to it by Alexander's historians of 90 stadia, or c.10 miles. Very much smaller was the Babylon inclosed within the two oldest walls, the Imgur Bel and the Nimitti Bel, which have been found. Koldewey laid bare the Processional Street, *Aiburshabum*, the Ishtar Gate, the foundations of two palaces of Nebuchadnezzar, the quays, the Marduk Canal, the great Marduk temple, *E-sagila*, the whole in the ground now called *El Sahau*, where stood the famous Tower of Babel (q.v.), the *E-temen-anki*. Numerous objects of art have been found and a large number of inscriptions from different times. As a result of these excavations, it is now possible to understand the allusions to walls and gates, streets and towers, temples and palaces in the cuneiform inscriptions. No archive has yet been found in any temple or palace of Babylon such as those that rewarded the search of excavators at Sippara, Lagash, and Nippur. The city of Hammurapi's time could not compare in extent and magnificence with the splendid capital of which Nebuchadnezzar is represented as having said, "Is not this Babylon the Great?" It is this city that is coming to light, while little remains from the earlier periods of its history.

BABYLON. A village in Suffolk Co., N. Y., incorporated in 1894; 37 miles east of New York City, on Great South Bay, here crossed by steam ferry to Fire Island and Oak Island Beach, and on the Long Island Railroad (Map: New York, B 3). The village is a popular summer resort, having an admirable beach, and good fishing. The surrounding region is adapted to general farming. Pop., 1900, 2157; 1910, 2600; 1913 (est.), 2650.

BABYLONIA (Gk. *Βαβυλωνία*, Heb. *Babel*, Pers. *Babiru*). The name given by Greek writers to the country whose capital they called Babylon (q.v.). It corresponds to the modern Irak al Arabi (q.v.), including the vilayets of Bagdad and Basra so far as the latter existed in ancient times. On the west the boundary line ran along the Arabian Desert; on the north the country reached to the neighborhood of Bagdad about 33° 30' N. lat.; on the east the territory spread beyond the Tigris toward the Zagros Mountains; and the southern limit was marked by the Persian Gulf, which, however, extended much farther north than at present, as there has been a constant growth of the land. As a satrapy of the Achaemenian Empire it was called Babiru, corresponding to Babilu, and in an addition to the Book of Jeremiah (I. 28), it is referred to as "the land of Babel." In earlier

times the inhabitants themselves do not seem to have used the same designation for the capital and the country as the Assyrians did in the case of Assur (q.v.). The reason was that, before Babylon became the chief city, other names had already come into vogue. The Sumerians spoke of the region where they dwelt simply as *Kiengi*, 'the land.' It is possible that North Babylonia became known as Akkad after the Semitic Akkadians had established a strong dynasty at Agade (see ACCAD), and that south Babylonia was then referred to as Sumer. At any rate, the whole country was designated as "Sumer and Akkad" in the title of Ur Engur and his successors in the control of Babylonia, whatever their nationality. The Kassites often used the name "Karduniash," and that was also employed by the Hittite King Hattusil in one of the Boghaz Keui letters (see HITTITES). In the Old Testament the designations most frequently used are Shinar and "the land of the Kasdim." As regards the origin of the former there is much difference of opinion. Since Babylon and Accad as well as Erech and Calneh (Nippur?) are assigned to Shinar, the name would seem to include both Sumer and Akkad. If Shinar is derived from Sumer, it must be supposed to go back to a period of Sumerian supremacy previous to Ur Engur, or even Sargon of Agade, when the whole country could be called Sumer, as in the days of Asurbanipal it was called Akkad. On the other hand, Shinar may be identical with the Sangara of the Egyptians and the Sanhar of the Tell el Amarna tablet xxv. 49, but it is not clear where these names originated or what they represented. Consult Landersdorfer, "Das Land Shin'ar," *Biblische Zeitschrift* (1913). The Kasdim are Kaldû, or Chaldeans, and their country, also called *mat tamti* and *mat marrati*, was the southernmost part of Babylonia, on the Persian Gulf. As the last native dynasty was Chaldean, the Greeks often used the name *Χαλδαία*, Chaldæa, for the whole country.

Physical Features. Babylonia is an alluvial plain created by the deposits of the Euphrates and the Tigris. The present rate of increase is about a mile in 70 years. It is not known whether it has been uniform in the past. As Mohammedrah was on the gulf in Alexander's time, it cannot have varied greatly since then. While it would be hazardous to affirm on this basis alone that no part of Babylonia existed 25,000 years ago, it is not improbable that this is the case. On the other hand, there is reason to believe that almost two-thirds of the present surface of Babylonia had risen above the waters at the time when our earliest inscriptions were written. But each of the two rivers then entered the gulf at a separate mouth; Shatt el Arab did not yet exist. The great fertility of Babylonia was due to a network of canals that was carefully kept up and to the systematic irrigation of the soil. Embankments and trenches are found everywhere, indicating the course of these ancient canals. As the result of long neglect there are to-day large tracts of land that are either swamps or deserts. In ancient times this plain yielded rich returns to the farmer. As long as the annual inundations of the Euphrates and the Tigris were under control, and the waters were properly led to the fields, he could count upon enormous crops. Wheat was the principal product, but barley, millet, and vetches were also cultivated in large quantities. Dates furnished wine, vinegar, and

flour for baking; the sap of the date tree gave palm sugar, and ropes were made from the bark. The vine and such fruits as apples, oranges, and pears were also cultivated. Among domestic animals may be mentioned camels, oxen, sheep, goats, horses, and dogs; among wild animals, lions, wild oxen, wild boars, jackals, hares, and gazelles; there was a great variety of birds, and an abundance of fish in the rivers.

Ethnology. The population of Babylonia seems at all times to have been very mixed. We have no means of knowing who first inhabited the strip of land between the two rivers available for settlers in the Neolithic Age. They may have been Semites, Sumerians, Anzanites, or Negritos. De Morgan thinks that Negritos descending from some Pleistocene race were the first to enter the country, but that the first real settlers were the Sumerians (*Les premières civilisations*, pp. 192 ff., 1909). In a careful study of the representations of Sumerians and Akkadians by the ancient artists, Ed. Meyer reached the conclusion that the Akkadians preceded the Sumerians in Babylonia (*Sumerier und Semiten in Babylonien*, 1907). He based his view partly upon the assumption that Nippur was an Akkadian cult centre, partly on the representation of their gods by the Sumerians with long hair and beard, like Semitic gods, though they shaved their heads and faces themselves. This theory has been accepted by Caetani, *Studi di Storia Orientale*, i, 145 ff. (1911), who modifies it by assuming two Semitic invasions—one before, and another after, the Sumerian conquest, and by Jastrow, *Die Religion Babyloniens und Assyriens*, Vorwort, ix ff. (1912) who emphasizes the coöperation of the two races in developing Babylonian civilization. But Clay has shown (*Am. Journ. of Sem. Lang.*, 1907) that the name of the god of Nippur was always pronounced Enlil or Ellil, not Bel, and Meyer has subsequently (*Geschichte des Altertums*, i, 2, 2d ed., p. 407, 1909), recognized that "Nippur always was a Sumerian cult centre." His arguments from hair, beard, and manner of dress have not been regarded as convincing by Langdon, "Sumerians and Semites in Babylonia" in *Babyloniaca*, vol. ii (1908) and King, *A History of Sumer and Akkad*, pp. 40 ff. (1910). Bearded Sumerians appear upon some of the earliest monuments, and they may well have represented their gods with hair and beard, not because their enemies, the Semites, represented them thus, but because their ancestors made these gods in their own image before they adopted the custom of shaving off the hair and the beard. The theory of De Morgan seems at present most probable, and it is more likely that the Sumerians came down the Adhem and the Diyala from the north-east than that they came by sea from the south. Concerning the ethnic relations of the Sumerians nothing is as yet known. The difference in language cannot be urged against a connection with the Anzanite stratum in Elam or the early population around Lake Van, since widely differing languages of the agglutinating type are found among people of the same racial stock. (See SUMERIAN LANGUAGE.) Whether the setting of the eyes in the finely chiseled heads of the Gudea period indicates a Mongolian origin is uncertain. If the Sumerians descended from the Zagros Mountains in the Neolithic Period, they are likely to have come from some region north of the high plateau of Iran. The Akka-

dians were Semites, entering the land probably from northeast Arabia. The representation of Naram Sin in high relief presents the type very clearly. Amoritish tribes seem to have pushed their way into Babylonia long before Sumuabur (2232-2217). The first dynasty of the city of Babylon known to us was Amoritish. (See AMORITES.) The racial connections of the Kassites are doubtful; but the occurrence of Shuriash (Sanskrit *Surya*, the 'sun') in Kassite names suggests that there was an Iranian element among them as among the Mitannians (q.v.). Numerous Aramean tribes occupied the plains east of the Tigris and between the two rivers in the south. (See ARAMEANS.) Whether the Chaldeans (*Kaldu*, Heb. *Chesed*, *Kasdim*) originally formed one of these cannot be determined, but is suggested by Gen. xxii. 22. The Chaldean kings of Babylon assumed names compounded with Marduk, Nabu, and Nergal, and had their inscriptions written in Babylonian. We have no inscriptions from Bit Yakin. Elamites (see ELAM), Gutians (see ARRAPACHITIS), Medes, and Jews, at least from 597, when the 10,000 exiles were placed on the river Chebar (Kubaru, the canal of Nippur), and 586 and 581, when several thousand more were deported from Jerusalem to Babylonia, helped to swell the population.

Cities. The chief cities in northern Babylonia were Opis, the seat of the earliest-known dynasty, first called Kesh, then Upi, whence the Opis of Xenophon, situated on the Adhem, near the Tigris, not yet identified with any existing mound; Agade (see ACCAD), not far from Sippara, and possibly identical with Sippara of Anunit, not yet identified; Sippara of Shamash, the modern Abu Habba, on the Euphrates; Dur Kurigalzu, the modern Akarkuf, built in the Kassite period; Cutha (q.v.), the modern Tell Ibrahim, northeast of Babylon; Kish, the modern Tell el Uhaimir, east of Babylon and its twin city Charsagkalama; Babylon (q.v.) north of Hillah; and Borsippa (q.v.), the modern Birs Nimrud, opposite Babylon, west of the Euphrates. In southern Babylonia the most important cities were Nippur, the modern Nuffar on Shatt el Nil; Adab, the modern Bismaya, between Shatt el Hai and Shatt el Kur; Kisurra, the modern Abu Hatab, west of Shatt el Kur; Shuruppak, the modern Fara, a short distance southeast of Kisurra; Umma, the modern Jochab, east of Shatt el Kur; Dur gurgurri, probably the modern Tell Sifr; Uruk, the Erech of the Hebrews, the modern Warka, between Shatt el Kur and the Euphrates; Larsa, the modern Senkera farther south; Lagash, the modern Tell Loh, on Shatt el Hai; Uru, the Ur of the Chaldees, the modern Mukayyar, west of the Euphrates; and Eridu, the modern Abu Shahrein, farther south. The important city of Isin has not yet been identified, nor the northern Charsagkalama, nor Anu; and the ancient names of the cities buried under the mounds of Hamam, Lamlun, Hatra, Hetima, El Jidr, El Hibba, Surghul, Tell Id, Tell Medain, and Tell Lahm have not been discovered.

Excavations. Sippara (see SEPIARVAIM), discovered by George Smith, was excavated in 1881 by Hormuzd Rassam, who secured some 60,000 tablets, among them the famous Nabunaid inscription giving the date of Naram Sin, and in 1902 by Scheil. Excavations were carried on by Rassam at Cutha in 1881 without im-

portant results. Oppert and Fresnel undertook for a brief period excavations at Kish in 1852. Most thoroughgoing excavations have been carried on by the Deutsche Orient Gesellschaft under the leadership of Koldewey at Babylon from 1899 to the present time, resulting in the discovery of many inscriptions and objects of art as well as in a greatly increased knowledge of the city as it was rebuilt by Esarhaddon and beautified by Nebuchadnezzar, with its palaces, temples, quays, streets, and walls. Some excavations were undertaken by Rassam at Borsippa in 1881. At Nippur excavations were begun by Layard in 1851. After a tour of reconnaissance by Ward in 1885, the city was thoroughly excavated by Peters in 1888 and 1890, by Haynes in 1893, and by Hilprecht in 1898 and 1900 for the University of Pennsylvania. A very large number of inscriptions were found, numerous objects were obtained, and temples and buildings from different periods examined. Adab was excavated by Banks in 1902-03; Shuruppak, which goes back to Neolithic times, and Kisurra were in part excavated by Koldewey in 1902; Loftus excavated at Dur gurgurri in 1854, at Uruk in 1850 and 1854. Most extensive and systematic excavations were conducted for the French government by De Sarzec at Lagash from 1877 to 1901 with some interruptions, and later by Cros, resulting in the discovery of a temple archive containing about 30,000 inscribed clay tablets, many thousand tablets in other parts of the mound, a vast number of objects of art, among them the remarkable Gudea statues, and an acquaintance with an ancient Sumerian city that had a very long history. Koldewey examined Surghul and its necropolis and El Hibba in 1902, and Hatra in 1912. Taylor conducted excavations at Ur and Eridu in 1854-55. Especially the excavations at Lagash, Nippur, and Babylon have been of great value; but at these places as well as in series of mounds covering ancient Babylonian cities there is an enormous amount of work yet to be done.

Chronology. Our knowledge of Babylonian chronology is based upon (1) lists of kings and dynasties, (2) chronicles, (3) references to dates of earlier kings by their successors, (4) documents dated in the years of various kings, (5) synchronisms with rulers in other lands, (6) excerpts from the history of Berosus, (7) Ptolemy's *Almagest*, and (8) dates that can be fixed astronomically. We possess at present a number of lists of dynasties and kings with regnal years and the sum total for each dynasty. The most important of these are a list of the dynasties of Opis, Kish, I Uruk, Agade, and II Uruk, published by Scheil in *Comptes rendus de l'Académie des Inscriptions et Belles Lettres*, pp. 606 ff. (1911); a list of the dynasties of Ur and Isin, published by Hilprecht, in *Babylonian Expedition of the University of Pennsylvania*, xx (1906); a list of 10 dynasties of Babylon, published by Pinches in *Proceedings of the Society for Biblical Archaeology*, vi, 193 ff (1884), and a list of the first two dynasties of Babylon, also published by Pinches, *id.*, i, 20 ff. (1880). The Babylonian Chronicle, written in the time of Darius I, was published by Pinches in 1884, and is given with a translation in Rogers, *Cuneiform Parallels to the Old Testament* (1912); and valuable data are found in *Chronicles concerning Early Babylonian Kings*, published by King in 1907. Important references

are made to the time when earlier kings reigned, e.g., by Nabunaid, who states that Naram Sin laid the foundation stone of the temple of Shamash in Sippar 3200 years before him, or about 3750 B.C., that Hammurapi lived 700 years before Burnaburiash (1381-1357), consequently in 2081, and that Shagaraktishuriash reigned 800 years before his time, i.e., about 1350; by Ellilnadinbal (about 1140) that Gulkishar reigned 696 years before him (c.1840); by Sennacherib that two images were found when he destroyed Babylon in 689 which had been taken from Tiglath-pileser I 418 years before, or in 1107; and by Asurbanipal that Kudur Nanchundi carried away Nanai from Uruk 1635 years ago, i.e., 2280 B.C. Dated documents, of which there is a very great number, often help to check the figures in the lists. Aside from the invaluable *Synchronous History* (Peiser and Winckler, in *Keilinschriftliche Bibliothek*, 1889) and the *Babylonian Chronicle*, it is important for the chronology that Burnaburiash of Babylon was the contemporary of Dushratta of Mitani, Subbiluliuma of Hatti, and Amenhotep III and Amenhotep IV of Egypt, as the Tell el Amarna Letters (q.v.) show; that Kadashman Turgu and Kadashman Ellil of Babylon were the contemporaries of Hattusil of Hatti and Ramesses II of Egypt, as the Boghaz Keui tablets show (consult Winckler in *Mitteilungen der Deutschen Orientgesellschaft*, No. 35 (December, 1907)); that Sumuabu was a contemporary of Ilusuma of Assyria, Ilumailu, the founder of the second dynasty of Babylon, a contemporary of Hammurapi's son, Samsuiluna, and Kashtiliash I of the third dynasty of Babylon, a contemporary of Eagamil, the last king of the second. Berossus evidently used lists of kings so far back as to the beginning of Sumuabu's reign, and the date he assigns for the first Babylonian dynasty is now recognized as correct; but the principle on which he arranged his dynasties has not yet been found and does not agree with that obtaining in our cuneiform inscriptions. Ptolemy's Canon gives a fixed starting point in the era of Nabunazir (747) and valuable astronomical data. The accuracy of his list of kings is proved by the lunar eclipses he records, as Zech has shown (*Untersuchungen über die Mondfinsternisse des Almagest*, 1851) and the accuracy of the date given by Berossus for the first dynasty is proved by observations of the appearance of Venus made in the twenty-first year of Annizaduga, as Kugler has shown (*Sternkunde und Sterndienst in Babel*, ii, 2, Heft 1, 1912).

While there are still some kings who cannot be dated and some dates that are not certain, the chronology of the period from 2232 to 539 has been in the main established. As we advance beyond the former date, three problems present themselves. The first concerns the end of the dynasty of Isin. If the conquest of the city by Rimsin of Larsa marks the end, and this conquest is identical with the fall of the city in the seventeenth year of Sinmuballit, then Ur Engur, the founder of the dynasty of Ur, began his reign in 2469, as Ed. Meyer maintains in *Sitzungsberichte der k. preussischen Akademie der Wissenschaften*, p. 1064 (1912). On the other hand, if the dynasty of Isin immediately preceded the first dynasty of Babylon, Ur Engur's date would be 2574. Much speaks in favor of the latter view, but it is by no means certain. The reliability of Nabu-

naid's date for Naram Sin constitutes the second problem. A textual error of 3200 for 2200 has been supposed; but such an arbitrary change of the document is generally regarded as unmethodical. It has been suggested that Nabunaid's scribes may have based their calculations on the precession of the equinoxes, and reckoned each degree at 100 years instead of 72. The assumption was that there could not have been at the time of Nabunaid lists of kings with their regnal years covering more than 3000 years. Yet it is admitted that very accurate lists must then have existed, going back to Sumuabu, covering over 1680 years, or more than half of the distance; the recently published lists for times earlier than Sumuabu give 1275 years; Hilprecht (l.c.) estimated that there must have been about 135 names before that of Ur Engur in the lost part of the broken tablet, and there is now no reason to suspect any of these to have been mythical. It is extremely improbable that contemporaneous dynasties were counted as successive; in the case of the second dynasty of Babylon the supposition proved mistaken. But an occasional overlapping of dynasties is very probable, though the Babylonian scribes seem to have been aware of this and taken account of it. When new lists of kings and dynasties formerly unknown are thus appearing from time to time, much weight cannot be given to the absence of documents for the centuries between the Gutian conquest and Ur Engur. Ed. Meyer points out that we have not a single tablet or document of any kind for half a thousand years, from 1925 to 1381. Only future discoveries can decide the trustworthiness of Nabunaid's statement, but in the light of recent finds it would seem more correct to accept it tentatively than to assign to Naram Sin arbitrarily a much later date, without any evidence and in the face of a positive testimony likely to be based upon the simple addition of a score of figures. The third problem is connected with the dynasty of Kish, which is given 586 years, but only eight rulers, the first of them a queen credited with 100 years. Some scholars accept only the eight rulers with the 192 years ascribed to them, and besides are inclined to doubt the length of Queen Azag Bau's reign, while others, like Hrozný in *Wiener Zeitschrift für die Kunde des Morgenlandes*, pp. 143 ff. (1912), assume the correctness of the sum total. In favor of Hrozný's view is the fact that we know quite a number of kings of Kish clearly belonging to the period before Sargon of Agade not mentioned in the new list, and among these we should probably count, with Meyer (l.c.), Sargon, Manishtusu, and Urumush. Hrozný, who places Sargon of Agade in 2744, assigns to Unzi, the first King of Opis, the date 3454. If Nabunaid's date for Naram Sin is accepted, Unzi would begin his reign in 4500 B.C.

History. *Dynasty of Opis* (c.4500-4401).—Concerning the history of Babylonia before this dynasty we have no positive information. How long the Sumerians had been in the land, whence they came, whether they were preceded by men of a different race, what degree of civilization they had attained, and to what extent, if any, Semitic tribes had pushed their way into the country as nomads or settlers, can only be matters of conjecture. It is significant that this earliest Sumerian dynasty appears in the northernmost town of Babylonia, east of the Tigris.

The regnal years of the six kings are given in the list. They are Unzi (30 years), Undalulu (12), Ursag (6), Basha Sir (20), Ishuil (24), and Shu Enzu (7).

Dynasty of Kish (c.4401-3815).—The power passed from Opis to Kish, east of Babylon. Only eight rulers are given in the list: Azag Bau, a woman (100 years), Basha Enzu (25), Ur Zamama (6), Zimudar (30), Uziwidar (6), Elmuti (11), Igul Babbar (11), Naniyach (3). Yet the total number of years for the dynasty is 586. This evidently covers the whole period of the power of Kish. The other Sumerian kings of Kish, such as Utug, Mesilim, Alzu, Lugalarsa, and Urzage, may have belonged to a different dynasty, as certainly did the Semitic kings of Kish, Enbi Ishtar, Sargon, Manishtusu, and Urumush. During this period a number of prominent patesis, priest kings of Ningirsu, reigned at Lagash, such as Enchegeal, Badu, Lugalshag Engur, the contemporary of Mesilim of Kish, Urnina and his lineal descendants, Akurgal, Enannatum I, Entemena, and Enannatum II, and later, Lugalanda, Enliltarzi, Emetarzi, and Urukagina. Enannatum, whose deeds are recorded on the Vulture Stele and in other inscriptions, conquered Alzu of Kish, and received from Ellil, the god of Nippur, sovereign power. The same success seems to have crowned the efforts of Lugalzaggisi, patesi of Uruk, who was recognized by Ellil, and made Ur his capital, where also Lugalzaggisi and Enshag-kushanna seem to have ruled as "kings of Sumer and the land." This may have been the response of the Sumerian south to the establishment of a Semitic family upon the throne at Kish. But Sargon, Manishtusu, and Urumush were conquerors who made their powers felt everywhere in Babylonia and in Elam.

First Dynasty of Uruk (c.3815-3790).—The power of Kish came to an end through Lugalzaggisi. This King was originally patesi at Umma, but took possession of Uruk, was recognized by the Ellil priesthood at Nippur, subdued the north, and made expeditions to Syria, so that he could claim to rule from the Upper Sea (the Mediterranean) to the Lower Sea (the Persian Gulf). He has left a long inscription, recording his victories, copied on a large number of vases.

Dynasty of Agade (c.3790-3593).—Lugalzaggisi was overthrown by the founder of the dynasty of Agade. There can be little doubt that this was Sargon I, King of Accad, who conquered Elam, Mesopotamia, the land of the Amorites, and the Gutians, and built temples in Babylon and Nippur. His son, Naram Sin, fought with Magan in Arabia, the Lulubians, and Bit Aram (possibly an Aramæan people), had a statue erected north of Diarbekr, ruled at Susa, as an Elamitish inscription shows, and may have made a raid on Cyprus. His two successors are unknown; after them came Sargon II, Abaiailu, Iliidinnam, Imiilu, Nannumsharru, Ihlukar, Dudu (21 years), and Shukarkab (15). There were 12 kings; the names of the eight last kings and the long duration of the dynasty have been known only since 1911.

Second Dynasty of Uruk (c.3593-3567).—The passing of the hegemony to Uruk probably represents a Sumerian reaction. The kings were Urnigin (3 years), Urinar (6), Kudda (6), Bashanini (5), Ur Utu (6). They are otherwise unknown. The dynasty was overthrown by a foreign invasion.

Gutian Dynasty (c.3567-?).—The people of Gutium took revenge for their long subjection to Accad and Uruk by ravaging the cities probably under their king, Erridapizir. Whether they ruled from their own capital, Arrapcha, or chose one of the great cities of Babylonia as seat of government, is unknown, as is the duration of the dynasty. It is not impossible that it lasted for centuries, as the Kassite rule at a subsequent period. We have no list of rulers, but Basum, Lasirab, and the last of the kings, Tirikan, are referred to in inscriptions.

Third Dynasty of Uruk (unknown date).—King Utechegeal, of Uruk, freed Babylonia from foreign domination. The dynasty was probably of Sumerian origin. How long it lasted cannot be determined.

Dynasties of Lagash and other Cities (before 2574).—The patesis who succeeded Urukagina (c.3815) in Lagash were apparently weak rulers and for the most part politically dependent. Only about a dozen are known from the long period preceding Gudea, possibly a fourth of the entire number. There may have been many dynasties, Sumerian and Akkadian, in the last half of the fourth millennium and the beginning of the third, which have not yet come to light. Nor is it possible to give the date of the greatest of all Sumerian rulers, Gudea, of Lagash. It is difficult to believe that Lagash in his time recognized the suzerainty of any other city. Gudea, indeed, never uses the title of king and always calls himself simply patesi; but he never alludes to any other king as his sovereign, he conquered Anshan, and sent out expeditions to Syria and Arabia to secure wood and diorite, and may have prided himself upon his patesi title, designating him as priest king of the god Ningirsu, as some of the earlier Assyrian kings did, who called themselves simply isakku of Asur. (See ASSYRIA.) The statues of Gudea give us the best idea of the Sumerian type. His son, Ur Ningirsu, seems to have retained the same power and independence. It is as yet impossible to say how long a time may have elapsed between him and the patesis Urabba, Galukazal, Urlama, Alla, and Arad Nannar, who were contemporaries of the kings of Sumer and Akkad.

Dynasty of Ur (2574-2457).—Under Ur Engur of Ur (18 years) Sumer and Akkad were definitively united, and this union was expressed in the royal title. His descendants were Dungi (58), Bur Sin (9), Gimil Sin (7), and Ibi Sin (25). Of all these kings we possess inscriptions. The patesis of Susa were subject to them, though Ibi Sin was finally taken captive to Susa.

Dynasty of Isin (2457-2232).—The power passed from Ur to Isin, a city which it has not yet been possible to identify. The kings were: Ishbi Ura (32 years), Gimililishu (10), Idin Dagan (21), Ishme Dagan (20), Libit Ishtar (11), Amil Ninib (28), Pur Sin (21), Iterkasha (5), Uraimitti (7), Sinikisha (½), Ellilbani (24), Zambia (3), . . . (5), Ea . . . (4), Sinmagir (11), and Damikilishu (23). Five of these have left inscriptions. During this period King Kudur Nañchundi plundered the temples of the land of Akkad and carried away the goddess Nanai from Uruk (c.2280), brought back by Asurbanipal 1635 years later. The dynasty seems to be of Amoritish origin. A rival dynasty appears to have been established at Larsa, c.2375, whose founder Gungunu was

recognized by Ishme Dagan's son, Enannatum, priest of Nannar at Ur.

First Dynasty of Babylon, Amorite (2232-1932).—The city of Babylon, mentioned already in the time of Sargon I of Agade, may have played a more prominent rôle in the centuries intervening between the expulsion of the Gutians and the establishment of the kingdom of Sumer and Akkad than our fragmentary sources reveal. An Amoritish chief Sumuabū (2232-2217) founded the first known dynasty of Babylon. His son Sumailū (2217-2181) greatly extended the power of this city kingdom which maintained itself during his successors Sabu (2181-2167), Apil Sin (2167-2149), and Sinmuballit (2149-2124). The greatest ruler of the dynasty was Hammurapi (2124-2081). At the beginning of his reign he probably recognized the suzerainty of the Elamitish king Kudur Mabuk, and it is not improbable, though it cannot be strictly proved, that he accompanied another Elamitish king, Kudur Lagamar (see CHEDORLAOMER) on a raid into Syria, as is suggested by Gen. xiv. 1 (see AMRAPHEL), some time before 2094, when he succeeded in overthrowing Rim Sin (probably Erim Aku, see ARIUCH), the son of Kudur Mabuk, who had succeeded his older brother Arad Sin as King of Larsa. Already in 2118 he had captured Uruk and Isin, and in 2114 he seems to have made Samsi Adad I of Assyria a vassal. There is no direct evidence that he ruled over either Syria or Elam. He devoted much time to the inner administration of his kingdom, on which his private correspondence with Sinidinnam, a friend and high official, especially throws light. In his famous law book (see HAMMURAPI, CODE OF) he not only vested with his authority many laws of Sumerian origin, already codified in the days of Urukagina, of Lagash, and others of Akkadian origin, but manifestly added many regulations made necessary by the recent development of commerce and industry. His ambition appears to have been to establish justice in the land as a righteous king. Samsuiluna (2081-2043) fought successfully with Ilumailu, a descendant of the old royal family of Isin, but could not prevent him from establishing himself as king in the Sea Country, north of the Persian Gulf. In 2072 he won a victory over a Kassite army. Abeshu (2043-2015) was also unable to subdue Ilumailu. During the reigns of Ammiditana (2015-1978), Ammisaduga (1978-c.1963), and Samsuditana (1963-1932) the power of the dynasty dwindles. The Hittites invade the country and put an end to the Amoritish kingdom, plunder Babylon, and the rival dynasty in the south, having gradually extended its territory, is ready to seize the capital itself.

Second Dynasty of Babylon, from Sheshazag, or the Sea Country (1932-1761; in the south 2079-1711).—It is not improbable that the Hittites established Damkiilishu on the throne of Babylon in 1932, as a Sumerian vassal. He counted his dynasty as beginning with Ilumailu (2079-2019) and therefore including his father Ittiilimbi (2019-1964) and his own reign from the time when he became king in the Sea Country (1964-1928). Ishkigal (1928-1913), Shushi (1913-1886), Gulkishar (1886-1831), Peshgal-daramash (1831-1781), and Adarakalama (1781-1753) followed him. Gulkishar gave a district of Der to Nina c.1850, referred to by Ellilnadinpal 700 years later. In the reign of Adarakalama the Kassite invasion took place.

The dynasty was evidently driven back to the Sea Country, where Ekurulanna (1753-1727), Melammakurkura (1727-1720), and Eagamil (1720-1711) continued to rule. The last of these kings was a contemporary of Kashtiliash.

Third Dynasty of Babylon, Kassite (1761-1185).—Whether Gandash (1761-1745) came from the home of the Kassites in the Zagros mountains or from some district in Babylonia occupied by this people at the time, is uncertain. His successors, Agum I (1745-1723), Kashtiliash I (1723-1701), Ushi (1701-1693), Abirattash (1693-c.1670), Tazzigurmash (c. 1670-1655), and Agum II (c.1655-1625), come more and more under the influence of Babylonian culture. Agum II styles himself King of Kashshu, Padan, Alman, and Gutī. He recovered from Khana in Mesopotamia the images of Marduk and Zarpant that had been carried away by the Hittites three centuries before. The names of at least six kings for the period from 1625 to c.1500 have not yet been supplied. Karaindah in the beginning of the fifteenth century entered into a treaty with Asurrimnisesu of Assyria. There may have been two reigns between Karaindah and Kadashmanharbe I, who corresponded with Amenhotep III (1411-1375). Kurigalzu I also exchanged presents with this Egyptian king. Burnaburiash (1381-1356) married Muballitserua, daughter of Asuruballit I of Assyria, made a treaty with Puzur Asur, but referred to Asuruballit II as his vassal in a letter to Amenhotep IV (1375-1350). His son Karahardash was murdered by the Kassites, but their leader Nazibugash (1356-1355) was deposed by Asuruballit II, who placed on the throne Kurigalzu II, another son of Burnaburiash. Toward the end of Kurigalzu's reign (1355-1333) he captured and plundered Susa, recovering the Dungi tablet, and defeated Adadnirari II of Assyria. Nazimaruttash (1333-1307) continued the war with Adadnirari II. Kadashman Turgu (1307-1290) and his son Kadashman Ellil (1290-1284) maintained friendly relations with Hattusil, the contemporary of Ramses II (1310-1244), as some of the Boghaz Keui letters show. (See HITTITES.) Probably in the year 1290 Kadashman Ellil fought with Shalmaneser I (c.1320-1290). Kudur Ellil (1284-1276) and Shagarakti Shuriash (1276-1263) were still able to defend themselves against Tiglath Ninib, but Kashtiliash (1263-1255) seems to have succumbed, and seven of his regnal years probably belong to Tiglath Ninib as the first Assyrian monarch ruling over Babylonia (c.1262-1255). After his murder, Ellilnadinshum (1255-1254), Kadashmanharbe II (1254-1253), Adadshumiddin (1253-1247), and especially Adadshumusur (1247-1217) kept up the struggle, which ended with a definitive victory over the Assyrians. Melishipak (1217-1202) pursued Ninibpilesur to the very gates of Assur. Mardukapaliddin (1202-1189), Zamamaiddin (1189-1188) and Ellilnadinahi (1188-1185) are the last kings of the dynasty.

Fourth Dynasty of Babylon, from Isin (1185-1051).—The deliverance from the foreign domination came from Isin. Only a part of the name of the founder has been preserved, Marduk . . . (1185-1168). Two names are missing; then comes Nebuchadrezzar I (c.1160-1140), who conquered Elam and made an expedition into Syria, but was defeated by Asurresisi; Ellilnadinpal I (1140-1117); Mardukna-

dinahi (1117-1105), who won a victory over the Assyrians in 1107; Mardukshapizermati (c. 1105-1095), Adadapaliddin (1095-1073), Mardukahierba (1073-1071), Mardukzer... (1071-1059), and Nabushumlibur (1059-1051).

Fifth Dynasty of Babylon, from the Sea Country (1051-1030).—Descendants of an earlier royal family in Isin seem to have established themselves in the Sea Country, where there apparently was a considerable Kassite element in the population. Shimashshipak (1051-1033) took possession of Babylon. Eamukinzer reigned only five months, and Kashshunadinahi less than three years (1033-1030).

Sixth Dynasty of Babylon, from Bit Bazi (1030-1010).—The origin of this dynasty is unknown. The three kings were Eulmashshukinshum (1030-1013), Ninibkudurur (1013-1010), and Shilanimshukamuna (three months, 1010).

Seventh Dynasty of Babylon, Elamite (1010-1004).—The name of the Elamite who captured the throne of Babylon and held it for six years is not given in the list; but another inscription suggests that it may be Eaapalusur.

Eighth Dynasty of Babylon, native (1004-753).—Only a few names have been preserved. Nabumukinpal reigned 1004-978; Shamashmudamik and Nabushumishkun I were contemporaries of Adadnirari III (911-890), Nabupaliddin of Asurnazirpal III (885-860), Marduknadinshum of Shalmaneser III (860-825), Mardukbalatsiikki and Bauahiiddin of Samsi Adad V (825-812).

Ninth Dynasty of Babylon, native (753-732).—The founder is unknown. He was followed by Nabushumishkun II. Why Ptolemy's canon begins with Nabunaser (747-734) has not yet found a satisfactory explanation. Nabunadinzer reigned two years, and Nabushumukin a little over a month.

Tenth Dynasty of Babylon, Chaldaeo-Assyrian (732-625).—This appears in the list not so much as a dynasty as a succession of rulers of different dynasties. Seven such dynasties are mentioned; some well-known Assyrian kings are given peculiar names, and the names of the dynasties do not suggest Assyria. Yet no effort to save national pride could quite gloss over the fact that for almost two centuries Babylonia was ruled by Assyrian kings, most of whom belonged to the Sargonid family. Concerning Ukinzer (732-729) nothing is known. Pulu (729-727) is Tiglath-pileser IV; Ulula (727-722) is Shalmaneser V. The Chaldaean Mardukapaliddin maintained himself for 12 years on the throne (721-709), but must yield to Sargon (709-705). Sennacherib succeeded him, but his authority was set aside first for a month in 703 by Mardukzakirshumi, and then for nine months by Mardukapaliddin (703-702). The attempt to rule through Belibni (702-700) having failed, Sennacherib made his son Asurnadinsum king (700-694). But he was carried away as a captive to Elam, and the King of this country appointed Nergalushezib as ruler of Babylon (694-693); he was captured by the Assyrians, and the Chaldaean Mushezib Marduk was proclaimed King (693-689). Sennacherib quelled this insurrection, and in 689 utterly destroyed the city of Babylon. He governed the country himself until his death in 681. Esarhaddon (681-668) pursued a conciliatory policy in Babylonia and rebuilt the ancient capital. He appointed his son Samassumukin as

viceregent in Babylonia. Rebelling against his brother Asurbanipal, Samassumukin found himself unable to hold Babylon and threw himself into the flames of his burning palace in 648. From that time to the end of his life Asurbanipal ruled as king in Babylonia under the name of Kandalanu.

The Chaldaean Empire (625-539).—When Asurbanipal died, Nabopolassar (Nabupalassar) refused to recognize Asurtilianiukin, declared himself independent, and apparently entered into an alliance with Cyaxares of Media and Psammetichus of Egypt against Assyria. Nineveh was saved in 625 by the prompt appearance of Assyria's ally, the Scythian king Madyas, who drove away the Medes and prevented a general defection in Syria or an Egyptian occupation of the land. There seems to have been an understanding between Cyaxares and Nabopolassar that, in the coming division of the Assyrian Empire, Media was to have Assyria proper and her quondam possessions in Asia Minor, while Chaldaea would be free to annex Syria and Egypt. It is not likely that the terms of this deal were officially made known to the court at Sais; but a suspicion of such an agreement may have determined Necho to force the issue in 608. From the standpoint of Babylon he was a vassal of Chaldaea as truly as his grandfather had been of Assyria. After the fall of Nineveh in 606, Nebuchadnezzar (Nabukudurur), then heir apparent to the throne, met Necho in a battle at Carchemish in 605. He captured Jerusalem in 597 and carried away to Nippur some 10,000 Judæans, and 11 years later was obliged to besiege and partially destroy the city. Though he laid siege to Tyre for 14 years, he was not able to take this city. His Egyptian expedition in 568 seems to have been a mere raid. He was a great builder (see BABYLON) and an energetic administrator. He reigned from 605 to 562, and was followed by his son Amil Marduk (562-560). Nergalsharusur (560-556) was not a descendant of Nabopolassar, but a son-in-law of Nebuchadnezzar, and his son Labashi Marduk was overthrown by Nabonidus (Nabuna'id), who was not a Chaldaean but a native of Babylon. In the beginning of his reign (556-539) the Medes under Astyages attempted to add Mesopotamia to their Assyrian province, but were driven away from Haran by Nabonidus. After the conquest of Media by Cyrus of Anzan in 553, this King occupied himself with Cressus of Lydia until Sardis fell in 546, whereupon he turned his attention to Babylonia. Nabonidus was a man of sincere piety, who sought by zealous worship of the gods to avert the danger to the state. He rebuilt the ancient temples everywhere in the kingdom, and dug in their foundations for the inscriptions of earlier kings. To the researches of his scribes and the excavations of his officials we are indebted for much information. It is not clear whether Nabonidus removed the images of the gods from other cities to Babylon in order to centralize all worship there or to save them in the capital in case the old sanctuaries elsewhere should fall into the hands of the enemy. As the King failed to attend the great Marduk festivals in Babylon, preferring to live at Tema, and the shrines for the gods brought into the city detracted from the revenues and power of the Marduk priesthood at the Esagila, disaffection and treason naturally set in. The Crown Prince, Bilsharusur (see

BELSHAZZAR) was defeated by the troops of Cyrus at Opis in 539, and in December of that year Gubaru took possession of the city without clash of swords. Nabonidus was permitted to retire into privacy in Carmania; what became of Bilsharusur is not known; Cyrus was solemnly recognized as King of Babylon in 538; he sent back the images to the local sanctuaries; and Babylonia became a province of his empire.

Government. It is possible that the *lumu* institution (see ASSYRIA) once existed also in the city states of Babylonia, as it was preserved in the old city of Shuruppak. But the power at an early time centred in the priestly class, and the patesi, or chief representative of the local deity, became the ruler of the community. In the case of the more important centres a two-fold development of the patesiate was possible. It might become a kingship over the whole country, or a large part of it, with the recognized hegemony of the metropolis, or it might become a great religious authority whose recognition was necessary for the exercise of sovereignty. Nippur seems to be an example of the latter development. The patesiate might also remain simply a local position. Conquerors like Sargon of Agade, Hammurapi, Agum II, and the Sargonids evidently attached much significance to the proclamation by the oracle of Elh1 at Nippur, or the seizing of the hands of Bel-Marduk in Babylon. To some extent the succession of foreign dynasties in Babylonia must have affected the inner administration. But the existence of a written law undoubtedly tended to give stability to the ordinary forms of governmental procedure. An influential bureaucracy furnished a check on the priestly power, and the prestige of the older sanctuaries no doubt limited the power of the Marduk priesthood in Babylon. While it may not be permissible to infer from the Code of Hammurapi that the state always assumed as much authority in regulating all forms of private business, it is probable that this law gives a fair example of what was generally considered the duty of government in Babylonia.

Art, Science, and Literature. The excavations, notably those at Lagash, Nippur, and Babylon, have revealed some of the characteristics of Babylonian architecture. Temples and palaces were built for the most part with brick and have been so largely destroyed that nothing but the ground plan remains. But from the foundations and parts of sculptural decoration it is possible in a measure to conjecture what the appearance of temples, zikkurats, or temple towers, and palaces must have been. Sculpture reached among the Sumerians a comparatively high degree of perfection. Entemena's Stele of Vultures, the statues of Gudea, and some representations of animals exhibit excellent workmanship. The Stele of Naram Sin shows that the Akkadians rivaled, if they did not excel, their masters, provided Sumerian artists were not employed in this case. We know nothing of Babylonian painting. In the textile arts the fame of Babylon spread to Egypt and Syria in the middle of the second millennium B.C. The Babylonians also excelled in the glazing of tiles, the cutting of precious stones, and the making of seals and gems.

In mathematics they succeeded, even with their imperfect system of notation, in extracting square and cube roots and in dealing with very small fractions. They invented a system

of weights and measures that spread far and wide. They made valuable astronomical observations, including that of the phases of Venus; and they divided the ecliptic into degrees, the year into months of 30 or 29 days, bringing the solar and lunar years into harmony by intercalary months, and the day into hours. There is no evidence, however, that they discovered the precession of the equinoxes. It seems to have been an early belief among them that the position of heavenly bodies had something to do with human affairs, and a large number of tablets contain observations and forecasts for the use of astrologers; but the complete system of astrology which passed from Babylonia to Greece was probably a creation of the Chaldeans in the beginning of the second millennium B.C. In medicine a false diagnosis, ascribing the origin of disease to the influence of demons, retarded progress, but much advance was made in surgery, operations on the eye and other organs being mentioned already in the time of Hammurapi. How much was due to the Sumerians, and how much to the Semites, in these various branches of learning, is as yet impossible to determine.

The Sumerians, no doubt, invented the system of writing (see CUNEIFORM INSCRIPTIONS). Only a small part of the inscriptions can be classified as literature in the strictest sense. There are thousands of contracts, magical texts, letters, and dispatches; but there are also many poems, stories, historical inscriptions, and scientific tablets. In Babylonian poetry each verse is divided by a definite number of stressed syllables or beats, and the verses are written in separate lines. Most of the poems are of a religious nature. The stories are well told. There are also commentaries on earlier works, syllabaries, and grammatical paradigms for the use of learners. Many inscriptions are bilingual, in Sumerian and Akkadian.

Religion. The chief gods of the Sumerian pantheon were Anu, the heaven god, of the city of Anu, later at Durilu; Elh1, the god of Nippur; Ea or Ae, the sea god, of Eridu. Ningirsu of Lagash; Shuruppak of Shuruppak; Marduk of Eridu, later of Babylon, the son of Ea; Babbar or Utu, the sun god, of Larsa; Nannar, or Enzu, the moon god of Ur; Tammuz, the brother of Marduk, and lover of Nanai of Uruk; Nergal, the war god, of Kuthia; and Zamama of Kish. Among the goddesses mention may be made of Bau and Ninharsag at Lagash; Ninlil at Nippur; Nanai at Uruk; Ereshkigal, the goddess of the nether world; Gatumdag, Ningal, and Nimmach. In remote antiquity Anshar and Kishar, gods of heaven and earth, Lahmu and Lahamu (worshiped at Tell Lahm) seem to have played an important rôle. Some of these gods were adopted by the Akkadians, or identified with gods they worshiped. Shamash of Sippara; Nabu of Borsippa; Sin, identified with Nannar of Ur; Ishtar, identified with Nanai; Ninib, of unknown origin, and his spouse Gula; Anunit of Accad are among these. The Amorites brought in new gods, such as Ibadad, Amuru, Dagan, and the goddess Ashirta. Numerous myths were told concerning these divinities and the many semi-divine heroes, such as the stories of the creation of the world through Marduk after his victory over the Chaos-monster Tiamat; of Adapa, or Adama, who just missed immortality by following too closely Ea's advice; of the ten antediluvian

kings; of the deluge from which Utnapishtim of Shuruppak is saved, so similar in its details to the story in Genesis; of Zu, the storm god, who stole from Ellil the tablets of destiny; of Etana, who, seated upon an eagle, ascends to heaven, but is overcome by fear and falls to earth; of Nergal's violent entrance into the lower world and his marriage to Ereshkigal, through which he becomes ruler of the realm; of Ishtar's descent to hell and escape from there; of Gilgamesh, the hero of Uruk, his friend Eabani, their attempt to rescue Nanai from Elam, and the journey of Gilgamesh to paradise, where he hears from Utnapishtim the story of the flood. It is becoming increasingly evident that the Sumerians developed most of this mythical material. Some of the stories deal with the nether world, whither gods may go, and men must. Gods may be sprinkled with the water of life and returned from the realm below, but there is no intimation that men may. A hero like Utnapishtim is regarded as having been translated to a realm of the blest, apparently in the Persian Gulf, and a king like Gilgamesh may go there and return. For ordinary mortals, certainly, there was no hope of anything but the most shadowy existence beyond the grave, involving neither rewards nor punishments. It was important, however, that the dead should be properly buried; otherwise they might appear as ghosts to harass the surviving kinsmen.

There were various classes of priests, soothsayers, diviners, conjurers, exorcists, omen readers, seeking for signs in the entrails of animals, especially in the liver; astrologers, offerers of sacrifices, singers, and temple attendants. Liturgical formulas, prayers, and hymns have come down to us, revealing the intensity and warmth of the religious feeling. Great festivals were held, such as the New Year's Feast, when Marduk was carried in procession to the zagmuk sanctuary and back to his temple, and Nabu came from Borsippa to visit his shrine in the temple of Marduk, and the Tammuz and Ishtar festivals. On the 7th, 14th, 21st, 28th, and also the 19th day of the month sacrifices were offered to give rest to the hearts of the gods and business was generally suspended. Among the hymns that have been found are many that were used on New Year's Day; others that were sung in honor of Shamash, Sin, and Ishtar, and some that were chanted as lamentations over Tammuz and as odes of rejoicing over his return to life.

BABYLONIAN ART. The style of art current in the valley of the Tigris and Euphrates, from the beginning of historic civilization until the time of the Median Conquest, in about 500 B.C., during a period of 4000 years or more. Its interest is increasing from the fact that it appears to represent the earliest artistic effort of mankind in many branches, antedating the culture of Egypt by a considerable period. The Babylonian temperament was, like the Egyptian, traditional, and the changes in style were few and conditioned largely by degrees of mastery over technical processes—over materials and implements. It was essentially a religious, priestly art, and its monuments can hardly be appreciated without a knowledge of Babylonian literature, mythology, manners, and customs. So far as can be judged from the very insufficient excavations, the periods of artistic de-

velopment were: 1. The pre-Sargonic era of primitive art, crude, especially in its sculpture, and with imperfect technical attainments. It extends to 3800 B.C. 2. The Age of Sargon, the golden era, distinguished for broad style with exquisite finish and perfection of technique. It lasted from 3800 to 2800 B.C. 3. After the interval of Elamite invasion came the Age of Khammurabi (Hammurabi) (2200-1700 B.C.), the silver era, when Babylon was the centre of Mesopotamian civilization, when art was somewhat more stereotyped and careless. 4. The Kassite Age (from c.1700 to c.1000 B.C.) with gradual complete decadence under a semi-barbarous dynasty, with loss of all reality and life, and final subservience to Assyrian art. 5. The Renaissance, under Nebuchadnezzar, when the ancient style of the best age, that of Sargon, was reproduced as closely as possible (c.600 to 500 B.C.). The researches and excavations that have disclosed what we know of Babylonian art are detailed under BABYLONIA. The Louvre is the only museum in Europe that contains many of the larger works; other collections being confined to terra cottas and carved boundary stones (British Museum, Berlin, etc.), and to engraved stones (Louvre, Bibliothèque Nationale, Paris; British Museum; Le Clercq collection; Metropolitan Museum, New York; etc.). The Museum of Constantinople is beginning, however, to receive a number from the latest excavations of Tel-lo, Babylon, Nippur, etc. The characteristic forms of Babylonian art are its brick architecture, with heavy masses of masonry and small vaulted interiors, with its lack of columns or piers or carved details, and its use of color surface decoration of faience, fresco, and hangings; its development of the industrial arts, especially of bronze casting, terra-cotta figurines, and reliefs and glyptics, or the cutting of hard and precious stones. Hitherto it is from these small objects, many thousands of which have been found, more than from the few pieces of large statuary and reliefs, that the character and continuity of Babylonian sculpture can be judged. (See GLYPTIC.) The artistic influence of Babylon was widespread and strong. It is tolerably certain to have been exercised in the formation of Egyptian and Elamite art at a very early date. The comparison of the brick making of the temple pyramids and the statuary of the two countries are among the indications for Egypt. The few researches for pre-Median Elam prove the same thing for sculpture, but excavations have not yet gone deep enough to show what was the primitive Elamite architecture. Then, the Babylonian conquests on the Mediterranean carried Babylonian art to Syria, even to the island of Cyprus, and into Asia Minor among the Hittites. The Phœnicians not only copied it, but carried it westward. Considering that Assyrian art also was substantially a branch of Babylonian, it is clear that Babylonian art was not only supreme throughout western Asia, but bore directly upon North Africa and the Pelasgians and other Egean peoples and therefore upon early Greek art. Its influence survived it in Persia, and, through it, in the later Oriental art of Parthians and Mohammedans. Even China and India felt it.

Architecture. Architecture as a fine art was first practiced in the valley of the Tigris and Euphrates, in the region we call Babylonia. Here were worked out the earliest forms of re-

ligious and civil structures. Everything had to be invented—materials, tools, methods, architectural forms, from the merest details to the broadest compositions. It was the same with the other arts utilized to assist in this development of architecture. The material used was brick, sun-dried and kiln-baked. The obvious reason for this was the absence both of stone quarries and of forests for timber. The tools required were therefore extremely simple; and the forms of ornamentation and composition were conditioned both by the material used and the physical surroundings. The absence of stone for walls and columns and of wood for timbers forced the builders to make their walls thick and their halls narrow, so that they could be spanned by brick vaulting. Thus, at the very beginning the arch and vault were invented—both the false corbel arch with straight courses and the true voussoir arch. Both pointed and round arches were used in barrel vaults. Since the country was very flat, it was difficult to lend impressiveness to buildings. In almost every other country natural eminences could be found, but here artificial platforms had to be constructed to make the buildings bulk large in the landscape. On this immense stage arose solid artificial mounds supporting single buildings or groups. The principal mound was always that of the temple, which was in the shape of an immense stepped truncated pyramid. At Babylon the “Birs Nimrud” is reckoned to have been over 250 feet high. The tower varied in the number of its stories from three to seven. The ascent was made in various ways—either by a continuous inclined ramp around the receding stories, or by a combination of internal staircases through the mass. On the way up were shrines, and the summit was crowned by the principal sanctuary. The chambers, however, were few and small. The stories appear to have been colored differently. In many temples the builders used brick dipped in colored enamel, to signify that each particular story was consecrated to one of the planetary deities. These brick were stuck into the mass of sun-dried brick, and formed both a preservative and a decoration. Moldings were used as well as color. The broad surfaces were broken into panels, often framed by pilasters or groups of palm-stem shafts, and even by series of convex flutings. The sites of nearly all the great Babylonian cities have been located, but natural disintegration has reduced them all to masses so unpromising and shapeless, without traces of construction, as to have discouraged explorers. Now, however, the buildings of Sirpurla, Nippur, and Babylon itself are being brought to light, and something has been done at Lippara, Eridu, Larsa, Ur, and Erech. At Tel-lo (= Sirpurla) the French have unearthed a royal palace dating back to about 5000 B.C., but rebuilt by King Gudêa. Its platform was 12 meters high, 200 meters long, and 50 meters wide, and was reached both by a stairway and by a ramp. The palace itself is an elliptical rhomboid, almost like a barrel. The outer walls are decorated with pilasters and semi-columns. The rooms, 36 in all, are grouped around three courts, presumably, as in the later Assyrian palaces, the centres of the three sections—state apartments, harem, and dependents’ quarters. The decoration given to these apartments is unknown. In other sites brilliantly enameled

cones were stuck into the soft bricks to form varied patterns. Far larger and more sumptuous palaces existed in other Babylonian cities, but they have not yet been excavated. Compared with our rapidly growing knowledge of the history, religion, and literature of the Babylonians, our knowledge of their architecture is small. No history of this architecture can yet be written. It would appear as if the reconstructions by the Neo-Babylonian kings, such as Nebuchadnezzar, of the ancient sacred shrines, such as the temples of Babylon and Ur, were substantially in the same style as the original structures built 2000 or 3000 years before. See BABYLON; BABEL, TOWER OF; NIPPUR.

Sculpture and Minor Arts. The use of sculpture in relief and in the round appears contemporary with the earliest architecture. The only group of works in historic sequence yet found is that from the mounds of Tel-lo. Many of these sculptures are carved with historic and dedicatory inscriptions of the rulers which make their date indisputable. There are very crude reliefs of the period c.4500-4000, including the famous battle and funeral scenes of the "Stele of the Vultures"; there are reliefs more delicate in technique and advanced in form, belonging to the age of Sargon and Naramsin (3800-3700); then a series of colossal statues in very hard stone of the time of King Gudêa, a little later, resembling in technique the statues of the ancient Empire of Egypt, though clumsier in proportion than these. Statues, both standing and seated, steles, friezes, carved basins, and other classes of reliefs show that the Babylonians practiced sculpture in more varied form than their successors, the Assyrians; but so far as can be judged by the monuments yet discovered, they never attained the skill of the Assyrians in low relief. There was a greater use of religious and mythological scenes, but the annals of the kings also supplied frequent themes. Of their ability to render genre scenes and animal life, in which the Assyrians were later successful, we can judge only from a few examples, such as some later terra cottas of animals and the seal cylinders. The treatment here is realistic and with good treatment of surfaces, without the sharpness of line and energy of Assyrian work. It is only from the minute sculpture of the cut gems and stones of the cylinders and seals that some idea of the historic development of Babylonian sculpture can be obtained during its course of over 4000 years. Every Babylonian was supposed to wear his seal and use it as his signature on all occasions, impressing it on the soft clay used as the universal writing material. The variety of the scenes carved upon them is wonderful, no two being exactly alike. Large collections of these small works have been made in Europe and America. The largest are those of the Louvre, the Bibliothèque Nationale, in Paris; of M. Le Clercq, also in France; of the British Museum; and of the Metropolitan Museum, New York. Several thousand can now be studied, and they illustrate the mythology, theology, religious rites, manners, and customs of the country better than any other works that have been found. Some are of extremely primitive workmanship, often executed principally with the drill, round holes of various sizes representing heads, shoulders, elbows, hands, hips, knees, and feet, con-

nected often by lines. Others, especially those between the time of Sargon (3800) and Ur-gur (2700), are wonderful in their technique, soft textures, and perfect rendering of detail. Such subjects as the adventures of Gilgamesh—the Babylonian Hercules—the fight of Merodach and the Dragon, or Order and Chaos, and the adoration scene of some patron god, are the most frequent.

Other branches of sculpture are less well represented by discoveries, but sufficiently to prove considerable proficiency on the part of the artists. Precious metals were embossed and chased, as shown in the famous silver cup of Tel-lo, now in Constantinople. Bronze figurines were cast at an early date with considerable skill, many being yielded by the Tel-lo excavations. Terra-cotta sculptures were made from molds in relief and in the round, and afterward finished by hand. A very original form of such work was the building up of large figures in relief, or the round out of separate tiles molded and then enameled in brilliant colors. Recent excavations at Babylon have brought to light an entire royal avenue leading through the city, flanked by colossal lions of this technique. The palace of Sargon at Khorsabad, and the palace at Susa, show that the Assyrians and Persians imitated this branch of art. See BABYLONIA.

The best restorations and descriptions are "La Chaldée et l'Assyrie," vol. ii of Perrot and Chipiez, *Histoire de l'art dans l'antiquité* (Paris, 1884), trans. by Armstrong, *History of Art in Chaldea and Assyria* (London, 1884). A good brief account is given in Babelon, *Manuel d'archéologie orientale* (Paris, 1888), trans. by Voetts, *Manual of Oriental Antiquities* (New York, 1889). The Tel-lo-Sirpurla discoveries are described briefly in Henzey, *Un palais Chaldéen* (Paris, 1884), and fully in De Larzac and Henzey, *Découvertes en Chaldée* (Paris, in course). The best historic and scientific treatment of gems is in Menant, *Les pierres gravées de la Chaldée et de l'Assyrie* (Paris, 1884), and the best series of illustrations and detailed descriptions in Menant, *La collection Le Clercq* (Paris, 1888). For explorations, consult Loftus, *Travels and Researches in Chaldaa and Susiana* (London, 1853), and Peters, *Nippur*, (New York, 1897). Compare also A. H. Layard, *Discoveries in the Ruins of Nineveh and Babylon* (New York, 1853); H. V. Hilprecht, *The Babylonian Expedition of the University of Pennsylvania* (Philadelphia, 1893); id., *Explorations in Bible Lands During the Nineteenth Century* (Philadelphia, 1903).

BABYLONIAN EXILE. The name given to the deportation of Jews to Babylonia by Nebuchadnezzar (604-562 B.C.) and to the period extending from the destruction of Jerusalem in 586 to the first year of Cyrus (538), when permission was granted to them to return to Palestine. The policy of deporting the principal inhabitants of conquered districts, as an effective means of preventing insurrections, was followed by the Assyrian monarchs. Thus Tiglath-pileser IV in 733 carried away parts of the population of Galilee and the country east of the Jordan; and after the capture of Samaria by Shalmaneser V, his successor, Sargon II, in 721 took many captives to Assyria and settled them in Mesopotamia and Media. The kings of the Chaldean period adopted the same policy, and Nebuchadnezzar carried away Jehoiachin, the

royal household, the princes, and 10,000 men to Babylonia in 597; when Jerusalem was destroyed in 586, a second deportation took place (2 Kings xxv.), and in 581 a third. According to the account in Jer. lii. 28-30, 3023 Jews were carried away in 597; 832 persons from Jerusalem in 586; and 745 Jews in 581. It is evident that the vast majority of the inhabitants remained in the land, even when account is taken of those who went into a voluntary exile in Egypt. Those who were taken to Babylonia were settled in various parts of the country. From the Book of Ezekiel we know that those who were exiled in 597 lived on the river Chebar. This, in all probability, is the canal *Kubaru* mentioned in inscriptions found at Nippur (see Hilprecht and Clay, *Business Documents of Murashu Sons* (Philadelphia, 1898)). Traces of settlements of Jews in Babylonia may be seen in the numerous Jewish names that appear in the so-called contract tablets belonging to the Chaldean and Persian periods. From these and other sources it is clear that many of the Jews acquired riches in Babylonia, and that, on the whole, they all lived in ease and comfort, if not in prosperity. As all other foreigners, they were allowed the greatest possible freedom and soon adopted the customs of the country. Instead, however, of cultivating the soil, as they had done in their own country, they entered upon commercial life; and this change from agricultural pursuits is perhaps the most significant feature of the Babylonian exile, which profoundly influenced the future fortunes of the Jews. So complete was the assimilation to Babylonian ways of life that when, after the capture of Babylon by Cyrus in 539 B.C., permission was given to the Jews to return to Palestine, only a comparatively small number availed themselves of the opportunity. Some priests and pious Yahwe-worshippers were impelled to take up the pilgrim's staff and to seek for new homes in Jerusalem or other parts of Judaea, now ruled by Sheshbazzar as Persian governor; but their experiences do not seem to have encouraged others to emigrate from Babylonia. Conditions were apparently more favorable there than in Palestine. Hence the response to Ezra's appeal in the time of Artaxerxes I was no more hearty than to that of the so-called Deutero-Isaiah in the days of Cyrus.

The period of the exile was an important epoch in the religious life of the people, both in Babylonia and in Judaea. It was natural that the downfall of Jerusalem should be looked upon as a punishment sent by Yahwe for the sins of the people in not following the injunctions of the law and the teachings of the prophets. Especially was the cause of the prophets strengthened by the catastrophe. It could not be forgotten that they had foretold this doom upon the nation. The event proved them to be true prognosticators of the future. Yet they had been exposed to evil treatment. Their oracles were gathered together, and words of comfort were now added. We owe to this tardy recognition the precious remains of pre-exilic prophecy in Israel and Judah. The new spirit manifested itself also in the collection of the annals and stories of the past and their arrangement and presentation in such a manner as to emphasize what seemed the obvious lesson taught by the prophets, that there was no god like Yahwe, who knew how to reward

his people for faithful service, but also how to punish them for disobedience to his will. It was important, therefore, for the future to know exactly what was the will of Yahwe. This gave a strong impulse to the collection of laws and the working out of codes regulating the forms of worship and the conduct of life. Soon after the fall of Jerusalem Ezekiel seems to have felt the necessity of elaborating such a code, based upon, and yet deviating from, the earlier codes. (For the relation of this code to the Mosaic legislation, see PENTATEUCH.) Of fundamental importance for later Judaism were also the ideas of Yahwe as the only existing god, the creation of the world, the election of Israel for service, and the infallible revelation of the future, set forth by the prophet whose words have come down to us in an appendix to the Book of Isaiah (chap. xl.-lv.) and who is supposed by most scholars to have uttered his oracles c.540 B.C., as his references to Cyrus by name and the unrealized hopes centred on this King seem to indicate. (See ISAIAH.) What part of the literature of the time came from exiles in Babylonia and what part originated among the people left in Palestine cannot easily be determined. Some of the earlier elegies in the Book of Lamentations have the appearance of coming from the latter source; and the same is true of the collections of history and ancient law made at this time. Whether the Babylonian Jews built for themselves a temple, as the Egyptian Jews did at Yeb (see ELEPHANTINE Papyri), we do not know; but it is by no means improbable, and the religious condition of the exiles in Babylonia is not likely to have been essentially different from that of the exiles in Egypt.

The Babylonian exile is generally regarded as coming to an end in 538 B.C.; and the following period is spoken of as "post-exilic." While there is no reference to an exile of 48 years (586-538) or 59 years (597-538), a 70-year period is often mentioned, probably counted from 586 to 516, when Zerubbabel's temple was dedicated. The completion of this temple, however, did not bring about any return of Jews to Palestine. At some time in the reign of Artaxerxes I (465-425 B.C.) 1496 persons left Babylonia for Palestine with Ezra, according to Ezra viii. 1-14. The bulk of the exiles never returned, but formed a part of what was called the *golah*, or *diaspora*, the body of Jews, voluntarily or involuntarily living away from Palestine, dispersed among the nations.

The name "Babylonish Captivity" is frequently applied in the history of the Church to the residence of the Popes at Avignon, from 1309 to 1376. See PAPACY.

For the history, consult Stade, *Geschichte des Volkes Israel* (Berlin, 1888, vol. ii. pp. 1 ff.); Piepenbring, *Histoire du peuple d'Israel* (Paris, 1898); Kent, *A History of the Jewish People* (New York, 1899); Guthe, *Geschichte des Volkes Israel* (2d ed., Leipzig, 1904); Benzinger, *Geschichte Israels bis auf die griechische Zeit* (2d ed., Leipzig, 1908); also for the special problems connected with the return from the exile, Koster, *Het Herstel van Israël in het Perzische Tijdvak* (Leyden, 1893); Hoonacker, *Nouvelles études sur la restauration juive* (Louvain, 1896); Cheyne, *Jewish Religious Life after the Exile* (New York, 1898); Meyer, *Entstehung des Judentums* (Halle, 1896); Torrey, *Ezra-Studies* (Chicago, 1910).

BACACAY, bā-kā-kī'. A town of the Philippines, in Albay, on the island of Luzon. It is situated on the south shore of Tabaco Bay, about 11 miles north of Albay, the capital, and grows much hemp. Pop., 1903, 14,214.

BACALAO, bā'ká-lá'ó. 1. A name applied in the West Indies to a grouper (*Mycteroperca falcata*), also called scamp and abadejo, and common in the markets. (See GROUPE.) 2. Formerly this word was applied in Europe to weather-cured codfish. "Among the Greeks the large codfish were called bacchi, from bacchus, a rod . . . by the Iberians the dried cod were called bacalaos from baculeum, a small stick. The rod held by Mercury was called a baculeum" (Brevoort, quoted in Goode's *Fishery Industries*, sec. 1, p. 200, Washington, 1884). The term is used in all the accounts of the early fishing expeditions from Europe to the Banks of Newfoundland and has long survived. A letter from Madrid to *The Remembrancer* (London, 1776), recounting discoveries on the coast of California, mentions the taking there of "cod, known in Spain by the name of *bacallao*."

BACARRA, bā-kār'rā. A town of Luzon, Philippines, in the province of Ilocos Norte. It is situated on the right bank of the Grande de Bacarra River, 4 miles north of Laoag, and had a population in 1903 of 14,616 (Map: Philippine Islands, C 1).

BACAU. See BAKAU.

BACCAHIRY. See BAKAIRI.

BAC/CANAR/ISTS. See PACCANARISTS.

BACCARAT, bā'ká-rá'. The chief town of a canton, arrondissement of Lunéville, in the department of Meurthe et Moselle, France, on the river Meurthe, 15½ miles southeast of Lunéville by rail (Map: France, N., M 4). It is noted for its extensive plate-glass and crystal factories, an industry established in 1765. Pop., 1901, 6085; 1906, 6996; 1911, 7277.

BACCARAT, bā'ká-rá' (Fr. of unknown origin). A game of cards, said to be of Italian origin and to have been introduced in France in the time of Charles VIII. The game is played for money between one of the players, who is called the banker, and any number of others. Each of the face or court cards, in all countries except America (where the face cards and tens have no value, and the naturals are 8 and 9), counts 10; in others, according to the number of their spots. Bets having been made, two cards are dealt by the banker to each player, including the banker himself, and if more than one pack of cards is necessary to deal round to all the players, more are used. Each player's aim is to make the value of his cards foot up the total of 9, 19, 29, or as near these totals as is possible. Any player has the privilege of *standing*, or remaining *content* with the two cards dealt to him at the outset by the banker, or he may call for more. When any player has a *natural*—i.e., a sum making 9, 19, or 29—he declares that it wins, and the banker has to pay all who hold hands of higher value than his own, receiving payment from all whose hands are inferior. The principal advantage in the game lies with the office of banker, which in social games is usually determined by cutting the cards. The banker retains his office until defeated by all the players in the same hand, in which event he surrenders the bank to the player winning on the highest hand. Consult Billiard, *Bréviaire du baccara experimental* (Paris, 1883).

BACCELLI, bāt-ché'la, GUIDO (1832-). An Italian physician and statesman, born at Rome. He studied medicine at the University of Rome, where he later successively filled the chairs of medical jurisprudence, pathological anatomy, and clinical medicine. In 1874 he was elected a member of the Chamber of Deputies and in 1880 was made Minister of Public Instruction. In the latter capacity he projected a thorough reorganization of higher instruction in Italy; but his plans met with decided opposition, in consequence of which he resigned his portfolio in 1884. In 1890 he was made a Senator, and subsequently, from 1893 to 1896 and from 1898 to 1900, again acted as Minister of Public Instruction. In 1901-03 he served as Minister of Agriculture in the Zanardelli cabinet. He became director of the medical clinic in Rome. His published writings include *Patologia del cuore e dell' aorta* (new ed., 4 vols., 1883-87).

BACCHÆ, bāk'kē. 1. A name given to the women companions of Bacchus in his journeys through the East, and to the female participants of the Dionysian festivals. They were crowned with wreaths of vine leaves, wore fawn skins, and carried the thyrsus. 2. A brilliant play of Euripides, abounding in tragic situations and splendid spectacles. See BACCHUS.

BACCHANALIA, bāk'ka-nā'li-ā. See BACCHUS.

BACCHANTES, bāk-kān'tēz (Lat. nom. pl. pres. p. of *bacchari*, to celebrate the festival of Bacchus). Devotees of Dionysus (Bacchus), both men and women, who engaged in orgiastic worship of the god. See BACCHUS.

BACCHIDES, bāk'ki-dēz. One of the comedies of Plautus, presented in 189 B.C. The early scenes are missing, having disappeared about the fifth century A.D. It is one of the best of Plautus's plays, especially in the skillful working up of the intrigue. It gets its name from the two sisters whose fortunes it portrays.

BACCHIGLIONE, bāk'ké-lyō'nē. A river of northeastern Italy, rising in the Alps. It flows eastward, traversing Vicenza and Padua, and after a course of 70 miles enters the Gulf of Venice. It is canalized as far as the city of Padua, whence a canal connects it with the town of Este and the river Adige.

BACCHUS, bāk'kūs (Gk. Βάχχος, *Bakchos*). Also called Dionysus (Gk. Διόνυσος, *Dionysos*) by the Greeks; this name perhaps meant 'Son of Zeus.' A god who originally belonged to the great group of vegetation spirits, whose worship was widely spread among European nations. As such his coming in the early part of the year was received with joy and revelry, while his departure or death was also celebrated at the winter season. In some instances of this sort of worship the old spirit is regarded as dying that the new one may be born, and there is some reason for believing that this feature was also found in the rites of Dionysus. The god never lost his early connection with the flourishing of vegetation and with fruitfulness generally, but he came to be associated more and more closely with the vine and its inspiring produce. His worship was exceedingly widespread and appears in manifold local forms and with large admixtures of foreign elements. Indeed, some of the myths seem to indicate the presence of a god of light as well as a true chthonic deity. There is also much in the worship and legends that indicates a foreign origin for the cult, though there can be no doubt that

many features, such as the satyrs, are purely Greek. So widely different are the stories and so varied the myths in which the god appears, that only some of the more important can be indicated. The common legend of his birth seems to have been that of Thebes. Zeus loved Semele, the daughter of Cadmus; but the jealous Hera induced her rival to beg the god to appear to her in all his splendor. Naturally the mortal was consumed by the thunderbolt; but Zeus saved her unborn child and sewed it in his thigh, whence in due time it was born. In this legend some have seen in Zeus the fertilizing rain-god and in Semele a personification of the earth. The infant was intrusted to Hermes, who delivered him to the nymphs of Nysa. This Nysa cannot be localized; wherever the worship of Dionysus was established, there story set a Nysa, sacred to the god. At Nysa, then, the god discovered and taught the powers of the grape and headed a band of nymphs and satyrs, the so-called Thiasos, with whom he wandered over the earth, communicating his new gift to men, blessing those who received him gladly and punishing his enemies. For the legends have much to tell of opposition to the new worship. So Lycurgus, King of Thrace, drove Dionysus in terror to the depths of the sea, but later perished miserably because of his opposition to the god. The story of Pentheus, King of Thebes, who cast Dionysus into prison, but was himself later torn in pieces by his own mother, Agave, and the Theban women who had been driven by frenzy to celebrate the rites of the god, forms the subject of the *Bacchæ* of Euripides. There is much to indicate that in these stories we have really versions of the death and the return of Dionysus himself. In friendship, on the other hand, Dionysus visits Icarus at Icaria, in Attica; but even here the story ends in death, since Icarus is killed by peasants, who fancy themselves poisoned by his new gift of wine. Another instance of Dionysus' power is furnished by the story of the transformation into dolphins of the Tyrrhenian pirates, who bound him in order to carry him to Italy. It is told in a Homeric hymn and also in the marble reliefs which decorate the choragic monument of Lysicrates in Athens. He took part also in the battle of the gods and the giants. Legend also makes him wed Ariadne when she was abandoned by Theseus on the island of Naxos. The conquering tour of Dionysus was greatly extended under the influence of Alexander's conquests; and the god's subjection of the East and India became a subject of later poets, and is preserved to us in the epic of Nonnus. He even descended to the underworld and brought back to earth his mother Semele. Thenceforth she was worshiped as Thyone, and Bacchus himself as Thyoneus. Bacchus had prophetic power too; his oracle at Delphi was of prime importance.

In art two types prevail. In the earlier period the god is represented as bearded and fully draped, and this type was not unknown in later times, when it was sometimes called "the Indian Bacchus." From the middle of the fourth century B.C. another type steadily gains in popularity, representing the god as a beardless youth, markedly effeminate in appearance, nude or wearing only the fawn skin, or *nebris*. He appears also as an infant, as in the famous statue of Hermes by Praxiteles. The chief attributes of the god are the thyrsus, or rod

ending in a pine cone and wreathed with ivy, and the great two-handled drinking cup (the *cantharus*). He is often accompanied by a panther, and the bull and the goat were closely associated with his worship. He is sometimes represented with the horn of a bull on his forehead. Naturally, as a god of vegetation and the vine, Dionysus was associated with Demeter, Ceres, and the Eleusinian Mysteries, where he bore the name *Iacchus*. In the mystic worship which grew up in the sixth century B.C., under the name of Orpheus, Dionysus Zagreus played a prominent part, and no doubt Orphic influence helped to produce the confusion of elements which is so marked in all this cult.

In the worship of Dionysus two distinct forms may be traced. The one appears most clearly in the Attic festivals, especially the country Dionysia. It is essentially a joyous but rude and boisterous vintage festival, celebrated by men and abounding in mummeries and coarse jests. Its connection with vegetation and fruitfulness is shown by the phallic procession, which held a prominent place in the celebration. The connection of Dionysus with wine occurs first in Hesiod. (For an account of the Attic Dionysia, see GREEK FESTIVALS.) The other form of Dionysiac worship was highly orgiastic, and was celebrated by women, at the time of the winter solstice, in alternate years; hence it was called the *Triateric Dionysia*. The celebrants, called in Greek *Mainades*, or *Mænads*, wandered among the mountains, indifferent to the cold, wearing fawn skins and carrying the thyrsus and torches, for the chief rites were held at night. The god was said to be lost, and was sought with wild cries. The culmination of the orgy was in tearing in pieces fawns, kids, and other animals and devouring the raw flesh in honor of the god. We hear even of human victims being rent asunder. These rites were thought to be an endeavor to arouse the dead or sleeping god; but it is also clear that originally the slain animal was the god, who was killed to be reborn. It is a common feature of primitive religions for the worshiper to partake of the god, especially if it be a deity connected with vegetation or fertility. Hints of these orgiastic rites appear in Homer. The rites were especially associated with Thebes and Delphi, though we hear that even Athenian women went to Mount Parnassus to join in this fierce and bloody worship. In later times the mysteries celebrated under the name of Dionysus became more and more occasions for intoxication and gross licentiousness.

The *Bacchanalia* were introduced into Rome early in the second century B.C., and at first were celebrated on three days of the year by women only. Later a priestess opened the mysteries to men, introduced evening celebrations, and greatly increased their frequency. The gatherings soon became suspected of gross immoralities; and in 186 B.C. the Senate ordered the consuls to arrest the priests and forbid further meetings of the association throughout Italy. The result of the judicial inquiry was that the majority of the members were sentenced to death, and others to life imprisonment, while by a decree of the Senate all such associations were forbidden in Italy. The decree (*Senatus Consultum de Bacchanalibus*) has been preserved in a single copy, *Corpus Inscriptionum Latinarum*, i, 196-x, 104.

On the vegetation spirits and their worship,

consult Mannhardt, *Wald und Feldkulte* (Berlin, 1875-77). On Dionysus, consult: Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. 1 (Leipzig, 1884-90); Preller-Robert, *Griechische Mythologie*, vol. 1 (Berlin, 1894); B. I. Wheeler, *Dionysus and Immortality* (Boston, 1899); Frazer, *The Golden Bough*, vol. ii (1913); Farnell, *Cults of the Greek States*, vol. v (Oxford, 1910); O. Gruppe, *Griechische Mythologie und Religionsgeschichte*, vol. II (1907).

BACCHUS AND ARIADNE. A painting by Titian, founded on the Greek myth of the marriage of Dionysus to the wife of Theseus, after she had been deserted by the slayer of the Minotaur upon the island of Naxos. The picture hangs in the National Gallery, London. Set in a background of thicket and sedge and ocean, Ariadne is turning away, filled with maidenly confusion, as the leopard-drawn chariot, surrounded by satyrs and menads, descends, bearing the god. Its date is 1523.

BACCHYLIDES, bāk-kil'ī-dēz (Gk. Βακχύνιδης, *Bakchylidēs*) (c.507 B.C.—?). A Greek poet, born at Iulis, on Ceos, at the end of the sixth century B.C., who flourished between 470 and 460 B.C. He was a nephew and pupil of Simonides and the rival of Pindar, according to well-established tradition. He lived for a time at the court of Hiero I, tyrant of Syracuse, who greatly admired him and whom he celebrated in three of his poems. When exiled from his native town, presumably by political opponents, Bacchylides resided in the Peloponnesus, and records of many of his victories in dithyrambic contests at Athens have been preserved. Some of the poems show intimate knowledge of the Peloponnesus. As the youngest, he was placed last in the list of nine lyric poets deemed worthy of immortality by the canon of the Alexandrian critics, who admired his grace and sweetness. (See ALEXANDRIAN AGE.) Though admired by Horace, and much read till 400 A.D., he finally shared the fate of the canonized lyric poets, whose works, with the exception of Pindar's, were all lost to posterity. Until 1897 only 107 lines were preserved in quotations, the longest one of 12 verses only. In 1896, the British Museum acquired, in Egypt, 200 fragments of a papyrus of Bacchylides. Piced together by F. G. Kenyon, they formed 1070 lines. Thus 6 poems were recovered practically entire, 8 others with lacunas, and 6 in considerable fragments. Fourteen are *Epinikia*, or Odes of Victory, of which 2 in honor of Hiero and 1 in honor of Pythias of Aegina duplicate odes of Pindar for the same occasions. The remaining 6 are the unique extant specimens of one department of Greek lyric poetry—dithyrambs. Pæans and hymns also occur. One poem (XVII) is the first recovered literary treatment of a subject common on vases—the descent of Theseus to the depths of the sea to prove his sonship to Poseidon. In style he is simple and clear, displaying a love of picturesque detail. Not so powerful, brilliant, or original as Pindar, he is a true and typical Greek poet in his smoothness, grace, and finish. His language has less of the Æolic admixture on the foundation of Doric than is the case with Pindar. The British Museum MS., in fine uncials, belongs to the first century B.C., and the accents and the breathings are generally carefully marked. The text was first edited by F. G. Kenyon (London, 1897), with an introduction and extensive notes. Another edition is by F. Blass (Leipzig, 1898).

Consult: Wilamowitz-Moellendorf, *Bakchylides* (Berlin, 1898); Richard Jebb, *Bacchylides* (London, 1905); Angelo Taccone, "Della vita di Bacchilide" in *Bacchylides Epinici* (1907).

BACCIO D'AGNOLO, bāt'chō da-nyō'lō. See BAGLIONI.

BACCIO DELLA PORTA, dēl'lā pōr'tā. See BARTOLOMMEO, FRA

BACH, bāc. The name of a family originating in Wechmar, near Gotha, Thuringia, famous in music and presenting the most remarkable instance of hereditary genius in all history. In seven generations there are found to be 49 musicians, 20 of whom, from Veit Bach (died 1619) down to Wilhelm Friedrich Ernst Bach (died, Berlin, 1845), have been more or less prominent musically, and one of them, Johann Sebastian Bach, is one of the great masters of music and the greatest of the Contrapuntal school. Veit Bach was a baker by trade, but devoted much of his spare time to zither playing. The best known of the early Bachs was Johann Christoph, son of Heinrich and a great-grandson of Veit. This Johann Christoph (1642-1703) was one of the important composers and organists of the seventeenth century, far surpassing his German contemporaries. None of his works were published, and many are lost, but his choral compositions (MSS. in the Berlin Royal Library) prove him the forerunner of Johann Sebastian and Handel.

BACH, ALEXANDER, BARON (1813-93). An Austrian statesman. He was born at Loosdorf, in Lower Austria, where his father held a judicial office. At the age of 24 he was made a doctor of laws, and then entered the Imperial service, where he remained for nine years. Although he favored a departure from the absolute system of Metternich, Bach was not prepared to go so far as the Revolutionists of 1848 wished. Popular opposition, in fact, drove him into the conservative ranks. In 1848, and again from 1849 to 1859, he was in the ministry, at first in the department of justice, and later in that of the interior. He stood for a strong and absolute central government, and opposed all measures that savored of liberalism and concession to other nationalities than the German. He however carried out some salutary measures, such as the emancipation of the peasants from their feudal obligations. From 1859 to 1867 he was Ambassador at Rome. Consult Springer, *Geschichte Oesterreichs seit dem Wiener Frieden* (Leipzig, 1863-65).

BACH, JOHANN CHRISTIAN (1735-82). Known as the English Bach. He was the youngest of the sons of Johann Sebastian. After his father's death his older brother, Karl Philipp Emanuel, continued his musical education and turned his interest in the direction of the lighter homophonic style, away from the severe contrapuntal style of the father. In 1754 he went to Italy as Kapellmeister of Count Litta. In Bologna he studied counterpoint with Padre Martini. He was appointed organist of the cathedral at Milan in 1760. All the time his reputation as a composer both of operas and sacred music was steadily growing. In 1762 he settled in London, where in the following year he scored a great success with his opera *Orione*, which procured him the appointment of music master to the Queen. As such he directed, jointly with K. F. Abel, the Bach-Abel Concerts from 1765 until his death. It was his misfortune to have been the son of his great

father, although his works belong to an entirely different school and ought to be judged accordingly. Johann Christian shows great talent, and his works are among the most important of their kind in introducing the reforms of Stamitz (q.v.). Even Mozart acknowledges his indebtedness to this son of Bach. Johann Christian was not only a meritorious but also a very prolific composer. He wrote 16 Italian and 4 French operas, 2 oratorios, an enormous number of instrumental works for many different combinations of instruments, and many pieces for the pianoforte, which instrument had come into great vogue in England since 1760. Consult M. Schwarz, *Johann Christian Bach* (Leipzig, 1900).

BACH, JOHANN SEBASTIAN (1685-1750). The greatest master of the Contrapuntal school of musical composition. He was born at Eisenach, March 31 (Old Style 21), 1685. He came of a Thuringian family, which presented a remarkable example of the principle of heredity. (See BACH.) Bach's father, Johann Ambrosius, was a violin player in the town band of Eisenach. His mother was Elizabeth Lämmerhirt, daughter of a furrier of Erfurt, where Johann Ambrosius had held a position previous to that at Eisenach. The boy was his father's pupil in violin playing until he was nearly 10 years old. After his father's death, in January, 1695 (two months after contracting a second marriage), he went to live with his elder brother, Johann Christoph, a pupil of Pachelbel and organist in the little town of Ohrdruf.

The Bachs held annual family and musical reunions. According to a description given by Bach's son, Karl Philipp Emanuel, to J. N. Forkel, one of Bach's biographers, these meetings opened with a chorale, which was followed by secular songs, until at a convenient pause some one of those present started a catch, in which each joined in proper turn with some humorous phrase, as likely as not hitting at a harmless family or individual failing; thus making a merry ending to the musical exercises of the reunion. The Bachs were a clan of working musicians; and quite as much as the violin lessons received from his father, the musical atmosphere of the Bach household and family traditions must have made their impression on Johann Sebastian. It was the homely life of people in humble circumstances, but it was permeated with music. To think in music was, from childhood, spontaneous—second nature with him. This, together with the scrupulous revision to which in his later years he subjected his earlier works, accounts for the sustained excellence of his vast production.

The Bach clan being so united, it is surprising that Bach's brother at Ohrdruf was moved more to jealousy than admiration by Sebastian's rapid progress. Johann Christoph taught him the clavierchord, but kept from him a book containing works by Froberger, Buxtehude, Pachelbel, and others, which the boy coveted. Not to be thwarted, however, he copied the book stealthily and laboriously on moonlit nights, only to be deprived of his copy when it was discovered. The anecdote is wholly in keeping with Bach's devotion to his art. At school, besides his general education, he was trained with the other boys for the church choir and moreover sang at weddings and funerals. In April, 1700, Bach went to Lüneburg, where he was accepted at the school of St. Michael's for the choir of the church. His general education continued at the

school; he took his commons at the refectory, and received musical training of much value for his future work, including high services with orchestra, choral singing, organ, and experience with a wider range of music. His fine treble voice, together with his knowledge of violin and clavierchord, secured him immediate admittance to the advance matin choir. There was keen musical rivalry between the schools of St. Michael's and St. John's; and when in winter the choirs went through the town streets to sing, separate routes had to be marked out for each, to avoid quarrelsome meetings. As the organ became in time Bach's instrument par excellence, and as he is regarded as its greatest master in composition and as one of its greatest masters in playing, it is interesting to note that his serious study of it began in Lüneburg under George Boehm, a pupil of Reinken and a composer of distinction, who was organist at St. John's Church; which shows that while the musical rivalry between St. Michael's and St. John's was keen, it was also generous. The seriousness with which Bach went about the study of the organ is attested by the fact that he made several journeys to Hamburg to hear Reinken play and profit by his suggestions. Nearly 20 years later, when shortly before Reinken's death Bach played in St. Katherine's Church, Hamburg, an improvised elaboration of the chorale *By the Waters of Babylon*, the "father of North German organists" exclaimed: "I thought this art was dead, but now I see it lives on in you!"

Bach's eagerness to leave nothing undone that would aid his progress in his art was again shown a few years later, when he walked 150 miles from Arnstadt to Lübeck for a brief course of study with the famous organist Buxtehude. Bach had left Lüneburg in 1703, and for a few months was a member of the band of Prince Johann Ernest at Weimar. Chancing to visit Arnstadt, where his grand-uncle, Heinrich, had been organist, and where an organ lately had been installed in a new church, he played on the instrument. Although the trial is not believed to have been official, he was, at 18 years of age (August, 1703), engaged for a position similar to that which his grand-uncle had filled with honor. Bach went to Lübeck in 1705 and remained with Buxtehude three months, deliberately extending his month's leave from his Arnstadt duties for this purpose. Whatever the personal consequences might be, he was determined to derive the greatest possible artistic profit from his contact with the justly famous organist. The result was a great advance in organ technique, especially in new insight into the resources and use of the pedal, in which Buxtehude was a master. Naturally the authorities were displeased at this unceremonious extension of his leave from one month to three; although, with characteristically Bachian honesty of purpose, he pleaded as an excuse his desire "to perfect himself in certain matters touching his art." Further, however, he was rebuked "for that he hath heretofore made sundry perplexing variations and imported various strange harmonies, in such wise that the congregation was thereby confounded." He had returned to Arnstadt in February, 1706. In June, 1707, he accepted the position of organist of St. Blasius's Church at Mühlhausen with the same salary as at Arnstadt, and "the accustomed dues of corn, wood and fish." In October he married his cousin, Maria Barbara, whose

father, John Michael Bach, had been organist at Gehren. June, 1708, he resigned from Mühlhausen to become organist in the Ducal Chapel at Weimar. Conditions at Weimar were such as to quicken Bach's already active musical faculties. The life of the court was decorous, influenced by Duke William Ernest, a man of serious temperament, a patron of arts and letters and wisely active in bringing the music of the Ducal Chapel up to a high standard. He in fact laid the foundation of that culture which made Weimar the centre of German letters in Goethe's time, and gave it a "golden period" of music when Liszt resided there. In addition to his duties in the chapel, Bach played the violin or accompanied on the harpsichord in the Court Orchestra, wearing a Hungarian uniform, in which it is difficult at the present day to realize the appearance of the great master of the Contrapuntal school whose perruqued portrait has come down to us. Bach's growing fame as an organist brought him many invitations to try or inspect organs and to play at various courts. For playing a pedal solo on the organ at Cassel with an agility "which few could equal with their hands" he received from the Hereditary Prince a precious ring which the Prince drew from his own finger.

Bach remained at Weimar nine years. In 1717 he accepted from Prince Leopold of Anhalt-Köthen the office of kapellmeister at Köthen. The Prince, who sang bass and played violin, viola de gamba, and clavicord, warmly welcomed Bach into musical fellowship and made him his companion on various trips. It was the kapellmeister's duty to compose for the instruments on which the Prince played. Accordingly, as Bach's Weimar period is distinguished for his organ compositions, including several of his greatest works for that instrument; so to his Köthen period belong much of his chamber music and works for clavicord and for orchestra. In a general way, it may be characterized as a lighter period in his life—a temporary relaxation in his self-imposed, severe course of artistic development before entering, in 1723, on the final and greatest epoch of his career as cantor of the School of St. Thomas at Leipzig, when he achieved the logical results of a genius trained during 32 years of rigid preparation; a prelude which alone would have been a sure foundation for his fame, had he not later accomplished so much more in larger musical forms. It was during the Köthen period that Bach's first wife died. Of the 20 children born in his two marriages, the two who achieved greatest fame as musicians, Wilhelm Friedemann and Karl Philipp Emanuel, were of the first. His second wife, Anna Magdalena Wülken, whom he married in December, 1721, was a singer at the Köthen Court, and proved herself, both in his domestic and musical life, a helpmeet in the truest sense of the word. Bach's first marriage is known to have been happy, but artistic unions as mutually helpful and felicitous as his second are among the rarities of history.

The post of cantor (or choir master) of the School of St. Thomas in Leipzig was made, through Bach's incumbency of it, one of the most famous in music. The school, which was five centuries old when, in 1723, Bach entered upon his duties, included a choir and a grammar school; and the cantor was supposed to teach in both. Bach, however, assumed the latter duties only when the substitute whom he was allowed

to engage was unable to act. Besides teaching the pupils vocal and instrumental music, the cantor had supervision not only of the music in the churches of St. Thomas and St. Nicholas, and in less degree in those of St. Matthew, St. Peter, and St. John, but also of the organists and other musicians of the municipality. He was, in fact, Musical Director of Leipzig. But the actual dignity was not so great as this enumeration of his duties would imply. During nearly his whole incumbency of the post this past master of his art was harassed by the Town Council, to which he was responsible and which sought to undermine his authority.

The result was that Bach found his usefulness as a teacher continually hampered. The Council even went so far as to accuse him of being slack; and this shortly after he had produced one of his greatest works, *The Passion according to St. Matthew*. On another occasion, when he had nine vacancies to fill among the choristers of his school, from which he supplied the various choirs under his supervision, the Council rejected four of those whom he had examined and nominated, and appointed others whom he had rejected. He was assigned a residence in the left wing of the Thomas building and received also the sum of 700 thalers annually. But the Council claimed that he was so unproficient an instructor in music that he must take part in the teaching of the school; and though he avoided this, the Council suspended some of the perquisites of his post. Those who are unfamiliar with Bach's life, or who form an opinion of the Leipzig cantors from the fame that has come to it through Bach, are apt to imagine that for 37 years he occupied an exalted and congenial position, active as teacher and composer. In point of fact, neither Council nor city appreciated the genius they had within their walls, and not only wholly failed to honor Bach, but even thwarted him in his work. The position of this great man, who was so wholly devoted to his art that the attitude of the Council simply seemed to him "peculiar," and puzzled while it irritated him, was, if not downright pitiable, at least deserving of deep sympathy.

There was a brief respite for him of four years during which Johann Matthias Gesner, who seems to have appreciated the genius of the cantor, was rector of the school. In 1729 Bach was made conductor of the Musical Society—a position which he held until 1736, and his connection with which doubtless accounts for the composition of his secular cantatas. In one of these, *The Contest of Phæbus and Pan*, he took occasion to change the wording of the libretto so as to convey covert satirical allusions to the hostile rector who had succeeded Gesner, and to one Scheibe, a mediocre musician; whose application for a position as organist Bach had rejected, and who, in consequence, showed his ill will in every way possible. When the quarrels which so harassed Bach are analyzed, it appears that the School of St. Thomas suffered from the double government of rector and cantor—the one in matters of general education, the other in music; and that in asserting what he deemed his prerogatives the rector probably went to work more practically than the musician whom his art so deeply engrossed. Moreover, Ernesti, who succeeded Gesner, was a son of the Ernesti who was rector at the time Bach became cantor, so that in a measure he had inherited the

quarrel. How little influence Bach had in the musical life of Leipzig is shown by the fact that while the Society of Musical Sciences made Handel an honorary member, Bach was admitted only as an ordinary member, and even that not until he had sent in a trial canon. Nor when, in 1743, the concerts from which developed the famous Gewandhaus concerts were inaugurated, was his advice sought. Yet to this master, whose qualifications as a teacher the Town Council of Leipzig impugned, pupils flocked from outside, and no musician of the day thought of passing through the town without paying his respects to the cantor. Besides his most eminent pupils, his two eldest sons, the list included men like Krebs, Agricola, Kirnberger, and Altnikol, who became his teacher's son-in-law. His activity as teacher and composer, and, above all, the happiness of his home life, must have offered Bach the needed respite from his worries with the authorities. His wife helped him copy his music. As his pupil she became an apt player on the clavichord; both she and his eldest daughter sang, and there were the sons and pupils from among whom to make up an orchestra in his own household. Bach possessed at his death five instruments of the clavichord family and many stringed instruments. It is likely that his two concertos for three pianos were written for himself to play with his two eldest sons; several of his church cantatas doubtless were written for his wife and daughter, and there can be no question that the opportunity for music in his congenial household greatly stimulated his faculties for composition. Thus at least part of that famous work, *The Well-tempered Clavichord*, had its origin in Bach's desire to give his sons a thorough course of instruction; and the so-called *French Suites* are among the pieces he wrote for his wife while he was teaching her the clavichord. It was Emanuel who, after becoming a kapellmeister in Berlin, brought about, in 1747, the famous meeting between Bach and Frederick the Great. As soon as the King heard of the composer's arrival, he exclaimed, "Gentlemen, old Bach is here!" and Bach, in his traveling clothes, was immediately summoned into his Majesty's presence. The King had 15 pianofortes in different rooms, and on these Bach improvised and developed in various ways a theme proposed by the King. The composer, who was treated with great distinction, wrote as a souvenir of his visit his *Musical Offering*, a series of compositions on the King's theme. Bach's labors were unremitting almost up to his death. His *Art of Fugue*, begun probably in 1749, was barely finished when he set to work at a quadruple fugue planned on a colossal scale and introducing as one of the subjects his own name in German notation (BACH, corresponding to our B-flat, A, C, and B). An affliction of his eyesight, which soon resulted in total blindness, stopped the work. It was completed entirely in Bach's spirit by Ferruccio Busoni, and performed in 1911, arranged for organ and orchestra. Ten days before he died, his eyesight suddenly was restored for a short time. His blindness returning, he called his son-in-law Altnikol to him and dictated music for the chorale, *When We are in the Depths of Need*. Later, feeling the hand of death upon him, he had Altnikol change the inscription to *Hercwith I Come before Thy Throne*. He died Tuesday, July 28, 1750. The only public notice

of the event was a brief minute of the fact entered by the Town Council. His widow was allowed to die a pauper; and when St. John's churchyard, where he was buried, became part of a road, early in the nineteenth century, his bones were carelessly transferred. For almost a century the world was ignorant of the resting place of one of its greatest sons. Not until 1894 were the remains discovered by the merest chance in a vault of St. John's Church itself.

Bach is regarded by organists as the greatest composer for their instrument. In the Lutheran church, while the congregation sustained the melody of a chorale, the organist was supposed to vary the harmonies. Bach's skill at this was prodigious. He collected no less than 240 chorales for use in his household; 138 have come down to us in print, besides those found in his church cantatas and other large works. His fame as an organ composer rests chiefly, however, upon his preludes, toccatas, fantasias, and fugues. Among these organ compositions should be mentioned the *Fantasia and Fugue in G minor* ("Giant"), probably played by Bach in 1720 in Hamburg in Reinken's presence; the *D minor Toccata and Fugue* (Doris); the *E minor Fugue* which is built upon chromatic intervals; and the *E flat or St. Ann Fugue*; besides the *Passacaglia in C minor*. No less an authority than Guilman has expressed the opinion that there has been no progress in organ composition since Bach, because Bach's achievements in that branch are the highest possible, and as modern to-day, both in the technical equipment they demand of the player and in the effect they produce, as when they were composed. Bach's most generally known works probably are the *D minor Toccata and Fugue*, arranged by Tausig; the *Chromatic Fantasia and Fugue* (D minor) for pianoforte, and the *Well-tempered Clavichord* (*Wohltemperirtes Clavier*)—the two former because they are found in the repertory of every great pianist, the last (48 preludes and fugues through all the major and minor keys), because some acquaintance with it is considered indispensable to a pianist's education. Beethoven mastered it at the age of 11. This famous work, composed partly in 1722, partly about 1740, did not see publication until 1799, nearly 50 years after Bach's death, when it was brought out in London. *Art of Fugue*, begun the year before Bach's death, consists of 15 fugues and 4 canons, all written upon one and the same theme in D minor. Besides these there is a fairly long list of other works for pianofortes, including the charming *French Suites* and *English Suites* and the pretty *Inventions*, showing with how light a touch Bach could handle the smaller forms of his school of composition in composing chamber music and for the orchestra. It is notable that while organ playing usually ruins the pianoforte touch, Bach appears to have been equally proficient on organ and clavichord.

Bach's greatest fame among musicians rests on the religious works composed during the Leipzig period of his career. It is noteworthy that these were composed for the Protestant church, the church of St. Thomas being Lutheran; and that, in consequence, their majesty is enhanced by an august severity in keeping with the simpler forms of Protestant worship. Bach has been compared with Milton, and not inaptly, except that the composer could unbend, as witness his *Coffee* and *Peasant's* cantatas and

his ditty upon his tobacco pipe, *The Edifying Reflections of a Tobacco Smoker*, which he composed as a bit of pleasantry for his wife. Of church cantatas he is understood to have composed nearly 300, a complete cycle for five church years. Of these cantatas some 200 are extant. The loss of so many valuable manuscripts is due to the carelessness of his son Wilhelm Friedemann (q.v.). All except about 30 date from the Leipzig period. He greatly developed this form of church music by freer treatment of the instrumental portions, as well as by his mastery of vocal composition. The chorales are especially rich and beautiful. Of the two *Passions* it has been well said that the *St. John Passion* is the perfection of church music; the *St. Matthew* "reaches the goal of all sacred art" (Poole). The latter, composed in 1729, so much overshadows the former that it is always meant when "Bach's Passion Music" is spoken of; and it is a question whether the majority of musicians consider this *Passion* (composed at intervals during 1733-38) or the *B minor Mass* the greatest of Bach's works. Bach also composed an *Ascension Oratorio* (usually classed with his cantatas), an *Easter* and a *Christmas Oratorio*, the latter in six divisions for performance respectively on Christmas and the two days following, New Year's, the first Sunday of the year, and Epiphany.

Bach is one of those masters that cannot be surpassed, because, as Riemann remarks, "in them the musical feeling and art of an entire epoch are, so to speak, embodied." Bach marks the culmination of the polyphonic, contrapuntal style, and at the same time he is one of the most imposing figures of the new homophonic, melodic style. (See POLYPHONY; HOMOPHONY.) He was living at a time when a desire for greater freedom of expression was chafing at the fetters imposed, by the older church modes, when musicians were beginning to employ the more natural modes of major and minor. It was chiefly Bach who decided the final victory of the natural over an artificial, though time-honored system. In the matter of equal temperament of instruments having a fixed intonation (organ, piano) his advocacy and practical employment of the "tempered" as against the "natural" fifth led to the universal adoption of the former. (See TEMPERATURE; TONALITY.) Thus, by means of the circle of tempered fifths, all the scales were brought into close relation, and the possibility of unlimited modulation was given. This wonderful insight into harmonic relations enabled Bach to impart to his works those subtle effects which even now, after 200 years, after the marvels of Beethoven, Chopin, Wagner, Brahms, fascinate the student. Harmonically Bach towers like a giant above his contemporary Handel, and it is no lack of reverence to say that the harmonic basis of Gluck, Haydn, and Mozart seems rather colorless when compared with that of Bach. Moreover, his melodic invention seems as inexhaustible as the resources of his stupendous technical skill. The more one penetrates into those works, the greater becomes one's admiration. With all the great musicians from Mozart down to Richard Strauss the study of Bach has been nothing less than an obsession. His profound study of the Leipzig cantor enabled Wagner to effect that perfect fusion of the characteristics of the polyphonic and homophonic styles which we admire in *Die Meistersinger*—

a fusion which Riemann regards as the ideal to be striven for by future generations. But we believe that this noble ideal exists already as a glorious reality in the work of Brahms. Regarded from the standpoint of our present musical development, Bach looms like a colossus; regarded from the standpoint of his own times, he appears superhuman. Because of this towering greatness, not only his contemporaries failed to appreciate him, but three-quarters of a century elapsed after his death before Bach's real position was recognized in wider circles. The undying glory of having been the first to begin an effective propaganda for the spreading and appreciation of this master's works belongs to Mendelssohn. In 1829 he gave in Berlin an inspired performance of the *Passion According to St. Matthew*, just 100 years after the first performance in Leipzig. The colossal work, neglected and forgotten for a whole century, made a profound impression, and the interest thus aroused grew steadily. Until the day of his death Mendelssohn worked indefatigably for the cause of Bach, and it was again due to his efforts that in 1842 the first statue of the great cantor, the *Altmeister*, as he was then and has since been admiringly called, was erected in Leipzig, near the church of St. Thomas. A fine bronze statue was unveiled in 1884 in his native town of Eisenach. After the discovery of Bach's remains in 1894 Karl Seffner made a special study of the skull and modeled a bust. The same artist cast a full-sized statue in bronze, which was unveiled with imposing ceremonies lasting three days, in May, 1908. This statue stands in the open place behind the church of St. Thomas in Leipzig. In 1850 the centenary of Bach's death was celebrated in a fitting manner. The two brothers, H. and R. Härtel, R. Schumann, O. Jahn, M. Hauptmann, and K. F. Becker founded the Bach Gesellschaft at Leipzig for the purpose of publishing the complete works of J. S. Bach. The first volume appeared in 1851, the sixtieth and last in 1900. With the attainment of the original object the Bach Gesellschaft went out of existence. But new manuscripts were found, and many other matters of importance came up, so that in 1903 a new society under the title "Neue Bach Gesellschaft" was organized at Leipzig. This society has been publishing annually a *Bach Jahrbuch* since 1904, and arranged important Bach Festivals in different cities. Of these the most important one was that of 1907 in Eisenach, when the house in which Bach was born, and which had been bought by the society, was opened as a Bach Museum. Great credit is also due to England for its earnest efforts in behalf of the German master. The English Bach Society even antedates the German Bach Gesellschaft by one year. The moving spirits were W. S. Bennett, J. Mullah, and H. Smart. The object was "(1) The collection of the music composed by J. S. Bach, either printed or in manuscript, and of all works relating to him, his family or his music; and (2) The furtherance and promotion of a general acquaintance with his music by its public performance." In 1870 the society was disbanded, and its valuable library presented to the Royal Academy of Music. In France Bach was entirely unknown to the general public until 1905, when G. Bret founded in Paris the Société Bach. For the cultivation of Bach's music in America, see BETHLEHEM MUSIC FESTIVAL.

Bibliography. The standard biography is that of Ph. Spitta, *Johann Sebastian Bach* (2 vols., Leipzig, 1873-80), Eng. trans. by Bell and Fuller-Maitland (London, 1899); C. F. A. Williams, *Bach* (London, 1900); A. Schweitzer, *J. S. Bach, le musicien-poète* (Leipzig, 1905), also Eng. trans. by E. Newman (Leipzig, 1911); C. H. H. Parry, *Johann Sebastian Bach* (New York, 1909); Ph. Wolfrum, *Johann Sebastian Bach* (2 vols., Leipzig, 1910); R. Franz, *Gesammelte Schriften über die Wiederbelebung Bach'scher und Handel'scher Werke* (Leipzig, 1910).

BACH, KARL PHILIPP EMANUEL (1714-88). Styled the "Berlin" or "Hamburg" Bach. He was the third son of Johann Sebastian and was born at Weimar. He attended the famous *Thomaschule* and afterward the University of Leipzig. Then he was sent to Frankfurt-a-O. to study law. But there he began his career as musician. In 1738 he went to Berlin, where two years later he was appointed chamber musician to Frederick the Great. In 1767 he became kapellmeister at Hamburg, where he passed the remainder of his life. His most ambitious composition is the oratorio of *Israel in the Wilderness*. The greater portion of his numerous works was written for his favorite instrument, the clavier (the piano of that day). His essay on *The True Method of Clavier Playing* was long a standard work, and contains invaluable information on the styles of playing prevalent at the time. It was reprinted in 1906 by W. Niemann. Clementi professed to have derived from Bach his distinctive style of pianoforte playing. Bach's importance rests upon his piano works, which not only materially advanced the technique of playing, but also assisted in spreading the innovations of Johann Stamitz (q.v.), the real father of modern instrumental music. It was through the works of Bach that Haydn became acquainted with Stamitz's ideas, which he developed still further, and thus established the modern sonata form, the highest of the forms of instrumental music. Bach was a most prolific composer, the number of solo pieces for piano amounting to 210, besides 52 concertos, numerous sonatas and songs. In the field of church music he wrote 22 Passions, 2 oratorios, and many cantatas. Consult Bitter, *K. Ph. E. Bach and W. F. Bach* (Berlin, 1868), and M. Flueler, *Die norddeutsche Symphonie zur Zeit Friedrich des Grossen, und besonders die Werke Ph. E. Bachs* (Berlin, 1909).

BACH, WILHELM FRIEDEMANN (1710-84). Known as the "Halle" Bach. He was the oldest of the sons of the great Johann Sebastian, and was born Nov. 22, 1710, at Weimar. He received his entire training from his father, who always regarded him as the most gifted of all his children. From 1733 to 1747 he was organist at St. Sophia's in Dresden, after which he accepted a similar post at St. Mary's in Halle. In this position he remained till 1764, when, because of his irregular habits and addiction to drink, he was dismissed. Afterward he never succeeded in obtaining a position, but drifted about from one city to another until he died in utter degradation in Berlin, July 1, 1784. The manuscripts of a number of his works are preserved in the Royal Library at Berlin. Riemann published a collection of his works for piano, containing concertos, sonatas, fantasies, and a suite. Stradal edited an organ concerto and a fantasy and fugue. All these works show extraordinary

talent and a strong individuality. In vol. 43 of the works of J. S. Bach is contained a sonata for two pianofortes, which has subsequently been identified as a work of W. F. Bach. After Johann Sebastian's death in 1750 all his manuscripts were divided between the two sons, W. F. and K. P. E. Bach. While those in the possession of the latter were preserved intact and completely catalogued, the manuscripts given to Wilhelm were almost all lost.

BACH FESTIVAL. See BETHLEHEM MUSICAL.

BACHARACH, bâg'a-râc. A town of the Rhine province, Prussia, Germany, picturesquely situated on the left bank of the Rhine, at the entrance of the Steeger valley, 8 miles northwest of Bingen. From the tenth to the sixteenth century it was one of the most important wine markets in the Rhine valley. There are slate quarries in the neighborhood, part of which is still given over to vine culture. Its commerce and population have greatly diminished, but it is noteworthy on account of its interesting historical associations and mediæval remains, which include the commanding castle of Stahleck crowning the hill, the old town walls and towers, the fine ruins of the thirteenth-century Gothic church of St. Werner, and a timbered hostelry of the fifteenth century. Bacharach wine had such high repute that by command a cask was annually sent to Rome for Æneas Sylvius (Pope Pius II.), and four tuns were accepted yearly by Emperor Wenzel as tribute for the freedom of the town. Through the Steeger valley, often called the Blucher valley, Blucher pursued the French troops after crossing the Rhine, on Jan. 1, 1814. Pop., 1900, 1904.

BACHAUS, WILHELM. See BACKHAUS, WILHELM.

BACHE, bâch, ALEXANDER DALLAS (1806-67). An American physicist. He was born in Philadelphia and was a grandson of Benjamin Franklin. He graduated at West Point in 1825, became a lieutenant in the corps of engineers, and remained some time at the Military Academy as instructor. He was employed under Colonel Totten on the fortifications at Newport, where he married Nancy Clarke Fowler. Bache was appointed professor of natural philosophy and chemistry in the University of Pennsylvania in 1828, and was an early member of the Franklin Institute, publishing many valuable scientific papers in its journals. He established the first magnetic observatory in the United States, where the periods of the daily variations of the magnetic needle were fully determined and other interesting observations made. A magnetic survey of Pennsylvania, made by Professor Bache, marks the beginning of the magnetic work since carried on by the United States Coast and Geodetic Survey. In 1836 he became president of the trustees of Girard College, and visited Europe to examine educational systems for the information of the board, who were about to organize that institution. His report, submitted in 1838, was of great value in suggesting improvements in educational methods. Before the college was organized Bache became connected with the public-school system of Philadelphia and developed the system of free education in that city. At the same time he was actively engaged in scientific work, particularly in the examination of meteorological and magnetic phenomena. In 1842 he returned to his professorship

in the university and in 1843 was appointed superintendent of the United States Coast Survey, succeeding F. R. Hassler, the first incumbent of that position. He reorganized and extended the work of the survey and laid the foundations which have brought the service to its present recognized efficiency.

Professor Bache was also a member of the lighthouse board, superintendent of weights and measures, an incorporator and regent of the Smithsonian Institution, vice-president of the United States Sanitary Commission, president of the American Philosophical Society, president of the American Association for the Advancement of Science, a founder and member of the National Academy of Sciences, and associate of many important scientific institutions at home and abroad. He was the recipient of many honors, including the degree of LL.D. from several colleges, and medals from foreign governments and learned bodies. He gave \$42,000 to the National Academy of Sciences for the promotion of its work in furthering scientific research. His important works are: *Observations at the Magnetic and Meteorological Observatory of Girard College*, reports on weights and measures, and various essays in the scientific journals and the proceedings of learned societies. Consult Henry, "Mémorial of Alexander Dallas Bache," vol. i. *Biographical Memoirs National Academy of Sciences*, reprinted in *Smithsonian Report for 1870*.

BACHE, BENJAMIN FRANKLIN (1801-81). An American surgeon, great-grandson of Benjamin Franklin. He graduated at Princeton (1819) and at the medical department of the University of Pennsylvania (1823); became a surgeon in the navy (1828); while on leave was for three years professor of natural science and natural religion in Kenyon College; and for some years was fleet surgeon of the Mediterranean, and later of the Brazil squadron. He established at New York a laboratory which supplied the medical department of the navy, and rendered important service to the Union armies during the Civil War, by running the laboratory at his own expense. He was retired with the relative rank of commodore in 1871.

BACHE, FRANKLIN (1792-1864). An American physician and chemist, born at Philadelphia, Pa. He graduated, in 1810, at the University of Pennsylvania; in 1814, at the medical department of the same university. In the latter year he was appointed a surgeon in the United States army. From 1814 until his death he was professor of chemistry at the Jefferson Medical College, and in 1854-55 was president of the American Philosophical Society. He published a *System of Chemistry* (1819); *Introductory Lectures on Chemistry* (1841-52) and other works; and, with G. Wood, prepared a *Pharmacopœia* (1830), which was the basis of the present-day *United States Pharmacopœia* and *United States Dispensatory*. The nineteenth edition of his *Dispensatory of the United States*, a book printed first in 1851, was published in Philadelphia in 1907.

BACHE, HARTMAN (1798-1872). An American engineer, born in Philadelphia. He graduated at the United States Military Academy and was appointed colonel of engineers in 1863. In 1865 he was brevetted brigadier-general. He was long employed in topographical surveying, and his engineering works included the Delaware Breakwater and the Brandywine Lighthouse. He retired from active service in 1867.

BACHE, RENÉ (1861-). An American journalist, born at Philadelphia. He studied at Yale and Harvard universities, and after 1889 devoted himself to journalism and literature. He is known as the contributor of a very large number of popular science articles, widely varying in subject-matter, to such periodicals as the *Technical World*, *Harper's Weekly*, *The Scientific American*, and *The Cosmopolitan*.

BACHE, SARAH (1744-1808). The only daughter of Benjamin Franklin. During the Revolution she was active in collecting clothing and money for the Patriot army, and at one time employed more than 2000 women and girls in making garments for soldiers. She also served in the hospitals and was widely known for patriotism and benevolence. She married Richard Bache, Franklin's successor as Postmaster-General.

BACHELET, bâsh'lâ', JEAN LOUIS THÉODORE (1820-79). A French historian, born at Pissy-Pôville, Seine-Inférieure. He was educated at the Ecole Normale, and was professor of history in various institutions, including the Lycée of Rouen, of which city he was appointed librarian. His publications are numerous, among the most important being *La guerre de cent ans* (1852); *Cours d'histoire* (3 vols., 1868-75); and, with C. Dezobry, the *Dictionnaire général de biographie et d'histoire* (12th ed., 1902); besides the *Dictionnaire général des lettres, des beaux-arts, des sciences morales et politiques* (7th ed., 1902).

BACHELIER, bâsh'lyâ', NICOLAS (c.1485-c.1566). A French sculptor and architect. He was born at Toulouse and studied under Michelangelo at Rome. He built a church and a palace at Assier, the main entrance of the church of St. Sernin at Toulouse, and other important works. He was among the first to introduce the Renaissance style into France.

BACHELIN, OLIVER. See BASSELIN.

BACHELLER, IRVING (ADDISON) (1859-). An American author, born at Pierrepont, St. Lawrence Co., N. Y. He graduated in 1882 at St. Lawrence University (Canton, N. Y.); in 1882-83 was connected with the *Daily Hotel Reporter*, of New York City, and in 1884 was a member of the staff of the *Brooklyn Times*. From 1884 to 1898 he was director of the Bachelier Syndicate for supplying literary material to periodicals and during a portion of that time was also editor of *The Pocket Magazine* and of the *Cosmopolitan*. Subsequently he was on the staff of the *New York World*. Prior to 1900 he had contributed to magazines and the newspaper press poems and sketches and had published two books, *The Master of Silence* (1890) and *The Still House of O'Darrow* (1894). In 1900 his *Eben Holden* achieved a great popular success suggesting that of *David Harum*, less fully repeated in 1901 with *D'ri and I* (originally a serial in the *Century Magazine*). Each of these—the former primarily a character study, the latter a martial romance—finds its setting in northern New York. His later publications include *Darrel of the Blessed Isles* (1903); *Vergilius* (1904); *Silas Strong* (1906); *The Hand-Made Gentleman* (1909); *The Master* (1910); *Keeping up with Lizzie* (1911); "Charge It" (1912); *The Turning of Griggsby* (1913).

BACHELOR, bâch'â-lër (OF. *bachelor*, Fr. *bachelier*, It. *baccelliere*, *baccelliero*, Portug. *baccilar*, all from ML. *baccalaris*, *baccalaris*, a

holder of a small farm or estate called in Low Lat. *baccalaria*. The latter was probably derived from Low Lat. *bacca* for Lat. *vacca*, cow, and thus meant 'grazing land'. The term was applied to (1) tenants of certain portions of church lands, called *baccalaria*, a fee of an inferior kind; (2) monks who had not yet taken the full vows of monasticism; (3) persons in the probationary stage of knighthood—not esquires simply, but knights who, for lack of means or from nonage, had not yet raised their banner in the field (*levé bannière*); (4) students who had completed the first grade of their university career, in this sense the word was afterward changed to read *baccalaureus*; (5) unmarried men who, because of their solitary condition, were regarded as candidates or probationers for marriage. It is the last meaning that the term "bachelor," at present, most often bears. Regarded as a class in the community, bachelors have formed the subject of legislation from the earliest times. Upon the principle that every citizen is bound to rear up legitimate children to the state, penalties have often been imposed upon male celibates in various countries. In proportion as the interests of the state were regarded above those of the individual, the enforcement of marriage would be made more or less severe. In ancient Sparta it was considered a punishable crime not to marry, or to marry too late in life; and in early Athens celibacy, though not severely punished, was discouraged. At Rome marriage was fostered by positive penalties imposed on unmarried men, and sometimes even on women, as well as by discrimination in favor of heads of families. In the allotment of the Campanian lands by Julius Cæsar portions were granted only to the fathers of three or more children. Under Augustus a law was enacted prohibiting unmarried men below the age of 60 and single women under 50 from taking possession of a legacy; and this prohibition applied even to widows, who, in order to secure their part of the deceased husband's estate, were forced to marry again within two years. There are numerous instances in Great Britain of special taxes being imposed upon bachelors and widows, with a view, however, more to the increase of revenue than for any other object. In France, where the problem of depopulation has been of such serious moment as to threaten the very position of the state among the Great Powers of Europe, frequent attempts have been made to impose taxes upon bachelors, but with very little success. See BACHELOR'S DEGREE.

BACHELOR. See CRAPPIE.

BACHELOR, KNIGHT (Fr. *bas chevalier*). The lowest grade of knighthood, now only bestowed in the United Kingdom. It has frequently been conferred for no weightier service than carrying a congratulatory address to court. See KNIGHT.

BACHELOR OF SAL'AMAN'CA, THE. A novel by Le Sage, published in 1736. Le Sage pretended that it was drawn from an old Spanish MS., but its inspiration need be traced no further back than the ingenious brain of the author of *Gil Blas*. It was his last work.

BACHELORS' BUTTONS. A name commonly applied to a species of *Gomphrena* ('globe amaranth') cultivated from India. Various other plants, both cultivated and wild, are also called "bachelors' buttons," as species of *Ranunculus* ('buttercup'), *Lychnis*, *Polygala*, *Cichorium* ('chicory'), and *Centaurea*.

BACHELOR'S DEGREE. One of the oldest of academic distinctions, the exact significance of which has varied in different countries and in different periods in the same countries. Originally it was not a degree conferred by the university but merely a recognition of a candidate's ability to proceed to a higher degree. During the fifteenth century it became well defined as a minor degree and in general it has been conferred at the close of the first stage in a liberal education and is supposed to indicate that the recipient is proficient in certain fundamental branches. The original form of the degree was Bachelor of Arts (B.A.), and usually it is essential that this degree should be taken before proceeding to the higher degree of Master of Arts, or Doctor of Philosophy. In France there are two forms for the baccalaureate degree—*bachelier ès lettres* and *bachelier ès sciences*. Great Britain, while conservative about the B.A. degree, recognizes also B.Sc., and confers the bachelor's degree in professional courses. So, too, in the United States there are Bachelors of Law (LL.B. or B.L.), Bachelors of Divinity (B.D. or S.T.B.), Bachelors of Medicine (M.B.), etc. Here, too, where academic degrees are but slightly protected by law, many modifications of the baccalaureate degree have been employed to indicate the completion of certain special courses of study. The scientific schools have given the degree of Bachelor of Philosophy (as at Yale, since 1852), Bachelor of Science (as at Harvard, since 1851), and in many places the degree of Bachelor of Letters is conferred upon those whose studies are not scientific or classical, but are based on modern literature. Bachelor of Science (B.S.) is an established degree in almost every college and university, while Bachelor of Philosophy (Ph.B.) and Bachelor of Letters (B.L. or Litt.B.) have in the majority of cases been introduced only to be discarded. The bachelor's degree has also been given in pharmacy, agriculture, music, veterinary medicine, and many other subjects; but there is much opposition to this use of the traditional "baccalaureate," and the tendency is more and more towards its limitation.

BACHER, bā'ç'er, WILHELM (1850–1913). A Jewish theologian and Orientalist, born in Liptó-Szent-Miklós in Hungary. He was educated in the universities of Budapest and Breslau and at the Jewish Theological Seminary of the latter city. In 1877 he became professor and in 1912 director of the rabbinical public schools of Budapest. His works include: *Nizamis Leben und Werke* (1872); *Die Agada der Babylonischen Amoräer* (1878); *Die Agada der Sannaiten* (2 vols., 1889–90; vol. i, 2d ed., 1903); *Die Agada der Palastinensischen Amoräer* (3 vols., 1892–99); *Die Anfänge der Hebräischen Grammatik* (1895); *Ein Hebräisches Wörterbuch aus dem Vierzehnten Jahrhundert* (1900); *Die Agada der Tannaiten und Amoräer*; *Bibeltellenregister* (1902); *Aus dem Wörterbuche Tanchum Jerusalemitis* (1903).

BACHERACHT, bā'ke-rākt, THERESE VON. See LÜTZOW, THERESE VON.

BACHET, bā'shā', CLAUDE-GASPAR, SIEUR DE MÉZIRIAC (1581–1638). A French mathematician and philologist. He was born in Paris and is said to have belonged in his youth to the order of the Jesuits. At the age of 20 he was teaching rhetoric in the College of Milan, but soon afterward settled in Paris, where he became a member of the French Academy from the time

of its foundation (1635). He published some literary works, among which is *Epîtres d'Ovide en vers français, avec des commentaires fort curieux* (Bourg-en-Bresse, 1620; reprinted at The Hague, 1716, with other of his works). In mathematics he was the first in Europe systematically to undertake the solution of indeterminate linear equations, and his commentaries were a point of departure for the work of Fermat in his theory of numbers. Bachet published *Les problèmes plaisants et délectables qui se font par les nombres* (Lyons, 1612; 5th ed., Paris, 1884); *Diophanti Alexandrini Arithmeticonum Libri Sex et de Numeris Rectangulis Liber Unus* (Paris, 1621-70). He also left a manuscript entitled "Elementorum Arithmeticonum Libri XIII (Bibliothèque de l'Institut)," extracts of which were published in the *Bollettino Boncompagni* (1879).

BACHIAN. See BATJAN.

BACHMAN, bák'mán, JOHN (1790-1874). An American naturalist and clergyman. From 1815 until his death he was pastor of a Lutheran church in Charleston, S. C. He was assistant to Audubon and chief author of the work on North American quadrupeds. Among his own works are *A Defense of Luther and the Reformation* (1853) and *Characteristics of Species and Genera as Applicable to the Doctrine of the Unity of the Human Race* (1854).

BACHMUT, bák-mööt'. See BAKHMUT.

BACHO, bák'kó. See BACONTHORPE, JOHN.

BÄCHTOLD, bék'tólt, JAKOB (1848-97). A German literary historian, born at Schleithelm, Switzerland. He studied at Heidelberg, Munich, Tübingen, Paris, and London, and in 1872 was an instructor in the gymnasium at Solothurn. In 1888 he became professor of the German language and literature at Zürich. His principal work is *Geschichte der deutschen Litteratur in der Schweiz* (1887-92), and his other important publications include *Deutsche Handschriften aus dem Britischen Museum* (1873) and *Gottfried Kellers Leben* (3 vols., 1894-97). He also published a critical edition of Goethe's *Goetz von Berlichingen* (1882); *Iphigenia* (1883); *Dichtung und Wahrheit* (1890-91). He was associate editor, with Vetter, of the *Bibliothek älterer Schriftwerke der deutschen Schweiz und ihres Grenzgebietes*. After his death Vetter published *Kleine Schriften von Jakob Bächtold* (1899).

BACHUONE, bá-chwō'ná, ARNOLDO. See VILANOVANUS, ARNOLDUS.

BACILLUS. See BACTERIA; CHOLERA; COLON BACILLUS; TUBERCULOSIS; SERUM THERAPY.

BACIOCCHI, bá-chō'ké, MARIE ANNE ELISA BONAPARTE. See BONAPARTE, FAMILY OF.

BACK, SIR GEORGE (1796-1878). A famous English Arctic explorer. He was born at Stockport, England. In 1819 and 1825 he accompanied Franklin in his expeditions to the north coast of America. He volunteered to the government to go in search of Captain Ross, who was supposed to have been lost in his attempt to discover the Northwest Passage; and on the 28th of June, 1833, he started from Norway House, a station of the Hudson's Bay Company. After passing a terrible winter with his companions at Slave Lake, he discovered, in 1834, Artillery Lake and the Great Fish River, or Back's River, which he followed to the Frozen Ocean. Being hindered by the ice from proceeding along the coast as far as Cape Turnagain, he returned by the river; but although he had received news of the return of Captain Ross, he continued his explorations in

the Northern Sea, and did not return to England until 1835, when he was raised to the rank of post-captain for his services. In 1836 and 1837 he further explored the Arctic shores—the Geographical Society, in the latter year, bestowing its gold medal upon him. Two years afterward he was knighted. He was made an admiral in 1857. He was an able artist and descriptive writer and wrote an illustrated *Narrative of the Arctic Land Expedition to the Mouth of the Great Fish River* (1834-35), and *Perils and Escapes of H.M.S. Terror* (1836-37).

BACK BAY. A former inner harbor of Boston, Mass., drained and filled in (1856-86), laid out in straight and wide streets and squares, and now the most exclusive residential district of the city. In it many of the finest streets, churches, and public buildings are situated, the Public Garden and Copley Square being prominent features.

BACK BITE, SIR BENJAMIN. A character in Sheridan's *School for Scandal*. He is an emaculated creature, with a vinegary tongue, deeply versed in all manner of evil speaking, lying, and slandering. Crabtree, his uncle, Mrs. Candour, and himself are the leading members of the "school." He affects to be a poet and wit.

BACKER, bák'ér, JAKOB (1608-51). A Dutch painter. He was born at Haerlingen and was a pupil of Lambert Jakobsz at Leuwarden and afterward of Rembrandt at Amsterdam, where he usually resided. Under the latter's influence he painted real masterpieces, such as the "Lady Regents of the Amsterdam Orphan Asylum," still in situ, and the fine "Guild of Archers," in the Town Hall (1642), and some of his portraits. But his art afterward became fashionable and declined. His nephew, ADRIAN BACKER, of Amsterdam (1638-86), was also a successful portrait painter, whose historical subjects are imitations of the Italians.

BACK'GAM'MON. One of the most ancient and widespread dice games, of which three schools survive—the Russian, Turkish, and Eng-

BACKGAMMON BOARD.

lish. It is sometimes called "tric-trac," though this is properly a distinct variety of the game, and in England was known as "tables" until the seventeenth century. The word "backgammon" has been ascribed to the Welsh tongue, in which it is said to signify "little battle." Strutt as-

cribes the term to the Saxon "bac" and "game,"—i.e., back game,—so denominated because the performance consists in the two players bringing their men back from their antagonist's table into their own; or because the pieces are sometimes taken up and obliged to go back—i.e., reenter at the table they came from.

The backgammon board consists of two parts or tables, known as the inner or home table and the outer table. Each table possesses 12 points, 6 at each end. The game is played by two persons, each of whom has 15 "men." In beginning the game the "men" are placed on certain points on the tables, directly opposite each other. The game is played with 2 dice, which are common to both players; but each player uses his own dicebox. The throws are alternate. If a player throws "doublets," or both dice of one number, double the number of dots is reckoned; thus, by a throw of 2 aces, the player does not count 2, but 4. Each player counts round from the right hand or ace point of the other. The object of the game is for each player to get all his "men" played round into his own left-hand table, removing them from point to point according to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by itself, or collectively with the number on the other side. Thus, if 4 be thrown by one side, and 6 by the other, one "man" can be advanced 4 points, and another 6 points; or one "man" can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by 2 "men" belonging to the adversary. If covered by only one "man," which is called a "blot," then that "man" can be "hit"—i.e., removed from the point, and placed on the bar between the tables, its place being taken by the "man" who has won it. The removal of a "man" to the bars throws a player considerably behind in the game, because the "man" must remain out of the play till the dice turn up a number corresponding to an open point on the adversary's table. There are two kinds of victory—winning the "hit" and winning the "gammon." The party who has played all his "men" round into his own table, and by fortunate throws of the dice has borne or played the "men" off the points first, wins the "hit." The "gammon" may be explained as follows: When you have got all your "men" round to your own table, covering every point, and your adversary has a "man" out, then you are enabled to "bear" or lift your men away. If you can bear all away, so as to clear your table before the adversary gets his "man" placed by a throw on your table, you will win the "gammon." If the adversary has been able to bear one before you have borne all your "men," it reduces the victory to a "hit." Two "hits" are reckoned equal to one "gammon" in playing matches. Consult Pardon and Anderson, *Backgammon and Draughts* (New York, 1889).

BACKHAUS, bîk'hous, WILHELM (1884–). A noted German pianist. He was born March 26, 1884, at Leipzig. When seven years of age, he received regular piano instruction from A. Reckendorf, and continued with him even during the four years he spent at the Conservatory of Leipzig (1894–98). After graduation he spent one year with Eugen d'Albert in Frankfurt. His concert career began in 1900, when his extraordinary powers won immediate recognition. In England his appearances created a sensation,

so that he was appointed at the age of 21 a professor of piano at the Royal College of Music in Manchester. This position he held only one year, for in that year he competed for and won the much-valued Rubinstein Prize (1905). Thereafter he devoted all his time to concert tours. In 1912 he visited America, where he had to compete with such artists as Busoni, De Pachmann, and Godowsky. Before he reached his thirtieth year Backhaus was generally regarded as among the very greatest of living pianists, his tremendous technic being entirely eclipsed by marvelous tone coloring, wonderful poetic feeling, and supreme intellectual grasp.

BACKLUND, bîk'lûnd (JOHAN) OSKAR (1846–). A Swedish astronomer, born at Lenghem, Sweden. He became lecturer at the University of Upsala (1875), assistant at the Stockholm Observatory (1876), observator at the Dorpat Observatory (1876), adjunct-astronomer at the Observatory of Pulkowa, Russia, and in 1895 its director. In 1887 he was made astronomer of the Academy in St. Petersburg. He spent some years in investigating the progressive decrease in the period of Encke's comet and in formulating a "theory of disturbances." One of his principal publications is the treatise entitled *Observations de Pulkowa* (1888). In 1906 was published *The Development of Celestial Mechanics during the Nineteenth Century*.

BACK RIVER. See GREAT FISH RIVER.

BÄCKSTRÖM, bæk'ström, PER JOHAN EDVARD (1841–86). A Swedish author, born at Stockholm and educated at Upsala. He published several volumes of verse, including *Lyriska Dikter* (1870). His dramas, of which the chief is the tragedy, *Dagvard Frey* (1876; Ger. trans. by Attinghausen, 1879), were long popular. He made translations from Ponsard, Victor Hugo, and others.

BACKUS, ISAAC (1724–1806). An American clergyman and author. He was born at Norwich, Conn. He left the regular Congregational body for the Separatists, or New Lights, and these sympathized warmly with the Baptists, whose leader he became, and by his own exertions largely increased the prosperity of the denomination. He was a strong advocate of the entire separation of church and state and went before the Continental Congress in 1774 to ask for the Baptists the same privileges that were granted to other sects. Among his numerous writings, 1 *History of New England, with Especial Reference to the Denomination of Christians Called Baptists* (3 vols., Boston, 1777–96; reprinted, 2 vols., Newton, Mass.) is the most important.

BACKUS, TRUMAN JAY (1842–1908). An American educator. He was born at Milan, N. Y., graduated at the University of Rochester in 1864, and was professor of rhetoric and English literature at Vassar College from 1867 to 1883. In 1883 he was appointed president of Packer Collegiate Institute (Brooklyn, N. Y.). He was one of the incorporators of the Brooklyn Institute of Arts and Sciences and at one time president of the Headmasters' Association.

BACLER D'ALBE, bâ'klar' dâlb', LOUIS ALBERT GHISLAIN, BARON (1762–1824). A French painter, soldier, and cartographer. He published a *Carte du théâtre de la guerre en Italie* (54 parts, 1802), and rose to be general of brigade under Napoleon, in all of whose campaigns he served. His most noted paintings, "The Battle of Arcola" and "The Battle of

Rivoli," are in the Versailles Gallery. He published *Souvenirs pittoresques contenant la campagne d'Espagne* (1824), a series of lithographic views, and other similar works.

BACOLOD, bū-kō'lōd, or **BACOLOT**, bū-kōlōt. The capital of the province of West Negros (area, 3112 square miles; pop., 231,512) on the island of Negros, Philippines. It is situated on the west coast and had in 1903 a population of 11,960 (Map: Philippine Islands, D 5). It is 26 miles by water from Iloilo.

BACOLOR, bū-kō-lōr'. The chief town and the capital of the province of Pampanga, Luzon, Philippines (Map: Luzon, D 7). It is situated 33 miles northwest of Manila, with which it is connected by road. It has a telegraph station and is connected by rail and highway with important towns on the island. Pop., 1903, 13,493.

BA-CÓN. A town in the Philippines, in the province of Sorsogon, Luzon. It is situated on the gulf of Albay, about 22 miles southeast of Albay, the capital, in a fertile agricultural district. Pop., 1903, 14,536.

BA'CON, ALICE MABEL (1858-). An American writer and teacher. She was born at New Haven, Conn., the daughter of the Rev. Dr. Leonard Bacon. She taught at Hampton Institute from 1883 to 1888, and in 1888-89 at the Peeresses' School, Tokio, Japan, where she wrote *Japanese Girls and Women* (1891) and *A Japanese Interior* (1893). She returned to Hampton Institute in 1890 and founded the Dixie Hospital for the training of colored nurses. In 1900-02 she taught in the Girls' High School, Tokio, Japan, and afterward lectured on Japanese subjects in this country. She wrote *In the Land of the Gods* (1905), and edited *Human Bullets, a Soldier's Story of Port Arthur* (1907).

BACON, AUGUSTUS OCTAVIUS (1839-1914). An American legislator, born in Bryan Co., Ga. He graduated from the University of Georgia (A.B. 1859; LL.B. 1860); served in the Confederate army during the Civil War; entered upon the practice of law in Macon and became prominent in State politics. For a number of years he was speaker of the Georgia House of Representatives, and several times he served as delegate to Democratic State and national conventions. Elected to the United States Senate in 1894, he was reelected for six-year terms in 1900, 1907, and 1913—this last time as the first Senator ever chosen by direct vote of the people. Senator Bacon came to be recognized as one of the most eminent lawyers of the Upper House, conspicuous especially for his knowledge of constitutional law. Upon the death of Vice-President Sherman he alternated with Senator Gallinger as president pro tempore of the Senate, and in this capacity presided at the impeachment proceedings against Judge Archbald (q.v.) in 1912. A year later, while he held the chairmanship of the important Foreign Relations committee, his conservative attitude towards troubled Mexican affairs was of great assistance to President Wilson in delaying radical action by Congress. Senator Bacon was made a regent of the Smithsonian Institution and a trustee of the University of Georgia.

BACON, BENJAMIN WISNER (1860-). An American theologian. He was born at Litchfield, Conn., and graduated at Yale (College, 1881; Divinity School, 1884). After serving in pastorates at Old Lyme, Conn. (1884-89), and at Oswego, N. Y. (1889-96), he was made an instructor in New Testament Greek at Yale

Divinity School and became in 1897 professor of New Testament criticism and exegesis. The degrees D.D., Litt.D., and LL.D. were conferred upon him. Besides contributions to the *Hibbert Journal* and to the *American Journal of Theology* (of both of which he was chosen an editor), his writings include: *The Genesis of Genesis* (1891); *Triple Tradition of the Exodus* (1894); *The Sermon on the Mount* (1902); *The Story of St. Paul* (1904); *An Introduction to the New Testament* (1907); *The Founding of the Church* (1909); *The Fourth Gospel in Research and Debate* (1909); *Jesus the Son of God* (1911); *The Making of the New Testament* (1912); *Theodore Thornton Munger* (1914).

BACON, DELIA SALTER (1811-59). An American author (born at Tallmadge, Ohio), the sister of Leonard Bacon. She wrote *Tales of the Puritans* (1837), and other works of fiction, and in 1857 published in London her *Philosophy of the Plays of Shakespeare Unfolded*, with a preface by Nathaniel Hawthorne. In this book she zealously advocated the theory that Francis Bacon wrote the plays of Shakespeare, a theory afterward exploited by Ignatius Donnelly (q.v.). Though this theory was not original with her, she was the first to give it general currency. Consult Hawthorne, "Recollections of a Gifted Woman," in *Our Old Home* (Boston, 1863), and Theodore Bacon, *Delia Bacon* (Boston, 1888).

BACON, FRANCIS, BARON VERULAM, VISCOUNT SAINT ALBANS (1561-1626). A celebrated English philosopher. He was born in London on Jan. 22, 1561. His father, Sir Nicholas Bacon, was Lord Keeper of the Great Seal, and his mother was the learned Ann Cooke, sister of Burleigh's (see CECIL, WILLIAM) wife. In early childhood Bacon manifested superior powers and an ardent love of knowledge; his precocious intelligence was so great, and his sedateness so remarkable, that Queen Elizabeth took pleasure in calling him her "young lord keeper." In his thirteenth year he was sent to the University of Cambridge, which he quitted after a residence of but two years. On leaving the university in 1576 he went to Paris in the suite of Sir Amias Paulet, the English Ambassador, and during his residence there he is said to have studied statistics and diplomacy. The sudden death of his father in 1579 recalled him to England, where, after failing to procure from the government a provision which would enable him to devote himself to science and literature, he betook himself for several years to the study of law and was admitted to the bar in 1582. Two years afterward he entered Parliament from the borough of Melcombe Regis. In 1584 or 1585 he published a "Letter of Advice to Queen Elizabeth," in which he advocated "that whosoever would not bear arms against all foreign princes, and namely the Pope, that should anyway invade her Majesty's dominions, should be a traitor." In 1586 he became a bencher of Gray's Inn, and in 1589 wrote another letter, this time in defense of Elizabeth's course in church matters. But neither these letters nor the support of the Earl of Essex, whose favor he had won, could counteract the effect produced on the Queen and the Lords by his opposition in Parliament to some taxation measures in which the government was interested. A chance was given him to apologize for this act of antagonism, but he resolutely refused, and thereby lost an opportunity to be-

LORD BACON

FROM AN ENGRAVING BY JACOBUS HOUBRACKEN

come Attorney-General (1594). Another failure to apologize was followed by failure to secure the solicitor-generalship, although he was now supported by both Essex and Burleigh. These facts it is well to keep in mind, because they show a strength of character in striking contrast to the glaring sycophancy of his conduct in later years. When Essex found that he could do nothing for his favorite at court, he presented him with a private estate worth about £1800, and also supported him in a suit for the hand of Lady Hatton, whom Bacon wished to marry for her wealth. Lady Hatton, however, preferred Coke, Bacon's future enemy. In spite of his readiness thus to accept the patronage of Essex, Bacon acted as Queen's counsel against his friend when the latter was brought to trial for his conduct in Ireland. His motives in this matter have been differently interpreted. Some say that, because he was straitened in his circumstances at this time, he was anxious to conciliate the court. Others maintain, with perhaps more justice, that he took this stand as being the only course open to him for securing the least severe sentence possible for his old friend. Essex himself, however, did not concur in this interpretation of Bacon's conduct. The result of this first trial of Essex was that he was set at liberty; only, however, shortly afterward to be tried again—this time for conspiracy. Bacon was now, without doubt, largely instrumental in securing for the crown the verdict against the accused. The merits of the case cannot be discussed here. Bacon asserted that his official position made it necessary that he should ignore ties of friendship; but then perhaps he should not have allowed himself to be put in such a position. Furthermore, the conscientious performance of official duties at the expense of his personal advantage was by no means a conspicuous trait in his character. After the Earl's execution he wrote, at the request of the Queen, *A Declaration of the Practices and Treasons Attempted and Committed by Robert, Earl of Essex*, which was printed by authority, but with so many changes made by another hand that Bacon cannot justly be held responsible for its authorship.

With the advent of the reign of James I, a new opportunity opened to Bacon, and by paying court to the King he made rapid progress. He was knighted in 1603; and in the following year a pension of £60 was attached to his office of learned counsel. In 1606 he succeeded in his ambition to marry a wealthy woman by winning the hand of Alice Barnham. In 1607 he secured the long-coveted solicitor-generalship, and thus came into the possession of what, in money of to-day, would amount to £4000 a year. This appointment Bacon had probably secured by his defense of royal supremacy in a dispute concerning the King's jurisdiction over some border counties. From now on he volunteered much advice to his sovereign, who, however, refused to be guided by him. Bacon's advice was marked by a strange mixture of great wisdom and unworthy trivialities. He showed wonderful insight into the political situation and suggested plans which, if carried out, might have averted much of the trouble that ensued. But James was not a king to listen to suggestions conflicting with his inclinations, while Bacon unfortunately did not possess a character that could give weight to his advice. In the coming struggle Bacon became more and more obsequi-

ous. He justified himself in his own eyes by the excuse that he was keeping in touch with the King for the good of his country; but it was now obvious to every patriot that no good would come to his country from the willful King. In 1613 Bacon was appointed Attorney-General; and in this new office he soon became entangled in dispute with Coke on constitutional principles, and made himself obnoxious to the people at large by his unscrupulous cupidity. His subservience to the King, however, served him in good stead for a few more years. In 1617 he was appointed to the position his father had held before him, that of Lord Keeper of the Great Seal, and in the year following he attained the high dignity of the Lord Chancellorship and the title of Baron Verulam. In 1621 he was created Viscount St. Albans. The enjoyment of his new honors was, however, very brief. The storm which had been gathering against the government broke first on Bacon's head. On the assembling of Parliament he was charged with bribery. During the trial he himself confessed to the Lords that "there had been a great deal of corruption and neglect," for which he "was heartily and penitently sorry." On the first of May he was deprived of the Seal, and then followed sentence on him, condemning him to pay a fine of £40,000, to be imprisoned during the King's pleasure, and to be excluded from Parliament and from court. The fine, however, was remitted by the King, and the imprisonment lasted only two days. Some time afterward he was even allowed to appear at court. It seems that he now conceived the hope of re-entering political life; but even in those debauched days this was impossible, and he thenceforth devoted himself to literature and science. He died, April 9, 1626, of a cold caught in making an experiment to test the efficacy of snow to preserve flesh.

The first edition of his *Essays* appeared in 1597; his two books on the *Advancement of Learning* in 1605 (this work was afterward treated as the first part of the projected *Instauratio Magna*); his *De Sapientia Veterum* ('Wisdom of the Ancients') in 1609; a revised edition of the *Essays* in 1612, while the final form was given to them in 1625; the *Novum Organum* (so called with reference to Aristotle's *Organon*) appeared in Latin in 1620 and was treated as the second part of the *Instauratio*. The third part of this comprehensively planned work, or at least a section of the third part, appeared in 1622, under the title *Historia Naturalis et Experimentalis ad condendam Philosophiam; sive Phænomena Universi*. Of the other three contemplated parts of the *Instauratio* only two prefaces remain. In 1622 he also published his chief historical work, *History of the Reign of Henry VII*. In 1623 appeared his *De Augmentis Scientiarum*, a Latin translation and extension of his *Advancement of Learning*. His last work, which was published posthumously (1627), was *Sylva Sylvarum*, a book which showed very conclusively that he was not able, in practice, to live up to his scientific theory. The *New Atlantis*, which appeared at the same time with the last-mentioned work, had been written as early as 1617. Besides these, he wrote several minor books and papers. His writings deal with a wide range of subjects, from jurisprudence—which he treated not as a mere lawyer, but as a legislator and philosopher—to morality and medicine. The

Essays are a treasury of rich knowledge of human relations, and the style in which they are written has seldom been equaled by any English writer.

Bacon's reputation as an original philosopher, as an epoch maker in philosophic and scientific thought, was higher a generation or two ago than it is now. Yet his *Novum Organum* has done, perhaps, as much as any other single work toward inculcating into science the spirit of unbiased, accurate, and careful observation and experimentation. In it he maintains that all prepossessions, called "idols," must be abandoned, whether they be the common property of the race due to common modes of thought ("idols of the tribe"), or the peculiar possession of the individual ("idols of the cave"); whether they arise from too great a dependence on language ("idols of the market place"), or from tradition ("idols of the theatre"). These idols once discarded, the seeker after truth must proceed to interrogate nature, not contenting himself with accepting what she has to say of her own accord. He must collect facts, arrange them in order, and then advance to the discovery of the laws that control their workings. This cannot be accomplished by the *inductio per enumerationem simplicem*, or mere inventory of all possible cases of the phenomena under investigation; but negative instances, i.e., cases in which the phenomena are absent, must be examined to discover wherein these instances differ from the affirmative instances—all this with a view to discover the "form" of the phenomena, or their abiding essence. This insistence upon the formal cause has its significance in connection with Bacon's exclusion of final causes or purposes from the domain of natural science. Not that purpose has no existence in the universe. On the contrary, Bacon believed in an overruling Providence with a perverse piety ill in accord with his life. But though religion can imagine the purposes of God, the business of the scientist is to understand the causal sequences of nature as controlled by the essences of phenomena. In ethics Bacon is to be regarded as the forerunner of the English Hedonistic school (see *HEDONISM*), of which his disciple, Hobbes, is usually regarded as the founder. Bacon's own scientific work amounted to little. It is true that he propounded the theory that heat is a form of motion, but this suggestion seems rather to have been a happy guess than a belief scientifically grounded. He was an opponent of the Copernican system of astronomy, which he regarded as a strange fancy; and he seems to have known nothing of the work of Kepler. His enthusiasm for science was not disinterested, but was due to a belief that "knowledge is power"; that human conditions can best be improved by a more thorough acquaintance with the world in which human life must be lived.

Bacon's collected works were first published by Blackbourne in 1730; another collection, with a life, by Mallet, in 1740; a handsome but ill-arranged edition is that of Montagu in 17 vols. (London, 1825-36), the best is that edited by Spedding, Ellis, and Heath, in 7 vols. (1857-59), with *Life and Letters* (7 vols., ed. by Spedding, 1861-74). A noted review of Bacon's character and works is to be found among Macaulay's *Essays*. For more temperate estimates consult: Fowler, "Bacon," *English Philosophers Series* (London, 1881); Church, "Life of Bacon," *Men*

of Letters Series (New York, 1884); Abbott, *Francis Bacon: An Account of his Life and Works* (London, 1885); and John Nichol, *Francis Bacon: His Life and Philosophy* (London, 1888-89).

BACON, HENRY (1866—). An American architect, born at Watseka, Ill. He graduated from the University of Illinois in 1888, and, as winner of the Rotch traveling scholarship, spent two years of study in Europe. From 1885 to 1888 he was in the office of Chamberlin & Whidden in Boston, and from that time until 1897 (with the exception of one year) was with the famous firm of McKim, Mead, & White. He severed this connection to help form the firm of Brite & Bacon. This partnership was dissolved in 1903, and Mr. Bacon began practice alone. He designed many important buildings and was successful competitor for the design of the Lincoln Memorial at Washington (1913). He was made a fellow of the American Institute of Architects and in 1913 a member of the National Institute of Arts and Letters.

BACON, JOHN. See *BACONTHORPE, JOHN*.

BACON, JOHN (1740-99). A British sculptor, born in London. In 1769 he received the first gold medal for sculpture awarded by the Royal Academy, of which he was soon after made a member. Among his principal works are two busts of George III—one at Christ Church, Oxford, the other in the University Library at Göttingen—and monuments of Lord Chatham in Westminster Abbey and in the Guildhall, of Dr. Johnson in St. Paul's Cathedral, and of Blackstone at Oxford. He made important improvements in the technical methods and processes of architecture and invented an instrument for use in transferring the model form to the marble. Consult R. Cecil, *Memoirs of John Bacon, R.A.* (London, 1811).

BACON, JOHN EDMUND (1832-97). An American lawyer, born at Edgefield, S. C. He graduated at South Carolina College in 1851 and soon afterward was admitted to the bar. In 1858 he was appointed secretary to the United States Legation at St. Petersburg, but resigned to enter the Confederate army, in which he rose to the rank of major. He was sent with Gov. James L. Orr to Washington in 1866 to bring about the restoration of South Carolina to the Union. In 1867 he was elected district judge, but was presently deposed by the Federal departmental commander. He was, in 1886, appointed United States chargé-d'affaires in Uruguay and Paraguay.

BACON, JOHN MACKENZIE (1846-1904). An English clergyman, scientist, and aeronaut. He studied at Trinity College, Cambridge; was ordained priest of the English Church in 1870. He gave up his clerical work in 1889 as a result of the opposition aroused by his publication of *The Curse of Conventionalism: a Remonstrance by a Priest of the Church of England*. From that time on he devoted himself to the study of astronomy and aeronautics. Two eclipse expeditions of the British Astronomical Association—that to Buxar, India, in 1898, and that to Wadesboro, N. C., in 1900—were made under his direction. In 1899 he accomplished the record voyage in English ballooning. In his ballooning he proved that sound travels less rapidly upward than downward, and that the ocean bottom is visible and can be photographed from great heights. He published *By Land and Sky* (1900), which contains narratives of his

ballooning exploits and the results of many of his investigations in meteorology, acoustics, and other subjects; and *The Dominion of the Air* (1902).

BACON, JOSEPHINE DODGE DASKAM. See DASKAM, JOSEPHINE DODGE.

BACON, LEONARD (1802-81). An American clergyman and writer. He was born at Detroit, Mich.; graduated at Yale in 1820 and at Andover in 1823. From 1825 till his death he was pastor of the First Church in New Haven; from 1866 to 1871, acting professor of revealed theology in Yale, and afterward lecturer on ecclesiastical polity and American Church history. He was one of the editors of the *Christian Spectator*, and later an editor of the *New Englander*; also, for 15 years, one of the editors of the *New York Independent*. Dr. Bacon edited the *Select Practical Writings of Richard Baxter, with a Life of the Author* (New Haven, Conn., 1831); and of his other writings may be mentioned, *Thirteen Historical Discourses on the Completion of Two Hundred Years, from the Beginning of the First Church in New Haven, with an Appendix* (New Haven, Conn., 1839); *Slavery Discussed in Occasional Essays from 1833 to 1846* (New York, 1846), and particularly *The Genesis of the New England Churches* (New York, 1874)—an important volume.

BACON, LEONARD WOOLSEY, D.D. (1830-1907). An American clergyman, born in New Haven, Conn.; a son of Leonard Bacon. He graduated at Yale in 1850, and was pastor of the First Church in Litchfield, Conn., of the New England Congregational Church in Brooklyn, N. Y., and of the First Church in Stamford, Conn. Subsequently he passed several years in Europe, chiefly in Geneva, as student, preacher, and writer; was pastor of the Park Congregational Church in Norwich, Conn. (1878-82), and later of other Congregational and Presbyterian churches. He edited *Luther's Deutsche geistliche Lieder* (New York, 1883), and wrote *A Life Worth Living: Life of Emily Bliss Gould* (1878); *Irenics and Polemics, with Sundry Essays in Church History* (1898); *History of American Christianity* (1898); *Young People's Societies* (with C. A. Northrup, 1900), and *The Congregationalists* (1904).

BACON, NATHANIEL (1648-76). An English colonist, famous as the leader of "Bacon's Rebellion" in Virginia in 1676. He was the son of Thomas Bacon of Friston Hall, Suffolk, whose grandfather was cousin to the great Lord Bacon. Nathaniel Bacon was educated as a lawyer and settled in Virginia in 1673, where he obtained two valuable plantations near the present Richmond and afterward was appointed a member of the Governor's Council. His democratic ways made him extremely popular among the colonists, who chose him to lead them against the Indians, in defiance of Governor Berkeley's commands, on the outbreak of the Indian disturbance in 1675-76. He accepted the position and, by placing himself at the head of the colonists and proceeding against the Susquehannocks, brought on what is known as "Bacon's Rebellion." In the midst of his operations against the Indians he was attacked by dysentery, and died on Oct. 26, 1676, his death putting an end to the rebellion. See BACON'S REBELLION.

BACON, SIR NICHOLAS (1509-79). A distinguished English statesman, father of Francis Bacon. He was born at Chislehurst, graduated at Corpus Christi College, Cambridge, in 1527,

and was called to the bar in 1533. He acquired a large property from confiscated monastery lands and in 1546 became Attorney to the Court of Wards and Liveries. He was in favor with Edward VI and, although a staunch Protestant, he escaped persecution under Mary and was even allowed to retain his office in the Court of Wards and Liveries. After the accession of Elizabeth he was Lord High Chancellor and Keeper of the Great Seal from 1558 to his death. As holder of this office he presided over Elizabeth's first Parliament and took a considerable part in the religious discussions preceding the Act of Supremacy. Brother-in-law of Cecil, he, in general, supported his policies, although at times he advocated a more strongly Protestant view. Sir Nicholas was one of those solid and stately Englishmen to whose sagacity, high principles, and firm demeanor his country owed its safety in that critical period when Elizabeth mounted the throne.

BACON, ROBERT (1860-). An American financier and public official. He was born in Boston and received his collegiate education at Harvard, where he graduated in 1880. Soon he became identified with prominent banking houses, first with Lee, Higginson & Co. of Boston, later as a member of the firms of E. Rollins Morse & Bro. and J. P. Morgan & Co. In 1903 he gave up active business life. Known to be a close student of foreign affairs, he was in 1905 made first assistant Secretary of State under Elihu Root, and in the beginning of 1909 succeeded to the cabinet position, upon Mr. Root's entering the Senate. He was appointed Ambassador to France by President Taft and served from 1909 to 1912. In the latter year he was made a fellow of Harvard University. He was also a member of the board of overseers of that institution from 1889 to 1908.

BACON, ROGER (c.1214-94). An English monk and philosopher. He was descended from a respectable family, and born at Ilchester, in Somersetshire, about 1214. Through the force of his intellect he raised himself far above his age, made remarkable discoveries in several branches of science, and contributed much to extend the then scanty knowledge of nature. The facts of his life, in the main, must be gathered from tradition and from references in various works. He studied at Oxford and then at Paris, where he received the degree of doctor of theology; and soon after his return to England he entered the order of the Franciscans and settled at Oxford. He carried on active studies and experimental researches, this latter work being done mainly in alchemy and optics. He was so far advanced in his discoveries as not only to arouse the jealousy of his associates and to create doubts as to his orthodoxy, but also to occasion his being accused of dealing in the black art of magic. In 1257, when Bonaventura was general of the Franciscan Order, Bacon was removed from Oxford, and for 10 years confined at Paris without writing materials, books, or instruments. Among those who had heard of Bacon was Guy de Foulques, the Cardinal-Bishop of Sabina, at that time (1264) papal legate in England, and later Pope Clement IV. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On his accession to the papacy as Clement IV, Bacon wrote to him, expressing his readiness to furnish him with

whatever he desired, and Clement in reply repeated his request to see Bacon's works, despite the Franciscan prohibition. Bacon accordingly prepared his *Opus Majus*, which he sent to the Pope, it is said, by his favorite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through different methods of studying the languages and nature.

The *Opus Majus* was an encyclopædia of all science, embracing grammar and logic, mathematics, physics, experimental research, and moral philosophy, many of these branches being discussed at length in other works. How Clement received these books is not known, as they could only have reached him about the time he was seized with his last illness. For 10 years after Clement's death Bacon was free from open persecution at least. But in 1278 the general of the Franciscan Order, Jerome of Ascoli (later Pope Nicholas III), declared himself against Bacon, forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by the Pope. This new imprisonment lasted 10 years, and at its conclusion Bacon returned to Oxford. He wrote a *Compendium Studii Theologiae* (1292) and shortly after died, probably in 1294.

Bacon, although an extraordinary genius, could not rid himself of all the beliefs and errors of his times. He believed in the "philosopher's stone" and in astrology. Many inventions have been credited to him, but some of them were doubtless derived from the study of Arabian scientists. There are in his writings new and ingenious views on optics, e.g., on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, however, he fell into the greatest errors. He made several chemical discoveries, which were wonderful for that time. He knew, for instance, that with sulphur, saltpetre, and charcoal we may produce a substance that would imitate lightning and cause explosions—in other words, gunpowder—but its previous use by the Arabs has since been shown. Mathematics, applied to observation, he considered to be the only means of arriving at a knowledge of nature. He studied several languages and wrote Latin with great elegance and clearness. Deserving of honorable mention are his discoveries of the errors that prevailed in the calendar. He prepared a rectified calendar (1263), of which a copy is preserved in the library of University College, Oxford. On account of his extensive knowledge he received the name of "Doctor Admirabilis." Six of his works were printed between 1485 and 1614, and in 1733 S. Jebb edited the *Opus Majus*. Professor Brewer edited the *Opus Tertium*, *Opus Minus*, and *Compendium Philosophiæ*, published at London in 1859, and under the title of *Opera Inedita*. Consult Charles, *Bacon, sa vie, ses ouvrages, ses doctrines* (Paris, 1861), and the German works of Siebert (Marburg, 1861) and Held (Jena, 1881).

BACON BEETLE. A small dermestoid beetle (*Dermestes lardarius*), known also as larder-beetle, whose whitish-brown, hairy grub devours many kinds of animal substances, such as lard, ham, bacon, old cheese, horn, feathers, leather, furs, etc., and is a pest in museums of stuffed animals. The adult beetle is one-third of an inch long, dark brown with a pale-yellowish band, containing six black dots across the upper half of the wing covers. See DERMESTID BEETLES.

BACON/GO. An African tribe inhabiting the upper Congo valley. They are of fair stature. Their religion is a curious mixture of paganism with Christian customs, introduced by the Portuguese, their chief deity being feminine, and known as Nzambi, i.e., "all-earth mother." They have an apparently lax social organization, with an order of popular guardians of justice analogous to the secret orders of many primitive tribes. Consult Deniker, *The Races of Man* (London, 1900), and A. de Calonne Beau-faict, *Études Bakongo* (Liège, 1912).

BACONIAN CONTROVERSY. See BACON, DELIA; SHAKESPEARE-BACON CONTROVERSY; DONNELLY, IGNATIUS; SHAKESPEARE, WILLIAM.

BA'CON'S REBEL'ION. An uprising of the Virginia colonists, particularly of the lower classes, under the leadership of Nathaniel Bacon (q.v.) against the Colonial authorities, represented by Gov. William Berkeley, in 1676. For some time before, taxes had been excessive and unfairly distributed, and Colonial commerce had been greatly hampered and restricted (see NAVIGATION ACTS, THE); the Assembly, since 1661, had been overbearing and wholly subservient to the Governor; and Governor Berkeley himself, besides showing gross favoritism, had exercised a virtual monopoly over the exceedingly profitable Indian trade. These facts combined to arouse a widespread feeling of discontent among the colonists; and this feeling was greatly intensified by the Governor's attitude toward the Indian outbreak in 1675, when he positively refused to take any effective measures to meet the threatened danger, but required, instead, that a certain number of forts be built with money to be raised by taxation. The Governor also prohibited the colonists from making any attacks on the Indians without his express orders. The Indian raids being renewed with especial violence early in 1676, and the forts proving to be altogether useless, 300 colonists assembled in disregard of the Governor's orders, and by acclamation chose Nathaniel Bacon as their leader. Though unable to procure a regular commission, Bacon accepted the position, marched against the Susquehannocks, and completely defeated them. On his return to Jamestown he was arrested, but soon afterward was released on parole. The Governor, however, gave undeniable evidence of double dealing and obstinately refused to sign Bacon's commission. Bacon thereupon marched upon Jamestown, captured it, and not only obtained a satisfactory commission as major-general, but also forced the Assembly to pass, and the Governor to approve, a set of liberal acts which became known as "Bacon's Laws," and which temporarily reformed many of the worst abuses in the colony. Bacon then undertook a second expedition against the Indians, and in the battle of Bloody Run, near the present Richmond, again completely defeated them. The Governor, meanwhile, tried to raise a force hostile to Bacon, and Bacon thereupon marched a second time against Jamestown, which he besieged, captured, and, on September 19, destroyed. On October 26, while marching to meet a hostile force under Major Brent, Bacon died in Gloucester County, of an attack of dysentery. With his death the rebellion ended. Berkeley's bloody revenge upon Bacon's followers elicited from Charles II the famous comment, "The old fool has put to death more people in that naked country than I did here for the murder of my father." The causes

of the rebellion, which is now regarded as having been a forerunner of the Revolution, were misrepresented by the authorities at the time, and were greatly misunderstood by historians until the discovery of many new documents bearing on the subject about 1890. Most of these documents have been published in the *Virginia Magazine of History* (Richmond, 1893-98). Consult an interesting and carefully written article by Edward Eggleston, entitled "Nathaniel Bacon, the Patriot of 1676," in the *Century Magazine*, vol. xl (New York, 1890), and the account in Fiske's *Old Virginia and her Neighbours* (2 vols., Boston, 1897). For Bacon's own statement see *Wilham and Mary College Quarterly*, vol. ix, p. 7.

BA'CONTHORPE, BA'CON, or BACHO, bā'kō, JOHN (?-1346). An English schoolman and philosopher, styled *Doctor Resolutus*, or "The Resolute Doctor." He was born at Bacons-thorpe (Norfolk). He entered the Carmelite Order, took his degrees as doctor of civil and canon law at the University of Paris, and from 1329 to 1333 was provincial of his order in England. He was the greatest of Carmelite scholars and also the chief expositor of the doctrines of the Arabian philosopher Averroës. He wrote more than 120 works, widely read in the Middle Ages. Of them many, including the *Commentaria super Quatuor Libros Sententiarum* (Paris, 1484), were published soon after the introduction of printing. Consult the critical works by H. Aymers (Turin, 1667-69), and Joseph Zagalia (Ferrara and Parma, 1696-1706).

BACOOB, bā'kō-ōr'. A town of Luzon, Philippines, in the province of Cavite. It is situated 9 miles south of Manila, on the south shore of Cavite Bay, and has a good sheltered harbor. (Map: Luzon, E 9). Pop., 1903, 10,925.

BACSÁNYI, bō'chān-yé, JÁNOS (1763-1845). A Hungarian patriotic poet. He was born at Tapoleva, May 11, 1763, and died at Linz, May 12, 1845. His historical work, *The Valor of the Magyars*, first brought him into notice in 1785; and the same year he was appointed clerk in the treasury at Kaschau, where he soon after helped to found a periodical called the *Magyar Museum*. Bacsányi was at this time saturated with the spirit of the French Revolution, and the liberal tendency of his poems led to the confiscation of the *Museum* in 1792. Another liberal poem soon afterward cost him his office, while his share in the so-called conspiracy of Abbot Martinovich, in 1794, resulted in two years' imprisonment in Kufstein. In prison he wrote some of his finest elegies. When the French took Vienna in 1809, he was suspected of having translated Napoleon's proclamation to the Hungarians and in consequence was forced to flee to Paris. After the Peace of Paris he was given up to the Austrian authorities, and had Linz assigned to him as a compulsory residence, but was allowed to receive his French pension until his death. Bacsányi exerted an important influence upon Hungarian literature, especially through his æsthetic writings in the *Magyar Museum* and elsewhere. He is remembered as one of the leading spirits of the "Debreczin class," which sought to weld together the best elements of the contemporary rival schools, the classical and the popular, and thus paved the way for the modern academic period. Bacsányi was made a member of the Hungarian Academy in his eightieth year. His *Works* were published by Toldy (Budapest, 1865).

BACTE'RIA (plur. of Neo-Lat. *bacterium*, from Gk. βακτήριον, *baktērion*, dimin. of βάκτρον, *baktron*, staff, stick). A name applied to vegetable organisms, the most minute organisms known. The name was given to the first-discovered of these bodies because of their shape, but is now used to designate this entire class of organisms. Many bacteria are not "little rods" at all, but are round or oval in shape.

The first recorded observation of the bodies we now recognize as bacteria was made about the middle of the seventeenth century by Antony van Leeuwenhoek, a Holland lens grinder, who reported his discoveries to the Royal Society of London in 1683. Continuing his investigations, Leeuwenhoek discovered the presence of bacteria in the mouth and in the intestinal evacuations; and it is interesting to note that there followed these discoveries a germ theory of disease no whit less far reaching, if less accurate, than that which exists at the present day. In 1773 O. F. Müller established two genera, *Monas* and *Vibrio*. Not much progress was made, however, until about 1838, when Ehrenberg and Dujardin included bacteria in their investigations of minute organisms. They referred the forms which they described to the animal kingdom, classifying them among the Infusoria, and placing a large number under the general title of Vibronia. Nor was this surprising. The means at the disposal of these early investigators were extremely crude. They saw these minute moving bodies and considered them animal in nature; for at that time naturalists had hardly begun to realize that animals have no monopoly of motility, though it is now a commonplace observation that the simplest plants exhibit a power of locomotion wholly lost in the higher forms. They were believed to develop spontaneously. Only after the experiments of Cohn was the doctrine of spontaneous generation as applied to bacteria overthrown, and Harvey's law, *Omne vivum ex vivo* ("All life comes from life") accepted as having universal application.

Bacteria are found almost everywhere. They are present in air, water, soil, in most foods and drink, and flourish in the mouth, stomach, and intestines, and the superficial layers of the skin. The rancidity of butter, the putrefaction of cheese, the gamy flavor and high odor of meat, the souring of milk, the mouldiness of stale bread, and many other similar conditions in food, are due to the presence of bacteria. So-called bloody stains on bread, meat, paste, etc., have also been traced to the growth of a brightly colored micro-organism. In sea water phosphorescence is caused by bacteria.

Water, even that which is usually considered pure, contains bacteria in abundance. This is true even of spring water and of water from artesian wells. Stagnant water, and the water of sewers, contain bacteria in immense numbers. The sulphurous springs of the Pyrenees are full of a bacterium (*Beggiatoa*) which accumulates sulphur in its body and is especially abundant in the scum that floats on the surface. Some bacteria, called chromogenic (color-forming) on account of the bright pigment which they produce, sometimes occur in water, and have given rise to superstitious accounts of bloody rain. The red color of stagnant pools in autumn is due to the presence of a micro-organism described by Ehrenberg as "*Ophidomonas sanguinea*," but now known as a species of *Spirillum*. Water serves as an excellent means for the trans-

portation of bacteria, and many of the epidemics of infectious diseases—typhoid fever, for example—are undoubtedly caused by infection of the water supply.

As already noted, bacteria were at first placed in the animal kingdom. To Cohn (1853) is due the credit of first definitely proving, on the grounds of their structure and life history, the fact that bacteria are plants. Nägeli (1857) confirmed the conclusions of Cohn, correcting certain details, and classifying bacteria not among the algae, but as a parallel class of fungi. (See SCHIZOMYCETES.) Bacteria are divided into two groups, according as they live on dead animal or vegetable matter, or on living animal or vegetable matter. The former are termed saprophytes, the latter parasites. The great importance of this distinction will appear when it is remembered that when bacteria are living on, i.e., destroying, dead matter, they are doing good. They are decomposing dead animals and plants into their constituent elements, and returning them to the mineral kingdom again to furnish food for plant life. In this way all decay and decomposition take place. But if they live on, i.e., consume, live animals or vegetables, they are doing harm in the sense of destroying life; and it is to this group that all harmful bacteria belong. Bacteria are pathogenic or non-pathogenic, according as they produce disease or not. They are denominated aerobic when they require oxygen for growth, and anaerobic when they thrive best in the absence of oxygen.

Classification. Bacteria are divided, according to their shape, into three main groups: 1. *Bacilli*, or rod-shaped bacteria. These may occur singly, in pairs, or in long threads or strings, but invariably have one diameter greater than the other. 2. *Spirilli*. These are longer than bacilli, but are curved or spiral. They may appear as mere commas; or they may be long, wavy threads, or may occur as very long spirals known as Spirochetæ, or short, thick spirals called Vibrios. 3. *Micrococci*. To this group belong all spherical or nearly spherical forms. The group has many subdivisions, according to the way in which the cocci arrange themselves. They are called Streptococci when they are arranged in rows like a string of beads. When they are in bunches like grapes, they are called Staphylococci. When grouped in pairs, Diplococci; when in fours, Tetrads; when groups of 8 to 16 are arranged as cubes, they are known as Sarcinæ.

Structure and Characteristics. Each bacterium is a single non-nucleated cell of protoplasm surrounded by a cell membrane, and is endowed with the properties which belong to living organisms as such. Bacteria are exceedingly minute. It has been estimated that a single bacterium weighs not more than $\frac{1}{10000000000}$ of a grain, and that 1500 of the rod-shaped forms placed end to end would about stretch across the head of an ordinary pin. Many bacteria possess distinct powers of motion, due to the possession of long, hair-like appendages or *flagella*, which project from the body of the bacterium, and with a lashing motion propel it through any liquid medium in which it may be. This motility differs greatly in degree for different species and for members of the same species under different conditions. It is confined mainly to the rod-shaped bacteria, but has been observed in a few species of micrococci. Like

all living things, bacteria nourish themselves from their surrounding media, taking up external substances as food and building them up into their own cell substance, at the same time giving off waste products. Bacteria multiply by fission or division, or by spore formation. The latter consists in the formation within the bacillus of a clear round or oval body, the spore, which, when fully developed, replaces completely the bacillus. A single bacillus can form but one spore. A single spore produces but a single bacillus. Spores are much more resistant to the methods usually employed for destroying micro-organisms than are the bacilli from which they develop; and it was the failure to destroy spores that kept alive, for so long a time, the theory of spontaneous generation. When bacteria multiply by simple fission they elongate, an indentation appears near the middle, and this is followed by complete division, forming two daughter cells similar to the parent cell. The different species of bacteria preserve their identity as carefully as do the higher vegetable organisms, a given species of bacteria never producing any but the same species. This reproduction of bacteria by fission is, under favorable circumstances, exceedingly rapid—a bacterium reproducing itself in from 15 to 40 minutes. This would, in 24 hours, result in the production of many millions of bacteria from a single individual.

Drying kills many species of bacteria, others simply remain inactive. Cold destroys many bacteria, though some are not killed by low temperatures. The typhoid bacillus can exist for many months frozen in a cake of ice, to become active and dangerous again when the ice is melted and used. Heat, especially moist heat, above a certain point, kills all bacteria: the application of heat to the destruction of bacteria is known as sterilization. Thus, boiling milk or water, or cooking meats or vegetables, destroys any bacteria that may have been present. The same applies to surgical dressings, such dressings being spoken of as sterile, or, because of the absence of infectious material, as aseptic. Certain chemical substances known as germicides, disinfectants, etc., are very inimical to bacteria, e.g., solutions of mercuric chloride, of carbolic acid, etc., and surgical dressings in which such chemicals are used are known as antiseptic dressings.

It is because of the relation of bacteria to certain diseases that these organisms have come to occupy so much general public attention. The parasitic bacteria, in contradistinction to the saprophytic, live upon and destroy living organisms. The disease-producing bacteria are known as pathogenic. Many infectious diseases are positively known to be caused by bacteria, and it is believed that all other infectious diseases are so caused, although the specific germs of measles, scarlet fever, and other diseases remain undiscovered, probably because they are ultramicroscopic. The effects of disease-producing bacteria upon the body tissues may be grouped in three classes: 1. Effects due to the direct local action of the bacteria on the tissues, as the membrane in diphtheria. 2. Mechanical effects, as when a clump of bacteria get into a blood vessel and block it (infectious embolus). 3. Effects due to the production in the body, under the influence of the bacteria, of certain chemical substances which act as poisons to the tissues. These poisons are in solution in

the body fluids, and each is peculiar to the species of bacteria which produces it; e.g., the poison, or toxin, as it is called, of diphtheria is different from the toxin of typhoid fever.

The question presents itself as to why, when bacteria once start to grow on such a good culture medium as the body, do they ever stop growing; or, in other words, why does one ever recover from an infectious disease? Our present belief is that there is produced in the body, as the result of the action of the bacteria, not only a toxin, but another chemical substance, which is antagonistic to the proliferation of the bacteria, and which is known as antitoxin. To the persistence in the body of this antitoxin is ascribed the immunity which a person who has had an infectious disease often has from that disease. Upon this principle is based the well-known diphtheria antitoxin. A fresh culture in bouillon of the diphtheria bacillus is allowed to stand until toxins are formed in the bouillon. It is then strained through a Pasteur filter, and a small amount is introduced into the body of a horse. Some days later a larger dose is given, and then constantly increasing quantities are injected during some months. The animal is thus rendered immune to the action of the toxin, and the fluid part, or serum, of its blood is the antitoxin now so successfully used in the treatment of diphtheria. See DIPHTHERIA; ANTITOXIN; TOXIN.

Bacteria may be grown artificially on various substances which furnish them suitable food. These are known as culture media. Among the more common of these are bouillon and potato. In order to make a medium which is solid at ordinary temperatures, but which may be liquefied by slight heating, gelatin or agar-agar is often added to the bouillon. Thus, if a drop of fluid containing bacteria which we wish to study be added to warm melted gelatin or agar-agar bouillon, the latter may be poured out in a thin layer on a cold plate, where it immediately hardens, thus fixing the bacteria and preventing their moving about in the medium. If the dilution be sufficient to separate the bacteria well, as growth occurs, minute specks are seen dotting the surface of the plate. These are called colonies, and each such colony consists of a single species of bacteria. By taking a bit from one of these spots or colonies and transferring it to some other sterile medium, there results a growth which is free from all life other than the single species of bacteria. This is known as a "pure culture." Many different species of bacteria so closely resemble one another in appearance that they cannot be differentiated by the microscope. Each species has, however, certain peculiarities of growth and development. Thus recourse is often had to cultivation upon different media, where their life histories may be studied and the identity of a particular species determined. For the very careful study of bacteria many different modifications of the culture media have been devised. The medium is sometimes colored by litmus, to show any reaction the growth of the bacteria may produce. Sugar is sometimes added to the medium, which is then placed in a crooked tube closed at one end, so that if the species causes fermentation it may be noted by the collecting of gas at the closed end of the tube. All media are sterilized before using, to destroy any bacteria that may be present. After inoculation the media are kept at room temperature, or

more often are placed in an incubator at about blood heat.

For microscopical study, bacteria may be simply placed under a thin glass cover upon a glass slide. They may be studied unstained, but are more often stained in various ways, to render them more distinct or to bring out certain peculiarities. Some of the bacteria, e.g., the tubercle bacillus (see TUBERCULOSIS), depend for their recognition very largely upon their specific reaction to certain stains and can be differentiated only in this way. They are usually studied with an oil-immersion lens of not less than 1000 diameter magnification. See ABSCESS. For history and bibliography, see DISEASE, GERM THEORY OF.

BAC'TRIA. The name given in ancient times to a province or country in Central Asia extending northward from the Hindu-Kush Mountains as far as the river Oxus (Amu or Jihon), and called also Bactriana by classical writers. The exact extent of this land in early times cannot now be determined, but it must have been considerable; and, although barren to the north, its southern regions were rich in pasture lands, which made Bactria famous in antiquity, among other things, for its fine breed of horses. In history it has been the seat of a number of powerful rulers, who are best known as the successors of Alexander the Great in the East. What was formerly Bactria is now included in parts of Afghanistan and Asiatic Russia.

The name of the province or country appears in the Old Persian Inscriptions (Bh. i. 16; Dar. Pers. c. 16; NR. a. 23) as *Bātrī*, i.e., Bakhtri. It is written in the Avesta *Bāxdi*. From this latter came the intermediate form *Bāxi*, Sanskrit *Bahlika*, *Balkhika*, 'Bactrian,' Armen. *Bahl*, and by transposition, the Mod. Pers. *Balk*, i.e., Balkh. The capital city, Balkh, or earlier Bactra, was situated on the Dargidus or Bactrus (now Dehas). This city seems also to be known in the classics as Zariaspa. In the Avesta (*Vendidad* 1.7), and elsewhere, it receives the title "beautiful" (Av. *srīra*), to which the attribute "with banners on high" is appended. This additional designation of the capital of Bactria in ancient times was apparently due to the custom, mentioned by Masudi and Yakut, of pious pilgrims hanging green silk banners from the walls of the temple Naubehar. This latter name has been supposed to refer to a Buddhist "New Cloister" (*navā-rihāra*), as we know that Balkh, in the province of Bactria, was a flourishing seat of Buddhism in the early Christian centuries.

Bactria is supposed to have been originally the centre of a powerful kingdom founded more than 1000 years before the Christian Era and exercising extensive sway throughout Iran. The strongest support for the existence of such a kingdom, antedating the Median rule and the Achaemenian sovereignty of the Persian Empire, will be found in Duncker, *Geschichte des Altertums* (Leipzig, 1878-86). One of the principal arguments brought forward in favor of such a view is the story of the campaign of Ninus of Assyria against a Bactrian king, Zoroaster, as mentioned by Ctesias, and recounted with some variations by Trogus Pompeius (in Justin), Eusebius, and others. The record seems to contain some allusion to Zoroaster, the Prophet of ancient Iran, whose patron was Vishtaspa, and whose death occurred at Balkh, according to Firdausi and others, when the city was stormed

by the Turanians. For this and similar reasons Bactria is often regarded as the cradle of the ancient Magian religion. (See ZOROASTER.) The bearing of all these passages in their historic light is discussed in Jackson, *Zoroaster, the Prophet of Ancient Iran* (New York, 1899). But considerable doubt is attached to the antiquity of the story of Zoroaster's death at Balkh; and so high an authority on Persian history as Justi disclaims the existence of a Bactrian kingdom before the time of Alexander the Great. Yet others may hold a different opinion. However the case may be, there is no doubt that Cyrus subjugated Bactria and made it a Persian province; and Darius in his inscriptions includes Bactria as one of the countries tributary to the Achaemenian power. Herodotus enumerates the forces which Bactria contributed to the Persian invasion of Greece.

From the time of Alexander the history of Bactria becomes clearer and may be followed with more detail. When he conquered the rest of Iran, Bactria likewise fell before his power, and he made Roxana, daughter of the Bactrian ruler Oxyartes, his wife, 327 B.C. On leaving Persia he assigned a strong force of Greeks to occupy Bactria, and it thus became part of the kingdom of the Seleucids. About 256 B.C., with the revolt of the satrap Didotus I, a new Græco-Bactrian kingdom was established, whose power ultimately extended as far as northern India, although in Iran it had to give place to the Parthian sway. The history of this later Græco-Bactrian kingdom has been cleared up in large measure by means of the coins and other antiquities which have been discovered in recent times, especially in Afghanistan. The Greek and later the Prakrit devices and inscriptions on these coins give a series of royal names whose succession has been fixed with comparative accuracy.

The inhabitants of ancient Bactria (modern *Balkh*) were closely related to the Persians and shared in, if they did not produce, the old Aryan culture of this region from which sprang Zoroastrianism, the Indo-Bactrian alphabet, etc. It was in this part of the world that ethnologists formerly sought the primitive home of the Aryan stock, but that assumption is now largely abandoned. Nevertheless an early presence of Aryan peoples here is undoubted, and their influence went both east and west. Of recent literature, reference may be made to Bidulph's *Tribes of the Hindoo-Koosh* (London, 1881) and Geiger's *Die Pamir-Gebiete* (Vienna, 1887), besides the numerous studies of Uffalvy on the Aryans of these regions, contained especially in his *Expédition scientifique française en Russie, en Sibérie, et dans le Turkestan* (Paris, 1878-80) and *Aus dem westlichen Himalaja* (Leipzig, 1884). For references of classical historians and authors, consult McCrindle, *Ancient India as described by Classical Authors* (5 vols., London, 1896). On the general question of the Bactrian kingdom, consult: F. Justi, in Geiger and Kuhn, *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1896-1904); Gutschmid, *Geschichte Irans* (Strassburg, 1887); Wilson, *Ariana Antiqua* (London, 1841); and especially Rawlinson, *Bactria, the History of a Forgotten Empire* (London, 1912); V. A. Smith, *The Early History of India* (Oxford, 1904), deals briefly but thoroughly with the general aspects of its history. On the coins, consult Percy Gardner, *The Coins of the Greek and Scythic*

Kings of Bactria and India (London, 1886), and E. Thomas, "Bactrian Coins," in *Journal of the Royal Asiatic Society* (London, 1873). For Indo-Greek art and Greek influence on India, consult Tarn, "Notes on Hellenism in Bactria and India," in the *Journal of Hellenic Studies* (1902), and Havell, *Indian Sculpture and Painting* (London, 1908).

BACTRIAN CAMEL. See CAMEL.

BACTRIAN SAGE, THE. A title of Zoroaster, the Persian religious teacher, who was a native of the hills of the upper Oxus. See ZOROASTER.

BAC'TRIS (Gk. *βάκτρον*, *baktron*, staff). A genus of palms, of which 90 species are known, all of which are tropical American. The leaves of some are pinnate, those of others entire. They are generally small palms, some of them very small and with slender stems, those of *Bactris tenuis* being no thicker than a goose quill. Some are spiny and form thickets not easily traversed. *Bactris acanthocarpa* yields a thread that is exceedingly tough and is used for making nets. The maraja (*Bactris maraja*) palm produces large clusters of fruit, resembling small grapes, with a thin pulp of an agreeable subacid flavor. The stems of this species are used for walking sticks.

BACTRITES, bāk-trī'tēz (Gk. *βάκτρον*, *baktron*, staff, stick, in allusion to its straight form similar to that of *Baculites*). A genus of fossil cephalopods of the order Ammonoidea, and the only member of the family Bactritidae. The shells are straight, very slender, and gently tapering, with a round or elliptical section. The siphuncle is situated near the ventral wall and is very delicate. The suture is a simple curve with a small ventral angular lobe over the siphuncle, and, in some species of elliptical section, an incipient lateral lobe. The protoconch or embryonic shell is egg-shaped and erect, and has no scar such as is found on the initial chamber of the nautilus. Bactrites is of more than ordinary interest, because it seems to furnish one of those rare examples of a connecting link between two well-differentiated orders of animals, viz., the Nautiloidea and the Ammonoidea. The general form of the shell is that of *Orthoceras*, and the straight cone of *Bactrites* is a primitive character, as it is in *Orthoceras*, and not to be compared with the degraded uncoiled shells (*Baculites*) that are evolved in the senile (phylogerontic) stages of several Jurassic and Cretaceous races of Ammonoidea. The shape and position of the protoconch are very similar to that of *Mimoceras* (*Gomiatites*) *compressum*, which shell is uncoiled in its early embryonic stages, but becomes closely wound in its adolescent stages. Moreover, one of the Nautiloidea; the genus *Protobactrites*, seems to afford an indication of the stock from which *Bactrites* itself was derived.

The genus *Bactrites* contains about 15 species that range through all the formations from the Ordovician to the Trias, inclusive, with the exception of the Silurian, in which latter no members of the group have yet been found. See CEPHALOPODA.

BACULAR D'ARNAUD, bā'ku'lār' dār'nō', FRANÇOIS. See ARNAUD, FRANÇOIS THOMAS DE BACULARD D'.

BACULITES, bāk'ū-lī'tēz (Lat. *baculum*, staff, stick, in reference to its straight form). A genus of fossil cephalopods of the order Ammonoidea, family Macroscaphitidae. The shells are

usually found as segments of an elongated cone that tapers gently and has an elliptical or ovate cross-section. The suture line is quite complex and indicates that these shells belong to an advanced race of ammonoids. In perfect specimens preserving the protoconch, the embryonic shell is seen to be closely coiled for several turns and then to branch off on a tangent to the coil and maintain a straight condition throughout the remainder of its life. Several other genera included in the same family show similar aberrant phylogerontic forms that have all been derived from the normally coiled shells of earlier types. The genus *Baculites* contains about 30 species, all of which are found in rocks of the Cretaceous Age in both Europe and America. At one locality in France these shells are so abundant as to cause the name of "Baculite limestone" to be given to the rock containing them. Very fine specimens, often of great size—4 feet in length—have been found in the Black Hills of Dakota and Wyoming, and here have also been obtained specimens on which the mother-of-pearl presents more beautiful coloring than is to be found on any shells now living in the ocean. For illustration, see CEPHALOPODA, Plate II, Fig. 7. See CEPHALOPODA; CRETACEOUS SYSTEM.

BACUP, bāk'úp. A manufacturing town of Lancashire, England, on the Lancashire and Yorkshire Railway, 22 miles north of Manchester (Map: England, D 3). The town was incorporated in 1882, and since that time great improvements have been made in its condition and appearance. Bacup owns its water works, maintains public markets, parks, baths, and cemeteries, and has fine playgrounds. It also has a sewage farm for the utilization of the town refuse. There is a mechanics' institute and library. Bacup has extensive cotton and woolen factories, brass and iron foundries; and there are numerous coal mines in the neighborhood. Coöperative stores on a large scale are maintained. Pop., 1891, 23,498; 1901, 22,505; 1911, 22,318.

BADAGAS, bá-dá'gáz. One of the Dravidian tribes of the Nilgiri Hills in southern India (numbering, in 1891, 29,613), somewhat shorter, darker-skinned, and longer-headed than the Todas, and probably less mixed with Aryan blood. They are not a disappearing people, but, aided by the policy of the Indian government, hold their own, though burdened by the caste system. Their name is said to signify 'north-ers,' which indicates comparatively recent migration. They are monogamous and have some curious marriage customs. (See DRAVIDIANS.) Of recent literature since Shortt's "Tribes of the Nilgherries," in the *Transactions of the Ethnological Society of London* for 1869, may be mentioned: Breeks, *An Account of the Primitive Tribes and Monuments of the Nilagiris* (London, 1873); Reclus, *Primitive Folk* (Eng. trans., New York, 1891); and Oppert, *On the Original Inhabitants of Bharatavarsa, India* (Eng. trans., London, 1894).

BADAGRY, bá'dá-gré'. A seaport of Southern Nigeria, British West Africa, situated west of Lagos, with which it is connected by lagoons. It was formerly the capital of a negro kingdom, and during the Portuguese occupation was an important slave-trading centre, with a population of 10,000. Since then it has diminished in importance and in population.

BADAJOZ, bá'dá-hōs', *Sp. pron.* bí'dá-hōth'

(anciently, Lat. *Pax Augusta*, 'Peace of Augustus' or *Batalium*, which the Moors turned into *Baw Augos*, *Bathaluz*, *Badaljoz*, whence *Badajoz*). Seat of a bishopric, capital of the Spanish province of the same name (Map: Spain, B 3), and official residence of the captain-general of Estremadura. It is situated about 5 miles from the borders of Portugal, in a fertile district, on the left bank of the Guadiana, which is here crossed by a granite bridge of 32 arches. It is strongly fortified and has a military hospital, an arsenal, and the old cathedral of San Juan, built about the middle of the thirteenth century, with a splendid organ, and paintings by Mateo, Cerezo, and Morales. The last named was born at Badajoz. Considerable trade is carried on with Portugal, and there are manufactures of soap, coarse woolens, leather, hats, and pottery. Pop., 1900, 30,899; 1910, 35,039. As one of the keys of Portugal, Badajoz has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the Allies in the War of the Spanish Succession in 1705. During the Peninsular War Badajoz was besieged by the French in 1808 and in 1809, and again in 1811, when it surrendered, March 11, to Soult. Several attempts to regain it were made by the British under Marshal Beresford and Lord Wellington, the latter of whom finally took it by storm, April 6, 1812.

BADAKHSHAN, bá'dák-shān' (Pers., Hind. *bad*, region, district + *Oxus*, river) (Map: Afghanistan, M 3). A district of north-eastern Afghanistan, lying directly north of Cabul, on the edge of the Tamir Plateau. The Amu Darya or Oxus River flows along its northwestern border. The capital is Faizabad. It is a region of great fertility and is rich in metals—iron, copper, and silver principally, as well as lapis lazuli and rubies. The inhabitants are in great part Tajiks, a Persian-speaking Aryan race. They are Mohammedans—Shiites in the mountains and Sunnites in the plains. The population is estimated at from 100,000 to 150,000. They are largely a pastoral people, raising goats, camels, and a breed of small fiery horses. After the trade in metals and precious stones, however, the slave trade is of next importance. The people of Badakhshan seem to have been always under the immediate rule of their own chiefs, at the head of whom was the Amecr. They have generally, however, formed part of some great empire. In the eighteenth century Badakhshan constituted a part of the empire of Nadir Shah, after whose death it became subject to the Afghans. After many revolts and changes it was confirmed to Afghanistan by the Anglo-Russian agreement of 1873. Consult Yule, *Marco Polo* (London, 1871), and Vambéry, *Central Asia* (London, 1874).

BADALONA, bá'dá-lō'ná (*Baetulo*, *Betulo* of the Romans). A seaport town of Spain, in the province of Barcelona, 5 miles by rail north-east of the city of Barcelona, of which it is a suburb (Map: Spain, G 2). It is situated in a fertile region which produces grain, oranges, and a great variety of vegetables. The town has experienced rapid industrial growth and manufactures wine. There are, besides, shipyards, sugar and petroleum refineries, and glass works, the latter the largest in Spain. A considerable coastwise trade is carried on. Pop., 1887, 15,974; 1900, 19,240; 1910, 20,957.

BADDECK' (from the Fr. *Bedeque* for Ind.

Ebédék). A seaport and favorite summer resort on Cape Breton Island and Lake Bras d'Or. It is the capital of Victoria Co., Nova Scotia, Canada (Map: Nova Scotia, J 2). It is celebrated by Charles Dudley Warner in *Baddeck, and That Sort of Thing* (Boston, 1874). Pop., 1901, 1235; 1911, 1650.

BADEAU, bá-dô', ADAM (1831-95). An American soldier and author. He was born in New York City, was educated in Tarrytown, N. Y., and in 1862 entered the Federal army as an aid to Gen. T. W. Sherman. In May, 1863, he was severely wounded while leading an assault on Port Hudson, and in March, 1864, became military secretary to General Grant, on whose staff he served until 1869, when he retired from the service with the regular rank of colonel and the brevet rank of brigadier general. He was afterward Secretary of Legation in London (1869), Consul General there from 1870 to 1881, and Consul General at Havana from 1882 to 1884. In 1877 and 1878 he accompanied General Grant on a portion of his tour around the world. In 1882-84 he was Consul General at Havana, but in the latter year he resigned because of differences with the administration. He published a collection of essays entitled *The Vagabond* (1859); *A Military History of Ulysses S. Grant* (3 vols.; new ed., 1885); *Conspiracy: A Cuban Romance* (1885); *Aristocracy in England* (1886); *Grant in Peace* (1886).

BADEBEC, bád'bék'. In Rabelais's *Pantagruel*, the wife of Gargantua and mother of Pantagruel. She died at his birth, after bringing forth at the same time 900 dromedaries, 7 camels, and a number of wagons, all laden with provisions.

BAD EMS. See EMS.

BADEN, bá'den. A grand duchy of the German Empire, the fourth state in size and the fifth in population, situated at the southwestern end of the empire (Map: Germany, C 4). It covers an area of 5823 square miles, exclusive of its share of Lake Constance (65 square miles). Its boundaries are formed by the Rhine on the west and the south, which separates it from the Rhine-Palatinate, Alsace, and Switzerland; Württemberg and Hohenzollern on the east; and Bavaria and Hesse on the north.

Surface and Hydrography. About 84 per cent of the total area is a part of the south German mountain and hill lands. The remainder belongs to the plain of the upper Rhine. The chief mountain system is the Schwarzwald (see BLACK FOREST), a narrow range of wooded mountains extending from Basel in a northeasterly direction for about 100 miles along the Rhine valley. It terminates at Pforzheim, descending gradually into the plateau of the Neckar in Württemberg. The highest peaks, as the Feldberg (4900 feet) and Belchen (4600 feet), are found in the upper or southern part of the Schwarzwald, which has a mean altitude of 3170 feet. The Odenwald Range, situated at the northern end of the grand duchy, has a mean altitude of about 1500 feet. One of the most remarkable mountain groups is the Kaiserstuhl, or 'Emperor's seat,' situated between Breisach and Endingen. Its base is about 23 miles in circumference, and its highest summit reaches an altitude of over 1800 feet.

Baden is drained by the Rhine, which receives the Neckar and smaller streams, and by the Danube, which takes its rise in the Schwarzwald. There are several mountain lakes in Baden, some

of them situated at a great altitude; and a part of Lake Constance is also included in it.

The climate of Baden is, on the whole, very warm, but its temperature varies considerably on account of its uneven surface. The average yearly temperature is about 51° F. in the plains and 44° in the highlands.

Agriculture and Forestry. In spite of its mountainous surface Baden is one of the most productive parts of Germany. Abundantly watered and well cultivated, its soil has been brought to a high state of productivity, not only in the valleys, but also in the hilly regions. Of the total area, in 1900, 568,600 hectares (37.7 per cent) were in cultivated field and garden; 209,600 hectares (13.9 per cent), meadow; 54,700 hectares (3.6 per cent), pasture; 20,000 hectares (1.3 per cent), vineyard; 567,800 hectares (37.7 per cent), forest; 87,400 hectares (5.8 per cent), roads, yards, water, etc. The harvest of 1912 included 77,476 metric tons of rye, 80,723 wheat, 89,029 spelt, 98,409 summer barley, 111,070 oats, 1,030,364 potatoes, and 1,193,440 hay. Tobacco is an important product; in 1911, from a total of 7211 hectares there was a yield of 13,221,829 kilos of leaves, valued at 8,089,616 marks. Though the area in vineyards shows a decreasing tendency, wine continues a staple product; the Baden brands are among the best in Germany. The centre of viticulture is the circle of Freiburg. From a total productive area of 15,084 hectares in 1912, there was a yield of 123,274 hectoliters of must, valued at 6,200,000 marks. This output showed a great decline as compared with that of 1911, when from 15,604 hectares there were produced 364,914 hectoliters of must, valued at 21,700,000 marks. The extensive forests of Baden are exploited on a large scale. The Schwarzwald region yields the best timber for shipbuilding, which finds its way chiefly to Holland. The annual output of timber is valued at 20,000,000 marks, of which fully one-third is exported. Cattle raising is also an important and progressive industry. Live stock (December, 1912): horses, 74,000; cattle, 649,000; sheep, 40,000; swine, 476,000; goats, 135,000; fowls, 2,556,000.

The mineral production is comparatively unimportant: the chief products are salt and building stone.

Manufacturing and Commerce. Since its incorporation with the customs union of Germany in 1835 Baden's industrial conditions have undergone a rapid extension. During the period 1882-95 the number of people engaged in manufacturing increased from 204,542 to 287,450. The manufacturing industries are centred chiefly in the two circles of Karlsruhe and Mannheim. Foremost among them are the cotton and silk mills and to a lesser extent the woolen and linen mills. There are also extensive manufactures of jewelry, mirrors, machinery, leather, paper, cigars, and woodenware. Baden also contains one of the largest sugar mills in Germany and several large chemical factories. Watch making is an important industry in the Schwarzwald region, employing over 11,000 people. Baden is well fitted for commerce by its extensive waterways and by its railways. The latter in 1911 had a length of 2351 kilometers (1461 miles); broad-gauge railways aggregated 2048 kilometers (235 private); narrow-gauge, 303 kilometers (276 private). Mannheim is the chief commercial centre of Baden and one of the busiest ports on the upper Rhine.

Government. The constitution of Baden dates from Aug. 22, 1818, and was modified Aug. 24, 1904. Baden entered the North German Confederation for the founding of the German Empire by treaty of Nov. 15, 1870. The executive power is vested in the grand duke, who inherits as the eldest son of the male line (or, if that fails, of the female line). The legislative power rests with the grand duke and a parliament (Landtag); the parliament consists of two chambers, which convene every two years. The Upper Chamber is composed of the princes (of full age) of the grand-ducal house, the heads of the seigniorial families, 8 members elected for eight years by the landed nobility, the Archbishop of Freiburg and the Protestant prelate, 2 representatives of the state universities and one representative of the technical high school, 8 members appointed by the grand duke regardless of rank or birth; and some others. The Lower Chamber is composed of 73 members, 24 from 13 towns and 49 from rural districts. The members of the Lower Chamber are elected by direct popular vote for a period of 4 years, half of the members retiring every 2 years. Every male citizen 25 years old or over has the right to vote, and every male citizen after reaching the age of 30 is eligible to office. Baden is represented by 3 members in the Bundesrat and 14 deputies in the Reichstag of the Empire. For purposes of administration it is divided into 11 circles. The Council of State is divided into the four ministries of the interior (including commerce, industry, and agriculture); foreign affairs and justice; finance; and worship and instruction. The capital is Karlsruhe, with a population in 1910 of 134,313.

Every citizen has the guarantee of religious freedom, and the several religious denominations receive state aid. In military affairs Baden is under the control of the Imperial government, and its military contingent constitutes almost the entire Fourteenth Army Corps.

The revenue is derived mainly from direct and indirect taxes, domains, railways, and customs. The budget for 1911 balanced at 105,179,459 marks: for 1912, 105,146,683 marks. The railway debt of Baden (the only indebtedness of the grand duchy) amounted at the beginning of 1912 to 542,864,491 marks.

Public Instruction. The institutions for higher education, viz., the two universities of Heidelberg and Freiburg, as well as the technical and the art school of Karlsruhe, are under the supervision of the minister of worship and instruction. In 1912 the universities had 6227 students, and the technical school 1375. The secondary and elementary schools are under the control of the board of education and the different local boards and commissioners. The public elementary schools (there are very few private ones) in 1911 numbered 1659, with 5625 teachers and 335,264 pupils. The schools for secondary education number about 100, excluding the numerous trade schools, seminaries, teachers' institutes, etc.

Population. The population of Baden at the census of Dec. 31, 1910, was 2,142,833. In 1816 the grand duchy had 1,006,000 inhabitants; in 1864, 1,432,000; in 1871, 1,461,562; in 1880, 1,570,254; in 1890, 1,657,867; in 1900, 1,867,944. The average annual increase from 1816 to 1864 was 0.74 per cent; from 1864 to 1910, 0.88 per cent; from 1900 to 1910, 1.37 per cent. Of the total population at the 1910 census, Roman

Catholics numbered 1,271,015 (59.32 per cent); evangelical Christians, 826,364 (38.56 per cent); other Christians, 13,229 (0.62 per cent); Jews, 25,896 (1.21 per cent). The population is very homogeneous, nearly 99 per cent being German (including 91 per cent natives of Baden) and only 1 per cent foreign. A comparison of the two industrial censuses of 1895 and 1882 reveals clearly the tendency in the economic development of the country. The proportion of the population engaged in agriculture shows a decrease for 1882-95 of 7 per cent; while the proportion engaged in manufacturing and other industries shows an increase of 3 per cent for the same period, with a corresponding increase in the number engaged in commerce and transportation and in persons without occupation.

History. The original inhabitants of Baden were the Alemanni. They were conquered by the Franks under Clovis in 496 and were Christianized. They made repeated attempts to regain their independence, but in vain; and the dukedom of the Alemanni was abolished in 748 by Pepin the Short. In the eleventh century Duke Berthold, a supposed descendant of the Alemannian Gottfried, built the castle of Zähringen in Breisgau, and with him begins the unbroken line of the princes of the house of Zähringen. Berthold's second son, Hermann, took the title of Margrave of Baden and became the founder of the still flourishing house of Baden. He died in 1074. The history of this house presents for several generations little else but a succession of partitions of the territories among brothers, to be again and again reunited upon one or other of the collateral branches becoming extinct. The prosperity of the country was thus greatly retarded. From the time of the Reformation there existed two lines, those of Baden-Baden and Baden-Durlach, which were united in 1771. The present capital, Karlsruhe, was built in 1715 by the Margrave of Baden-Durlach, Charles William. His grandson, Charles Frederick, favored the policy of Napoleon and joined the Confederation of the Rhine. By this move he doubled his possessions in extent and population and acquired successively the titles of Elector and Grand Duke. In 1811 he was succeeded by his grandson, Charles Louis Frederick, who, five years before, had married Stephanie, an adopted daughter of Napoleon. After the battle of Leipzig this prince seceded from the Confederation of the Rhine and (1815) joined the German Confederation.

In 1818 the Grand Duke Charles granted the charter which forms the basis of the present constitution. He was succeeded in the same year by his uncle, Louis, who was inclined to absolutism and had to contend at first with a powerful opposition. He succeeded, in 1825, in carrying through an alteration of the constitution, extending the duration of the diets, after which the government and the chambers acted more harmoniously. Louis died childless (1830) and was succeeded by his half-brother, Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional government; but the tide of reaction, which became strong after the failure of the Polish insurrection and the fall of Warsaw in 1831, soon seized upon the government, and the act establishing the freedom of the press, which had been passed in 1831, was in 1832 declared abrogated. A fluctuating contest between a reactionary government and a growing opposition was carried on till 1846,

when the Constitutionalist Bekk was made Minister of the Interior, and liberalism thus placed at the helm. The first effect was to calm the public mind and to cause a split between the Liberals and the Radicals. The ninth Parliament met (December, 1847) under the most friendly and promising auspices, but the French Revolution of February, 1848, suddenly aroused the Radical party to the most violent activity. Not satisfied with a multitude of liberal measures passed by the Legislature, the revolutionary leaders, Hecker and Struve, aimed at establishing a republic, and stirred up an insurrection. The army sided with the insurgents, the Grand Duke fled, and a constituent assembly was called. The Grand Duke had recourse to Prussian aid, and after several battles was reinstated on his throne. Upon the whole, the reactionary tendency was less marked in Baden than in most other German states. In 1859 a conflict between the authorities of the state and the Roman Catholic hierarchy ended in favor of the latter; in 1861 the complete independence of the Catholic church was recognized by a definite settlement, and a like privilege was extended to the Protestant church of Baden. In the war between Prussia and Austria, in 1866, Baden lent aid to the latter, and on the declaration of peace was obliged to pay a heavy indemnity and to reorganize her army on the Prussian model. In 1867 Baden entered the North-German Confederation. In 1870-71 the troops of Baden fought with distinction in the Franco-German War, and the grand duchy became a part of the new-born German Empire. The present Grand Duke is Frederic II, who succeeded to the throne Sept. 28, 1907. See GERMANY.

Consult: *Das Grossherzogthum Baden in geographischer, naturwissenschaftlicher, etc., Hinsicht dargestellt* (Karlsruhe, 1885); Weech, *Badische Geschichte* (Karlsruhe, 1890); *Regesten der Markgrafen von Baden und Hochberg* (Innsbruck, 1892); Meyer, *Badisches Volksleben im 19 Jahrhundert* (Strassburg, 1900).

BADEN (Ger. baths). A watering place in the canton of Aargau, Switzerland, on the Limmat, 1260 feet above the sea, 13 miles northwest of Zürich (Map: Switzerland, C 1). It was known to the Romans as *Therma Helvetica* and under the Hapsburgs was a stronghold of importance. Its waters are considered beneficial for gout, rheumatism, and diseases of the throat and lungs. Pop., 1900, 6100; 1910, 8318.

BADEN, or **BADEN BEI WIEN** (Ger. baths near Vienna). A watering place of Lower Austria, beautifully situated on the Schwechat, about 17 miles by rail southwest of Vienna (Map: Austria, F 2). Its warm sulphur springs, 13 in number, vary in temperature from 72° to 97° F. The town has the usual accessories of a fashionable watering resort—large bathing establishments, curasaal, trinkhalle, summer theatre, etc. In the neighborhood are numerous villas belonging to the Austrian nobility, and some interesting ruins. Baden was known in the time of Marcus Aurelius as *Therma Pannonica* (*Pannonian Springs*). It was made a city in 1840. About 4 miles from Baden is Meierling, a royal hunting lodge (now a convent), where Crown Prince Rudolph of Austria met his tragic death in 1889. Visitors number from 18,000 to 25,000 annually. Pop., 1890, 15,800; 1900, 17,700; 1910, 19,073.

BADEN, or **BADEN-BADEN**. A town and fashionable health resort of the grand duchy of

Baden, about 20 miles southwest of Karlsruhe, situated in the pleasant valley of the Oos River, at the edge of the Black Forest (Map: Germany, C 4). It is chiefly celebrated for its hot saline springs, which were famous in the time of the Romans. They range in temperature from 115° to 153° F., and are recommended for the treatment of rheumatism, gout, and diseases of the kidneys and skin. Among the chief buildings and objects of interest in Baden and its vicinity are the ruins of the old castle, once the residence of the margraves of Baden; and the new castle, the summer residence of the Grand Duke since 1842; the Pfarrkirche; the Anglican and Greek churches; the trinkhalle, museum, luxurious bathing establishments, and the nunnery of Lichtenthal, founded in 1245. The principal industry is wood carving. The town Baden was known to the Romans as *Civitas Aurelia Aquensis* ('watering place of Aurelius'). It was burned by the French in 1689. Pop., 1895, 14,862; 1900, 15,700; 1910, 22,066. At the height of the season the influx of visitors quintuples the number of the resident population.

BADENI, bā-dēn'yē, CASIMIR FELIX, COUNT (1846-1909). An Austrian statesman, born at Surochów, Galicia. After the completion of his academic education he studied law at Cracow and early entered political life. He rose rapidly into prominence, becoming in 1888 Governor of Galicia and seven years later Premier of the Austro-Hungarian Empire. The most notable event of his administration was the promulgation of the Ordinance of Languages for Bohemia and Moravia, a measure by which Badeni endeavored to place the Czech language on an equal footing with the German in the two provinces named. Disorderly scenes of obstruction occurred in the Austro-Hungarian Parliament, as the Germanic element bitterly opposed the bill, and finally, in 1897, the premier was forced to resign. From that time until his death he took no active part in politics.

BADEN-POWELL, bā'den-pō'el, SIR GEORGE SMYTH (1847-98). An English politician and author, born at Oxford. He graduated at Balliol College, Oxford, in 1875; in 1877 was appointed private secretary to the Governor of Victoria, and in 1885 was returned to Parliament as a Conservative for the Kirkdale Division of Liverpool. In 1886 he established a new steamship line running from Vancouver to Yokohama; in 1886-87 and 1891 investigated the dispute between Canada and the United States concerning the Bering Sea fisheries, and in 1893 was expert agent for the government in the conduct of the British case before the tribunal at Paris. He published *Protection and Bad Times* (1879); *State Aid and State Interference* (1882), also in protest against protection; and an anti-Home Rule work, *The Saving of Ireland, Industrial, Financial, Political* (1898).

BADEN-POWELL, SIR ROBERT STEPHENSON SMYTH (1857-). A British general. He entered the army in 1876, and served in India, Afghanistan, and South Africa, where he became assistant military secretary (1887-89) and occupied the same position at Malta (1890-93). He afterward served with distinction in Ashanti, as commander of the native levies (1895), and in the Matabele campaign. In 1897 he became colonel of the Fifth Dragoon Guards. During the Boer War Colonel Baden-Powell, with a force of 1200 men, was besieged for 215 days by a large Boer army in the town of Mafeking, and

notwithstanding famine and sickness and a number of desperate assaults by the Boers, he held out until he was relieved (May 18, 1900). In recognition of his great ability and imperturbable coolness in conducting the defense, he was advanced to the rank of major-general. He became chief of the South African Constabulary in 1900, and inspector-general of cavalry in 1903. In 1908 he became a lieutenant-general, commanding the Northumbrian territorials, and in the same year he inaugurated the boy-scout movement (q.v.). His principal publications are: *Pig-Sticking or Hlog-Hunting* (1889); *Reconnaissance and Scouting* (1890); *Vedette* (1890); *Cavalry Instruction* (1895); *The Downfall of Prempeh* (1896); *The Matabele Campaign* (1896); *Aids to Scouting* (1899); *Sketches in Mafeking and East Africa* (1907); *Scouting for Boys* (1908); *Boy Scouts beyond the Seas*; *My World Tour* (1913).

BADENWEILER, bā'den-vī'lēr. A town of Baden, Germany, situated among the spurs of the Black Forest, 700 feet above the Rhine and 1450 feet above sea level. It is well sheltered, has an equable temperature, fine air, and is visited annually by from 6000 to 7000 tourists. There are beautiful promenades and numerous villas in the vicinity, and the town contains a grand-ducal palace dating from the sixteenth century, a Kur-haus, Kur-park, etc.

BADGE, or COGNISANCE (LL. *bagea*, *bagia*, OF. *bagc*, sign; cf. AS. *beág*, *beáh*, ring, ornament, LL. *bagā*, Fr. *bague*, ring). A figure either selected by the owner from some part of the family coat or chosen as alluding to his name, office, or estate, or granted by the sovereign as a token of his favor. Badges were much used in England from Edward I to Elizabeth. The principal noble houses, in imitation of the royal family, had a distinctive mark for their retainers, the whole coat of arms being often too complicated to reproduce. Some of these badges are well known in history, and many have been perpetuated in the signs of old inns, with the memory of their origin entirely lost. Such are the white hart of Richard II, the bear and ragged staff of Warwick, the three feathers of the Prince of Wales (though King Stephen used this badge before the Black Prince's time), and the roses of York and Lancaster. Queen Anne was the last English sovereign to use a personal badge; she had the rose of England and the thistle of Scotland growing from one stem and imperially crowned. The term is loosely applied at the present time to various society emblems. See the illustration accompanying the article FRATERNITIES, COLLEGE.

BADGER, bāj'ēr (probably from *badge*, alluding to the white mark on its head). Any of several small, burrowing carnivores of various genera, scattered throughout the warm and temperate parts of America, Asia, and Europe, and constituting, with the skunks, to which they are closely allied, the subfamily Melinae in the family Mustelidae. The group is characterized mainly by short, strong legs, elongated and more or less plantigrade feet, and straight, strong, fossorial toes. All are heavily furred, distinctly marked, and possessed of great strength, acuteness, and courage. They inhabit dens and are abroad mostly at night. They are provided with perineal glands, which contain substances emitting a fetid odor, the service of which, probably, is to attract the sexes. The pelts have considerable value as furs, and the hairs are largely

used in making artists' brushes. The flesh is edible, but not often eaten in civilized communities.

The AMERICAN BADGER (*Taxidea americana* or *taxus*) is about 2 feet long, and has an appearance of remarkable breadth and flatness. The legs are short and firm, and the large feet are furnished with long and very strong claws, making them powerful digging tools. The tail is short and thick. The head is broad, massive, and dog-like, with round, furry ears, a hairy muzzle, and jaws filled with formidable teeth, scarcely less serviceable than those of the wolf. The whole squat, compact, large-boned, massively skulled form indicates great muscular power, and it is controlled by a well-developed brain and great courage. The loose fur is a blend of blackish with white, gray, or tawny, except as to the feet, which are blackish brown. The head is strikingly marked, the general color, from the back of the neck forward, dark brown, broken by a distinct white stripe from the bridge of the nose back to the nape of the neck, and a somewhat irregular white stripe on each cheek, reaching from the corners of the mouth to near the top of the ears. Below this on each side is a crescent-shaped, dark-colored patch, separating the stripe from the white of the ears and throat. These conspicuous markings give to the countenance an expression of native ability and shrewdness in the disguise of a painted clown. This animal formerly ranged from Ohio westward, but now is not known east of the dry plains, except in Minnesota. It is found northward almost to Hudson Bay and southward into Mexico, where the local form (*T. verlandieri*) is called *tejon*. The badger's stronghold is in the arid regions that abound in gophers and similar burrowing rodents, which he digs out with ease or sometimes catches by a leaping chase. These form his principal food, and he is likely to seize and enlarge their burrows for himself; but birds, frogs, lizards, snakes, insects—in short, any animal food not carrion—are welcome to him. On the whole he fares well by digging out the snugly ensconced striped squirrels, prairie dogs, and other small animals from their underground retreats; and in this practice he serves the agriculturist a friendly turn. In New Mexico the badger is active all the year round, but in Canada it goes into its burrow as soon as the ground freezes and sleeps through the winter with no store of food other than its own fat. When surprised away from its hole, a badger will usually strive to avoid being seen by flattening itself upon the ground. If cornered, it will fight with the greatest courage. Young badgers occasionally are captured, and make interesting though hardly affectionate pets. They exhibit amazing strength in moving barriers and breaking bonds. The pelt is prime about October 1. It is strong and a beautiful silvery gray and brings from 75 cents to \$1.50. During the 64 years from 1842 to 1905 over 80,000 badger skins were collected by the Hudson's Bay Company. For details of its life consult E. T. Seton, *Life Histories of Northern Animals*, vol. ii (New York, 1909). See Plate of MINOR AMERICAN CARNIVORES with CARNIVORA.

The EUROPEAN BADGER (*Meles taxus*) is similar to the American in size and colors, but different in dentition and other details. In the absence of open plains it haunts deeply wooded places and digs a deep chamber, where it spends

the winter, and where in spring four or five naked and blind young are produced. It is omnivorous in a wild state as well as in confinement; fruits, roots, beech mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects equally constitute its natural food. It has been known to visit a garden for strawberries. It is also fond of honey and of the larvæ of wasps and wild bees, for which it digs up their nests, its shaggy hair protecting it from their stings. Its strength and courage are conspicuous. A barbarous sport was formerly practiced, called badger baiting or "drawing the badger." A badger kept in a burrow or a barrel was assailed by dogs, until at last, yielding to superior numbers, it was dragged out, upon which it was released and permitted to go back to its den, to recover itself and be baited again. This often happened several times daily when the badger was kept as an attraction to a public house of the low sort. The verb *to badger*, expressive of persevering annoyance by numerous assailants, arose from this practice. An old English name for the animal was "grey," and in Scotland and northern England the badger is still called a "broek" (see *Twelfth Night*, Act ii, Scene 5), and is frequently kept in captivity. (Consult Johnston, *British Mammals*, London, 1903). Several closely related species belong to the Asiatic fauna, where also are other relatives of different genera.

The SAND BADGER, or BALISAUR (*Arctonyx collaris*), of northeastern India and Assam, is a yellowish animal, taller and larger than the common badger and looking like a small bear. It is nocturnal and omnivorous in habits and is considered very fierce. The STINKING BADGER, or TELEDU (*Mydaus meliceps*), is an odd little burrower and insect eater of Java, with a skunk-like power of emitting a powerful stench. H. O. Forbes says of this animal: "Another slow prowler, the *Mydaus meliceps*, very often made my evening hours quite unbearable by the intensely offensive odor with which, even in its most inoffensive frame of mind, it hedged its crepuscular walks for at least a mile around . . . with a malignant scent that clung to one's garments, furniture, and food for weeks. . . . The natives have a superstition that if a man has fortitude enough to eat its flesh he will have become proof against sickness of all kinds."

The common HONEY BADGER of India, and the RATEL, or CAPE BADGER, of South Africa, are somewhat more distant relatives, closely allied to each other and forming the genus *Mellivora* of the subfamily Mustelinae. Their coloration is peculiar, all the upper surface of the body, head, and tail being ashy gray, while the lower parts, separated by a distinct longitudinal boundary line, are black. Both are vigorous diggers and are even accused of robbing graves. Their generic name alludes to their observed fondness for honey (the ratel really hunts for bees with great sagacity), but they subsist upon living animals. Certain small raccoon-like animals of India and eastward, constituting the genus *Helictis*, and the Cape polecat (*Ictonyx zorrilla*) of South and West Africa, which is remarkably like an American skunk in appearance and habits, complete the group of the nearest relatives of the badger.

BADGER, CHARLES JOHNSTON (1853-). A rear admiral in the United States navy, born at Rockville, Md. Appointed at-large to the

United States Naval Academy by President Grant in 1869, he graduated four years later. He was promoted through successive grades to a captaincy in 1907 and became also in that year superintendent at Annapolis. During the world cruise of the Atlantic fleet in 1909-11 he was in command of the battleship *Kansas*. Soon afterward (in 1911) he was made a rear admiral and was given the command of the second division of the Atlantic fleet, with the rank of rear admiral. Of the entire Atlantic fleet he assumed command on Jan. 5, 1913.

BADGER, GEORGE EDMUND (1795-1866). An American statesman, born at Newbern, N. C. He graduated at Yale in 1813, studied law, and practiced in Raleigh. In 1816 he entered the State Legislature and later served as judge of the Superior Court of North Carolina. In 1841 he was appointed Secretary of the Navy by President Harrison, but after Harrison's death resigned because he disapproved of President Tyler's veto of the Bank Bill. He was elected to the Senate in 1846 to fill a vacancy and in 1848 to a full term. In 1853 President Fillmore nominated him as a judge of the United States Supreme Court, but the Senate would not confirm the nomination. He was an opponent of secession.

BADGER, OSCAR C. (1823-99). An American naval officer, born at Windham, Conn. He entered the navy as midshipman and served during the Mexican War. In 1861-62 he was in command of the *Anacostia*, of the Potomac flotilla, and for the precision of his fire was frequently mentioned in the reports of Lieutenant Wyman, commanding the flotilla. He was promoted to be lieutenant commander in 1862, and in 1863 commanded the ironclads *Montauk* and *Patapsco* in many engagements with the batteries and forts of Charleston Harbor. In 1863, while acting fleet captain on board the flagship *Weehawken*, he was severely wounded. In 1866 he was appointed commander, in 1881 commodore, and in 1885 was retired.

BADGER DOG. A dog formerly used in hunting or in baiting badgers. In England the basset, an almost extinct breed of medium-sized, long-bodied, short-legged hounds, was so used; and the German dachshund (q.v.) of the present originated in a breed adapted to pursuing badgers into their holes, the word meaning 'badger-dog.' It is said that the greyhound had a similar origin; but although a coarse sort of greyhound may probably have been used often in the sport of baiting badgers (called "greys"), this breed originated otherwise in the Orient.

BADGER STATE. See STATES, POPULAR NAMES OF.

BADGHIS, bād-gēz', or **BADGHIZ** (Pers. the place where the wind rises). A region in the northwestern part of Afghanistan, bounded by the Heri-Rud and the Persian and Russian frontiers. It is mountainous in the centre, taking in a portion of the Paropamisus Range. The southeastern portion is less elevated and fertile. It is inhabited by Jamshidis and Hazaras.

BADHAM, bād'am, **CHARLES** (1813-84). A distinguished English classical scholar, professor of classics and logic at the University of Sydney, New South Wales, from 1867 until his death. He was born at Glasgow, Scotland, as the son of Charles Badham, Regius professor of physics at Glasgow and the translator of Juvenal, and of a cousin of the poet Thomas Campbell. He received his early education under Pestalozzi, in

Switzerland. He graduated at Oxford (1837), after which he spent some time in Italy, studying ancient manuscripts, and in Germany. He was a warm friend of Cobet. His chief publications are: *Criticism Applied to Shakspeare* (1846), and annotated editions of the Greek classics, including the *Iphigenia* and *Helena* of Euripides (1851); and the *Philebus* (1855), *Euthydemus* (1865), and *Laches* (1865) of Plato. In his criticism of texts he followed the methods of Porson. Consult Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

BADIA Y LEBLICH, bā-dē'ā ē lā-blēch', DOMINGO (1766-1818), known also by the name Ali-Bēi-el-Abbassi. A Spanish traveler. He was born at Barcelona, and studied the Arabic language, physical science, and mathematics at Valencia. Partly out of personal curiosity and partly as an emissary of the Spanish government, he determined to visit the Barbary States in the disguise of a Mussulman. He went for a short time to London to study commerce and politics and spared no labor to make himself familiar with the manners and customs of the people he was about to visit. In 1803 he sailed for Africa, where he represented himself, under the name of Ali-Bēi, as a descendant of the Abbassides. His talents gained for him such esteem that he was invited to the court of the Emperor of Fez and Morocco. After a two years' residence in Morocco he set out on a pilgrimage to Mecca in 1805, and after sojourning some time in Tripoli, Cyprus, and Egypt, arrived at the "holy place" in 1807, being the first Christian to visit it since the institution of Islam. Subsequently he visited Jerusalem and the chief places in Palestine and Syria, and in the autumn of 1807 arrived at Constantinople, whence he had soon to flee, the genuineness of his Mohammedanism being suspected. His long journey had been a bold masquerade, carried out with exquisite art. He deceived Moslem emperors and scholars; and in Cairo Châteaubriand spoke of him as the most cultured and polished Mussulman he had ever met. After his return to Spain he was made Intendant of Segovia and Prefect of Cordova by Joseph Bonaparte. On the expulsion of the French, Ali was compelled to leave the country. He went to Paris, where in 1814 he published an account of his travels, under the title *Voyages d'Ali-Bēi en Afrique et en Asie pendant les années 1803-07*. The work was translated into the principal European languages. Four years after the publication Badia y Lebllich set off on another journey to the East, but died suddenly at Aleppo.

BADINGUET, bā'dān'gā'. Napoleon III, often so called because the garments in which, in 1846, he escaped from the castle of Ham, belonged to a mason of that name. His party came to be known thereafter as the "Badingueux."

BADIUS, bā'dē-us, JONOCUS, or **BADE**, bād, JOSSE (1462-1535). A French printer and author. He was born at Asche, near Brussels, and for this reason is sometimes called Ascensianus. He studied at Brussels and Ferrara and for several years taught Greek at Lyons. About 1500 he settled in Paris, where he founded a printing establishment and published, with his own notes, a large collection of the classics; also produced a *Life of Thomas à Kempis*, and a satire on the follies of women, called *Navicula Stultarum Mulierum*. His printer's stamp is the oldest-known reproduction of a printing press.

BAD LANDS. An American term applied

to regions of unconsolidated rocks that have been extensively eroded. Bad Lands occur on arid plateaus formed by horizontal strata of loosely cemented sands and gravels. In these regions rain falls only during short periods, but then the storm waters erode the incoherent rock that is unprotected by vegetation, resulting in the formation of a labyrinthine series of valleys of all sizes, most of which are dry "arroyos" during the greater part of the year. When the erosion is carried to its extreme limit, the greater part of the region is reduced to base level, and isolated fragments of the old plateau rise above this to form table mountains, or "mesas." The best examples of Bad Lands are found in the upper portion of the Missouri drainage basin, in the vicinity of the Black Hills. They occur also to lesser extent in Colorado, Arizona, New Mexico, and Texas. The name "Bad Lands" is a literal translation of "Mauvais Terres," a term used by the French-Canadian trappers, who first visited the regions.

BAD'MAN, THE LIFE AND DEATH OF MR. An allegorical tale by John Bunyan in 1680. As a realistic picture of the masses during Charles II's reign, it is quite as vivid as anything of Defoe's or Pepys's.

BAD'MINTON (from Badminton, England, the seat of the Duke of Beaufort). A game which much resembles lawn tennis. It can be played by two or four players, either in or out of doors, on a marked-out space 44 feet long by 20 feet wide for the four-handed and 17 for the two-handed game, divided into 4 courts, 2 at each end, with a centre space, across which a net is fixed, 5 feet from the ground at the centre, and 5½ feet at the posts. It is played with shuttlecocks, having 16 feathers, from 2½ to 2¾ inches long and weighing from 73 to 85 grains, which are driven by rackets or battledors over the net, backward and forward, until one of the players fails, under certain technical regulations applicable to the game, to return it. The racket is strung with fine gut and weighs usually about 6 ounces.

BADMINTON, THE. A large London club of sporting men, so named in honor of the Duke of Beaufort's estate. It was formed in 1876.

BADOC, ba-dōk'. A town of Luzon, Philippines, in the province of Ilocos Norte (Map: Philippine Islands, C 2). It is situated near the coast, about 22 miles south of Laoag, and in 1903 had a population of 12,564.

BADOURA, bā-dōō'rā. In the story of Prince Camaralzaman in the *Arabian Nights*, the daughter of the King of China, who falls in love with the sleeping prince.

BADRULBUDUR, bā-drōōl'bōō-dōōr'. Aladdin's wife in *The Arabian Nights' Entertainments*. She is a beautiful Chinese princess. Despite her love for her husband, she twice nearly causes his undoing by giving away the "wonderful lamp."

BAEDA. See **BEDÉ**.

BAEDEKER, bēd'e-kēr, KARL (1801-59). A German publisher, born at Essen. In 1827 he set up a bookshop at Coblenz and in 1839 published travelers' handbooks for Belgium and Holland. These were succeeded by the *Handbuch für Reisende durch Deutschland und den österreichischen Kaiserstaat* (1842), and by guides to Switzerland (1844) and Paris and environs (1855). Thus was inaugurated this series of world-famous publications. Since 1861 English editions have appeared. The collection

now includes almost all European countries, and portions of North America and the Orient, as well as monographs on London, Paris, and Berlin. The volumes are supplied with excellent maps. In 1872 the firm removed to Leipzig, where complete revisions are frequently prepared.

BAEHRENS, bär'ens, EMIL (1848-88). A German Latinist, born at Bayenthal. He studied classical philology at Bonn and Leipzig, was appointed instructor at Jena in 1873, and was professor at Groningen from 1877 until his death. His editions of the classics, though often marred by careless haste or bitter attacks on his opponents, are considered valuable because of the use they make of new manuscripts. His publications, which were extremely numerous, include *C. Valerii Flacci Argonauticon* (1875); *Catulli Veronensis Liber* (2 vols., 1876-85); the *Silva* of Statius (1876); and *Poetae Latini Minores* (5 vols., 1879-83, with the additional volume of *Fragmenta Poetarum Romanorum*, published in 1886). In the preparation of the last-named work he examined over 1000 manuscripts.

BAEKELAND, ba'ke-länd or bā', LEO HENDRIK (1863-). A Belgian-American chemist. He was born at Ghent and was educated at the university there, receiving the Doctorate of Science in 1884. He later studied electro-chemistry in the school of technology at Charlottenburg, Germany. After teaching chemistry and physics for several years at the university in his native city and in the normal school of science at Bruges, he came to America in 1889 and engaged in the manufacture of photographic papers of his own invention, including the widely used Velox paper. In 1899 he entered industrial practice as consulting research chemist. His best-known invention is Bakelite, a condensation product of carboic acid and formaldehyde, which possesses a variety of valuable properties and is used as an electric insulator and as a substitute for amber, celluloid, and similar materials. In recognition of the value of this invention the American Chemical Society conferred upon him the Nichols medal and the J. Willard Gibbs medal. He contributed to scientific journals a number of original papers on photo-chemical and electro-chemical subjects and was president of the American Electro-chemical Society in 1909 and of the American Institute of Chemical Engineers in 1912.

BAENA, bā-ā'nā (*Baniāna, Biniana* of the Romans). A town of Spain, in the province of Córdoba, situated about 32 miles southeast of the city of Córdoba (Map: Spain, C 4). There are interesting remains of ancient and mediæval times here; of the old Roman town there are a number of relics. The town has stock-raising interests, and manufactures silk, spirits, soap, and flour. It also carries on a trade in grain, esparto, fruit, and wine. Pop., 1887, 12,036; 1900, 14,539; 1910, 14,730.

BA'ER, GEORGE FREDERICK (1842-). An American lawyer and capitalist, born in Somerset Co., Pa. He was educated at Franklin and Marshall College. After serving in the Civil War, he was admitted to the bar in 1864 and became confidential legal adviser to J. Pierpont Morgan. In 1870 he was counsel to the Philadelphia and Reading Railway Co., for some time was one of its directors, and in 1893 helped to reorganize the corporation. He became its president in 1901 and president also of the Philadelphia and Reading Coal and Iron Co., and of the Central Railroad of New Jersey. He is best known as

the leader of the operators in the great anthracite coal strike of 1902. Because of his attitude during this time he aroused the animosity of American labor leaders and of many social reformers. In certain quarters he came to be referred to as "Divine Right" Baer because of a letter that he wrote in 1902 to the Rev. W. F. Clark at Wilkes-Barre, Pa. In this he said: "The rights and interests of the laboring man will be protected and cared for—not by the labor agitators, but by the Christian men to whom God in His infinite wisdom has given the control of the property interests of the country, and upon the successful management of which so much depends."

BAER, bär, KARL ERNST VON (1792-1876). A Russian naturalist, born in the province of Esthonia, Russia. From 1810 to 1814 he studied medicine at the University of Dorpat, and subsequently comparative anatomy with Döllinger at Würzburg, and in 1817 became prosecutor in the University of Königsberg. He was there appointed professor of zoölogy in 1819 and director of the Anatomical Institute in 1826. In 1829 he became professor of zoölogy and member of the Academy of Sciences at St. Petersburg, but returned the following year to Königsberg. After 1834 he was prominently identified with the Academy of St. Petersburg. He was one of the founders of the modern science of embryology, and was among the most influential scientists of his day. Of his numerous works, the most important are *Epistola de Ovi Mammalium et Hominis Genesi* (1827), in which the mammalian egg is described for the first time; *Ueber Entwicklungsgeschichte der Thiere* (1828-37); and *Untersuchungen über die Entwicklung der Fische* (1835). Consult the study by Stieda (Brunswick, 1878).

BA'ER, WILLIAM JACOB (1860-). An American miniature painter. He was born in Cincinnati and studied at the Royal Academy in Munich under Loefftz, 1880-84. On his return to America he at first practiced genre and portrait painting in New York. In 1892 he took up miniature painting, to which his admirable draughtsmanship was exceptionally adapted, and became the pioneer of the modern miniature in America. When the American Society of Miniature Painters was founded in 1899, he was its secretary and later became its president. To a strong capacity for characterization he unites a broad and pictorial technical treatment, excelling especially in his delicate color. Works like "Primavera" and the "Hours" rank with the very best that has been produced in this art. Among his other well-known works are "Madonna of the Auburn Hair," "Daphne," "The Golden Hour," "Aurora," "In Arcadia," and "The Apple."

BAERLE, bär'le, CORNELIUS VAN. A cultivator of tulips in the story of the elder Dumas, *La tulipe noire*.

BAERLE. See BARLAEUS, KASPAR.

BAETHGEN, bêt'gen, FRIEDRICH (1849-1905). A German evangelical theologian and Orientalist, born at Lachem. He studied at Göttingen, Kiel, and Berlin, and held professorships at Kiel, Halle, and Greifswald. In 1895 he was appointed professor of Old Testament exegesis and Semitic languages at the University of Berlin. His works include *Untersuchungen über die Psalmen der Peschita* (1878), *Evangelienfragmente* (1885), and *Die Psalmen übersetzt und erklärt* (1892).

BAEYER, bá'yér, ADOLF VON (1835-). A

distinguished German chemist. He was born at Berlin. He studied chemistry under Bunsen and Kekulé, and received the degree of Ph.D. at Berlin in 1858, where he remained as privat docent, becoming assistant professor in 1866. In 1872 he became professor of chemistry at Strassburg. After 1875 he taught at the University of Munich. In 1881 the Royal Society, London, awarded him the Davy medal for his researches on indigo. In 1905 he was awarded the Nobel prize for chemistry. Professor Baeyer was one of the greatest organic chemists. He succeeded in synthesizing a remarkably large number of carbon compounds, including new classes of substances, some of which are not only important from a theoretical point of view, but have also found extensive application in the arts. His works in two volumes were published at Brunswick, Germany, in 1905. For his process in making artificial indigo, see INDIGO.

BAEYER, JOHANN JAKOB (1794-1885). A German soldier and geologist. He was born at Muggelsheim, Prussia, and educated at Berlin. He served with distinction in the War of Liberation, and in 1821 entered the topographical bureau of the general staff. He was intrusted with the task of preparing a triangulation of East Prussia. He became chief surveyor of the general staff in 1843 and in 1852 was promoted to the rank of major-general. His plan for a general survey of central Europe was accepted by the Prussian government, and in 1867 the survey was extended to embrace all of Europe. When the Central Bureau of European Surveys was established in 1865 at Berlin, Baeyer was appointed president, and four years afterward he was elected president of the Geodetic Institute. His numerous important works include: *Die Verbindungen der preussischen und russischen Dreiecksketten* (1857); *Ueber die Strahlenbrechung in der Atmosphäre* (1860); *Ueber die Grösze und Figur der Erde* (1861); *Das Messen auf der sphurroidischen Erdoberfläche* (1862).

BAEZ, bū'ās, BUENAVENTURA (1820-84). A president, for four terms, of the republic of Santo Domingo. He was the son of a mulatto, inherited a large fortune, and was prominent in securing Dominican independence. He was president of the republic from 1849 to 1853, when he was driven from the country by Santa Ana. He returned in 1856, was again made president, and in January, 1858, was again driven out, but in 1865 returned once more, and was elected for the third time. The next year an insurrection drove him into exile, and in the following year he was again restored. He strove to have the United States annex the country, but the United States Senate refused to ratify the treaty which he and President Grant had drawn up in 1869 for the purpose.

BAEZA, bū-ā'thā. An old town of Spain, in the province of Jaén, about 22 miles northeast of the capital city (Map: Spain, D 3). It is in a fertile region, the leading products of which are barley, wheat, vegetables, and oil, and has manufactures of spirits, soap, and leather. Many cattle are raised in this district. Pop., 1900, 14,379; 1910, 15,843. Baeza, anciently known as *Fivatia*, was prosperous under Gothic kings, and flourished under the Moors, several of whose caliphs and kings resided here. It was taken from them by Alfonso VII in 1147, only to change hands several times. In the thirteenth century it was sacked by St. Ferdinand. It was

formerly the seat of a university, founded in 1533, and contains evidences of former splendor. The cathedral, several fine churches, the oratory of St. Philip Neri, and the university, are among its interesting buildings.

BAFFIN, WILLIAM (1584-1622). An English navigator. He accompanied James Hall in his search for a northwestern passage in 1612, and in 1613 commanded the English whaling fleet in the Arctic seas. In 1615 he went north in the *Discovery* under Bylot and explored the inlet now known as Baffin Bay. He was killed in 1622 while trying, in conjunction with a Persian force, to expel the Portuguese from Ormuz. Baffin was the earliest recorded navigator to attempt to determine longitude at sea by astronomical observation. Consult C. R. Markham's edition of the *Voyages of William Baffin* (London, 1881) for the Hakluyt Society.

BAFFIN BAY. A part of the northern Polar Sea between Greenland in the east and Baffin Land and North Devon in the west (Map: North America, F 2). It is about 800 miles long, with an average breadth of 280. Its greatest depth is 6890 feet. The tides do not rise more than 10 feet. The currents are generally toward the south, though on the east side of Davis Strait and Baffin Bay a current from Spitzbergen flows northward round Cape Farewell. The bay is scarcely ever free from ice, though during the summer months it is usually open, but sometimes ice-choked in Melville Bay and farther north. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. The prevailing rocks are granite and gneiss. There are Danish settlements on Disco and Whale islands, and Eskimos inhabit the east coast from Cape York to Smith Sound. The principal animals are, on land, bears, black foxes, and hares; in the sea, the black whale, walrus, and seal, gulls, ducks, and other sea fowl. Baffin Bay was first explored in 1615 by William Baffin, and the accuracy of his observations and descriptions has been confirmed by subsequent navigators.

BAFFIN LAND. A large island west of Greenland, constituting a part of the Canadian District of Franklin. Its area is not accurately known, the west coast not having been as yet entirely outlined, but it is about 238,000 square miles, making Baffin Land the fourth largest island in the world. The east coast is mountainous and glaciated and is deeply indented by large bays. A few Eskimos are found along the east coast. The island is named in honor of William Baffin (q.v.). (Consult Franz Boas, *Baffin Land*, 1885, and *The Eskimo of Baffin Land and Hudson Bay*, 1901.) After nearly a year spent in exploring Baffin Land, Bernhard Hantzsch died there in June, 1911, leaving an account of his work and maps that was published in *Mitt d. Verein f. Erdkunde zu Dresden*, Band ii, pp. 669-716 (1913).

BAFFO, bū'fō. See PAPHO.

BA-FYOT, bū'fē-ōt', or BA-FIOT. A Bantu tribe (also called Cabinda), living between the lower Kuilu and the Congo estuary. They are industrious and skillful, good boat builders, and reputed the best craftsmen on the West African coast. They have profited by contact with Europeans more than other tribes in this region, but still burn witches and combine paganism and Christianity in their religion.

BAGAMOND'S ROLL. See BAGIMONT'S ROLL.

BAGAMOYO, bā'gā-mō'yō. A seaport town and caravansary of German East Africa, situated a short distance northwest of Dar-es-Salaam (Map: Belgian Congo, G 4). It has few stone houses, as the natives, who constitute the bulk of its population, live mostly in huts. There are a custom house, a post office, and a park, with a monument to the troops who fell during an uprising of the natives in 1889. The town is connected by cable with Dar-es-Salaam and Zanzibar. Its roadstead is accessible for small boats. The region is fertile, and the town is a trading centre. Grain, bananas, and vegetables are among the important products. There is considerable caravan trade in ivory, cotton, and manufactured goods. The population is about 25,000 and includes only a few Europeans. Consult Dietert, "Bagamoyo und Handel und Wandel in Deutsch-Ostafrika," in *Jahrg. ii Beiträge zur Kolonialpolitik und Kolonialwirtschaft* (Berlin, 1901).

BAGANDA. See UGANDA PROTECTORATE.

BAGARA, bā-gā'rā. A tribe of pastoral Arabs in the Egyptian Sudan, on the White Nile, above Khartum.

BAGARIA. See BAGHERIA.

BAGASSE, bā-gās' (Fr. dialectic by-form of *bagage*, baggage, lumber), CANE STRAW, or CANE TRASH. The refuse matter left after the extraction or expression of the saccharine juice from sugar cane and sorghum. It was formerly used mainly for fuel in the sugar house, but is now fed to live stock and employed in paper making, etc. See SUGAR.

BAGATELLE, bāg'ā-tēl' (Fr., It. *bagattella*, dim. of *bagata*, trifle, from Low Lat. *bagā*, bundle; cf. *bag*, baggage). A game some forms of which are akin to pool, inasmuch as they are played with cues and balls upon a cushion-rimmed table. The table is usually about 7 feet long and 38 inches wide. At the head (which is semicircular) a group of 9 cups, set into the bed of the table, are arranged and numbered as follows:

```

      5
    3 2
  8 9 7
    4 6
      1

```

It is played with 9 balls, one black, four red, and four white, or eight white and one red or black. The red or black ("King") ball is placed on a spot in front of hole 1, and the player strikes a ball at it from the balk line at the end of the table, and endeavors to put it, his own, or both balls into a hole or holes. Whatever hole the king ball falls into counts double. The remainder of the balls are driven, one by one up the table in like manner, and the sum total of the holes they drop into is the player's score.

In "Mississippi" a bridge with nine or more arches is placed in front of the first hole, and through these arches the ball must pass (but not until it has struck a cushion) before it can reach the holes beyond.

In the "Cannon" game three balls (and sometimes a table without cups) are used, a white, a spot-white, and a black, the object being to place the balls in the pockets by means of "cannon" (i.e., *carom*) play. See BILLIARDS.

In *Sans Egal*, a French form of the game, the players use red and white balls respectively, and play at first on the black ball, each player trying to pocket that ball and then his own without

pocketing his opponents. Another form of the game, "Bell Bagatelle," is played on an inclined board fitted with cups, arches with bells, and stalls, each of which is marked with a number.

BAGAU'DÆ. Peasants of Gaul who resisted Roman oppression about 270 A.D., capturing and destroying Augustodunum (now Autun). Claudius II temporarily repressed them, but Aurelian made concessions to them and proclaimed general amnesty. They rose again in 294, and Maximian was sent against them. Their first leader was Victoria; subsequently there were two, Alhanus and Amandus, the latter calling himself Emperor. The two last named fell in battle, and Maximian utterly defeated their forces; but they were troublesome to Rome until the end of the Western Empire.

BAGBY, GEORGE WILLIAM (1828-83). An American humorist. He was educated at Delaware College and afterward had a medical course at the University of Pennsylvania. He then took up editorial work, especially on the *Southern Literary Messenger*, from 1859 till near the close of the war. Subsequently he was made State Librarian and became widely known as a lecturer and humorist, writing over the name "Mozis Addums." He deserves to be remembered as having kept up the old school of Southern humor, founded by Longstreet and Hooper. His works were collected in 3 vols. (Richmond, 1884-86). Consult Trent, *Southern Writers* (1905).

BAGDAD, bāg-dād' or (as Anglicized) bāg'dād. A vilayet of Asiatic Turkey, situated near the southeastern end of the country, and covering an area of 42,962 square miles (Map: Turkey in Asia, L 6). It is watered by the Tigris and Euphrates, but the soil, with the exception of a small portion, is barren and unproductive. The population is estimated at 614,000, consisting of Turks, Arabs, Armenians, Jews, and Kurds.

BAGDAD, or **BAGHDAD**. The capital of the Turkish vilayet of the same name, and formerly one of the most magnificent cities of the Mohammedan world, situated in the centre of the vilayet on both sides of the Tigris (Map: Turkey in Asia, L 6). It is probable that the name is of Iranian origin coming from *Bag*, 'god,' and *dad*, 'given,' 'the gift of god'; for even if Bagdada is the correct reading of the name of a city occurring in Babylonian inscriptions as "Delitzsch maintains," it is by no means impossible that an Iranian tribe established itself in this region as early as in the Kassite period. (See BABYLONIA.) The modern and larger portion of the city lies on the eastern bank and is connected with the old town on the opposite side by two pontoon bridges, 650 and 715 feet long respectively. Bagdad is surrounded by the ruins of a brick wall, and a dry moat, and has an attractive appearance from the river. Upon closer examination, however, it proves to be ill built and neglected, with but few remnants of its former splendor. The streets are crooked, narrow, and filthy, houses are low, and the absence of windows in the front renders them exceedingly sombre and uninviting. The interior, however, is here and there richly decorated, and the courts are sometimes ornamented with artistic fountains. Bagdad contains a large number of mosques (most of them ruined), which alone testify to its former splendor. Among public buildings the most noteworthy are the Governor-General's palace, the citadel, and the numerous *khāns*. Bagdad also contains a number of brick-covered bazaars, which have long

been famous. In the vicinity are situated tombs held in high reverence by the natives and visited annually by thousands of pilgrims. In olden times Bagdad was famous as a seat of learning and culture, but at present its high schools or *medresses* are few in number, and its importance is due chiefly to its commerce. Before the opening of the Suez Canal Bagdad was an important centre on the trade route from India to Europe. The traffic from India has declined somewhat, but, owing to development of railway facilities, it is still a place of commercial importance, being the mart through which pass the imports and exports of Mesopotamia, and the outlet for products of Arabia and Persia intended for Eastern markets. Transportation is effected from Basra to Bagdad by the Tigris, and from there to Constantinople, Aleppo, and Damascus by caravans. The chief articles of export are wool, grain, fruits (especially dates), horses, various Oriental fabrics, skins, gum tragacanth, feathers, and leather articles. Imports include iron and copper, sugar, and coffee. There are numerous manufactures of copper utensils, cloth, and felts. Bagdad is the seat of a United States consulate. The population has been repeatedly decimated by pestilence and inundations. It is variously estimated, the returns ranging from 125,000 to 200,000, consisting of Arabs, Turks, Jews, Persians, Kurds, Armenians, Syrians, and some Hindus. The Mohammedan population numbers about 125,000 and is practically equally divided between Sunnis and Shias. There are over 50,000 Jews, 15,000 Chaldean Christians, besides Jacobites, and Greek Orthodox Christians.

Bagdad was built by the Abbassid Caliph Mansur (Almansur), 762 A.D., on the site of an old Babylonian city of a similar name. It was greatly enlarged by Harun-al-Rashid, under whom and his successor Mamun it attained the prosperity which is described in the pages of the *Arabian Nights*. Then, and for long afterward, it was one of the richest and most splendid cities of the world, except for a brief period when it was deserted by the caliphs. The rise to power of the commander of the caliph's Turkish bodyguard gradually reduced the caliphs to political insignificance, but they retained their headship in religion. In 1258 the grandson of Genghis Khan, Hulaku, put an end to the Abbassid Caliphate; but the descendants of the Tatar conqueror were expelled by Timur, who took the city 1393. In the beginning of the sixteenth century Shah Ismail, the founder of the Sofi Dynasty in Persia, made himself master of it. Turks and Persians strove for its possession until Amurath IV, in 1638, annexed it to the Ottoman Empire. Since then it has been nominally a part of the Ottoman Empire, but for long periods it was practically independent. Consult Le Strange, *Bagdad during the Abbassid Caliphate* (Oxford, 1900); C. Huart, *Histoire de Bagdad dans les temps modernes* (Paris, 1901); Streck in *Enzyklopadie des Islam* (1911).

BAGDAD. The port of Matamoros (q.v.), Mexico (Map: Mexico, K 5). It is situated in the State of Tamaulipas at the mouth of the Rio Grande del Norte, on the Gulf of Mexico, but its harbor is not accessible to large vessels. During the Civil War in the United States it was an important trading place for the Confederates, who had to run the blockade of the Federal ships.

BAGDAD RAILWAY. See TURKEY.

BAGE, ROBERT (1728-1801). An English novelist born at Darley, Derbyshire, Feb. 29, 1728. At the age of 23 he settled at Elford, near Tamworth, where he engaged in the manufacture of paper until his death, Sept. 1, 1801. The prevailing French social theories he embodied in several novels of considerable interest, as *Mount Henneth* (1781), *Barham Downs* (1784), and *Hermesprong* (1796). Consult Bal-lantyne, *Novelists' Library*, edited by W. Scott (London, 1821-24).

BAGEHOT, bā'jot, WALTER (1826-77). An English economist and publicist. He was born at Langport, Somersetshire, and was educated at University College, London, where he won distinction by his work in mathematics and in mental and moral philosophy and political economy. He began to read law, but never practiced the profession. After a stay of some months in Paris in 1851, where he lived through the coup d'état of December, he returned to England to take part in his father's shipowning and banking business. In 1858 he married the eldest daughter of the Rt. Hon. James Wilson, founder of the *Economist*, which had been established during the Corn-Law agitation to advocate free trade principles. In 1860, on the departure of his father-in-law for India, Bagehot became editor of the *Economist* and retained that position until his death in 1877.

Bagehot's principal works, which were widely translated and passed through several editions, were *The English Constitution* (1867), *Physics and Politics* (1872), and *Lombard Street* (1873). The first work, which has been widely used in England and the United States as a text-book, is a keen analysis of the English system of government. It is striking in its distinction between the "ornamental or theatrical" part and the practical parts, the crown and the House of Lords constituting the first, and House of Commons and the cabinet the second. The vigor of his language would imply that the theatrical parts were useless; but, on the contrary, Bagehot holds them in high honor, despite proposals for reforming the House of Lords. They seem to assure confidence in the stability of government and inculcate a respect for superiority and tradition which is the saving grace of English democracy. In his discussion of the practical parts he brings out strongly the essence of parliamentary government in the blending of executive and legislative authority in the cabinet. He was among the first to point out the excellences of the cabinet system. His work, *Physics and Politics*, expands the thesis that rule and tradition, awakening the spirit of cooperation, is the keynote of political progress. Without this habit of pulling together intellectual nations have failed to maintain themselves.

His *Lombard Street*, which is a description of the rôle that the Bank of England plays in the English financial system, lies in quite another field of thought, for which his training as vice-chairman of the Langport Bank and his position, as editor of England's financial organ gave him special facilities of knowledge. The work is a masterly analysis of the English credit system, and its lucidity of statement has gained for it a wide reading and a permanent place in the literature of political economy.

Bagehot was a man of great versatility, whose reputation as one of the best conversationalists of his day will be understood by those who read

his *Literary Studies* and *Biographical Studies*, republished after his death in his collected writings, in which his vivacity and humor find greater scope than in his larger works. Consult the prefatory notice to *Literary Studies*, edited by R. H. Hutton (London, 1879), and M. E. Grant-Duff, "Walter Bagehot: His Life and Works," in his *Out of the Past* (London, 1903).

BAGGAGE (Fr. *bagage*, from OF. *bague*, bundle, pack). In the law of common carriers all such articles of a traveler as are incidental to the journey or required by him during the journey. Thus, personal jewelry and a reasonable amount of money for expenses, as well as wearing apparel, etc., are baggage; but jewelry and goods intended for sale, articles of furniture, etc., are not. The significance of the distinction lies in the fact that the extraordinary liability of the common carrier extends to the baggage of a passenger, and yet, as a carrier of passengers, he is exempt from that liability for goods not coming under the description of baggage. The carrier, however, is liable for damage resulting from his gross negligence, even if the articles shipped or carried by the passenger are not baggage; and his acceptance of them, knowing their character, may put upon him the full liability of a common carrier. See **CARRIER, COMMON**.

BAGGAGE, MILITARY. The impedimenta of an army, including all articles of stores necessary, or pertaining to, a body of men moving from one point to another. Ammunition and food supplies, while coming under this general heading, take precedence of all other baggage, on account of their imperative necessity to the existence of troops in the field. In all armies strict rules are enforced, regulating the amount and description of baggage that may be carried for officers and soldiers at home and abroad, both in time of peace and during war. In the field, though a soldier in the ranks carries his whole kit, yet a certain proportion of wagons are allotted to his command for the heavier baggage—tents, cooking utensils, ammunition, etc. The question of baggage is one of the most difficult problems a commander in the field has to deal with. In the United States the transportation of baggage is covered by sec. 1151, *United States Army Regulations*, which provides that the baggage to be transported at public expense, including mess chests and personal baggage, upon change of station, shall not exceed the following weights:

RANK	IN THE FIELD, POUNDS	CHANGING STATION, POUNDS
Lieut.-General	1,500	15,000
Major-General	1,000	10,500
Brigadier-General	700	8,400
Field Officer	400	7,200
Captain	200	6,200
First Lieutenant, Contract Surgeon	150	5,100
Second Lieut. and Veterinarian Post and Regimental non-commissioned Staff Officer, 1st Class Sergeants of the Hospital Corps, Chief Musician, Sergeant of the Signal Corps, Squadron and Battalion Sergeant Majors, First Sergeants, each, and Civil Service employees transferred	150	4,500
	3,000

Adequate allowances are made for the expense of packing and crating baggage preparatory to

shipment. Official books and papers of officers are transported at government expense and are not charged against the baggage allowances of officers. When officers or soldiers entitled to baggage allowances are retired, their baggage within their allowances is transported to their homes.

BAGGESEN, båg'ge-sen, JENS (1764–1826). A Danish poet, born at Korsør, who in his early works represented eighteenth-century culture and afterward became a representative of a restrained romanticism. His first poems were *Comiske Fortællinger*, 'Comic Tales' (1785), followed by satires, epistles (*Skientomme Rim-breve*, 1807), and elegies, produced with restless haste, in which, however, he showed himself a conservative champion of form against the innovation of the romanticists, and won the title "poet of the graces." Under the patronage of the Duke of Augustenburg he traveled widely, was for a time director of the National Theatre in Copenhagen, and in 1800 went to Paris. In 1811 he became professor at Kiel and later returned to Copenhagen to find his fame eclipsed by that of the romantic Oehlenschläger (q.v.), who at first commanded his sincere admiration, but later evoked his bitter criticism. He left the field, defeated, for a voluntary exile at Håmburg in 1820. The *Labyrinth* (2 vols., 1792–93), his most important work, is a graceful impressionist's description of his journeys. He wrote also in German and left a vast and entertaining *Correspondence*. Though now little read and never genuinely popular, his work exercised in its time a great influence upon the literary public. His *Danish Works* were first published in 1827–32; his *Poetische Werke in deutscher Sprache* in 1836. Consult: Arentzen, *Baggesen og Oehlenschläger* (Copenhagen, 1870–78); A. Baggesen, *Jens Baggesens Biografi* (ib., 1843–56); Clausen, *Jens Baggesen* (ib., 1895).

BAGHELKHAND, bâ-gâl'küñd' (Ar., Turk. *bagh*, garden + *cl*, the + *khand*, hill). A British agency of Central India, situated between lat. 22° 40' and 25° 10' N. and long. 80° 25' and 82° 45' E. It comprises the native states of Rewah, Nagode, Maihar, Sohawal, and eight of lesser importance. Area, 14,706 square miles. Pop., 1891, 1,737,606; 1901, 1,554,577; 1911, 1,772,574.

BAGHERIA, bâ'gâ-rê'â, or **BAGARIA**, bâ'gâ-rê'â. A city in the province of Palermo, Sicily, 8 miles southeast of the city of Palermo (Map: Italy, II 9). The surrounding plains are splendidly fertile, and the town contains many deserted villas, formerly occupied by Palermo grandees. Among them are the Villa Palagonia, celebrated by Goethe, and the Villa Valguarnera, which has one of the most beautiful prospects in Sicily. Pop., 1881 (commune), 14,000; 1901, 18,218; 1911, 21,212.

BAGIMOND'S (bâj'î-möñds), or **BAGIMUND'S** (bâj'î-mündz) **ROLL**. The name given, from the end of the thirteenth century till the Reformation, to a valuation, according to which the ecclesiastical benefices of Scotland were taxed. It took its name from an Italian churchman, Boiamund de Vitia, who was sent from Rome in 1275 to collect the tithes from all the church livings in Scotland for an expedition to the Holy Land, as decreed by the Second Council of Lyons (1274). Hitherto the Scotch clergy had been taxed according to a conventional valuation, called the *antiqua taxatio*; but Boiamund set this aside, and, in spite of their opposition, assessed the benefices at their actual yearly

worth, or *versus valor*. Consult *Publications of the Surtees Society*, vol. xii (London, 1846).

BAGINSKY, bā-gēn'skī, ADOLF (1843-). A German physician. He was born at Ratibor, and studied at Berlin and Vienna. In 1890 he was appointed director of the hospital known as the Kaiser- und Kaiserin-Friedrich Krankenhaus, in Berlin, an institution devoted chiefly to the cure of the infectious diseases of children. He was private lecturer on children's diseases at the University of Berlin from 1881 to 1892, and in 1892 was appointed extraordinary professor at that institution. He founded and became co-editor of the *Archiv für Kinderheilkunde*, established in 1880. His principal works include: *Handbuch der Schulhygiene* (3d ed., 1898-1900); *Lehrbuch der Kinderkrankheiten* (8th ed., 1905); *Pflege des gesunden und kranken Kindes* (3d ed., 1885); *Das Leben des Weibes* (3d ed., 1885); *Die Antipyrese im Kindesalter* (1901); *Sänglingskranknpefle und Sänglingskrankheiten* (1906); *Die Kinderaussage vor Gericht* (1910).

BAGIRMI, bā-ger'mē, or **BAGHIRMI**. A sultanate in the military territory of the Chad, French Equatorial Africa, bounded by Bornu, Wadai, and Lake Chad (Map: Africa, F 3). Its area is estimated at about 70,000 square miles. The population is made of different races, including Fulahs and Arabs, and before the wars with Wadai and Bornu numbered from 1,000,000 to 1,500,000, but has thereby been reduced to three-quarters of that number. The principal occupation is agriculture, but there are also some manufactures of textiles and leather. The form of government is absolute, and an armed force, estimated at over 10,000, is maintained. The prevailing religion is Islam, which was introduced in the sixteenth century. Since the agreement of 1896 between France and Germany Bagirmi has been recognized as belonging to the French sphere of influence. In 1897 a separate treaty was signed between France and the Sultan of Bagirmi, and a French resident appointed at Chekna, the capital. The former capital Massenya was destroyed in 1898. At the end of 1899 Rabah, a usurper of Bornu, invaded the state, but was speedily defeated by the French troops. His sons continued the contest, but by May, 1901, the country was completely pacified.

BAGLIONI, bā-lyō'nē. A family of Florentine Renaissance architects, sculptors, and wood inlayers of the fifteenth and sixteenth centuries. The founder was BACCIO D'AGNOLO BAGLIONI (1462-1543), of whose four sons, all artists, two became prominent, DOMENICO (born 1511) and GIULIANO (1491-1555), who followed their father's style. Baccio d'Agnolo, while not a genius, showed real talent in the treatment of palace architecture of moderate size in Florence. He continued the manner of Cronaca (q.v.), whom he had assisted in building the great hall of the Palazzo Vecchio. While not modifying Cronaca's style of exterior, he gave greater elegance and simplicity to the palace courts. Such were the Taddei and Ginori palaces. He showed considerable originality in the Bartolini Palace (1520), and in a couple of villas (Bartolini and Borgherini). The best work of Domenico is the Buturlin Palace.

BAGLIONI, CAVALIERE GIOVANNI, called IL SORDO DEL BAROZZO (1571-1644). An Italian painter and art historian. He was born in Rome, where most of his life was spent. His celebrated paintings in the St. John Lateran, St. Peter's,

and elsewhere, are examples of the tasteless mannerism of his day and no longer interest us; but it is otherwise with his most important literary work, *Le vite de' pittori, scultori, architetti, ed intagliatori dal pontificato di Gregorio XIII del 1572, fino a' tempi di Urbano VIII nel 1642* (Rome, 1642; Naples, 1733), which is still a valuable source of information.

BAGLIVI, bā-lyé'vè, GIORGIO (1669-1707). A celebrated Italian physician of the Iatro-Physical school (see BORELLI); descended from a poor Armenian family. In 1692 he went to Rome, where he attended the lectures on anatomy given by Malpighi. Soon afterward he was appointed professor of anatomy at the Sapienza College, Rome. He was the first to propound the doctrine of "solidism" in medicine, according to which the primary seat of disease is in the solid parts of the organism and not in the fluids, as had been universally maintained previous to his time. His complete works were published under the title *Opera Omnia Medica Practica et Anatomica* (Lyons, 1704). Under the title *De l'accroissement de la médecine pratique* a French translation by Boucher was published (Paris, 1851) of Baglivi's *De Praxi Medica ad Priscam Observandi Rationem Revocanda*.

BAGNACAVALLLO, bā-nyā-kā-vāl'lō (1484-1542). An Italian painter of the High Renaissance. His real name was Bartolommeo Ramenghi, and Bagnacavallo was his birthplace. He was a pupil of Francesco Francia at Bologna and afterward assisted Raphael in the decorations of the Vatican. His later work, however, shows the influence of Dosso Dossi. On his return to Bologna he became the head of the local school. The museum and churches of Bologna are rich in his works, among the best of which are "Christ Crucified" in St. Peter's and a "Madonna with Saints" in the Museum. Good examples of his work are also in the galleries of Berlin, Dresden, Milan, and Paris.

BAGNÈRES-DE-BIGORRE, bā-nyār' de bē-gōr' (Fr. baths of the Bigerrones; see below). A town and watering place situated on the left bank of the Adour, amid lovely scenery, in the department of the Hautes-Pyrénées, France (Map: France, S., E 5). At Bagnères there are 30 mineral springs of varied temperature and chemical composition, each of which is described as a specific for different diseases. There are 10 bathing establishments, and the place is visited annually by 25,000 to 30,000 invalids and tourists. It is a centre for winter sports, fêtes being organized each year. There are marble quarries in the vicinity of the town, which is noted for its manufacture of table tops, chimney-pieces, and woolen knitted goods. Pop., 1901, 8437; 1906, 8591; 1911, 8455. The place was well known to the ancient Romans, who called it Vicus Aquensis, or Aquæ Bigerrionum, and erected there many baths and a temple of Diana.

BAGNÈRES-DE-LUCHON, ly'shōn'. A watering place in the department of Haute-Garonne, France (Map: France, S., E 6). It is divided into an old and a new town; the latter, with its villas and gardens, fine streets and promenades, being five times as large as the cluster of mean and narrow streets which forms the old town. Bagnères-de-Luchon has 48 springs, which vary in their composition and their temperature. About 50,000 strangers annually resort to these springs. Pop., 1901, 3260; 1906, 3465; 1911, 3415. The Romans gave it the name *Thermæ Lixonenses*, but for many centuries, even

throughout the Middle Ages, the place was deserted. Mègret d'Etigny, whose statue stands in the town, caused the waters to be analyzed in 1751 and drew attention to their medicinal properties, but the popularity of the place dates only from the beginning of the nineteenth century.

BAGNES, bân'y', or **BAZNE**, VAL DE. A picturesque valley in the canton of Valais, Switzerland, watered by the Dranse, a tributary of the Rhône. It is encircled by mountains, of which the highest are Grand Combin, 14,164 feet, and Mont Gelé, 11,000 feet. Glaciers are found in the valley, the largest being the Corbassière and the Grétroz. Waterfalls and gorges abound along the course of the river, and its current is very swift. It has frequently overflowed and inundated the valley, notably in 1818, when, dammed by the Grétroz Glacier, it broke through and swept away 500 dwellings, drowning a number of people. The chief town of the valley, Chablé, is sometimes called Bagnes.

BAGNES. The convict prisons of France. Serious crimes in France were, till 1748, punished by terms of service in the galleys. In that year these were abolished, and the convicts were employed in hard labor in arsenals and other public works, and the prisons in which they were lodged were called *bagnes*, from the Italian *bagno*, literally 'a bath'—a name supposed to have originated in the fact that the slave prisons at Constantinople contained baths, or because they stood near the baths of the seraglio. The Legislative Assembly of 1791 and 1792 mitigated the sufferings of the convicts, and substituted, for the detested name *galères*, that of *travaux publics*, to which succeeded the *travaux forcés* of the Code Napoléon. The practice of branding criminals with a hot iron was not abolished until 1832. The latest existing institutions of this class were at Toulon, Brest, and Rochefort. The discipline of the *bagnes* was cruel. Men were always chained in couples and released only after the most exemplary behavior. Their food was miserable, and they were herded together at night like cattle. The labor of the convicts was turned to profitable account, and the various handicrafts were taught in the prison under the direction of overseers. The industrious and clever were enabled to earn small wages. Formerly the punishment of the galleys was inflicted for comparatively slight offenses, such as removing landmarks, begging, poaching; but hard labor in the *bagnes* was reserved exclusively for such as committed crimes which seriously menaced the public peace and personal safety. These prisons were abolished in 1854, and the convicts were gradually drafted off to French Guiana and New Caledonia. Toulon Prison was not emptied till 1870. To readers of Victor Hugo's *Les misérables* the *bagnes* are familiar as the home, during many years, of the hero, Jean Valjean. Consult Zaccane, *Histoire des bagnes* (Paris, 1875).

BAG'NET, Mr. and Mrs. JOE. A gallant ex-artilleryman and his wife in Dickens's *Bleak House*. They have three children, all named after the towns at which they were born, Malta, Quebec, and Woolwich.

BAGNI-DI-LUCCA, bā'nyé dē luk'ká (It. Baths of Lucca). A spa much frequented in the summer, in north Italy, 15 miles northeast of Lucca (Map: Italy, E 3). There are hot springs of various temperatures from 96° to 133° F. scattered over a limited neighborhood. It

consists of several villages in the cool and shady valley of the Lima. The springs number 100, and were known in the Middle Ages as the Baths of Corsena. Pop., 1881, 9205; 1901, 12,150; 1911, 12,939.

BAG'NIGGE WELLS. A London picnic ground in the reign of George II situated on Gray's Inn Road, across from the present Mecklenburg Square. It was elaborately laid out with promenades, flower beds, and shrubbery, and contained a large single-roomed hall for entertainments of various kinds. It contained medicinal springs and originally consisted of certain baths, founded in 1708 as a rival of Baine's cold-bath establishment. It was highly popular until about 1850.

BAGOBO, bā-gō'bō. A Malay people living in the Davao District, Mindanao. They build good houses, are fair agriculturists, and are the best clad of any wild tribe on the Philippines, yet despite this they practice many savage customs, including human sacrifice. Consult *Philippine Journal of Science*, vol. vi, No. 3 (June, 1911); also F. C. Cole, "Wild Tribes of Davao District," *Field Museum Publication* (1913).

BAG'OT, SIR CHARLES (1781-1843). An English diplomatist. He became Under-Secretary of State in 1807; special envoy to France in 1814; Minister Plenipotentiary to the United States in 1815; Ambassador to Russia in 1820 and to Holland in 1824, and special Ambassador to Austria in 1835. He became Governor-General of Canada in 1842 and died in office.

BAGOT, RICHARD (1860-). An English novelist. He was educated in private schools. In 1882 he became the private secretary of the Governor of Western Australia, Sir Frederick Napier Broome. His publications comprise the following: *A Roman Mystery* (1899); *Casting of Nets* (1901); *The Just and the Unjust* (1902); *Donna Diana* (1903); *Lore's Proxy* (1904); *The Passport* (1905); *Temptation* (1907); *The Lakes of Northern Italy* (1907); *Anthony Cuthbert* (1908); *The House of Scervalla* (1910); *My Italian Year* (1911); *The Italians of To-Day* (1912; Am. ed., 1913); *Darnceley Place* (1912; Am. ed., 1913).

BAG'PIPE. A wind instrument, which up to the eighteenth century was common in almost every country in Europe and still continues in use among the country people in Poland, Italy, Sicily, the south of France, Scotland, etc. It consists of a leather bag, which the player inflates by blowing with his mouth through a tube, as among the Scotch Highlanders, or by means of a small bellows. The music proceeds from three or four pipes, whose mouthpieces are inserted into the bag; the wind being forced out by pressing the bag under the arm. One of the pipes, the *chanter*, is a primitive oboe with eight holes; the others, called *drone*s, sound each only one continuous low note. It is certain that the bagpipe was in use among the Hebrews and Greeks, and there is enough evidence that in Germany and elsewhere in Europe it was among the most favorite instruments in the fifteenth century.

Though fallen generally into disuse, with the growth of musical refinement, the bagpipe is still a popular instrument in the Highlands of Scotland, and at gatherings of Highlanders, and even of Lowland Scotch, in America and other countries. Pipers in proper costume are also attached to the Highland regiments in England, and in some instances pipers are retained by Scottish noblemen to play on festive occasions.

Skill in playing the bagpipe is promoted by various Highland societies, which at periodical competitions give prizes to the best players of pibrochs, reels, and other airs. Consult E. de Biequeville, *Les Musettes* (Paris, 1894), and W. H. Grattan-Flood, *The Bagpipe* (London, 1911).

BAGRADAS. An eastern Algerian river, now called Medjerda. Its length is about 200 miles, and it opens into the Gulf of Tunis.

BAGRATIDES, bāgr'ra-tidz, or **PAGRATIDES**, pāgr'ra-tidz. A noble family of Armenia, descended from the ancient Jews, and converted to Christianity about the close of the third century. In 743 they were made hereditary governors of Armenia by the caliphs, and in 885 the first king of the line was crowned. The dynasty was extinguished in 1079 by the Byzantines. A line of Bagratides ruled in Georgia until 1802, when the last king ceded his territory to Alexander I and became a prince of the Russian Empire.

BAGRATION, bā-grū'té-ôn', PETER IVANOVITCH, PRINCE (1765-1812). A distinguished Russian general, descended from the noble family of the Bagratides of Georgia. He entered the Russian service in 1782 and was trained under Suvaroff. In 1788 he was engaged at the storming of Oczakov, fought in 1792 and 1794 against the Poles, in 1799 in Italy and Switzerland, and distinguished himself in the Austro-Russian War of 1805 against the French, especially in the sanguinary engagement of November 16 of that year at Hollabrunn, when, with a small body of troops, he bravely stood during six hours opposed to the superior forces under Murat, and thus enabled the Russian general, Kutusoff, to reach Znaim with the main army. Subsequently Prince Bagration was engaged in the battles of Austerlitz, Eylau, Heilsberg, and Friedland, and took part in the Russian campaign against the Turks, being defeated in the battle of Tartaritz, 1809. In the campaign of 1812 he commanded the Second Russian Army of the West, and had the misfortune to fail in his attack on Davout, near Mohilev, but succeeded in forming a junction with the First Army of Smolensk. He was mortally wounded in the battle of Borodino and died on October 7.

BAGSHOT BEDS (found in Bagshot Heath in Surrey). A series of sands belonging to the Middle and Upper Eocene of Great Britain. They rest on the true London clay, but their best development is on the Isle of Wight, where a thickness of at least 660 feet is recorded. Certain beds of the series are rich in reptilian and fish remains, as well as in those of mollusks.

BAGSHOT HEATH. A level stretch of country near the English counties of Surrey and Berkshire, once the place of many a highway robbery.

BAG/STOCK, MAJOR JOE. A character in Dickens's *Dombey and Son*. He is fat, purple-cheeked, martial of speech, and apoplectic. He dines with amazing frequency and heartiness at Mr. Dombey's during that worthy's palmy days; but after the failure of *Dombey and Son* he severs the acquaintance in words of injured dignity. He lives opposite Miss Tox and is not without an interest in her matrimonial prospects.

BAGUIÓ, bā-gé-ó'. A town of Luzon, Philippines, capital of the province of Benguet, 4 miles north of Dagupan, the former capital, with which it is connected by rail. It is a health resort for the American troops, has a large sanitarium,

and is the seat of government during the summer months. Pop., 1903, 489.

BAG/WORM, or **BAS/KET WORM**. The caterpillar of a moth (*Thyridopteryx ephemeraeformis*) common throughout the northern United States, which spins a silken bag as a protection and moves about with it, head downward. It is enlarged as the larva grows, and at last is fastened to a tree branch at one end; within this the caterpillar transforms to pupa, and there the wingless female lays her eggs. The male is a fully winged moth, with dark body and light-colored wings. Bagworms often swarm in city parks and similar situations, and defoliate shade trees, unless the cocoons are collected and destroyed. Compare FAGGOT WORM.

BAHADUR, bá-hq'dur, SHAH (c.1767-1862). The last Great Mogul of the House of Tamerlane, who was nominal ruler from 1837 to 1857. For 70 years preceding his accession, however, the East India Company had been firmly established as the controlling force in the Mogul's realm. When he was 90 years old, the Mohammedans of Hindustan made him leader of the movement to reestablish the Mogul Empire. He took refuge in the tomb of his ancestors when Delhi was captured by the British, but was taken prisoner, tried for rebellion and complicity in the murder of Europeans, and banished to Rangoon, under a sentence of imprisonment for life. He wrote a large number of songs, which were published under the title of *Safar* ('Victory'), and was regarded as the most gifted of the modern poets of Delhi.

BAHALUL, bá'há-lóol'. A character in *The Arabian Nights*. He is nicknamed "The Crazy" and is a fool of Harun al-Rashid's court.

BAHA/MAS. A group (the most northerly) of the British West Indian islands, situated in the Atlantic Ocean, between lat. 21° and 27° 31' N., southeast of Florida and north of Cuba and Haiti (Map: West Indies, D 1). Including the reefs, they number over 3000, of which only about 20 are inhabited. The principal islands are New Providence, Abaco, Harbor Island, Great Bahama, Andros Island, etc. Total area of the group, 4403½ square miles. The islands are long and narrow, with a generally low surface, the highest point attaining an altitude of a little above 410 feet; they are comparatively fertile. Some of the larger islands have a valuable growth of timber. Cotton, which in former times was a staple product, is now little grown (export, 1911, £361), but efforts are being made to revive the industry. Sisal cultivation is important, the estimated area under this plant in 1911 being 20,000 acres, and the output for the year 6,672,780 pounds, valued at £44,855. Other products are maize, pineapples, oranges, grapes, etc. Fishing for sponges and other marine products is one of the important occupations. The climate, although moist, is not unhealthful for whites, though among the negroes there is a high rate of mortality from pulmonary complaints. The mild winter temperature has made the islands, particularly New Providence (the most important, with an area of 85 square miles), a popular health resort.

The imports into the Bahamas in 1911, principally textiles and flour, amounted to £311,095 (£306,098 in 1902), while the exports were valued at £209,251 (£207,601 in 1902). The principal articles of export are sponges, fibre, turtle shell, etc.

The islands are administered by a governor,

assisted by executive and legislative councils of nine members each, and a representative assembly of 29 members. The revenue and expenditures of the colony for 1911-12 amounted to £85,592 (£72,442 in 1902-03) and £82,676 (£74,613) respectively. The capital, Nassau (q.v.), is on New Providence; a United States consul is stationed there. Total population of the Bahamas in 1881, 43,521; 1901, 53,735; 1911, 55,944.

The Bahamas were discovered by Columbus in 1492, though the exact locality of his first landing has been the subject of considerable dispute. (See WATLING'S ISLAND; SAN SALVADOR; GUANAHANI; COLUMBUS, CHRISTOPHER.) The English in 1629 established a settlement on New Providence, from which they were driven by the Spaniards in 1641, in 1680, and again in 1703. In 1703 the settlement was abandoned, and the islands became notorious as the rendezvous of pirates and the scene of wild disorders, until recovered by the British in 1718. Again driven out by the Spaniards (1781), the British were finally confirmed (1783) in their possession. During the Revolution the Bahamas gave refuge to a number of American Tories, whose wealth and slave labor aided materially in the development of the islands. The blockade of the Southern ports during the Civil War made Nassau the chief station in the blockade-running trade and increased the commerce of the islands to an enormous extent. The Bahamas have suffered severely from hurricanes, notably in 1866, 1883, and 1908; and disastrous droughts have occurred. In 1848 the Turks and Caicos islands were separated from the other Bahamas and joined to Jamaica for administrative purposes. Consult *British Empire Series* (London, 1900), and G. B. Shattuck, *The Bahama Islands* (New York, 1905). For further references, see WEST INDIES.

BAHAR, bā-hār'. See BEHAR.

BAHAWALPUR, bā-hi'wāl-pūr', or **BHAWALPUR**, b'hū'wāl-pūr'. One of the native states of the Punjab, India, in lat. 27° 41' to 30° 25' N., and long. 69° 30' to 73° 58' E., with an area of 17,285 square miles (Map: India, B 3). Pop., 1891, 650,000; 1901, 720,700; 1911, 780,641. The country is remarkably level, and, in spite of various irrigation projects, approximately only one-sixth is capable of cultivation, the fertile portion skirting the Ghara and the Indus. Beasts of chase, such as tigers and boars, abound; domestic animals, camels, kine, buffaloes, goats, and broad-tailed sheep, are raised. The principal exports are cotton, sugar, indigo, hides, drugs, dyestuffs, and wool. The principal imports are the wares of Britain. Bahawalpur is traversed by the Punjab Railway. It is one of the most important Mohammedan states in the district.

BAHAWALPUR, or **BHAWALPUR** (*Bhawāl Khan*, name of a ruler + Skt. *pur*, city). The capital of the native state of the same name, India, situated 65 miles by rail from Multan, on a tributary of the Ghara, in lat. 29° 24' N. (Map: India, B 3). It has a circuit of 4 miles—part, however, of the inclosed space being occupied by groves of trees. Bahawalpur has manufactures of silk scarfs and turbans, chintzes, and other cottons, and the immediate neighborhood is remarkably fertile, producing grain, sugar, indigo, tobacco, and butter, with an abundance of mangoes, oranges, apples, and other fruits in perfection. For external commerce Bahawalpur is favorably placed. It stands

at the junction of three routes from the east, southeast, and south; while, toward the north, the Hindu merchants have dealings with Bokhara and even with Astrakhan. Pop., 1901, 18,716.

BAHIA, bā-ĭ-ā. An eastern state of Brazil, bounded by Pernambuco and Piauí on the north, Goyaz on the west, Minas Geraes on the south, and the Atlantic Ocean on the east. It has an area of 164,649 square miles. The slightly indented coast is well wooded and is the most fertile part of the state. In the interior the land rises in terraces and forms numerous elevated plateaus, mostly unfit for agricultural purposes. The northern part is taken up by the desert tracts called *sertaos*. The chief river is the São Francisco, which crosses the state from south to north. There are also a number of smaller streams flowing toward the Atlantic, such as the Paraguassu, Itapicuru, and the Rio de Contas, the first two navigable by steamers. The climate is hot and moist on the coast and dry in the interior. In the eastern part tobacco, sugar, cotton, tropical fruits, coffee, and cocoa are raised, and the cultivation of rubber trees has been introduced; but in the west grazing is the most important industry. Gold and diamonds are mined chiefly in the Sierra da Assurua, about the Paraguassu River, while salt and saltpetre are found in many other parts of the state. The commerce is to a large extent with Great Britain and France, and the exports consist of tobacco (used chiefly in the manufacture of cigars, about 70,000,000 being produced yearly), sugar, rubber, coffee, diamonds, and skins. The chief railway line is the Bahia-São Francisco, mostly owned by the state. There is another line from São Amaro to Bom Jardim. Pop., 1890, 1,919,802; 1910 (est.), 2,335,000. Capital, Bahia. Consult *Almanak administrativo do estado do Bahia* (Bahia, 1898); Branner, "The Geography of Northeastern Bahia," *Geographical Journal*, vol. xxxviii (London, 1911).

BAHIA (Sp. and Portug. bay), or São Salvador de la Bahia de Todos os Santos. Capital of the state of Bahia, Brazil, the second city of the country, and the seat of an archbishop, who is primate of Brazil (Map: Brazil, K 6). It is situated on the east shore of the Bahia de Todos os Santos, or Bay of All Saints, from which it takes its name. It is 440 miles southwest of Pernambuco and 800 miles northeast of Rio Janeiro, with both of which cities it has communication by steamship and telegraphic cables. The city is divided into the *cidade baixa*, or lower city, and the *cidade alta*, or upper city. The former is the business quarter, with narrow, close, and dirty streets, while the upper city is clean and cool and commands a magnificent view. Hydraulic elevators connect the two parts of the city, and passenger traffic is also effected between them by means of *cadeiras*, or sedan chairs, the streets being so steep that carriages in many places cannot pass along them. The upper section is pleasantly surrounded by gardens of orange and banana trees and contains some fine buildings, notably the cathedral and the palace of the archbishop. The former edifice, the finest basilica in Brazil, constructed from marble brought from Europe, was the church of the Jesuits. The principal educational institutions are the university, normal school, medical college, museum, and a public library. Electric street railways traverse the city and suburbs, and Bahia is the starting

point and terminus of a railway to the interior. The harbor, protected by the natural breakwater formed by the island of Itaparica, is excellent. It has a circumference of more than 112 miles and is everywhere deep enough for the largest vessels. Extensive improvements were begun in 1909, with the result that the modern facilities instituted permit the mooring along the new docks of the largest ships. Heretofore only small boats could unload at the quays because of the heavy ground swell from the open sea. The ocean liners of the chief maritime powers of the world are represented in the shipping trade of Bahía. The bay and city are defended by an extensive system of fortifications, making it the most strongly protected town in Brazil. Of these defenses the best is the Fort do Mar, or Sea Fort, perched on an artificially enlarged rocky islet in the middle of the harbor.

The city has numerous industries. For upward of half a century Bahía has been the largest producer of cotton cloth, and also the supply base of northern Brazil for shoes, boots, and hats. It has considerable coast trade, the leading exports being sugar, cotton, coffee, hides, dyewoods, jute wares, and tobacco—its snuff having a widespread reputation. In spite of customs restrictions which prevent the full expansion of its trade, imports in 1912 amounted to nearly \$17,000,000. Bahía is the seat of a United States consul. It is the oldest city in Brazil; Amerigo Vespucci first entered its bay in 1503; from its foundation, in 1510, by the Portuguese navigator Correa, till 1763, it was the capital of the country. It fell into the hands of Holland in 1624, but not long after was regained by Portugal, remaining in her possession till 1824, more than a year after the proclamation of independence in the rest of Brazil. Pop., 1890, 174,412; 1911 (est.), 290,000.

BAHÍA BLANCA, blán'ka (Sp. White Bay). A port of Argentina in the southern part of the province of Buenos Aires, about 450 miles by rail southwest of the capital of the country (Map: Argentina, E 11). The site was occupied as a trading post about 1829, but its development industrially did not begin until 1885. Situated on the Neposta River 3 miles from its entrance into the bay of Bahía Blanca, which offers one of the best harbors along this section of the coast, it is the natural outlet for trade of an extensive fertile region adjacent. The city is in direct steamship connection with European ports. It is well built, well paved, and possesses fine buildings, plazas, parks, hospitals, and all modern conveniences. It is an important railroad centre, and this fact, together with its well-sheltered harbor, has greatly enhanced trade, which has been very active since the beginning of the twentieth century. In 1912 the value of imports amounted to nearly 12,000,000 pesos, while the value of its export trade totaled 69,000,000 pesos. The leading articles of the latter are wool and grain. The Argentine government has established this port as its principal naval base. The United States is represented by a consular agent. Pop., 1901, 14,238; 1912, 72,706.

BAHÍA HONDA, ón'dá (Sp. Deep Bay). A harbor on the north coast of Cuba, in the province of Pinar del Rio, about 55 miles west of Havana (Map: Cuba, B 4). The harbor is one of the best on the island, 5 miles long by 3 miles wide, with a depth of 18 to 36 feet. The town of Bahía Honda is distant about 2 miles.

Sugar and tobacco are cultivated to a considerable extent in the vicinity, and there are copper and coal mines. At Aguacate are sulphur springs. Pop., Bahía Honda and Aguacate, in 1890, 1278.

BAHMAN, bá'man, PRINCE. A character in "The Two Envious Sisters," a tale of the *Arabian Nights*. Leaving home in quest of adventure, he committed to his sister Parisadé a knife whose magic would reveal to her how he fared.

BAHNASA, bá-ná'sá, or **BEHNESA**, be-ná'sá. A town of central Egypt, situated on the Bahr Yusuf (Joseph Canal) (Map: Egypt, C 2). It occupies the site of the ancient Oxyrhyncus, or Pempte, the capital of a nome in which the fish Oxyrhynchus ('sharp-snouted') was held sacred. Plutarch relates that a feud arose between this city and its neighbor, Cynopolis (Gk. κύων, dog + πόλις, city), where the dog was revered, on account of mutual insults and injuries to their respective sacred animals. Under the Ptolemaic Dynasty Oxyrhynchus was the seat of a Greek colony, and after the establishment of Christianity it became a city of convents, containing at one time more than 20,000 monks and nuns. Excavations conducted by Grenfell in the neighborhood in 1897 resulted in the discovery of a large number of valuable Greek papyri, including portions of the New Testament and of the works of classical authors (Homer, Herodotus, Thucydides, Sophocles, etc.), some letters, and many legal and commercial documents, illustrating life in Egypt during the Greek and Roman periods. The most important of these papyri have been edited, with translation and notes, by Grenfell and Hunt, under the title *The Oxyrhynchus Papyri* (2 parts, London, 1898-99). The name "Bahnasa" is sometimes applied to the oasis of Bahriyer, near the town.

BAHR, bär (Ar. a body of water). The Arabic word for sea, also applied to lakes and rivers. **BAHR-EL-ABIAD**, á-bé-yád' (the White River), and **BAHR-EL-AZRAK**, á-láz'ræk (the Blue River), are the chief branches of the Nile. **BAHR-EL-YEMEN**, el-yá'men, is the Red Sea, and **BAHR LUT**, lóot, the Dead Sea.

BÄHR, bär, GEORG (1666-1738). A German architect. He was born at Fursenwalde, Prussia. As master builder for the municipality of Dresden he constructed the celebrated Frauenkirche, or Church of Our Lady (1726-40), in that city, which is considered one of the most perfect examples of the baroque style in Germany. He was famous as a builder of Protestant churches, and also erected a number of hotels in Dresden, such as the Hôtel de Saxe (1713-17) and the British Hotel (1720).

BAHR, bär, HERMANN (1863-). A prominent Austrian author and journalist, born at Linz. He studied philosophy, law, and political economy in the universities of Vienna, Gratz, Czernowitz, and Berlin, traveled extensively, and finally made his home in Vienna. In 1890 he became associate editor of the *Berliner Freie Bühne* (*Free Stage*), and in 1892 and 1893 was associate editor and critic of the *Deutscher Zeitung*. In 1894 he began to publish *Die Zeit*, and at other times edited the *Neue Wiene Tageblatt* and the *Oesterreichische Volkszeitung*. In 1906 he became manager of the *Deutsches Theater* in Berlin. Bahr appeared as an acute critic of the theories of life exploited in modern German and French literature. Although he began his literary career as a naturalist, he later attacked

this school, and tried to introduce into German and Austrian literature some of the features of the French symbolists and "decadents." This effort is especially pronounced in his *Zur Kritik der Moderne* (1890), *Die Ueberwindung des Naturalismus* (1891), and *Neue Studien* (1891). His later critique is contained in *Bildung* (1900), *Secession* (1900), *Premièren* (1902), and *Dialog vom Tragischen* (1903). His novels include *Die gute Schule* (1890); *Dora* (1893); *Neben der Liebe* (1893); *Stimmen des Bluts* (1909). Among his romances are *O Mensch!* (1910) and *Druf* (4th ed., 1910). Among his plays are *Die neuen Menschen* (1887); *Die Mutter* (1891); *Die häusliche Frau* (1893); *Der Apostel* (1901); *Der Krampus* (1902); *Der Meister* (1904); *Sanna* (1905); *Die Andere* (1905); *Das Konzert* (5th ed., 1909); *Die Kinder* (1911); *Das Prinzip* (1912). He also published the politico-controversial work, *Die Einsichtslosigkeit des Herrn Schaffle* (1886) and a volume of *Essays* (1912).

BÄHR, bär, JOHANN CHRISTIAN FELIX (1798–1872). A German classical scholar, born at Darmstadt. He studied at Heidelberg, where he gained the favor and friendship of Creuzer, whose symbolic system of interpretation in mythological matters he himself pursued at a later period. He was elected a professor at Heidelberg in 1821. Previous to this he had occupied himself chiefly with the elucidation and criticism of Plutarch, the result of which was an annotated edition of *Alcibiades* (Heidelberg, 1822), and of his *Philopæmen*, *Flaminius*, *Pyrrhus* (Leipzig, 1826). At the same time he collected and published the fragments of Ctesias (1824). But a greater interest was excited by his *Geschichte der römischen Litteratur* (1828; 4th ed., 1868–70), which is noted for its clearness and comprehensiveness. Three supplements to this work also appeared: *Die christlichen Dichter und Geschichtsschreiber Roms* (1836; 2d ed., 1872), *Die christliche-römische Theologie* (1837), and *Geschichte der römischen Litteratur im karolingischen Zeitalter* (1840). One of his most important works is his elaborate and learned edition of Herodotus (1832–35). In 1835 he published his *De Universitate Constantinopoli Quinto Sæculo Conditâ*. He likewise contributed numerous articles to Jahn's *Jahrbücher für Philologie* and kindred publications.

BÄHR, Otto (1817–95). A German jurist, born at Fulda. He studied law and political science at Marburg, Göttingen, and Heidelberg, and in 1849 became justice of the Supreme Court of Cassel. For his defense of the constitution during the struggle of 1850 he was made justice of the Supreme Court at Fulda in 1851, but in 1856 he was recalled to Cassel and in 1863 was made a member of the Court of Appeals. In 1867 he became a member of the new Court of Appeals established at Berlin for Alsace-Lorraine and was elected to the Reichstag from the city of Cassel and to the Prussian House of Deputies. He became a justice in the Imperial Court at Leipzig in 1879, but retired in 1881 on account of ill health. His most important writings are a highly esteemed monograph entitled *Die Anerkennung als Verpflichtungsgrund* (1855) and a treatise on political philosophy, *Der Rechtsstaat* (1864). He was also author of the *Gesammelte Aufsätze* (2 vols., Leipzig, 1895).

BAHRAICH, bâ-riçh'. The name of a district in the division of Faizabad, united prov-

inces of Agra and Oudh, British India, and of a town, capital of the district, situated at the foot of the Himalayas, 65 miles northeast of Lucknow (Map: India, D 3). Area of district, 2650 square miles; pop., 1891, 1,000,400; 1901, 1,051,850. The town, on the junction line from Gonda to Basti, began to flourish when the railroad was built and has a considerable trade. It manufactures fireworks and native cloth. Many thousands of pilgrims are attracted every year to the shrine of Masaud, a Mohammedan saint. Pop., 1901, 27,304; 1911, 26,907.

BAHRAL, bâ'ral. See BURHEL.

BAHRDT, bårt, KARL FRIEDRICH (1741–92). A German theologian of the extreme skeptical school. He was born Aug. 25, 1741, at Bischofswerda, in Saxony, and studied at Leipzig, where he soon displayed extraordinary talents, together with some defects of character. His early theological writings betrayed the skeptical tendencies which were afterward more fully developed. On account of his immoral conduct he was, in 1768, compelled to leave Leipzig, where he had been a popular preacher and professor. In Erfurt, his next residence, he was appointed professor of philosophy and Hebrew antiquities, but gave offense by his rationalistic teaching as well as by his mode of life. He wrote *Briefe über die systematische Theologie* (2 parts, 1770–71), and *Wünsche eines stummen Patrioten* (1770), two works whose heterodoxy involved him in controversies and made his position untenable. In 1771 he went to Giessen, where he delivered theological lectures and preached with approbation. His translation of the New Testament (1773) was regarded as so heretical that the author was deprived of the privilege of teaching (1775). His creed, in fact, was simple deism, and one of the chief points in his theology was his rejection of miracles. Even the immortality of the soul was not positively maintained in his work. From 1775 to 1779 he was most of the time in great straits and compelled to earn his support as best he might; but in 1779 he became professor of philosophy at Halle and won enormous popularity. But he overworked himself and so resigned his professorship. When the Wöllner edict of 1788 against rationalism appeared, he ridiculed it anonymously, but was condemned to a year's imprisonment at Magdeburg. He employed his leisure in writing his autobiography, which is not noted for veracity (1790). Released, in 1790, he opened an inn at Halle, where he lived with a mistress. He then wrote the best book of the many he produced, *System der moralischen Religion* (1719). He died at Halle, April 23, 1792. For his biography consult J. Leyser, *F. Bahrdt, sein Verhältniss zum Philanthropismus und zur neuern Pädagogik* (2d ed., Neustadt, 1870).

BAHREIN (bâ-rân') ISLANDS (Ar. *Bahr-ein*, two seas). A group of islands under British protection, situated in lat. 26° N. and long. 50° 40' E., on the west side of the Persian Gulf, lying mostly within the bay northwest of the Katar Peninsula (Map: Asia, E 6). Total area, 230 square miles. The chief island, called Bahrein, or Aval, has a north and south extent of 25 miles and a greatest breadth east and west of 9 miles; and while having flat, sandy coasts, yet is hilly in the interior. The soil is generally fertile, and the frequency of springs permits the somewhat extensive growing of eastern tropical fruit, such as figs and dates, and

of grains, particularly wheat and barley. The pearl fisheries, on banks submerged from 50 to 200 feet below the sea level, and extending for a distance of nearly 125 miles along the shore, form an important industry. In the interior are found many curious mound tombs of considerable size. An excellent breed of donkeys is raised, and the only manufactures are mats and cloth made from fibre. There are about 100 villages in the islands, but only two cities of considerable size: Manama, the chief trading centre; and Moharek, the capital, each with a population of about 25,000 in 1912. These islands have long been important trading points. Pop., 1890, 68,000; 1912 (est.), 90,000.

BAHR-EL-ASWAD. See **ATBARA**.

BAHR-EL-GHAZAL, bā'r-el-gā-zāl' (Ar. the river of gazelles). A western tributary of the upper White Nile, which it joins in about 90° N. lat. Through its affluents (the Bahr-el-Arab and others) it collects all the waters flowing southeastward from the highland of Darfur; also those flowing north through the Bahr-el-Ghazal Province (Jur, Jalo, etc.) east of the water parting between the Nile and Congo basins. The slope of the river is so exceedingly gentle that the current is slow, swamps spread far and wide, and immense barriers of vegetation are formed that make navigation very difficult.

BAIÆ, bī'ē, now **BAJA**. A famous watering place of the ancient Romans, situated on a beautiful bay in Campania, west of Puteoli (now Pozzuoli) and north of Cape Miseno. It was renowned for its lovely climate and scenery, its warm sulphur springs, and its excellent sea food, especially the oysters of the neighboring Lucrine Lake. Many wealthy Romans had villas here, and the shore is dotted to-day with the remains of ancient houses, baths, and temples. Even under the republic Baiæ was notorious for its loose morals, and under the emperors life there was marked by extreme luxury and sensuality. With the decline of the Roman power Baiæ rapidly lost its importance, and was finally abandoned because of its malarious atmosphere. Recently it has attained some importance as a naval station.

BAIER, bī'ēr, JOHANN WILHELM (1647-95). A Lutheran divine. His *Compendium Theologiæ Positivæ* (Jena, 1686; many ed., rep., St. Louis, Mo., 1882) was long the principal manual used by Lutheran divinity students.

BAIF, bā'f, JEAN ANTOINE DE (1532-89). A French poet, born at Venice. He was a member of the Pléiade (q.v.) and is perhaps best known for his unsuccessful attempt to introduce into French poetry the rhymeless verse (*vers mesurés*) of the ancients. For the promotion of this, and of a further design for the simplification of French orthography, he founded an "Académie de poésie et de musique" (1567-84). His *Poésies choisies* have been edited by Beq de Fouquières (1874), and his *Mimes, enseignements, et proverbes* by Blanchemain (1880). Consult Nagel, *Die metrischen Verse J. A. de Baif* (Leipzig, 1878), and Mathieu Augé-Chiquet, *La rîe, les idées et l'œuvre de Jean Antoine de Baif* (Paris, 1909).

BAIKAL, bī'kāl' (Turk., Tatar *bai*, rich + *kal*, lake, sea; Mongol, *Dalai-Nor*, holy sea). The third lake in point of size in Asia, and the largest fresh-water lake of the Continent; situated in the south of Siberia, in the government of Irkutsk, on the line of the Siberian Railway, in lat. 51° 28' to 55° 50' N., long.

103° 45' to 110° 20' E. (Map: Asia, K 3). It covers an area of 13,330 square miles and has a shore line of 1220 miles. Its length is 386 miles, and its breadth from 9 to 50 miles; height above the sea, 1587 feet; greatest depth, 4997 feet, making Baikal the deepest fresh-water lake of the world. The average depth is 820 feet, and the lake is divided by two areas of shallow water into three deep basins. Its waters are clear and transparent. The Baikal, Barguzin, and other mountains inclose the lake, which is fed by over 300 streams, the chief of which are the Selenga and Barguzin. Its outlet is by the lower Angara, a chief tributary of the Yenisei. Baikal has several islands, the largest of which is Olkhon. Petroleum wells, mineral and hot springs are found in the vicinity of the lake. Earthquakes occasionally occur. Baikal forms an important link in the chain of communication between Russia and China and has several commercial ports, the most important being Lisvinchnoe, whence the Angara carries its waters to the Yenisei. The Trans-Siberian Railway passes around its southern end. Of recent years steamboats have given a considerable impetus to its trade. Its sturgeon, salmon, and fresh-water seal fisheries are valuable, and large quantities of other fish are also taken. A peculiar fish, called the golomyinka (*Comephorus baicalensis*), which is almost one mass of fat, yielding train oil, was at one time caught in immense numbers, but is now rather scarce. The surface of the lake is frozen from November to April, but traffic is carried on over the ice. Besides the Russians settled on the banks of the Selenga and Angara, the shores of Lake Baikal are also inhabited by tribes of the Buryats and Tunguses. Consult Drizhenko, "Exploration of Lake Baikal," in *Geographical Journal*, vol. ii (London, 1898); Wookow, "Der Baikalsee," *Pet. Mitt.*, 56, Band, Heft. vi (1910).

BAIKIE, bā'ki, WILLIAM BALFOUR (1825-64). An English naturalist, traveler, and philologist. He was born at Kirkwall, Orkney, joined the British navy, and was made surgeon and naturalist to the Niger Expedition in 1854. The senior officer died before reaching Africa, and Baikie took command and explored the Niger for 250 miles. In 1857 he was sent on a second expedition, but his vessel was wrecked, and all his companions returned to England. He settled for a time, with none but native assistants, at the confluence of the Binue and the Niger. Within five years he opened the Niger to navigation, made roads, and established a market for the native trade. He studied and made vocabularies of nearly 50 native dialects, and translated into Hausa portions of the Bible and Prayer Book. He published *List of Books and Manuscripts Relating to Orkney* (with Kirkwall, 1847), *Historia Naturalis Orcadensis Zoology* (with R. Heddle, 1848), and *Observations on the Hausa and Fulfulde Languages* (1861).

BAIKTASHI, bik-tā'shē, or **BEKTASCHI**. A mendicant order of dervishes (q.v.), which had its origin in the fourteenth century. It takes its name from Hadji Bektasch, a Mohammedan saint. It was he who christened the newly constituted troops of Murad I the Janizaries. Shortly after this the Bektaschi sprang up and from their common patron were associated with the troop until its destruction. The order was abolished in 1826.

BAIL (OF. *bailler*, to carry, give, deliver,

from Lat. *baiulare*, to carry a burden, from *baiulus*, porter, carrier). The delivering up of a person under arrest, or against whom personal proceedings have been instituted, to accepted sureties who give security for his appearance at the proper time before the court, or for his carrying out the judgment of the court. The form of this security is usually a bond executed by the sureties, or a recognizance (q.v.) acknowledged by them. The term "bail" is also commonly applied as well to the security given and to the persons who give the security.

Bail may be required either in a criminal or a civil case, but in the latter only when the *person* of a defaulting debtor is proceeded against. With the modern changes of the laws with respect to the arrest and confinement of a debtor, the applicability of bail in civil cases has very greatly decreased. A person who has been bailed is placed in the custody of the surety who gives bail for him. He may therefore be arrested by the surety at any time and surrendered to the court, and when this is done the responsibility of the surety at once ceases. The surety is bound to produce his principal at the specified time unless prevented by the sickness, death, or legal imprisonment of the principal. In obtaining possession of the person of the principal, the surety has the right to call upon the sheriff or other law officers to assist him. An accused person entitled to bail has a right to demand the privilege at any time between the arrest and the final judgment of the court. The responsibility of the surety ceases upon the appearance in court of the principal at the proper time. If he does not so appear, the bond given as security may at once be declared forfeited by the court; whereupon execution may issue as for any judgment, and collection may be made forthwith. Under the common law bail could not be demanded in cases of felony. By statute law in Great Britain, and now universally in the United States, however, bail can be demanded in all cases except those of capital offenses. Considerable discretion is left to the magistrate as to whether an offense may or may not be such as properly to admit of bail. Thus, where an assault has been committed under such circumstances as to make it murder if the injured person should die, and where there is reasonable probability that death may ensue, a magistrate in any of our States would refuse to accept bail.

Generally speaking, in the United States the common law is closely followed in the regulation of bail. The English Bill of Rights (1 Will. and M. 2, chap. 2), the Constitution of the United States (Amdts., Art. VIII) and those of the several States prescribe that excessive bail shall not be demanded. What excessive bail may be is generally left to the determination of the court, though the criminal codes of many States specify a minimum sum for each class of offenses against the law, a lower amount than which shall not be accepted as security in such cases. A *bail piece* was originally a certificate issued to the surety attesting his act of offering bail; at present it generally signifies a warrant issued to the surety upon which he may arrest the person for whom bail has been taken. The term *straw bail* is a familiar designation of bail offered by persons not possessing the requisite financial responsibility, but willing to swear that they do possess it. The term is said to have originated in the fact that in the

English bankruptcy courts such rascals were always in waiting in the outer halls, and that it was their custom to carry straw fastened on the shoe to signify the kind of service they were willing to render. At the present day, in civil cases, bail cannot be required unless there is some allegation of fraud involved, such as that the defendant is suspected of the design of putting property out of the reach of the court, or where he is arrested in a debt proceeding, and affidavit is made that he is about to leave the State, or where a tort or personal injury of a malicious kind is alleged. The old distinction in civil cases between common bail (or bail below) and special bail (bail above or bail to the action) is, therefore, not now of such consequence as formerly. Common bail, or bail below, was in effect an undertaking that the defendant would appear before the court at the day and place named in the process; special bail was a more general undertaking, entered into after such appearance had been made, that the defendant should satisfy the judgment of the court in damages, debt, or costs, or, failing to do so, should surrender his person to the court. The statutes of the States and the practice of the courts usually require persons giving bail to be possessed of real estate or property not easily removable from the jurisdiction of the court. In admiralty bail is often required, in actions *in rem*, to procure the discharge of the property proceeded against. The bail is in the form of a stipulation, by which the owner of the seized property and his sureties undertake to pay and perform the final decree in the case. Consult the authorities referred to under PRACTICE.

BAILÉN, bi-lán'. A town in the province of Jaen, Spain, 20 miles north of Jaen (Map: Spain, D 3). It is celebrated as the place where, in July, 1808, the French general, Dupont, capitulated, surrendering 18,000 men to the Spaniards under Castaños—the first great disaster to the French arms in the Peninsular War. Galena and zinc blende are mined in the vicinity. Pop., 1900, 7420; 1910, 8334. Consult Galdós, "Bailén," in *Episodios nacionales*, vol. ii (Madrid, 1882).

BAILEY, bá'li (OF. *baile*, ML. *ballium* = Lat. *vallum*, wall = a court). Originally the bailey was any outer line of defense; then, more specifically, the wall of the outer court of a feudal castle, or any of its inner walls of defense. Hence it came to mean the whole space inclosed within these walls, except that covered by the keep. (See CASTLE.) With the development of feudal architecture there were several distinct courts, with their buildings and embattled walls, and each was called a bailey. Thus, there were the outer, the middle, and the inner baileys. The entrance to the outer bailey was by a drawbridge over the moat and through a strong gate; it was often defended by a barbican (q.v.), and precautions were also taken to defend the inner baileys. Each bailey had its special function. (See CASTLE; GOTHIC ARCHITECTURE.) In towns the bailey meant the entire space inclosed within the walls, or *vallum*, and was used in connection with civil and criminal jurisdiction; hence the Old Bailey in London and the Bailey in Oxford. In France the governor of a town was long called a *bailli*, and his subordinates were bailiffs.

BAILEY, FLORENCE MERRIAM (1863–). An American writer on ornithology. She was born at Locust Grove, N. Y., studied at Smith

College, Northampton, Mass., and began writing of bird life in the intimate fashion made so popular by the essays of John Burroughs. Her *Birds Through an Opera Glass* (1889) directed attention to that method of observation. She also published *A-Birding on a Bronco* (1896), *Birds of Village and Field* (1898), and *Handbook of Birds of the Western United States* (1902).

BAILEY, GAMALIEL (1807-59). An American journalist, prominent in the antislavery conflict. He was born at Mount Holly, N. J., the son of a Methodist preacher; graduated at the Jefferson Medical College, Philadelphia, in 1827; and for several months, after 1829, was the editor, at Baltimore, of *The Methodist Protestant*, the short-lived official organ of a radical offshoot of the Methodist Episcopal church. He went to Cincinnati in 1831, and was physician in the cholera hospital during the great cholera epidemic of that year. Converted to Abolitionism through the famous Lane Seminary debates of 1834, he thereafter took an active part in the anti-slavery conflict, and in 1836 assisted James G. Birney (q.v.) in establishing a weekly antislavery paper, *The Cincinnati Philanthropist*, of which he became proprietor and editor-in-chief in September, 1837. His press was repeatedly destroyed by mobs, and his life was often threatened, but he nevertheless continued his work until 1847 and after 1843 was editor also of a daily paper, *The Herald*, likewise established by himself. In 1847 he removed to Washington and became the editor of a newly established antislavery paper, *The National Era*, which under his management attained a wide circulation, exerted a powerful influence, and came to be regarded in many quarters as the central organ of Abolitionism. To this paper Mrs. Stowe, Whittier, Amos A. Phelps, and Mrs. Southworth were regular contributors, and it was in it that, in 1852, Mrs. Stowe's *Uncle Tom's Cabin* first appeared. In 1848 the *Era* office was besieged for three days by a proslavery mob, which finally dispersed under the influence of an eloquent address by Dr. Bailey. Consult an article, "A Pioneer Editor," in *The Atlantic Monthly*, vol. xvii (Boston, 1866).

BAILEY, JACOB WHITMAN (1811-57). An American naturalist, known as the pioneer in microscopic research in America. He was born at Auburn, Mass., and in 1832 graduated at West Point, where, after 1834, he was successively assistant professor, acting professor, and professor of chemistry, mineralogy, and geology. He devised various improvements in the construction of the microscope and made an extensive collection of microscopic objects and of algae, which he left to the Boston Society of Natural History. In 1857 he was president of the American Association for the Advancement of Science. He wrote many articles on scientific subjects for the *American Journal of Science* and for scientific societies, a report on the infusorial fossils of California, and a valuable volume of *Microscopical Sketches*, containing more than 3000 original figures. A sketch of his life is given in the *American Journal of Science and Arts*, vol. xxv (New Haven, 1847).

BAILEY, JAMES MONTGOMERY (1841-94). An American journalist who won an ephemeral popularity as the "Danbury News Man." He was born at Albany, N. Y., and, after receiving a common-school education, learned the trade of a carpenter. He removed to Danbury, Conn., in

1860, and worked at his trade for the two following years, but found time to write occasionally for the newspapers. During the Civil War he served in the Seventeenth Connecticut Volunteers. In 1870 he established the *Danbury News*, for which he wrote the humorous sketches, sometimes original, often simply descriptive of commonplace happenings, which won for him a national reputation and made his paper known throughout the country. His first book, *Life in Danbury*, was published in 1873; it consisted of selections from his newspaper articles. His other publications were *The Danbury News Man's Almanac* (1873), *They All Do It* (1877), *England from a Back Window* (1878), *Mr. Phillips's Goneness* (1879), and *The Danbury Boom; with a Full Account of Mrs. Cobleigh's Action Therein* (1880).

BAILEY, JOSEPH (1827-67). An American soldier, born in Salem, Ohio. He entered the Federal army as captain in 1861, in 1862 was appointed acting engineer of the New Orleans defenses, and in 1863 was promoted to be lieutenant-colonel. When, in 1864, the Red River was found too shallow for the passage of Admiral Porter's gunboats, Bailey, in face of opposition from the engineers, superintended the construction of dams which deepened the water in mid-channel and thus permitted the vessels to descend. He was promoted to be brigadier-general in 1864, resigned from the army in 1865, and, having removed to Missouri, was killed there while performing his duties as sheriff.

BAILEY, JOSEPH WELDON (1863-). An American legislator, born in Copiah Co., Miss. He was admitted to the bar in 1883 and within a few years was brought into prominence by his interest in politics. From Georgia he was a presidential elector in 1884, and four years later, having removed in the meantime to Gainesville, Tex., was a presidential elector-at-large. Elected to the House of Representatives in 1891, he was continued there for 10 years, at the end of which time he was chosen to the United States Senate. He was reelected Senator in 1907 for the term ending 1913, and in the latter year was not again a candidate. Senator Bailey gained a reputation during his period of service as one of the most conspicuous and picturesque figures in the Senate and as one of the most eloquently persuasive orators ever a member of that body. Identified with the conservative wing of the Democratic party, and a deep student of constitutional law, he was particularly opposed to "free" interpretations of the Constitution. While in the House and during his earlier years in the Senate he was noted for aggressiveness in debate, but later on he was less frequently heard from the floor. In 1911, on account of the action of Democratic Senators in voting to accept the radical constitution passed by the voters of Arizona, Senator Bailey handed in his resignation to the Governor of Texas. This he later withdrew, announcing, however, in 1912, that he would not be a candidate for reelection, but would retire to the practice of law. His last speech in the Senate was a remarkable attack on the initiative, referendum, and recall, and all similar devices for bringing about so-called reforms in the State and national governments.

BAILEY, LIBERTY HYDE (1858-). An American horticulturist and botanist, rural sociologist, and agricultural educator. He was born at South Haven, Mich., graduated at Michi-

gan Agricultural College in 1882, and became professor of horticulture and landscape gardening in that institution, 1883. He was appointed to the chair of general and experimental horticulture at Cornell University in 1888-1903, when he became dean of the College of Agriculture and director of the experiment station there until his retirement in 1913. He made numerous important investigations in the science and practice of horticulture, rural economics and sociology, agricultural education, and general rural questions. He served as chairman of the Roosevelt Commission on Country Life in 1908-09. He has published a large number of scientific and popular works, contributed largely to technical journals and popular magazines, and written numerous poems on country life. He edited *The Cyclopaedia of American Agriculture* (1907-09), the *Cyclopaedia of American Horticulture* (1900-02), and the *Rural Science, Rural Textbook, Gardencraft, and Young Folks' Library* series of manuals. He was also author of much of this material and of many other works, notably *The Principles of Fruit-Growing* (1897); *The Nursery Book* (1897); *Plant-Breeding* (1897); *Sketch of the Evolution of our Native Fruits* (1898); *Principles of Agriculture* (1898); *The State and the Farmer* (1908); *The Nature Study Idea* (1909); *The Training of Farmers* (1909); *Manual of Gardening* (1910); *The Outlook to Nature* (1911); *The Country Life Movement* (1911); *The Practical Garden Book* (1913).

BAILEY, NATHAN or NATHANIEL (?-1742). An English lexicographer. He published *An Universal Etymological English Dictionary* in 1721, adding a supplementary volume in 1727. This work was so popular that by 1802 it had reached its thirtieth edition, and Johnson made a liberal use of it in preparing his own dictionary. Among Bailey's other works is *The Antiquities of London and Westminster* (1726). In 1883 the English Dialect Society reprinted the eighteenth-century dialect words preserved in Bailey's dictionary. This work was one of the sources from which Chatterton drew his pseudo Old English words.

BAILEY, PHILIP JAMES (1816-1902). An English poet, born at Basford, Nottingham. He studied at the University of Glasgow and was called to the English bar in 1840, but never practiced. His first poem, *Festus*, begun before he was 20 years old, was published in 1839. It was received with great enthusiasm, its author being classed by many critics of the day with Shakespeare and Milton. This extravagant estimate was naturally succeeded by a reaction, and for many years *Festus* was practically forgotten. In 1900, however, a renewed interest was manifested in it, and something like a fair critical estimate of the poem was made. *Festus* does, in fact, contain many passages of great power, and its language is often striking and majestic. On the other hand, it is excessively rhetorical; and this defect gives, upon a second reading, the impression of artifice and insincerity, while some of its best lines are really variants of Shakespearean originals. It was followed by *The Angel World* (1850), *The Mystic* (1855), and *The Universal Hymn* (1867), all of which have since been made a part of *Festus*. Bailey also published *The Age*, a satire (1858). Consult the eleventh or Jubilee edition of *Festus* (London, 1889). See ENGLISH POETRY, SPASMODIC SCHOOL OF.

BAILEY, SAMUEL (1791-1870). An English writer on politics, political economy, philosophy, and criticism. He became a banker and at his death left £90,000 to his native town, Sheffield. His writings generally are distinguished by independent thinking, logical precision, and warm aspirations for the improvement of mankind. His treatises on the mind, while abounding in original suggestions, expand and enforce the views of the school of Locke in metaphysics and what is termed the doctrine of utility in morals. Among his works the following may be mentioned: *A Critical Dissertation on the Nature, Measures, and Causes of Value* (1825); *The Right of Primogeniture Examined* (1837); *Letters on the Philosophy of the Human Mind* (3 series, 1855, 1858, 1863); and *The Received Text of Shakespeare's Dramatic Writings and its Improvement* (1861-62).

BAILEY, SOLON IRVING (1854-). An American astronomer, born at Lisbon, N. H. He graduated in 1881 at Boston University and was subsequently appointed associate professor of astronomy at Harvard. In 1889 he established at Arequipa, Peru, a southern station of the Harvard Observatory, and in 1893, on the summit of Mount Misti at an elevation of 19,000 feet, the most loftily situated scientific station in the world. During 1908-09 he made astronomical observations and an investigation of climatic conditions in South Africa. Papers by him are to be found in the *Annals of the Harvard Observatory*. In addition, he published: *A Discussion of Variable Stars in the Cluster α Centauri* (1902); an extensive work, *Peruvian Meteorology* (1902); *Recent Total Eclipses of the Sun* (1902).

BAILEY, THEODORUS (1805-77). An American naval officer, born in Chateaugay, N. Y. He entered the navy in 1818, became lieutenant in 1827, was commissioned commander in 1849 and captain in 1855, and in 1861 was assigned to the command of the *Colorado* in the blockade of Pensacola. In 1862 he was second in command of the fleet sent under Farragut against New Orleans. He led the attack upon the forts and was dispatched by Farragut to demand the surrender of the city. He was promoted in the same year to be commodore, and was appointed commander of the Eastern Gulf blockading squadron, in which post it is said that in 18 months he captured more than 150 blockade runners. After the war he was commandant at the Portsmouth (N. H.) Navy Yard and in 1866 was retired with rank of rear-admiral.

BAILEY PEONAGE CASE. See ALABAMA, History.

BAILIE (Scotch for *bailiff*). A superior officer or magistrate of a municipal corporation in Scotland, with judicial authority within the city or burgh. In royal burghs the office is in some respects analogous to that of alderman in England. The chief magistrate of a Scotch corporation, called the provost (q.v.), and often one or more of the bailies, are, by virtue of their office, in the commission of the peace. There are also *bailies of regality* and *barony*, who are appointed by the superior or overlord of the manor (q.v.), with limited powers. There is a bailie for the sanctuary or abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper and having jurisdiction within the precincts. See BAILIFF.

BAILIFF (OF. *bailiff*, Fr. *bailli*, administrator, Low Lat. *bailivus*, from *bailulus*, carrier,

one who carries burdens, takes charge of). An officer exercising superintendence on behalf of some superior authority. Through all the changes of application the word has undergone in the course of history, it has denoted an overseer of some kind. At the Greek Imperial court in Constantinople, the chief tutor of the Imperial children was called *baulus*. The same title seems also to have been given in Constantinople to the superintendent of the foreign merchants, who was appointed by the Venetians, and it may possibly be for this reason that the title *balio* came at length to be applied also to the Venetian ambassadors themselves. In France, the royal *baillis* were at one time commanders of the troops, administrators of the royal domains, and judges, each one in his district. Under the feudal system in England lords of manors or of the larger territorial units known as liberties or hundreds, enjoyed usually the right of administering justice in their domains and, as an incident of their jurisdiction, appointed bailiffs to superintend their courts of justice. As very little knowledge was required for these situations, and as they might be purchased, they were held in little estimation; and in later times, the bailiffs became standing characters on the stage, held up to ridicule on account of their ignorance and absurd pretensions. In some instances, however, the office of bailiff has been preserved in England as an office of dignity and authority, corresponding to that of sheriff, as in the case of the Bailiff of Dover Castle.

In modern English law the term "bailiff" means (a) a superior servant or agent, in which sense the term is synonymous with *steward* or *factor*; and (b) an officer of the court, a tipstaff, a sheriff's officer or deputy. Its first application is to a person employed in the administration and charge of lands, goods, or chattels. The bailiff is liable in an action of account for the profits which he has made, or which he might, by proper industry and care, have made.

In the second sense in the English law bailiffs may be either officers appointed by the judges of certain courts, or, in more modern times, officers appointed over their respective districts by the sheriff to perform certain duties, including the service of process of arrest, collection of fines, and summoning of juries. The sheriff being answerable for their misdemeanors, bailiffs are usually bound in an obligation with sureties for the due execution of their office, and are then called *bound bailiffs*. *Special bailiffs* are officers appointed by the sheriff on the application of a party in a civil suit for some particular purpose, and the sheriff is not held responsible for their acts in this regard. In the United States the term "bailiff" is seldom used, the corresponding officer being the deputy or undersheriff. Deputies are of two classes: (1) general deputies, or those who by virtue of their appointment have authority to execute all the ordinary duties pertaining to the sheriff's office; and (2) special deputies, or officers *pro hac vice*, to execute particular processes for a special purpose. See SHERIFF.

BAILIFF'S DAUGHTER OF ISLINGTON, Iz'ling-ton, THE. An old ballad in Bishop Percy's *Reliques of Ancient English Poetry*. The heroine, after dismissing her lover, finds him seven years later in London.

BAILTWICK (*bailiff*, *baillie* + *wick*, AS.

vic, village, from Lat. *vicus*, village). In English law, the district within which a sheriff may exercise jurisdiction. Thus bailiwick is generally synonymous with county, and as such includes the limits within which a sheriff's deputies may execute process. The term is said by Blackstone to have been introduced into England by the Normans "in imitation of the French, whose territory is divided into bailiwicks, as that of England into counties." The term is not in use in the United States. See BAILIFF; SHERIFF.

BAILLARGER, bá'yär'zhä', JULES GABRIEL FRANCOIS (1809-91). A French physician; born at Montbazou (Indre-et-Loire). He devoted himself principally to mental disorders, and in 1842 obtained a prize from the Academy of Medicine for his admirable essay entitled *Des hallucinations, des causes qui les produisent et des maladies qu'elles caractérisent*, published in vol. xiii of the *Mémoires* of the society. In association with Longet and Cerise, he founded in 1843 a review especially devoted to the study of nervous affections and mental diseases, under the title *Annales médico-psychologiques du système nerveux*. In recognition of his splendid services during the second outbreak of the cholera in 1849, Baillarger was decorated with the medal of the Legion of Honor.

BAILLET, ba'yä', ADRIEN (1649-1706). A French scholar and critic, born at Neuville-au-Héz, Beauvois, and educated there. In 1676 he was ordained to the priesthood, and in 1680 he became librarian to the advocate-general. His principal work is *Jugements des savants sur les principaux ouvrages des auteurs* (9 vols., 1685-86). He also wrote *Des satires personnelles* (2 vols., 1689); *Vie de Descartes* (2 vols., 1691); *Les vies des saints* (3 vols., 1701).

BAILLEUL, ba'yäl'. The chief town of a canton, arrondissement of Hazebrouck, in the department of Nord, France, 46½ miles southeast of Calais by rail (Map: France, N., H 2). It is picturesquely situated on rising ground north of the river Lys, near the Belgian frontier. It is a quaint town of Flemish origin: the church of Saint-Vaast dates from the fourteenth century, and the Hôtel-de-Ville from the fifteenth; there is a museum of antiquities and paintings. Handmade lace is the chief industry, but the town has also manufactures of woollens, leather, brandy, and pottery. Pop., 1896, 13,450; 1901, 11,899; 1906, 13,573; 1911, 13,251.

BAILLIE, LADY GRIZEL (1665-1746). A Scottish poet, born in Berwickshire. She was the daughter of the Scottish patriot, Sir Patrick Hume, afterward first Earl of Marchmont, and in 1684 supplied him with food during his concealment in the vault beneath Polwarth Church. She shared her father's exile in Utrecht (1686-88). In 1692 she married the son of Robert Baillie, of Jerviswood. Some ballads written by her are preserved in Allan Ramsay's *Tea-Table Miscellany* (1724-27). The best known of them is "And Were na my Heart Licht, I wad Dee."

BAILLIE, HARRY. The shrewd proprietor of the Tabard Inn, in Chaucer's *Canterbury Tales*. It is in his hostelry that the pilgrims pass the first night of their journey, and in the morning he decides to continue on the road with them. He acts as the toastmaster of this literary feast, linking the different tales together by his little prefatory speeches.

BAILLIE, JOANNA (1762-1851). A Scottish

dramatist and poet born Sept. 11, 1762, at Bothwell, in Lanarkshire. In 1784 she went to reside in London, where her brother was a physician. Here and in Hampstead she remained till her death, Feb. 23, 1851. Through her long life she enjoyed a large share of the esteem and affection of her literary contemporaries. Her greatest achievement is undoubtedly the *Plays on the Passions*, which, though erroneous in conception, are full of noble and impressive poetry, and often display intense dramatic power. The principle upon which Miss Baillie proceeded in the construction of these plays was to take as the subject of each some passion, like hate, love, fear, or remorse, and to exhibit its influence on a character supposed to be actuated by nothing else. The leading personages of Miss Baillie's plays are, therefore, rather personifications of certain elements of human nature than genuine human beings. Still, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shown in her minute delineation of a particular passion, and where he is forced to forget the artificial theory underlying it. The first volume of the *Plays on the Passions* appeared in 1798 and met with remarkable success. Four years afterward she published a second volume; in 1804, *Miscellaneous Plays*; in 1812, the third volume of her *Plays on the Passions*; and in 1836, three volumes of dramatic poetry. The most popular, as well as the most powerful of her works, is the tragedy of *De Montfort*. It was performed in London, when Charles Kemble acted for 11 nights the character of the hero. Many of Miss Baillie's minor pieces are very sweet, simple, and beautiful; some of them are humorous ballads and poems in the Scottish dialect. Consult Baillie, *Dramatic and Poetical Works* (London, 1851), and Thackeray-Ritchie, *Book of Sibyls* (London, 1883).

BAILLIE, MATTHEW (1761-1823). A Scottish anatomist, born in Lanarkshire. He received his education at the universities of Glasgow and Oxford and subsequently continued his anatomical studies in London. In 1795 he published a small work entitled *The Morbid Anatomy of Some of the Most Important Parts of the Human Body*, which had a remarkable influence on the study of medicine and excited a spirit of careful induction among professional men. In 1799 Baillie relinquished his anatomical lectureship, in 1800 his position at St. George's Hospital, and after 1810 he acted as physician to the King.

BAILLIE, ROBERT (1599-1662). A Scottish Presbyterian clergyman. He was born at Glasgow and was educated in its university. In 1622 he was episcopally ordained, and (1631) was settled in Kilwinning. In 1640 he was one of the commissioners to go to London to prepare charges against Archbishop Laud. In 1642 he was appointed first professor of divinity at Glasgow; in the next year he sat as a commissioner in the Westminster Assembly of Divines and there asserted the divine right of presbytery as intolerantly as the churchmen had asserted the divine right of episcopacy. In 1649 he was one of the delegation sent to Holland to ask Charles II to accept the covenant and crown of Scotland. In 1661 he was made principal of Glasgow University. He died there in July, 1662. He was one of the most learned and accomplished of the Scottish clergy. His *Letters and Journals* (1637-62, best ed. by David Laing, 3 vols., Edin-

burgh, 1841-42) is a valuable contribution to knowledge of the times.

BAILLIE-GROHMAN, WILLIAM ARTHUR (1851-). An English sportsman and author. He was educated in England and on the Continent, had wide experience in the pursuit of big game, and as a rifle shot won about 70 prizes in America and Europe. His collection of prints and books pertaining to the chase is considered valuable. He was appointed a justice of the peace in British Columbia and published *Tyrol and the Tyrolese* (1876), *Sport in the Alps* (1896), *Sport and Life in North America* (1900), and other similar works.

BAILLIE OF JERVISWOOD, ROBERT (?-1684). A Scottish patriot and martyr to the cause of civic liberty. He was a native of Lanarkshire and came into prominence in 1676 by opposing the tyranny of the Duke of Lauderdale, the favorite of Charles II, in the illegal arrest of a relative. By means of an antedated warrant Baillie himself was thrown into prison and, indignantly refusing to pay the fine inflicted, was kept there four months, but was finally released on paying one-half of the amount demanded. After this he was a marked man and on the discovery of the Rye House Plot was arrested on no stronger evidence than certain letters, really of a non-compromising character, to the leaders of the Puritan party in London. He was kept in prison 20 months and became seriously ill. At last, in a dying condition, he was brought before the High Court in Edinburgh on a charge of treason, and although no valid evidence was presented to show his complicity in the plot, was adjudged guilty on the morning of Dec. 24, 1684, and barbarously hanged the same afternoon. His bearing throughout was dignified and heroic, and he has been called the "Scottish Algernon Sidney." His son married the poet Lady Grizel Baillie (q.v.). Consult *The Trial and Process of High Treson and Doom of Forfaultere Against Mr. Robert Baillie of Jerviswood, Traitor* (London, 1685).

BAILLOT, ba'yô', PIERRE MARIE FRANÇOIS DE SALES (1771-1842). A French violinist and composer. He was born at Passy and died at Paris. After receiving his musical education in Paris and Rome, he appeared in public in 1791, and in 1795 became professor of the violin in the Paris Conservatoire, which post he held until his death. He studied harmony and counterpoint under Catel and Cherubini, became a member of Napoleon's private orchestra in 1802, traveled in Russia in 1805-08, and in 1814 organized chamber-music concerts in Paris, which gained him reputation as a quartette player. In 1815-16 he made a tour in Holland, Belgium, and England, and became a member of the London Philharmonic Society. He was director of the orchestra at the Paris Opera in 1821-31, of the Concerts Spirituels in 1822-24, and of the Royal Orchestra in 1825. Baillot was the last great representative of the classical school of violin playing in Paris; he was famous as a teacher, and his *Méthode du violon*, adopted by the Conservatoire, was considered by Fétis one of the best works of its kind. His compositions are difficult and are almost forgotten. Consult Wasielewski, *Die Violine und ihre Meister* (Leipzig, 1893).

BAILLY, ba'yé', ANTOINE NICOLAS (1810-92). A French architect, born in Paris. He executed various works as diocesan architect at Bourges, Valence, and Digne, and after 1860

erected in Paris the Lycée St. Louis and his most famous work, the Tribunal de Commerce. He was the first president of the Société des Artistes Françaises and an officer of the Legion of Honor.

BAILLY, JEAN SYLVAIN (1736-93). A French savant. He was born in Paris. Originally intended by his father to be an artist, he first turned aside into literature, until, becoming acquainted with Lacaille, he was induced to study astronomy, which proved to be the true sphere of his genius. In 1763 he presented to the Académie des Sciences his *Lunar Observations*; in 1766 appeared his *Essai sur la théorie des satellites de Jupiter*, and in 1771 a treatise on the light of these satellites. His historico-scientific works, *Histoire de l'astronomie ancienne* (1775), *Histoire de l'astronomie moderne* (3 vols., 1779-82), *Traité de l'astronomie indienne et orientale* (1787), are full of learning and ingenious disquisition and written with great elegance. In 1777 he published his *Lettres au l'origine des sciences*, and in 1779 his *Lettres sur l'Atlantide de Platon*. In 1784 he was elected a member of the Académie Française and in the following year of the Académie des Inscriptions. The *éloges* which he wrote about this period for the Académie des Sciences, viz., those on Charles V, Molière, Corneille, Lacaille, Leibnitz, Cook, and Gresset, were very highly praised. The Revolution interrupted his peaceful studies. During the earlier part of it he occupied a very prominent position. Elected president of the National Assembly, June 17, 1789, and mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the National Guard to fire on the masses who were assembled in the Champs de Mars, on the 17th of July, 1791, to demand the dethronement of the King. He now threw up his mayoralty, considering it impossible to satisfy either party, withdrew altogether from public affairs, and went to live first at Nantes, and afterward with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery and brought to Paris, where he was accused of being a conspirator and was executed Nov. 12, 1793. Among his papers were found, and afterward published, an *Essai sur l'origine des fables et des religions anciennes* (1799), and *Mémoires d'un témoin oculaire de la Révolution* (1804). Consult Arago, *Biographie de Jean Sylvain Bailly* (1853) and Nourisson, *Trois Révolutionnaires: Turgot, Necker, Bailly* (1885).

BAILMENT (for derivation, see BAIL). A delivery of personal property by one party to another, to be held for the purpose and according to the terms of the delivery, and returned or delivered over when that purpose is accomplished. The party delivering the chattel is termed the *bailor*; the recipient, the *bailee*. A bailment is distinguished from a sale in that the identical thing delivered is to be restored in the same or an altered form and not its value in money or in a substituted article, and from a mortgage by the fact that in bailment there is no transfer of title. But so important is possession at the common law that the ownership is deemed to be divided between the bailor and bailee, the latter being said to have the "special property" in the bailed article, while the interest of the owner, sometimes described, by analogy to the law of real property, as a reversionary

interest, is known as the "general property" therein. Bailments are generally divided into three classes, formerly designated by terms derived from the civil law: (1) that for the sole benefit of the bailor or the party whom he represents; (2) that for the sole benefit of the bailee or the party whom he represents; (3) that for the benefit of both parties. Familiar instances of bailment are the lending or hiring out of chattels, lien or the right to detain a chattel to enforce the payment of charges thereon, pledge or pawn and the custody of goods by an innkeeper or common carrier. As the common law is mainly concerned to protect possession, it is the bailee and not the owner of a chattel who is entitled to maintain the ordinary actions, such as trespass, trover, and replevin, for an interference with the bailed article while in the bailee's possession, although for a permanent injury done to the chattel, the bailor may prosecute a special action for the inquiry to his reversionary interest. The wilful destruction of the bailed article by the bailee or any unauthorized use thereof by him amounts to a conversion (q.v.) and ipso facto puts an end to the bailment. The important question, however, of the law of bailments is the determination of the obligations and liabilities of the respective parties in their several relationships. Thus, when the bailment is for the bailor's sole benefit, the bailee is required to exercise but slight care and is responsible only for gross negligence; but when wholly for the bailee's benefit, as a gratuitous loan, he must exercise the greatest care and is answerable for slight negligence; when the transaction is reciprocally beneficial to both parties, the bailee is required to exercise only ordinary care and is answerable only for ordinary neglect. It follows from this that a bailee, in the absence of special agreement, is not an insurer of the chattel placed in his hands and is not responsible for losses or damages necessarily incident to the purpose of the bailment; but he is liable for the violation of the obligation imposed by the terms of the contract, or for the misappropriation of the chattel or the misdirection of its use. By the common law an exception is made in the case of innkeepers and common carriers who are absolutely liable for the safe return of the goods intrusted to them, except from losses occurring by the act of God, the public enemy, or through the fault of the bailor. But this rule has been modified by statute in conformity with modern conditions, both in England and the United States; and the innkeeper may now, by providing a safe deposit and giving proper notice, require the guest to deposit his valuables, in default of which the innkeeper's liability does not exceed that of an ordinary bailee. It is also generally recognized that a common carrier's liability as an insurer against everything except the act of God or the public enemy may, by proper notice and fair and reasonable special contract, be reduced to exclude all losses and injuries except those resulting from his own or his servants' negligence. In the State of New York this doctrine is carried to the extent of permitting exception even from those damages resulting from his own negligence, but not from willful wrongdoing. The contract of a carrier of passengers is not a contract of bailment. Consult: Schouler, *Treatise on the Law of Bailments* (3d ed., Boston, 1897); Story, *Commentaries on the Law of Bailments* (9th ed., Bos-

ton, 1878); Beal, *Law of Bailments*, with notes to Canadian cases (London, 1900). See CARRIER, COMMON; INNKEEPER; LIEN; PLEDGE; MORTGAGE.

BAILY, EDWARD HODGES (1788-1867). An eminent English sculptor, particularly known for his portrait statues and busts, born at Bristol. In 1807 he entered the studio of Flaxman in London. He was made an associate of the Royal Academy in 1817 and a full member in 1821. The statue of Nelson in Trafalgar Square, London, is one of his finest works. His other sculptures include "Eve at the Fountain," "Hercules Casting Hylas into the Sea," "Psyche," "Eve Listening to the Voice."

BAILY, FRANCIS (1774-1844). An eminent English astronomer, born at Newbury. In the midst of active business as a London stockbroker, he laid the foundation of his scientific fame, and during the years of life usually devoted to repose, underwent labors and rendered services to astronomy which entitle him to be regarded as one of the most remarkable men of his time. Among the chief of these services were his share in the foundation of the Royal Astronomical Society and in the improvement of the *Nautical Almanac*, his laborious repetition of Cavendish's pendulum experiments and the production of the Royal Astronomical Society's star catalogue, based on a revision of the catalogues of Tobias Mayer, Halley, and the earlier astronomers. In 1842 he completed the reduction of Lalande's great catalogue for the British Association. He was elected a Fellow of the Royal Society in 1821 and was twice awarded the gold medal of the Royal Astronomical Society (1827 and 1843). He was also the first to describe fully the phenomenon known as Baily's beads, which is observed in connection with total eclipses of the sun. Just before the beginning and after the end of the obscuration of the sun by the moon's disk, the thin crescent-shaped unobscured portion of the sun seems to become suddenly discontinuous and looks like a belt of bright spots varying in size and separated by dark spaces. The resulting appearance may be compared to a string of beads. The phenomenon is the effect of irradiation and the inequalities of the moon's edge. In addition to an immense mass of contributions to the *Memoirs of the Royal Astronomical Society*, Baily wrote a valuable *Account of the Rev. John Flamsteed, the first Astronomer Royal* (1835), which gave rise to much discussion on the subject of that eminent man's connection with Newton. To the literature of life annuities, etc., he contributed several standard works, the chief of which are *The Doctrine of Interest and Annuities* (1808) and *The Doctrine of Life Annuities and Assurances* (1810). Consult Herschel, *Memoir of F. Baily, Esq.* (London, 1847).

BAILY'S BEADS. See BAILY, FRANCIS.

BAIN, bān, ALEXANDER (1818-1903). A Scottish psychologist. He was born at Aberdeen, Scotland, and studied at Marischal College from 1836 to 1840, obtaining the degree of M.A. He taught moral and natural philosophy at this institution from 1841 and 1845, and afterward became successively professor of natural philosophy at Anderson's University, Glasgow, assistant secretary to the Metropolitan Sanitary Commission from 1847 to 1855, secretary of the General Board of Health from 1848 to 1850, examiner in logic and moral philosophy at the University of London from 1857 to 1862, examiner in moral science for the India Civil Ser-

vice from 1858 to 1860 and in 1863, professor of logic and English literature in the University of Aberdeen from 1860 to 1880, and lord rector of the University of Aberdeen in 1881. He received the degree of LL.D. from Edinburgh University in 1859. From the year 1840 Bain was a frequent contributor to the *Westminster Review* and *Chambers's Papers for the People and Information for the People*. In these publications he became well known both for his exceptionally apt popularizations and for his own researches in fields of applied science. But his enduring fame will be associated with his treatises on psychology. His best-known works are: *The Senses and the Intellect* (1855; 4th ed., 1894); *The Emotions and the Will* (1859; 4th ed., 1899); *The Study of Character* (1861); *Mental and Moral Science: A Compendium of Psychology and Ethics* (1868; 3d ed., 1872); *Logic, Deductive and Inductive* (1870, 1879); *The Relation of Mind and Body* (1873, 1897); *Education as a Science* (1879; 7th ed., 1889). Bain also edited Paley's *Moral Philosophy* (1852), published a biography of James Mill (1882), a criticism of J. S. Mill (1882), assisted in editing Grote's *Aristotle*, edited Grote's *Minor Works*, and wrote several authoritative works on composition and rhetoric.

Bain was a staunch empiricist, emphatically opposed to all transcendental and a priori methods of procedure. Following Hartley's lead, he sought to supply a physiological basis for all psychical facts. Perhaps the best characterization of his place in psychology is given by J. S. Mill in *Dissertations and Discussions* (1874): "Bain has stepped beyond all his predecessors and has produced an exposition of the mind of the school of Locke and Hartley . . . which deserves to take rank as the foremost of its class, and as marking the most advanced point which the *a posteriori* psychology has reached." "Those who have the highest appreciation and the warmest admiration of his predecessors are likely to be the most struck with the great advance which this treatise [*The Senses and Intellect*] constitutes over what those predecessors had done, and the improved position in which it places their theory." "With analytic powers comparable to those of his most distinguished predecessors, he combines a range of appropriate knowledge still wider than theirs; having made a more accurate study than perhaps any previous psychologist of the whole round of physical sciences." The most important modification made by Bain in the doctrine of association was the introduction of a new element in mental development—the tendency to spontaneous movement. "He holds that the brain does not act solely in obedience to impulses, but is also a self-acting instrument; that the nervous influence which . . . excites the muscles into action is generated automatically in the brain itself; not, of course, lawlessly and without a cause, but under the organic stimulus of nutrition." His work is marked by a spirit of precise analysis and zealous accuracy. It represents the high-water mark of English associationism. Consult: Mill, *Dissertations and Discussions* (New York, 1874); Ribot, *Contemporary English Psychology* (New York, 1873); articles in *Mind* (1904).

BAIN, ALEXANDER (1810-77). A Scottish electrician. He was born in Scotland, but in 1837 removed to London as a journeyman. Among his inventions were electrical clocks, an

earth-battery (1843), an apparatus for registering the progress made by ships (1844), the electro-chemical telegraph (1843), and an electrical apparatus for playing musical instruments at a distance.

BAINBRIDGE. A city, and the county-seat of Decatur Co., Ga., 235 miles west by south of Savannah, on the Atlantic Coast Line and the Georgia, Florida, and Alabama railroads, and on the Flint River (Map: Georgia, B 5). It is in a region producing cotton and tobacco and has brickyards, turpentine distilleries, iron-works, cotton oil mills, syrup refinery, etc. The city contains a Carnegie library and historic Fort Hughes, and owns its water works and electric light plant. Pop., 1900, 2641; 1910, 4217.

BAINBRIDGE, WILLIAM (1774-1833). An American naval officer. He was born at Princeton, N. J., entered the merchant marine at the age of 15, became captain of a merchantman four years later, and in 1796, while in command of the *Hope*, was attacked by and defeated an English schooner, whose captain had attempted to impress some of the *Hope's* crew. On the organization of the navy in 1798 he became a lieutenant, and was placed in command of the schooner *Retaliation*. Later in the year he was captured off Guadeloupe by the French frigates *Volontier* and *Insurgente*. Being released after several weeks, he returned to the United States and made a report which caused the passage of the "Retaliation Act" of 1798 against French subjects captured on the high seas. In March, 1800, he was raised to the rank of captain and later in the year was sent with tribute to the Dey of Algiers, who compelled him to convey an embassy, under Algerian colors, to Constantinople. He next served as commander of the *Philadelphia* in the war against Tripoli (1801-05), capturing the Moorish frigate *Mesh-boha* (Aug. 26, 1803), but, running aground, he was himself captured in November, off Tripoli, where he and over 300 of his men were kept prisoners until the close of the war. Early in 1812 he was put in command, as commodore, of the *Constitution*, *Hornet*, and *Essex*, he himself being on the first; but soon afterward the three vessels parted company, and on December 29 the *Constitution* met and captured the British frigate *Java*. (See CONSTITUTION, THE.) In 1815 he was made commander of the squadron fitted out against Algiers, but the war was averted. In the same year he established in Boston the training school for naval officers and afterward for two years (1819-21) cruised in the Mediterranean. He subsequently served at the Philadelphia and Charlestown navy yards, and from 1832 to 1833 acted as chief of the board of naval commissioners. He was a tall and powerful man and was noted at once for his strong will and his remarkable tact. Consult Harris, *Life of Bainbridge* (Philadelphia, 1837), and Cooper, *Lives of Distinguished American Naval Officers* (2 vols., Auburn, 1846).

BAINES, bānz, EDWARD (1774-1848). An English publicist, born at Walton-le-Dale. He was apprenticed to a printer at Preston and afterward at Leeds and in 1801 bought the *Leeds Mercury*, which subsequently became one of the most important of the provincial newspapers. He was consulted on important questions by many parliamentary leaders and was elected, in 1834, to succeed Macaulay as a member for Leeds. Until 1841 he continued in

Parliament as an independent Liberal. He advocated the separation of church and state and the reform of factory laws, and opposed governmental interference in educational matters. He wrote *of Lancaster*, and a *History of the Reign of the County of York* (1823), later enlarged as the *History of the County Palatine and Duchy of Lancaster*, and a *History of the Reign of George III* (4 vols., 1823). Consult his *Life* by his son (1861).

BAINES, SIR EDWARD (1800-90). An English politician, son of the preceding. He was elected in 1859 to Parliament, where he became the champion of many reforms. He opposed church tests in the universities, sought the disestablishment of the Irish church, and in 1861 and 1864 presented bills for extending the electoral franchise. He wrote a *History of the Cotton Manufacture in Great Britain* (1835) and other works.

BAINI, bà-ē-né, GIUSEPPE (1775-1844). A celebrated Italian composer, one of the most distinguished and scientific of modern times. He was born and died in Rome. A pupil of the Seminario Romano and later of Jannaconi, he entered the papal choir in 1795 and in 1814 succeeded Jannaconi as chapelmaster. His numerous church compositions are distinguished by religious austerity and severe classical profundity. His *Miserere* for 10 voices was the only work of the nineteenth century deemed worthy to be performed at the Sistine Chapel, alternately with those of Allegri and Bai, during Holy Week. His best title to fame, however, rests upon his life of Palestrina, *Memorie storico-critiche della vita e delle opere di Giovanni Pierluigi da Palestrina* (2 vols., Rome, 1828; German trans. by Kandler, with notes by Kiese-wetter, 1834). It is the standard work on Palestrina, though strongly biased with regard to non-Italian composers.

BAIOCCO. See BAJOCCHO.

BAIRAKTAR, bi-rak-tār', or BAIRAK-DAR ('standard-bearer'). The title of the energetic Grand Vizier, Mustapha (1755-1808). He was born of poor parents, but early distinguished himself by his bravery. He fought against the Russians as Pasha of Rustchuk in 1806. When Selim III was deposed by the Janizaries in 1807, Bairaktar took the part of the dethroned Sultan, and after the murder of Selim in 1808 he deposed his successor, Mustapha IV, and elevated Mustapha's brother, Mahmud II, to the throne. Bairaktar was now appointed Grand Vizier. In the exercise of this office he deposed the Grand Mufti, the leader of the Janizaries, and all the ulemas who had taken any part in the late revolution; while at the same time he was careful to secure the tranquillity of the capital and strengthened the regular army. His chief object was the annihilation of the Janizaries, but, like the unfortunate Selim, he fell a victim to that fierce band of soldiery. Favored by the more fanatical among the people, the Janizaries rebelled and, with the support of the fleet, attacked the Seraglio on Nov. 15, 1808, and demanded the restoration of Mustapha. Bairaktar defended himself bravely, but when he saw that the flames threatened to destroy the palace and that he was in danger of falling alive into the hands of his enemies, he strangled Mustapha, threw his head to the besiegers, and then killed himself.

BAIRAM, bi-rām' or bi-rām. See BEIRAM.

BAIRD, ABSALOM (1824-1905). An American

soldier. He was born at Washington, Pa., graduated at West Point in 1849, served in 1850-51 as second lieutenant of artillery in the Seminole War, was assistant professor of mathematics at the Military Academy in 1853-59, and from 1859 to 1861 was on garrison and frontier duty. During the Civil War he served in the Peninsular campaign, in Tennessee, and in the Atlanta campaign, and in 1865 was brevetted major-general U.S.A. In 1866-68 he was inspector-general of the Department of the Lakes; in 1868-70 of the Department of Dakota; in 1870-72 of the Division of the South; and in 1872-81 and in 1885, of the Division of the Missouri. From 1885 until he was retired in 1888, he was staff inspector-general, with the rank of brigadier-general.

BAIRD, CHARLES WASHINGTON (1828-87). A Presbyterian scholar. He was born at Princeton, N. J., a son of Robert; graduated at the University of the City of New York (now New York University) in 1848 and at Union Theological Seminary in 1852; American chaplain in Rome, 1852-54; pastor of a Reformed Dutch church in Brooklyn, 1859-61; after that time pastor of the Presbyterian Church at Rye, N. Y. He is the author of *Eutaxia, or the Presbyterian Liturgies* (New York, 1855); *A Book of Public Prayer* (1857); *A History of Rye* (New York, 1871); *Bedford Church* (1882); and especially *A History of the Huguenot Emigration to America* (2 vols., New York, 1885). Unhappily he did not live to carry out his plans for this extensive and valuable work.

BAIRD, SIR DAVID (1757-1829). A British general. He was born, Dec. 6, 1757, at Newbyth, Scotland, and was left fatherless at an early age. His mother procured his entry to the army in 1772, as ensign in the Second Foot, and he joined his regiment at Gibraltar in 1773; in 1778 he received his lieutenantcy and in the same year, on account of his distinguished bearing and great height, was appointed by Lord Macleod, a family friend, to be captain of the Seventy-third Grenadier Regiment, afterward famous as the Seventy-first Highland Light Infantry. He served in British India, 1780-89. In September, 1780, at Perambucum, heroically fighting against overwhelming odds, he was severely wounded, taken prisoner, and held captive by Hyder Ali. Released in March, 1784, he became, in 1787, major in his regiment and in 1789 returned to England. In 1790 he purchased the lieutenant-colonelcy of his regiment, but, owing to the delay of his agent in this transaction, on two subsequent occasions lost the succession as commander-in-chief of the army. In 1791 he returned to India and, after some minor service, in 1799 led the storming party at Seringapatam, having obtained that perilous honor at his own urgent request, Colonel Wellesley (afterward Duke of Wellington) commanding the reserve. His merit was acknowledged by the home government. In the following year he was appointed to the command of an expedition against Batavia, which was, however, afterward sent to Egypt, where he assisted in the final expulsion of the French. On his return to India he found that the star of Wellesley was in the ascendant; and Baird, who had already complained of the preference given to that officer and who was, besides, of opinion that his own merits were constantly overlooked, applied for leave of absence and sailed for Europe in 1803. He was received at court with

great distinction, knighted in June, 1804, and made a K.C.B. in the following August. In 1805 he commanded an expedition against the Dutch Settlements at the Cape of Good Hope, which was successful; in 1807 he commanded a division at the siege of Copenhagen; and in 1808 was sent to Spain with an army of 10,000 men to assist Sir John Moore. He distinguished himself in the battle of Corunna, Jan. 16, 1809, when his left arm was shattered by grapeshot and had to be amputated. Moore was killed in the action, and Sir David succeeded to the chief command, and had the honor of communicating the intelligence of the victory to government. On this occasion he received, for the fourth time in his life, the thanks of Parliament and was created a baronet. He retired from active service in 1810 and was made commander of the forces in Ireland in 1820. He died Aug. 18, 1829. Consult Hook, *Life of General Sir David Baird* (London, 1832), and Gore, *Character of Sir David Baird* (London, 1883).

BAIRD, GEORGE WASHINGTON (1843-). A rear-admiral, retired, of the United States navy, born in Washington, D. C. Following a public school and academic education, he studied engineering, was appointed third assistant engineer in the United States navy in 1862, and saw service during the Civil War. Promoted through successive grades up to 1905, he was then retired with the rank of rear-admiral. He became president of the Board of Education of Washington and was made a member of many engineering societies.

BAIRD, HENRY CAREY (1825-). An American publisher and writer, born at Bridesburg, Pa. From 1845 to 1849 he was a member of the publishing house of Carey & Baird, of Philadelphia, and in the latter year reorganized the firm as Henry Carey Baird & Co. In politics he was first a Whig and then a Republican. In 1875 he became a leader of the Greenback party, which nominated him for State treasurer of Pennsylvania and for mayor of Philadelphia. The former nomination he declined. He supported the free-silver cause and the protective system. His publications include pamphlets and contributions to works of reference and to periodicals on banking, money, and other economic subjects.

BAIRD, HENRY MARTYN (1832-1906). An American historian and educator. He was born in Philadelphia, graduated at New York University in 1850 and at Princeton Theological Seminary in 1856; traveled in Greece and Italy, and from 1855 to 1859 was tutor at Princeton. From 1859 until the year of his death he was professor of the Greek language and literature in New York University. He became widely known for his researches in the history of the Huguenots. Among his works are: *History of the Rise of the Huguenots in France* (1879; 1907); *The Huguenots and Henry of Navarre* (1886); *The Huguenots and the Revocation of the Edict of Nantes* (1895). These three works comprise, in six volumes, a succinct history of French Protestantism from 1512 to 1802, which has been admired by American and continental scholars. In 1906 he became a pensioner under the Carnegie fund.

BAIRD, ROBERT (1798-1863). An American clergyman and author. He was born in Fayette Co., Pa., graduated at Jefferson College in 1818 and at Princeton Theological Seminary in 1822. He passed several years in Europe, where he

labored especially for temperance and the revival and consolidation of evangelical Protestantism. He was agent and secretary of the American and Foreign Christian Union. His works include: *A History of Temperance Societies in the United States* (1836); *A View of Religion in America* (1842); *Protestantism in Italy* (1845); *History of the Albigenses, Waldenses, and Vaudois*. Consult a *Life* by Henry M. Baird.

BAIRD, SPENCER FULLERTON (1823-87). An American naturalist. He was born at Reading, Pa., Feb. 3, 1823, of English and German parentage, and died at Woods Hole, Mass., Aug. 19, 1887. He graduated from Dickinson College, Carlisle, Pa., in 1840, and in 1842 studied at the College of Physicians and Surgeons in New York City. During these earlier years he had formed valuable and influential acquaintanceships with Audubon and Agassiz and other leaders of American zoölogy, in much of whose work he was a collaborator. In 1845 he was elected professor of the natural sciences in Dickinson College, but continued his original work. He became assistant secretary of the Smithsonian Institution in 1850 and entered upon his life work. This was the period of an extensive exploration of the western half of the United States, and Baird had charge of the energetic efforts made under the direction of the Smithsonian Institution to carry on a scientific investigation coincident with the geographical exploration of that region and of the formulation and publication of the results in the reports of the Pacific Railway surveys and elsewhere. He also stimulated private research and the deposit of objects in the care of the Smithsonian, thus laying the foundation of the National Museum, which was organized (1857) and developed by him. Upon the death of Joseph Henry in 1878, he became secretary of the Smithsonian, and still further advanced its work and collections in the direction of zoölogy and American archaeology. Meanwhile he had been urging the need of the investigation and conservation of the fishes and fisheries of the United States, and through his action Congress created in 1874 the Commission of Fish and Fisheries, appointing Professor Baird its first commissioner—an office which he retained until his death, and wherein he organized the entire science and practice of fish culture (q.v.) in the United States and made it a model that has been widely copied in other countries.

In the dual relation which he sustained to two great branches of public scientific work, increased by his constant editing and writing for the press, Baird exerted an influence more extensive and stimulative than was exercised by any other man of his time. He trained a large number of men who have reached great usefulness and fame in various departments of scientific and economic natural history and is affectionately remembered by a great circle of students for his helpful kindness and encouragement. A complete bibliography of the titles of his works and papers to 1882 was compiled by G. Brown Goode and published as *Bulletin No. 20 of the United States National Museum* (Washington, 1883). It contains 1063 titles, to which the product of five more years is to be added. He edited the Smithsonian Reports from 1878 and several Reports of the United States Commission of Fish and Fisheries, to

which he also contributed many special papers. Among the more important of his publications are: *Catalogue of North American Reptiles* (1853); *Birds of America* (with Cassin, 1860); *Mammals of North America* (1859); *History of American Birds* (with Brewer and Ridgway, 1874-84).

BAIREUTH, bi'roit. See BAYREUTH.

BAISCH, bish, HERMANN (1840-94). A German landscape painter and etcher. He was born at Dresden. He studied at the Stuttgart Academy, and in 1868 went to Paris, where he was much influenced by the works of Dupré and Rousseau. In 1869 he became a pupil of Lier at Munich, and soon became known for his landscapes, which are distinguished by careful observation and subtlety of atmospheric effects. He ranked as one of the first "plein air" painters of Germany. He received numerous medals, was honorary member of the principal German academies, and exercised a wide influence as professor of landscape painting (after 1881) in the Academy of Karlsruhe. His most prominent works include: "Mill by Moonlight" (1878, Stuttgart Gallery); "Dutch Canal Landscape" (1882, Dresden Gallery); "At the Watering-Trough" (Hanover Museum); and "Ebb-Tide near Dordrecht" (1884, Berlin National Gallery). He is also known as an illustrator, chiefly of the poems and proverbs of his brother, Otto Baisch.

BAIT, bit. See BEIT.

BAITER, bi'ter, JOHANN GEORG (1801-77). A Swiss classical scholar born at Zürich. He studied at Munich, Göttingen, and Königsberg, was for some time professor in the University of Zürich, and in 1837-39, 1843-45, and 1849-65 was rector of the Zürich Gymnasium. With Orelli and Winckelmann, he prepared a collective edition of the works of Plato (1839-42); with Sauppe, one of the speeches of Lysurgus (1834), and *Oratores Attici* (1838-50); and he contributed the *Annals* (1858) to the second edition of Orelli's recension of Tacitus. He also published an edition of the *Fabellæ Iambicæ* of Babrius, then recently discovered (with Orelli, 1845). In conjunction with Orelli, and afterward with Halm, he bought out the second edition of Orelli's great edition of Cicero, and, with Kayser, edited the philosophical writings of Cicero for the Tauchnitz edition of the complete works of that author (1860-69). He owes his fame chiefly to his skill in textual criticism.

BAIT FISHING. The second great subdivision of angling, which is again divisible into fresh-water fishing and salt-water fishing. For fresh-water bait fishing a shorter and stiffer rod is required than is used for angling with a fly for the same fish. The bait generally is sunk by attaching a split shot, or other lead sinker, about a foot above the hook, and in still water sometimes a cork or quill float is attached to the line at a point which will allow it to float upon the surface of the water when the bait is at the desired depth. The bait varies almost as much as does the fly in casting; for trout those commonly employed are worms, grasshoppers, and minnows; for bass, minnows, the helgramite or dobson, crawfish, small frogs, grasshoppers, and crickets. For sea fishing of the ordinary nature, where the fish are not expected to weigh more than two pounds, a stout rod 8 or 10 feet long, with 100 yards of No. 12 Cuttyhunk and a strong single gut-leader 3 feet long, a small float and 2-0 hooks, with shrimp or shedder crab bait, will be found effective. From the

2-pound blue fish up to the giant tarpon, which is occasionally yet caught by "still-fishing," bait fishing passes through a wide variety.

Bait casting is a variety of bait fishing in which the sinker and float are discarded: as in angling for black bass the rod should be from 6 to 8 feet long, weigh not more than 8 ounces, and have a first-class quadruple multiplying reel holding from 80 to 100 yards of line attached. The minnow is hooked and reeled up to within a foot or two of the tip of the rod. With the thumb pressing firmly on the spool of the reel, to prevent the back lashing of the line the rod is swung at arm's length to the rear below the waist line and pointing downward, and then brought forward with a steady sweep until it points in the desired direction, when the pressure on the reel should be released sufficiently to permit the line to pay out. For an overhead cast the rod is swung back directly over the shoulder and then quickly forward, the line being released, when the rod is about perpendicular. When the line is running out, the reel should be held with the side plates parallel to the water and with the handle uppermost. Reeling in should begin instantly the bait strikes the water. See ANGLING; FLY CASTING; TROLLING.

BAJA, bô'yô. A market town of Hungary, in the country of Bács-Bodrog, near the Danube, about 90 miles south of Budapest (Map: Hungary, F 3). It has manufactures of alcohol and shoes and carries on a large trade in grain, fruit, wine, and hogs. It is the chief river port of the grain-producing district known as the Bácska. Pop., 1890, 19,500; 1900, 20,361.

BAJADA DEL PARANÁ, bâ-nâ'dâ dël pâ'-rà-nî'. See PARANÁ.

BAJAN. See BEJAN.

BAJAZET, bâ'zhâ-zâ'. One of Racine's tragedies, having for its hero Bajazet, brother of Amurath I, Sultan of the Turks, 1359-89. The plot hinges on the hero's choice between the throne and his mistress. The play was performed at Paris, on Jan. 4, 1672. The character also occurs, with a change of episode, in Marlowe's *Tamburlaine* (1587), and in Rowe's *Tamerlane*, a tragedy performed in 1702.

BAJAZET I, bâ'ye-zêd', or **BAYAZID I**, bâ'yâ-zêd' (1347-1403). Sultan of the Turks from 1389 to 1402. He succeeded his father, Amurath I, who was killed on the battlefield of Kosovo. Immediately on ascending the throne he inaugurated his rule by strangling his younger brother, Yakub, lest he should dispute the succession. He overran Bulgaria and a part of Servia, Macedonia, and Thessaly and subdued most of the states of Asia Minor. He received the name of Yilderim, "Thunderbolt," either because of these victories or because of his murder of his brother. At Nicopolis he gained a decisive victory over the Allied Hungarians, Poles, and French on Sept. 28, 1396. The greater part of the French, through whose impetuosity the battle was lost, were taken prisoners and slain. In 1402 Bajazet led his army against Timur (q.v.), who had invaded Asia Minor, and was completely defeated by the Mongol ruler near Angora. Bajazet himself fell into the hands of the conqueror, who treated him with great generosity. The story that he was carried about imprisoned in a cage is without any historical foundation. Bajazet died in 1403 in the camp of Tamerlane. He was succeeded in the government by his sons, Solyman I, Musa, and Mohammed I, the last of whom became sole ruler in 1413. The reign of Bajazet

was a period of great corruption, in which the people generally imitated the actions of the Sultan and his chief ministers. Consult Gibbon, *Decline and Fall of the Roman Empire*, vol. vii (London, 1900), and Lane-Poole, *Turkey* (New York, 1889).

BAJAZET, or **BAYEZID II** (1447-1513). Sultan of the Ottoman Empire from 1481 to 1512. He was the son of the Sultan Mohammed II, the conqueror of Constantinople. He engaged in continual wars with Poland, Venice, Egypt, and Persia, and strengthened the Ottoman power in Europe, though not without meeting frequent checks and reverses. His later years were disturbed by disputes among his sons about the succession to the throne. He died near Adrianople in 1513, shortly after abdicating in favor of his son Selim. He was a patron of learning, a lover of luxury and splendor, and built several magnificent mosques in Adrianople and Constantinople. See OTTOMAN EMPIRE.

BAJAZET, MOSQUE OF. One of the many beautiful mosques erected by Bajazet II (q.v.). It was built in 1505, at Constantinople, and still stands. Its court is surrounded by marble arcades, the capitals of which are of jasper, and contains an octagonal fountain in the centre. Four Persian doorways lead into the richly carved and decorated interior.

BAJOCCO, bâ-yôk'kô, or **BAIOCCO**, pl. **BAJOCA CHI** (from *baio*, brown; so called from its brown-chai color). A copper coin in the Papal States equivalent to nearly a half-penny. It was 1-100 of the scudo, which was equal to \$1.00. In the island of Sicily the Neapolitan *grano*, the 1-100 part of the ducato (= \$.83) was also called a bajocco.

BAJ'REE. See GUINEA CORN.

BAJURA, bâ-jôo'rá. The name of the banner of Mohammed.

BAJUS, or **BAIUS**, MICHAEL—properly, DE BAY (1513-89). One of the most distinguished theologians of the Roman Catholic church in the sixteenth century. He was born in 1513 at Melin, Hainaut. He studied at Louvain and became doctor and professor of theology there in 1550. He was present at the Council of Trent in 1563 and also in 1564. He was the founder of the system of theology based directly on the Bible and the writings of the Fathers and setting aside the scholastic method. He assumed to base his theory on the writings of St. Augustine, whose doctrine of grace and free-will he sought to interpret into the entire inability of the human will to do good and into the absence of merit in all good works. His position was vigorously assailed by the Jesuits as unorthodox. The assertions that the human will, so long as it is left to its own freedom, can do nothing but sin, and that even the mother of our Lord was not free from original and actual sin, together with other such doctrines, drew on him the accusation of heresy. Seventy-nine of his propositions were condemned by Pope Pius V, in 1567, in the bull *Ex Omnibus Afflictionibus*, but he was not named as the author of them. Bajus submitted in 1569, but nevertheless did not give up his doctrines. He retained his position and was made chancellor of his university in 1575, but this did not shield him from the criticisms of his theological opponents. Gregory XIII confirmed the condemnation in the bull *Provisionis Nostræ*, Jan. 28, 1579, and Bajus was obliged

a second time to make explanation. He died at Louvain, Sept. 15, 1589, having earned the reputation of great learning, pure manners, and singular modesty. He may be regarded as the predecessor of the Jansenists, who inherited his Augustinian view, which was at that time termed Bajanism. His writings, mostly of a polemical nature, were published by Gerberon (2 vols., Cologne, 1696). Consult F. X. Linsennann, *Michael Bajus und die Grundlegung des Jansenismus* (Tübingen, 1867).

BAJZA, boi'zò, JÓZSEF (1804-58). A Hungarian poet and critic, born at Szücsi, county of Heves, Jan. 31, 1804. When barely 20, he began contributing to Kisfaludy's *Aurora*, which has been called the cradle of modern Hungarian poetry and which Bajza afterward edited from 1830 to 1837. He was also editor of *Kritikai Lapok* ('Critical Leaves'), during 1830-36, and of the *Athenæum*, 1837-43; and these, together with Toldy's *Figyelmező* ('Observer'), were the principal vehicles of his thoughtful essays and unsparing criticism, which exerted a strong and beneficent influence upon the rising Hungarian literature. His poems (Pesth, 1835) earned him a place among the best of his country's lyric poets. Through the publication of a series of foreign plays, and as director of the National Theatre at Pesth, he also gave valuable aid to the cultivation of a national drama. Later, his interests turned largely to history and bore fruit in 'Historical Library' (*Történeti Könyvtár*, 6 vols., Pesth, 1843-45), containing translations from many excellent foreign works; and a compilation from the German, 'The New Plutarch' (*Új Plutarch*, Pesth, 1845-47). After March, 1848, Kossuth appointed him editor of his semi-official organ, the *Kossuth Hírlapja* (May to December). He died March 3, 1858, from a brain disease, which had been slowly developing for eight years. Bajza stands unsurpassed in the Hungarian literature for his perfection of poetic form. Because of his cold classicism Bajza did not attain the popularity of his fiery and patriotic contemporary Vörösmarty. His *Collected Works* have been edited by Toldy (6 vols., Pesth, 1861).

BAKAČS, bô'kôch, TAMÁS (?-1521). A Hungarian statesman and prelate, who was born about the middle of the fifteenth century. Though by birth a peasant, he became secretary to King Matthias Corvinus. He held various bishoprics, became Archbishop of Gran, and on the accession of Ladislaus II was made chancellor of the kingdom, and later Cardinal-Primate of Hungary and papal legate. He afterward preached a crusade against the Turks; but his army of peasants and vagabonds turned their arms against the nobility and clergy and a civil war ensued, accompanied by great cruelty on both sides, till it was ended by the rout of the insurgents by John Zápolya. Bakačs died in 1521, leaving an immense fortune.

BAKAIRI, bá-kä-i-ré'. A detached Cariban tribe of primitive type, living about the headwaters of the Xingú River, central Brazil. They were visited in 1884 by Von den Steinen, who made the first scientific study of them and their language, which he regarded as the oldest representative of the Cariban linguistic stock, and thus of some ethnological importance. Consult Von den Steinen, *Durch Central-Brasilien* (Leipzig, 1888), and *Die Bakairi-Sprache* (Leipzig, 1893).

BAKALAI, bá-kä'li. A Bantu tribe on the

Ogowe, French Equatorial Africa. They have been pushed to the west by the warlike Fans, losing their former skill as workers in iron and copper and becoming traders. They number more than 100,000. Their religion is Mohammedan; learning is at a standstill. Consult Keane, *Ethnology* (Cambridge, 1896), and Deniker, *Races of Man* (London, 1900).

BAKAR. See BUCCARI.

BAKAU, bà-kou'. The capital of a district of the same name in Moldavia, Rumania, on the Bistritz, 188 miles north of Bucharest, by rail (Map: Turkey in Europe, F 1). It has a gymnasium and some trade in agricultural products. Pop. (latest report), 1899, 16,187, of whom 4000 were Jews.

BAKE, bá'ke, JAN (1787-1864). A distinguished Dutch philologist, born at Leyden, Sept. 1, 1787. He held the professorship of Greek and Roman literature in the University of Leyden for the long period of 42 years (1815-57). His first important publication was a valuable contribution to the literature on Posidonius (1810), and this was followed by a learned edition of Cleomedes (1820). In collaboration with Geel, Hamaker, and Peerlkamp he published the *Bibliotheca Critica Nova* (1825-31) and independently contributed various classical articles to the *Scholica Hypomnemata* (1837-62). He brought out critical editions of Cicero's *De Legibus* (1842), the rhetorical work of Apsines and of Longinus (1849), and Cicero's *De Oratore* (1863). He died March 26, 1864. He was the brother of the philologist and jurisconsult ALEXANDER BAKE (1791-1844).

BAKEL, bá'kél'. A strongly fortified town, capital of the arrondissement of the same name, in the French colony of Senegal, northwest Africa, on the left bank of the Senegal River, northwest of Kayes (Map: Africa, C 3). Bakel has belonged to France since 1820 and was of great strategic importance in the wars with the natives. It is an important trade centre and the meeting place of caravans from the upper Senegal basin and the Niger. The trade is chiefly in dates, rice, beeves, ivory, and gold dust. During the rainy season it has direct navigation with St. Louis on the coast. Pop., 1900, 1760.

BAKELITE. An artificial coal-tar product, used as a substitute for hard rubber, celluloid, or amber, and valuable for its properties of electrical insulation and resistance to heat. This substance was invented by the chemist, Dr. Leo Baekeland, from whom it derives its name. For its invention Dr. Baekeland received the Nichols medal of the American Chemical Society in 1909. Chemically bakelite is oxybenzyl-methylenglycol anhydride. It is produced by warming together equal weights of phenol and formaldehyde and a small amount of an alkaline agent. The mixture separates into two layers, the upper of which is an aqueous solution, while to the lower, an intermediate condensing product, is given the name of "A." If the latter is heated above 100° C., a final condensing product called "C" is obtained, which may be avoided by working under a pressure of 50 to 100 pounds per square inch. The product so resulting is a hard solid mass, which is known as bakelite. It has a specific gravity of 1.25, is very hard and inelastic, and is an excellent insulator for both heat and electricity. As it is cheaper than hard rubber, it has found extensive application in electrical apparatus,

and for the same reason it is supplanting casein and celluloid in other fields. Wood soaked in the "A" product, and then heated under pressure, becomes coated with it so that it will appear as with a firm and waxy varnish. Card-board, also, can be made into hard-polished sheets, and metal surfaces can be given a like coating. It also serves as a powerful cement, as, for example, in forming grindstones and like purposes.

BAKER. A city, and the county-seat of Baker Co., Ore., 357 miles east by south of Portland, on the Powder River, and on the line of the Oregon Railroad and Navigation Company (Map: Oregon, H 3). It is in the centre of the eastern Oregon mining region and has a considerable trade as a distributing point for this district as well as an export trade in lumber, wool, live stock, and products of the mines. Gold mining, lumbering, stock raising, flour milling, clay and stone quarrying, and agriculture are the leading industries, and manufacturing interests are represented by saw and planing mills, iron works, brewery, brickyards, etc. Among points of interest in or near the city are the opera house, hospital, Masonic temple, natatorium, and several mines. Settled in 1860, as Baker City it was incorporated in 1872 and has since adopted the commission form of government. There are municipal water works, and electric light plant. Pop., 1900, 6663; 1910, 6742.

BAKER, SIR BENJAMIN (1840-1907). An eminent British civil engineer, born in England. He designed the cylindrical ship that transported one Cleopatra's Needle to America and the other to England, planned with Sir John Fowler the great Forth Bridge, and assisted in the construction of the great Assouan dam in Egypt. He also had an important part in designing the Blackwall tunnel, the great Tower Bridge in London, and the Metropolitan Railway system in that city. He published *Long Span Railroad Bridges* (1870).

BAKER, CHARLES FULLER (1872-). An American zoölogist, born in Lansing, Mich. He graduated in 1892 from the Michigan Agricultural College, where during his course he acted as assistant in zoölogy. After filling several positions in secondary schools and colleges as a teacher of biological subjects, he became an assistant professor at Pomona College, Cal., in 1903. Subsequently he was for several years chief of the department of botany at the Cuban agronomical station, then curator of the botanical garden and herbarium at the Museu Goeldi in Pará, Brazil. After serving in other similar positions in South America, he returned in 1908 to the United States and to Pomona College as professor of biology. He was in charge of the Colorado zoölogical and forestry exhibit at the Chicago World's Fair in 1893, and four years later became zoölogist and associate botanist to the Alabama botanical survey. Besides serving as botanist to the H. H. Smith exploring expedition in the Santa Marta Mountains in Colombia (1898-99), he himself conducted field explorations in several Western States and in Nicaragua, Cuba, and Brazil. He became editor of the *Pomona Journal of Entomology* and published *Invertebrata Pacifica* and (coöperatively) *Economic Plants of the World*.

BAKER, EDWARD DICKINSON (1811-61). An American soldier and lawyer. He was born in England, but came to this country in 1816. He practiced law at Springfield, Ill., became promi-

nent in politics, and was a member of the Illinois Legislature from 1837 to 1844, when he was elected to Congress. He resigned in 1846 to serve in the Mexican War and commanded a brigade at the battle of Cerro Gordo. After the war he was again elected to Congress. He declined a renomination in 1850, and in 1851 settled in San Francisco, where he soon became the leader of the California bar. Thence he went to Oregon and was United States Senator from that State. When the Civil War began, he raised a regiment in New York and Philadelphia. He declined a commission as brigadier-general and was killed at Ball's Bluff while leading a desperate charge. Consult J. D. Baltz, *Lancaster, Pa.* (1888), and Willard Glazier in *Heroes of Three Wars* (1880).

BAKER, FRANK (1841-). An American zoölogist and anthropologist, born at Pulaski, N. Y. He graduated at the Columbian (now George Washington) University in 1880 (M.D.), took his master's degree at Georgetown University in 1883, and Ph.D. at the same institution in 1890. He became assistant superintendent of the Life-saving Service in 1889 and superintendent of the National Zoölogical Park at Washington in 1890. In 1883 he was appointed professor of anatomy in the Medical School of Georgetown University and was elected vice president of the American Association for the Advancement of Science in 1890. For the seven years following 1890 he was editor of the *American Anthropologist* and in 1897 was made president of the Association of American Anatomists.

BAKER, FRANK COLLINS (1867-). An American zoölogist, born at Warren, R. I. He studied at Brown University and at the Philadelphia Academy of Natural Sciences. The latter institution sent him on a Mexican exploring expedition in 1890. After serving as zoölogist of invertebrates at Ward's Natural Science Establishment, Rochester, N. Y., he became curator of zoölogy of the Field Columbian Museum of Chicago in 1894, and curator of the Chicago Academy of Sciences in the same year. His publications include: *A Naturalist in Mexico* (1895); *Mollusca of the Chicago Area* (1898-1902); *Shells of Land and Water* (1903); *The Lymnæidæ of North and Middle America* (1911).

BAKER, GEORGE PIERCE (1866-). An American scholar, writer, and educator, born in Providence, R. I. Graduating from Harvard in 1887, he became in the year following instructor in English at that university and thereafter successively instructor in forensics (1889), assistant professor of English (1895), and professor of English (1905). He established and carried on a department of dramatic writing and criticism at Harvard. His writings include: *The Principles of Argumentation* (with H. B. Huntington, 1895, 1905) and *The Development of Shakespeare as a Dramatist* (1907). Also he edited *The Forms of Public Address* (1904), *Some Unpublished Correspondence of David Garrick* (1907), *The Correspondence of Charles Dickens and Maria Beadnell, Hamlet* (1913), and various Elizabethan plays.

BAKER, HENRY (1698-1774). An English naturalist. He was brought up to the book-selling business, but afterward devoted himself to scientific studies, especially to botany and microscopy. In 1744 he received the Copley medal from the Royal Society for his microscopic study of saline particles. Among his

works may be mentioned *The Microscope Made Easy* (1743), *Employment for the Microscope* (1753), and some poetical works.

BAKER, H. BRERETON. An English chemist, born at Blackburn, Lancashire. He was educated at Balliol College, Oxford, where he was a scholar in natural science in 1879 and a demonstrator in chemistry in 1883-85. From 1885 to 1902 he was head of the science department in Dulwich College and in the following year served as head master of Allyn's School, Dulwich. He became professor of chemistry in the Imperial College of Science and Technology, London, in 1912. His publications include "Combustion in Dried Gases" in the *Philosophy Transactions* (1888), and in the *Journal of the Chemical Society* the following: "Action of Light on Silver Chloride" (1892); "Drying of Ammonia and Hydrogen Chloride" (1898); "Union of Hydrogen and Oxygen" (1902); "Gaseous Nitrogen Trioxide" (with Mrs. Baker, 1907).

BAKER, IRA OSBORN (1853-). An American civil engineer, born at Linton, Ind. He graduated from the University of Illinois in 1874 and in the same year became assistant in civil engineering and physics at that institution. He was appointed instructor in civil engineering in 1878, assistant professor in 1880, and professor in 1882. Besides contributions to technology journals, his writings on engineering subjects include *Leveling* (1886), *Treatise on Masonry Construction* (1889, 1909), *Engineers' Surveying Instruments* (1882, 1909), and *Treatise on Roads and Pavements* (1903).

BAKER, JAMES HEATON (1829-1913). An American soldier and politician, born at Monroe, Ohio. He was educated at Ohio Wesleyan University. After having served as Secretary of State of Ohio (1854-56) and of Minnesota (1857-61) he entered the army as colonel of the Tenth Minnesota Volunteer Infantry and was brevetted brigadier-general and was mustered out of service in 1865. Subsequently he served as United States commissioner of pensions under President Grant, as surveyor-general of Minnesota (1875-79), and as state railroad commissioner (1881-86). In 1879 he purchased two Republican newspapers which he combined under the name of the *Mankato Free Press*. He published "Lake Superior" in *Minnesota Historical Society Collections* (1879); "The Sources of the Mississippi," do. (1887); *The Lives of the Governors of Minnesota* (1908).

BAKER, JOHN GILBERT (1834-). An English botanist. Born at Guisborough, England, he was educated at the schools of the Society of Friends at Ackworth and York. Later he became lecturer on botany at the London Hospital and in 1866 was appointed assistant curator at the Kew Herbarium. From 1890 to 1899 he was keeper of Kew Gardens. Baker was associate editor of the *Journal of Botany* and published several works of importance on systematic botany, among the more important of which are the following: *Synopsis Filicum* (London, 1883), which is a later edition of the work begun by J. D. Hooker under the same title in 1868 and which is a descriptive catalogue of all species of ferns known at that time; *Monograph of the British Roscs* (1869); *Monograph of the Ferns of Brazil* (1870); *Flora of Mauritius and the Seychelles* (1877); *Flora of the English Lake District* (1885); *Handbook of the Fern Allies* (1887); *Handbook of the Amaryllidaceae* (1888); *Handbook of the Bromeliaceae* (1889).

A large number of shorter papers on botanical subjects have appeared in scientific journals. Baker was elected to the membership of the Royal and Linnæan societies and received honors from several scientific associations.

BAKER, MOSES NELSON (1864-). An American editor and writer, born at Enosburgh, Vt. He graduated from the University of Vermont (collegiate department) in 1886 and from the engineering school, with the degree of C.E., a year later. In 1887 he became associate editor, and in 1908 editor, of the *Engineering News*. Montclair, N. J., chose him as the president of its board of health in 1904. As the result of special study of matters connected with sewage disposal and with municipal government, he wrote: *Sewage Purification in America* (1893); *Sewage Disposal in the United States* (joint author, 1894); *Potable Water* (1899); *Municipal Engineering and Sanitation* (1901); *British Sewage Works* (1904). He was editor of the *Manual of American Water Works* (1888-91, 1897) and of the *Municipal Year Book* (1902). He also edited the departments of municipal engineering and municipal government in THE NEW INTERNATIONAL YEAR BOOK and revised articles in these departments for THE NEW INTERNATIONAL ENCYCLOPEDIA.

BAKER, RAY STANNARD (1870-). An American journalist and author. He was born in Lansing, Mich., and graduated from the Michigan Agricultural College in 1889. A partial law course, and studies in literature, he took at the University of Michigan. He was reporter and sub-editor on the *Chicago Record* (1892-97), managing editor of McClure's Syndicate (1897-98), and associate editor of *McClure's Magazine* (1899-1905). In 1906 he became one of the owners and editors of *The American Magazine*. One of the most widely read journalists of his day, he contributed to *McClure's* and other magazines several notable series of articles on social and economic conditions in the United States. Among his writings are: *Boys' Book of Inventions* (1899); *Our New Prosperity* (1900); *Seen in Germany* (1901); *Boys' Second Book of Inventions* (1903); *Following the Color Line* (1908); *New Ideals in Healing* (1909); *The Spiritual Unrest* (1910).

BAKER, SIR RICHARD (1856-1645). The author of the *Chronicle of the Kings of England from the Time of the Romans' Government unto the Death of King James*, a book long esteemed and quoted on all matters of English history by the country gentry. Addison makes his model squire, Sir Roger de Coverley, refer to it frequently. Baker was born in Kent, was educated at Oxford, and in 1603 was made a knight. About 1620 he married and settled in Oxfordshire, of which county he was made high sheriff; but he was soon after thrown into the Fleet Prison for the debts of his wife's family which he had assumed, and here he wrote his *Chronicle*, first published in 1641, besides several pious works of less note. He died in prison in great poverty.

BAKER, SIR SAMUEL WHITE (1821-93). An English traveler, explorer, and sportsman, born in London. He studied in England and Germany and in 1848 established an agricultural colony at Newara Eliya, Ceylon, where he remained until 1855 and achieved much reputation as a hunter of big game. In 1859-60 he superintended the construction of a railway connecting the Danube with the Black Sea. In

1861 he set out from Cairo for the discovery of the source of the Nile. He first explored the Atbara, Setit, and other Nile tributaries of northern Abyssinia, added somewhat to geographical knowledge of the region, and demonstrated that to these tributaries the Nile sediment is due. Thence he (in 1862) proceeded up the Nile to Gondokoro, where he awaited the arrival of Speke and Grant, who had left Bago-wayo in 1860, and the former of whom had discovered the Victoria Nyanza to be the true Nile source. Informed by Speke of another lake, said to be crossed by the Nile on the river's course to Gondokoro, he continued his journey amid the defiance of the slave traders and the mutiny of his troops, and on March 14, 1864, discovered the Albert Nyanza. Thus, notwithstanding the inaccuracy of some of his observations, subsequently rectified by Stanley, he had finally cleared away the mystery from the Nile problem which, since Herodotus, had perplexed the world. In 1869-73, with the rank of pasha and major-general, he commanded an expedition sent out by the Khedive of Egypt for the suppression of the slave traffic, the establishment of regular trade, and the opening to commerce of the great equatorial lakes. Subsequently he explored and hunted in Cyprus, Syria, India, Japan, and the United States. He wrote: *The Rifle and the Hound in Ceylon* (1853); *Eight Years' Wanderings in Ceylon* (1855); *The Albert Nyanza* (1866); *The Nile Tributaries of Abyssinia* (1867); *Cast up by the Sea* (1868); *Ismailia* (2 vols., 1874); *True Tales for my Grandsons* (1883); *Wild Beasts and their Ways* (1890). Consult the T. D. Murray and A. S. White *Memoir* (London, 1895).

BAKER, THOMAS (1656-1740). An English antiquary and author. He was born at Lanchester, Durham, and was educated at St. John's College, Cambridge, where he soon became a fellow. As a non-juror he lost in 1690 the rectory of Long Newton, and in 1717 his fellowship, but spent the last 50 years of his life at Cambridge. He is known chiefly from his valuable manuscript collections, comprising 42 folio volumes, on the history and antiquities of the University of Cambridge. His history of St. John's College was edited by Professor Mayor in 1867.

BAKER, VALENTINE (1827-87). An English soldier, known as Baker Pasha, brother of Sir Samuel White Baker. He served in the Kaffir War (1852-53), received two medals for bravery in the Crimean War, and was promoted to colonel of the Tenth Hussars in 1860. He left England in 1873 to explore the northeastern frontier of Persia and described his journey in *Clouds in the East* (1876). In 1875 he was imprisoned and cashiered for insulting a young woman in a railway carriage. He entered the service of the Sultan in 1877, took part in the Turko-Russian War as major-general unattached in Mehemet Ali's army, and wrote a history of that campaign, entitled *The War in Bulgaria* (2 vols., 1879). He was summoned to Cairo by the Khedive in 1882 to be commander in chief of the Egyptian army, but on arriving there he was offered the command of the Egyptian police instead. Ordered to Suakim after the defeat of Hicks Pasha (November, 1883), he was defeated near Tokar by a body of Osman Digna's troops in 1884. He then returned to England and in 1885 was appointed to General Wolseley's staff; but Queen Victoria refused to ratify any appointment restoring him to the British army. In

1887 he went again to Egypt, and died at Tel-el-Kebir.

BAKER, WILLIAM MUMFORD (1825-83). An American author, born in Washington. He graduated at Princeton and was a Presbyterian pastor successively at Galveston and Austin, Tex., and at Newburyport and South Boston, Mass. Besides *Inside: A Chronicle of Secession* (1866), considered his most important work, he wrote a number of tales, including *The Virginians in Texas* (1878), *The New Timothy* (1870), *His Majesty, Myself* (1879), and *Blessed Saint Certainty* (1881).

BAKER, AND THE BAKER'S WIFE, THE. Popular names for Louis XVI and Marie Antoinette, because of their giving bread to the starving rioters who collected before the Palace of Versailles, Oct. 6, 1789.

BAKERIES, MILITARY. See FIELD KITCHEN.
BAKER'S ANTELOPE. A large antelope (*Hippotragus bakeri*) of the Sudan, with horns of a massive type. It is pale liver-red, with penciled ears and some black stripes on the shoulders. It was named after its discoverer, Sir Samuel Baker.

BAKER'S DOZEN. The number 13, instead of the usual 12. The custom of using 13 for a dozen is supposed to have originated when heavy fines were imposed for short weights, and the bakers in particular added an extra unit to guard against a possible short weight. The number 13 has also been called the Devil's Dozen, referring in that case to the number of witches supposed to assemble at each of their great festivals, and also to the superstition that 13 is an unlucky number. See WITCHCRAFT.

BAKERSFIELD. A city and the county-seat of Kern Co., Cal., 168 miles northwest of Los Angeles, on the Southern Pacific and the Atchison, Topeka, and Santa Fe railroads, and on Kern River (Map: California, G 7). It has a public library and fine county buildings. The city controls important commercial interests as the centre of an oil, natural-gas, live-stock, and fruit-growing region, and contains foundries and machine shops, refineries, extensive gold mines, planing and flouring mills, packing houses, etc. There are also large deposits of fuller's earth, gypsum, borax, marble, salt, copper, tungsten, iron, and sulphur. A considerable water power is developed from the Kern River. Bakersfield was settled in 1872. Pop., 1890, 2626; 1900, 4836; 1910, 12,727.

BAKER UNIVERSITY. A coeducational institution at Baldwin, Kan., founded in 1858 by the Kansas Conference of the Methodist Episcopal church. The departments include the College of Liberal Arts, academy, musical conservatory, public speaking, fine arts, household arts, preparatory professional courses, and summer school. In 1913 there were 32 instructors and 515 students. President, Wilbur N. Mason, D.D.

BAKEWELL (anciently, *Badecan-willan*, protected wells, from AS. *peccan*, Ger. *decken*, to cover = *wella*, *wylla*, spring, Eng. well). A small but ancient town in Derbyshire, England, on the Wye, 25 miles northwest of Derby (Map: England, E 3). It lies in the midst of beautiful scenery; in the vicinity are black-marble and limestone quarries and coal and zinc mines. Arkwright first established cotton mills here. The town has chalybeate springs and warm baths, a museum, and a spacious old Gothic church. In the seventeenth century the plague

ravaged and almost depopulated this town. Pop., 1901, 2850; 1911, 3078.

BAKHUT, bāk-mōōt'. The chief town of the district of the same name, in the government of Ekaterinoslav, south Russia (Map: Russia, E 5). It lies in a hollow on the banks of the Bakhmut, a shallow affluent of the north Donetz River. In its immediate vicinity are deposits of salt of great purity and thickness of vein. A number of foreign companies exploit the mineral from which they also manufacture soda. The region, within a radius of 60 to 80 miles, abounds in coal, both of the cheaper and the anthracite varieties, and quicksilver is also mined. In the city salt is manufactured by the evaporating process from water drawn from wells. The product is accounted among the best in the world and is exported widely. Among the industrial establishments are glass, fireproof-brick, lime, and cement factories, iron and flour mills and breweries. The town was settled in the seventeenth century and was surrounded by a wooden wall in 1703; 80 years later it was promoted to the rank of chief town of the district. Pop., 1897, 19,400.

BAKHTCHISARAI, bāk'ch'tsā-rī' (Pers. palace of gardens, from *bakhtcha*, garden, orchard + *sarāi*, palace, inn). The residence of the ancient princes or khans of the Crimea, situated in a narrow limestone valley about 20 miles from Simferopol, the capital of the government of Taurida, Russia (Map: Russia, D 6). It is a typical Tatar town and has 36 mosques, one Christian church, and two synagogues. In the centre of the city is the famous palace or Khan-sarai. Built in 1519 by the Khan Abdul-Sakhal-Gerai, the magnificent palace, after years of decay, was restored to its former grandeur in 1787 by orders of Prince Potemkin. Of the other noteworthy buildings, the mosque of the Khan is probably the most magnificent; it was erected in 1737 by the Khan Selamit-Gerai. In one of the old Jewish synagogues a parchment roll of the Bible—the most ancient, according to some Hebrew scholars—was discovered. It is now in the Imperial Library. The principal articles of manufacture are the well-known red and yellow morocco leather, fur coats, boots and shoes, and cutlery. The town is a mart for the products of the neighboring country, such as tobacco, flax, grain, and especially fruits. Its population, principally Mohammedans, numbered (1897) 13,000, including 3000 Christians, 1000 Jews (mainly Karaites), and some Greeks.

BAKHTEGAN, bāk'te-gān' (Map: Persia, E 6). A salt lake in southwest Persia, to the east of Shiraz, 74 miles long, and from 4 to 13 miles broad. It is formed by the Kur River. Its altitude is 5100 feet above the sea. Large deposits of fine salt are gathered from its basin when the lake dries up in summer.

BAKHUIZEN VAN DEN BRINK, bāk'hoi-zen vān dān brīnk, REINIER CORNELIS (1810-65). A Dutch historian. He was born at Amsterdam, Feb. 28, 1810. Among his noteworthy achievements must be mentioned *Vondel met Roskam en Rommelpot* (new ed., 1891), *Varia Lectiones ex Historia Philosophiae Antiquæ* (1842), *La retraite de Charles Quint* (1842), and *Het huwelijk van Prins Willem met Anna van Saksen* (1853). He was in 1854 made keeper of the state archives and published *Het Rijksarchief* (1857) and *Cartons voor de geschiedenis van den nederlandsche Vrijheidsoorlog* (1860-77). He died at The Hague, July 15, 1865. Not the

least of his services to Holland was his connection with *Gids*, a monthly publication of very high aim.

BAKHUYSEN, bāk'hoi-zen, LUDOLF (1631-1708). One of the foremost Dutch marine painters. He was born at Emden and began as a clerk and writing teacher in Amsterdam. His masters in painting were Aldert van Everdingen and Heinrich Dubbels, and he soon rose to the first rank in marine painting. The rival of Wilhelm van der Velde, who painted "The Calm," Bakhuyesen depicted stormy seas and many times risked his life and those of seamen in the pursuit of studies for his pictures. His coloring does not compare favorably with that of his rival, nevertheless he portrays the spirit of the sea, particularly in its wild and boisterous aspects. He has left numerous examples of his work, and many of them are of considerable size. One, representing a coast scene of great beauty, dated 1675, is in the Amsterdam Museum. In the Louvre is his "Rough Sea at the Mouth of the Maas." Two of his pictures are in the Museum at The Hague. Many are in England, seven being in the National Gallery, London. Peter the Great was his pupil, and the painter made for the Czar numerous drawings for the construction of vessels. The King of Prussia and other European princes are said to have visited his studio. After he was 71 years old he began etching on copper. He also painted portraits of considerable ability. Consult Van der Willigen, *Les artistes de Haarlem*.

BAKING. The mode of cooking food in a heated chamber or oven. The term is also applied in the manufacture of bricks, pottery, etc. The oven of a kitchen range is simply an iron chamber, with flues for conveying the heated gases of the fire round it and usually provision for ventilation. Ovens are now often heated by water or by steam and also by gas and electricity. The chemical as well as the mechanical effect of cooking upon food is explained in the article on COOKERY. The chemistry of bread baking is discussed under BREAD.

BAKING POWDER. A chemically prepared material used as a substitute for yeast in making bread, biscuits, etc. Bicarbonate of soda, tartaric acid or bitartrate of potash, and acid calcium phosphate mixed with starch or flour are the materials from which the baking powders are very commonly made. When water is added to these substances in making bread, they combine and give off carbonic-acid gas or carbon dioxide, exactly as does yeast by fermenting, which causes the bread to rise. Sometimes in place of tartaric acid alum is substituted to cheapen the cost of production. The possible harmfulness of alum for the purpose is a disputed point. Bicarbonate of ammonia is sometimes used to leaven foods. A domestic method uses bicarbonate of soda and sour milk or cream of tartar (potassium bitartrate). See BREAD.

BAKONY WALD, bō'kōn-y' vālt, or **BAKONY FOREST**. A chain of mountains in Hungary, extending northeastward from the neighborhood of Lake Balaton towards the bend of the Danube (Map: Hungary, F 3). It is about 60 miles long, over 20 miles in width, and densely covered with forests. Numerous herds of swine are reared within its limits. Its average height is not over 2000 feet; the highest peaks are found on the western side. The lower parts of the chain are under cultivation; a considerable export trade is carried on in the excellent

marble of several quarries, and there are numerous villages in the valleys. The railway line from Stuhlweissenburg to Komorn winds through the chain, reaching its highest point near Gombas (1220 feet).

BAKSHEESH, bāk'shēsh', or **BAKSHISH** (Pers. *bakshish*, a present). In the East, in modern times, in special significance of gratuity (Ger. *Trinkgeld*), which, however, the Orientals do not quietly wait to receive, but loudly and even insolently demand. Every traveler, whether in Turkey or in Egypt, in Asia Minor or in Syria, if he receives the smallest service from any native, is immediately reminded, by the cry of "Baksheesh, Baksheesh," to pay for the courtesy by a monetary gift.

BAKST, bākst, LEON NIKOLAJEWITSCH (1886-). A Russian decorative designer. He was born in St. Petersburg, of Jewish parentage, and studied there in the Academy of Arts. Under the patronage of a Russian Grand Duchess, he continued his studies in Paris. Returning to Russia, he was active at Moscow, painting interesting genre scenes of Russian life and portraits in the conventional manner, several examples of which are in the Tretiakoff Gallery, Moscow. His reference to political conditions in his paintings displeased the Russian authorities, and he removed to Paris in 1906. He soon became known as a designer of stage settings and achieved universal recognition, when the Imperial Russian ballet visited the French capital in 1909, with the productions of *Cleopatra* and *Scheherazade*. These were followed by the remarkable designs for *Salome*, with Egyptian settings, *Narcissus*, *Daphnis and Chloe*, and *A Faun's Afternoon* in Greek settings, *The Blue God*, Anamese and Javanese, *Thamar*, Transcaucasian and Chinese. *The Butterflies*, and *The Carnival*. He also designed settings for Wolf-Ferrari's opera, *The Secret of Suzanne*, in rococo, Boris Godounow in Byzantine settings, and for D'Annunzio's *La Pisanella* (Renaissance) and *Saint Sebastian* (mediæval). The ballet for his most recent production, *The Orientale*, was given in New York in 1914 with the celebrated Russian dancer Pavlova in the leading rôle. His designs are characterized by extraordinary richness and brilliancy of color, caused by pure tones interplaying with remarkable chromatic effect. His drawing is conventionalized, but highly characteristic. His teeming imagination is only equalled by his remarkable fertility of invention. An interesting exhibition of his principal designs and drawings was held in New York and other American cities in the winter of 1913-14.

BAKU, bā-kōō' (a corruption of the Pers. *badkubu*, given to it on account of the destructive winds of that region). The seat of administration of the Russian government of Baku in the Caucasus; an important seaport and naval station on the west coast of the Caspian Sea, on the peninsula of Apsheron (Map: Russia, J 6). It is an important commercial and manufacturing centre, has several shipbuilding yards, and is known especially for the rich petroleum wells in its neighborhood. On the new quay, which is about a mile in length, along the shore south of the city, there are modern stores and bazaars, many fine buildings, and the ancient garden of the khans. The older town, laid out in terraces on the slope of a hill, has irregular, narrow streets and alleys lined with low, wooden, flat-roofed houses. Here are the ruins of the palace of the khans—

once a magnificent edifice built in the Mussulman style of the fifteenth century, and the mosques of the shah, erected in 1078. North of the harbor, also on the shore, is the so-called "black town," whither the crude oil is conducted through pipe lines from the oil wells 8 or 9 miles north of the town, and where it is refined for the market.

The climate of Baku is mild, its harbor having frozen but once in 80 years; the mean temperature for the year is 58° F., for January 38°, and for July about 78°. The city owes its prosperity to the petroleum industry. In addition to oil refineries there are a number of mills, tobacco factories, shipbuilding yards, and chemical works. The advantageous position of Baku near the Persian frontier and at the eastern terminus of the Transcaucasian Railway has made it the *entrepôt* for the Russo-Persian trade. Cotton, rice, silk, wine, dried fruits, and walnut wood pass through Baku from Persia on their way to Russia and western Europe, in exchange for various goods of Russian manufacture. The growth of Baku's population has kept pace with that of its industry. In 1860 it numbered only 13,800; in 1897, 112,253. In 1904, 177,777; in 1910, 217,900. The predominating element is Tatar. This race constitutes the bulk of the laborers and small traders; Russians are next in number and fill the official positions as well as some of the commercial and financial posts; Armenians are numerous, and among them are the leading merchants. The petroleum industry is largely in the hands of foreign capitalists.

The date of the founding of Baku is not known; the town is mentioned by an Arab geographer of the tenth century. The easily igniting gases, arising from the soil saturated with petroleum, seem to have been known to the ancient Persians, or fire worshipers, and attracted great numbers of pilgrims. Baku was in possession of the Persians from 1509 to 1723, when it was captured by the Russians; the latter restored it to the Persians in 1735, but in 1806 it passed finally to Russia. A vast conflagration took place in 1901. In September, 1905, Baku was the scene of sanguinary conflicts between the Armenian and Tatar populations. During the rioting the oil industry suffered immense damage. The total loss, direct and indirect, to the different concerns amounted to tens of millions of rubles. The commercial and industrial section of the town was almost entirely destroyed. Consult: Marvin, *The Region of Eternal Fire* (new ed., London, 1891); Louis, "The Baku Petroleum District," in the *Engineering Magazine*, no. xv (New York, 1898); Henry, *Baku: An Eventful History* (1906).

BAKU. A government of the Russian viceroyalty of the Caucasus. Area, 15,061 square miles; pop., as estimated Jan. 1, 1911, 1,033,700 (274,100 urban, 759,600 rural). Capital, Baku (q.v.). It is classed as a Transcaucasian government, though its northern part extends beyond the Caucasus Range. It is of importance largely on account of its oil wells. These are principally located in the vicinity of the city of Baku, into which the oil is piped and where it is prepared for export. This district is the most prolific single district in the world and the principal source of Russia's supply. The output in 1901 was 671,000,000 poods, the entire Russian output 706,000,000; in 1908, 467,000,000 poods (525,000,000 for all Russia); in 1909, 490,000,000 (557,000,000); in 1910, about

479,000,000 (about 573,000,000). The average output per well in 1910 was 188,000 poods, 186,000 in 1909, 187,000 in 1908, 351,000 in 1901. The decline is due to the gradual decrease in the quantity derived from spouters (15,000,000 poods in 1910, and 98,000,000 poods in 1901); to the decrease in the average output per well; and to the increased depth of the bore holes together with a decrease in the number of holes bored per annum. The output from the island of Tcheleken (about 20,000,000 poods) is shipped to Baku, but is not included with the Baku production.

BAKUBA, bā-kōō'bā. A Bantu-speaking people living in the Kasai District of the Congo, who have recently been described under the name of "Bushongo"; they are related to the Baluba. The Bakuba are distinguished among all the Congolese tribes by the high development of their aesthetic sense. They are admirable wood carvers, decorating goblets, toilet boxes, drums, and in fact all kinds of wooden objects with characteristic plait patterns. The most remarkable product of their industry, however, is the plush-like pile cloth woven of raffia-palm fibres by the men and decorated with designs sewed on and trimmed down by the women. Visited and briefly described by the early travelers in the Kasai region, the Bakuba have been more recently studied by Frobenius and Torday. The latter and Joyce have collaborated in the most authoritative account hitherto published, *Les Bushongo* (Publications of the Tervueren Museum, Belgium, 1911). Some valuable data are to be found in Sir Harry Johnston's *George Grenfell and the Congo*.

BAKUNIN, bā-kōō'yēn, MIKHAIL (1814-76). A Russian agitator and writer, the founder of militant anarchism. He was a member of an aristocratic family, and after serving in the army from 1832 to 1838, traveled in Germany, where he devoted himself to the study of philosophy. His liberal tendencies had become marked even before he left Russia. In 1841 he was in close association with the leaders of the Young-German movement at Berlin, and in 1843 he appears as fraternizing with the Polish exiles in Paris. He passed a number of years in Switzerland, where he became prominent in communistic circles. In 1847 the Russian government demanded his return to Russia and upon his refusal confiscated his property. In the same year he was expelled from Paris upon the demand of the Russian authorities as the result of a violent speech in which he called upon the Poles and Russians to unite for the overthrow of the absolute monarchy. During the two years following he was plunged into the vortex of the revolutionary movement which was then convulsing all Europe. We find him at Berlin shortly after the outbreak of the March Revolution in 1848; in June of the same year he took part in the Pan-Slavic Congress at Prague and in the disturbances which followed, and in May, 1849, he was one of the leaders of the insurrection at Dresden and became a member of the Revolutionary government there. He was taken prisoner at Chemnitz and was condemned to death in May, 1850, but the Saxon government surrendered him into the hands of the Austrian authorities, by whom he was tried and again sentenced to death. At the request of the Russian government he was returned to Russia, where he was tried and for a third time sentenced to death. The sentence was

commuted to life imprisonment by order of the Czar, and after several years in various fortresses Bakunin was sent to Siberia in 1855. In 1859 he was sent to the Amur region, whence he succeeded in making his escape on an American ship to Japan. Proceeding to London by way of the United States, he threw himself into the Socialistic movement, which was then making rapid progress under the leadership of Marx and Engels. In 1869 he founded the Social Democratic Alliance, which soon joined the International Workingmen's Association. By this time, however, he had become a believer in militant anarchism, and he attempted to impose his doctrines upon the association, whose policy was one of peaceful agitation. This led to his expulsion in 1872. In 1873 Bakunin retired from active life and spent the remainder of his days in Switzerland. He died at Bern June 13, 1876. A list of his writings, comprising mainly articles in newspapers and periodicals, covers 10 printed pages in Nettlau's *Bibliographie de l'anarchie* (Paris, 1897).

BAKWIRI, bā-kwē'rē. A Bantu tribe of Kamerun, of medium height, well proportioned, and with regular features. Cannibalism was formerly practiced. Drum signaling is much used. The code admits of carrying on sustained conversations, and news is rapidly conveyed to long distances. Witchcraft, ordeals, and sacrifices prevail.

BALAAM, bā'lām. A seer, and the hero of a remarkable story told in connection with the conquest of Palestine by the Hebrews. The main narrative is found in Num. xxii-xxiv. At the instance of Balak, King of Moab, Balaam is said to have left his home at Pethor to pronounce a curse upon Israel. He at first declined (xxii. 13), but on the second call was allowed by God to go, though with the instruction to speak only what God should tell him. In reality, however, God was angry with Balaam because he went, and manifested his displeasure by sending an angel with drawn sword to block up Balaam's path. While Balaam himself did not notice the angel, his ass saw him and tried to turn aside. Driven back into the road, the ass pressed so closely against the mountain wall that Balaam's foot was crushed. The angry seer continued to beat his ass until God opened the mouth of the ass, and she spoke to Balaam, rebuking him. Then his eyes were opened, and he saw the angel, who permitted him to go on, with the understanding that he was to speak only such words as were put upon his lips. He was received by Balak at Kiriath-huzoth and taken to the shrines of Baal. At Balaam's order seven altars were prepared and seven oxen and seven rams sacrificed. Then Balaam prophesied, but God put a word of blessing in Balaam's mouth instead of a curse. A second and a third time Balak prepared altars and offered sacrifices, but each time Balaam blessed Israel. When rebuked for this by Balak, he answered that he must obey the commands of God. The seven oracles prophesy (1) Israel's greatness (xxiii. 7-10); (2) Israel's conquering power (xxiii. 18-24); (3) Israel's prosperity, with a king greater than Agag; (xxiv. 3-9); (4) Israel's king, the star coming forth from Jacob, who will smite Moab and Edom (xxiv. 15-19); (5) the destruction of Amalek (xxiv. 20); (6) the capture of the Kenites by the Ashurites (xxiv. 21 f.); and (7) the end of another people, probably the Amorites, who afflicted Asher and

Eber (xxiv. 23 f.). According to Num. xxxi. 16, Balaam counseled the women of Midian to cause the Israelites to commit trespass against Yahwe; as a punishment he was slain with the Midianites (Num. xxxi. 8; Josh. xiii. 22).

As to the home of Balaam, Num. xxii. 5 declares that he came from the land of the sons of Ammon (so Heb. MSS., Jerome and Syriac), but this may be a gloss occasioned by the absence of an oracle against Ammon. "Pethor on the river" has been understood as referring to Pitru on the Euphrates, and Aram to Mesopotamia; but the river is not necessarily the Euphrates; the similarity between the Hebrew letters *r* and *d* has often caused a confusion of Aram and Edom, and Balaam is not likely to have been represented as coming a distance of 20 days' journey, or through the country occupied by Israel to the southern end of Moab. Balaam ben Beor is believed by many scholars to be identical with Bala ben Beor, the first King of Edom according to Gen. xxxvi. 32. Attempts have been made by critics to assign different parts of the narrative to two sources, but they have not been very convincing. Balaam is nowhere represented as friendly to Israel, and, in the present condition of the text, it is not possible to use the alternation of the divine names as a criterion, or to put stress upon the apparent inconsistencies between xxii. 20 and xxii. 22. The episode of the talking ass adds to the charm of the story and, like so many an animal fable, teaches a very wholesome lesson. That animals may be conscious of the presence of a spirit when men fail to recognize it is a widespread idea (cf. Wellhausen, *Reste arabischen Heidentums*, pp. 151, 201, 2d ed., 1897). From the statement in Deut. xxiii. 5 f., that "Yahwe was not willing to hearken unto Balaam, but changed the curse into a blessing," Bertholet infers that Balaam was supposed actually to have cursed Israel, but without effect. It is possible that this passage alludes only to Yahwe's unwillingness to hear from the lips of Balaam a curse of his people Israel and a consequent change by the divine afflatus of an intended curse into a blessing. A conception of the inherent efficacy of the prophetic curse or blessing clearly underlies the whole story. Nevertheless the earliest tradition may have known only that the *hija*, or "curse," which formed so important a preparation for, and accompaniment to, the actual fighting was pronounced by the King of Edom and Midian. The later success of Israel showed the futility of any such curse and paved the way for the conviction that no curse could have been uttered, but only words of praise. A gifted poet in Israel answered the natural question as to what these words must have been. He probably lived in the Davidic age, as his allusions to the great King, his victories over Edom and Moab, and the discomfiture of nations like the Kenites and the Amelekites that still existed at his time seem to indicate. In later times Balaam became the type of the prophet uttering his oracles for hire and the heretical teacher. Consult A. v. Gall, *Zusammensetzung und Herkunft der Bileamperikope* (1900); Holzinger, *Numeri*, pp. 104 ff. (1903); Bertholet, *Die Religion in Geschichte und Gegenwart*, vol. i, pp. 1248 ff. (1909); N. Schmidt, *The Messages of the Poets*, pp. 327 ff. (1911).

BALAAM. The name under which the Earl of Huntingdon is satirized in Dryden's *Absalom and Achitophel*.

BAL'ACHONG (Malay *balachān*). The name given by the Chinese to a condiment eaten with rice, made of putrid shrimps or small fish pounded with salt and spices and then dried.

BALAFRE, bā'lā'frā', LÉ (Fr. the scarred). 1. A name applied to Ludovic Lesly, uncle of Quentin, in Scott's *Quentin Durward*, because of his scarred cheek. 2. A characterization of two dukes of Guise for a similar reason.

BALAGUER Y CIRERA, bā'la-gār' ē thē-rā'rā, VÍCTOR (1824-1901). A Spanish poet, historian, and statesman; born and educated at Barcelona. He was archivist and afterward professor of history in the university there. For the 25 years following 1843 Balaguer was head of the Liberal party in his native city. His political views were advanced through the medium of *El Conseller*, a paper which he owned and edited. Although intensely regional in his sympathies, he was not a separatist. He was made Minister of Public Works in 1872, Vice-President of the Cortes in 1880, and successively Minister of the Colonies and Minister of Finance, and later a life Senator. A special study of the history and legends of Catalonia was made by him. A writer of plays which were produced in Barcelona while their author was still in his teens, and of verse more popular than original, he frequently used the pseudonym "el Trovador de Montserrat." His influence upon the literary renaissance in Catalonia was very great, and no one did more than he in the establishment of the Floral Games (*Juegos Florales*) that so powerfully aided this movement. In 1891 he published his great epic trilogy, *Los Pirineos*, which has been translated into Italian, and into German verse for the stage. This work inspired the Spanish composer Felipe Pedrell to create a lyric drama for which Balaguer made the special libretto. During the last 15 years of his life he devoted much of his time and most of his wealth to establishing and equipping a library and museum at Villanueva y Geltrú, which he left heavily endowed in his will. He was a member of the Royal Academy of History (1875) and of the Spanish Royal Academy of the Language (1883) and possessed the Grand Cross of the Order of Carlos III. Among his more important works are: *Estudios históricos y políticos* (1876), *Historia de Cataluña y de la Corona de Aragón* (1860-63), *Historia política y literaria de los trovadores* (1878-80), *Tragedias* (1879), and *Poesías completas* (1884).

BALAHISSAR, bā'la-his-sār' (Turk. and Ar. *bala*, high + *hissar*, castle). A village of Asiatic Turkey, situated about 8 miles southwest of Sivrihisar, in the vilayet of Angora (Map: Turkey in Asia, D 3). Near by are ruins of the ancient Pessinus, a flourishing town of Galatia, famous for the worship of Cybele, to whom a fine temple was built by the kings of Pergamum. The people of Sivrihisar use this region as a quarry, and the ancient ruins are fast disappearing.

BAL'AK. A caricature of Dr. Burnet, Bishop of Salisbury, in *Absalom and Achitophel*, by Dryden and Tate. He appears in part ii.

BALAKIREFF, bā-lā'ké-ryēf, MILI ALEXEYEVICH (1837-1910). A Russian composer and founder of the Young Russian school of music. Ulybysheff (Oulibicheff) was his first teacher in music at his native city, Nizhni-Novgorod. Of exceptional memory, he knew at the age of 18 nearly all the classics of music by heart.

In 1855 he graduated from the mathematical department of the University of Kazan and went to St. Petersburg, where Glinka befriended him. He made a brilliant début as a pianist, but gave up that career; nor could Ulybysheff's Mozart worship make a classicist of him. Russia was reawakening, after the Crimean War, from her enforced torpor during the reign of Nicholas I, and Balakireff gathered around him several youthful enthusiasts, Cui, Mussorgski, and later Rimsky-Korsakoff and Borodin, all striving for nationalism in music, with Glinka and Dargomyzhski as their models. The foundation of the Modern Russian school was now laid. Under the energetic guidance of Balakireff they studied all the masters of music from the earliest times. He possessed a striking power of analysis as well as of imparting knowledge, and he taught them whatever he learned himself. "Truth and nationalism" was their battle cry. At first in literary articles, then in musical compositions, they embodied their theories. Balakireff's own contributions to this movement were *Songs* (1858-60), three overtures (on Russian themes, 1858; on Czech themes, 1867; and the Millennium, 1862); incidental music (overture, march and four entr'actes) to *Lear* (1858-61); a collection of 40 *National Songs* (1866); and a piano fantasy, *Islemy* (1869). The songs have remained a classic in their national treatment of the added accompaniments, and the fantasy has been pronounced the most difficult piano composition. It was a favorite of Liszt's, and one which all his pupils had to learn. Jointly with Lomakin, Balakireff founded, in 1861, the *Free Music School*. In its classes the "new truths" were inculcated, at its concerts the works of the Young Russian school were performed, under Balakireff's passionate baton. In 1867 he gained a European reputation by his production and conducting of Glinka's *Ruslan and Lyudmila* in Prague. On his return he was elected conductor of the Russian Musical Society, but resigned in 1869 on account of intrigues, and in 1872 withdrew from public life owing to ill health. From 1883 till 1894 he was director of the Imperial Capella, which he has placed on a solid musical foundation by organizing classes in various branches of musical instruction. His fantasy for orchestra, *Tamara* (1867-82), and his symphony in C major (1898) are his greatest works. They are growing, passionate, and full of rich orchestration. All his larger works are programme music of the Berlioz-Liszt school. Though not prolific, he occupies, in the history of Russian music, one of the most distinguished places. Consult Cui, *La musique en Russie* (Paris, 1880), and Pougin, *Essai historique sur la musique en Russie* (Turin, 1897).

BALAKLAVA, bā'lā-kā'vā. A small port in the southwest of the Crimea. It is separated by a rocky peninsula from the harbor of Sebastopol, from which it is about 6 miles distant. The harbor, which affords secure anchorage for the largest ships, is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. Balaklava is the Portus Symbolorum of the ancients, and the present name is supposed to be a corruption of the Italian *Bella-chiava* ('fair haven'). It was long the seat of a Greek colony. In the fourteenth century it fell into the hands of the Genoese, who have left behind them the interesting ruins of a fortress on a rock overlooking the bay. They were expelled in the fifteenth

century by the Turks. On the acquisition of the Crimea by Catherine II of Russia it was made a military station. In 1854 the town was occupied by the British, under Lord Raglan. Here an inefficient commissariat allowed great numbers of the troops to starve to death in the midst of bountiful supplies rendered inaccessible by official red tape. The name "Balaklava" is probably best known to English peoples in connection with the charges of the Heavy and the Light Brigades (Oct. 25, 1854), the latter made famous by Tennyson's poem. To-day, in spite of its splendid harbor, the town has a population of only about 1500, mostly Greek fishermen. The surrounding country is devoted to grape growing.

BALALAIKA, bāl'ā-lī'kā. A popular Russian stringed instrument. It consists of a triangular (rarely, oval) body and a rather long neck with frets. Formerly it had only two strings; now the usual number is three, although there are also instruments with four strings, which are plucked with the finger. The Russian peasants use it in the accompaniment of their folk songs. In recent years W. W. Andreeff has improved the quality of the tone and organized at St. Petersburg a regular balalaika orchestra of 30 instruments, which he has taken on tours through Europe, rendering only Russian folk music. The organization visited America in 1910 and in succeeding years with great success.

BALAMBAN. A pueblo on the west coast of Cebu, Philippines, about 23 miles northwest of the town of Cebu, on the Strait of Tanon. It has a well-sheltered harbor, an active coast trade, and a population of about 13,000.

BALA MURGHAB, bāl'ā mūr-gāb'. See MURGHAB.

BALAN, bā'lān'. An early poem, a later rendering of which was *Fierabras*, one of the most popular tales of the Charlemagne cycle. An English version of *Balan* was *The Sordan of Babylon*. In the latter romance Balan is the name of the father of Fierabras. He was overcome by Charlemagne. The Arthurian character, Balan, was the brother of Baln.

BALANCE (Lat. *bilanz*, having two scales, from *bis*, twice + *lanx*, plate). An instrument used for the comparison of two masses or, speaking less technically, for ascertaining the weight of a body. The balance in its essence is simply a lever (q.v.) or beam poised or suspended so as to move freely about an axis transverse to its length. The force acting on one arm of the lever is produced by the action of gravity on the body whose weight is to be determined, and is equal to its mass *m* multiplied by *g*, the acceleration due to gravity. (See MECHANICS.) If the lever is in equilibrium, or the beam at a horizontal position, there must be a force equal, but opposite in direction, acting on the other arm at an equal distance, and as the acceleration due to gravity is a constant for any one point on the earth's surface, and as the arms of the lever are equal by construction, the mass of known magnitude upon which gravity acts must be equal to the mass of the unknown body. If the arms of the balance are unequal in length, it follows, from the law of the lever, that the masses are inversely as the length of the arms. The balance, accordingly, enables us to learn the actual mass of a body by direct comparison with a standard of mass. The spring balance (q.v.), on the other hand, measures the weight or attraction exerted by the earth on a body, and as the

force of gravity varies from point to point, the force acting on the spring must vary with the place. The mass of the body which is being weighed is constant, so that the amount that the spring is stretched depends upon the acceleration due to gravity.

From the foregoing considerations it will readily be seen that there are two methods which

FIG. 1.

may be followed in the construction of a balance: Either to make the arms equal in length, and then find the number of weights of known value which will produce equilibrium, as in the case of the ordinary balance; or by having a known constant weight whose position, and consequently the effective length of the arm on which it is suspended, can be varied at will, as in the case of the steelyard. These facts were early known, and the balance is one of the first instruments to be used for measurements, having been employed by the ancient Egyptians, as the accompanying illustration testifies, and by other nations of antiquity. The steelyard played

an important part in the ordinary commercial transactions of the Romans, and interesting specimens of these balances and their weights have survived which show few if any important variations from the ordinary steelyard of the present.

Considering the simple balance, it is found that its first essential is that the arms should be equal, so that when once there is equilibrium the known

FIG. 2.—ROMAN STEELYARD.

and unknown weights may be interchanged without disturbing this condition. Otherwise the balance is false, and the weight obtained is not correct, being too great if the standard or known weights are placed in the short pan, and vice versa. Then, as it is necessary that the beam should move freely, there must be a proper mounting or suspension where friction is reduced to a minimum, and as the force of gravity

acts vertically, both known and unknown weights must be carried in suitably suspended pans.

The balance is an instrument whose use is susceptible of great accuracy, and this is attained in the balances used by physicists and chemists in their measurements of precision. While the theoretical considerations involved are of course applicable to all forms of balances, they become of greater significance in discussing these finer instruments where extreme accuracy is desired. In such a balance the beam is of metal and carries at its middle point, transverse to its length, a steel or agate knife-edge which rests on surfaces of similar material. The line of contact between the knife-edge and the plane is the axis around which the beam revolves; and when the beam is at rest a vertical line through the centre of gravity would include this knife-edge. Connected with the beam, as shown in the illustration, Fig. 3, is a fine pointer, which passes over a graduated scale at the base of the supporting pillar, while at or near its extremities are placed, at equal distances from the central knife-edge, knife-edges upon whose sharp edges, turned upward, are placed the bearing surfaces of the

FIG. 3.—ANALYTICAL BALANCE.

metallic pieces from which the pans are suspended. In order that a minimum of wear should come upon these sharp edges, mechanism is provided to support the beam and pans whenever there is no actual weighing, and the devices to accomplish this vary in different forms of balances. The beam is graduated into 10 equal divisions, which in turn are similarly subdivided, and a hook on a movable rod is provided, by means of which a fine loop or rider of wire can be placed and removed at any desired point on the beam. Such is a general description of a balance, though there are, of course, numerous mechanical modifications and refinements to insure facility of operation and accuracy of measurement. The underlying principles will perhaps better be understood by referring to the diagram, Fig. 4. Let ACB represent the beam of a balance, and let the points where the knife-edges intersect a vertical plane through the beam be located on the line ACB , though this condition in practice is not always realized, and the knife-edges at the end of the beam may be either higher or lower than the centre knife-edge. The point of support is at C , consequently the centre of gravity is situated at C on a vertical line passing through this knife-edge. The location of the centre of gravity of the beam is an important consideration. If it were above the point of support, the beam would be in unstable equi-

librium and would seek a more stable position and in so doing would overturn. If the centre of gravity coincided with the axis of revolution, the beam would rest in any position indiffer-

FIG. 4.

ently, while the stability increases with the distance of the centre of gravity below the point of support. With an increase in the stability of the beam, the less the sensitiveness of the balance and the quicker the time in which it will cease from oscillating and take up a position of rest. The sensitiveness also depends on the length of the arms, increasing with the length, and the ease, or lack of friction resulting from skillful construction, with which the beam oscillates. The more sensitive the balance the larger the period of oscillation of the beam, though it is necessary to consider the time necessary in making a weighing, and not adjust an ordinary balance to too high a degree of sensitiveness. An ordinary fine balance, as used by the physicist or chemist, is constructed and adjusted to have a period of vibration of between 10 and 15 seconds.

Assuming that the arms are equal in length and that equal loads are carried in each pan, or, in other words, that the beam is in equilibrium, the forces denoted by the dotted lines p and p' , acting vertically, are of course equal. If now a small excess of weight be added to the right-hand pan, there will be an increased force on the right-hand arm, which may be represented by p'' , and the beam will be deflected by an amount which for small additions of weight is proportional to the excess and is of course indicated by the pointer and scale.

In using a fine balance, precautions must be observed in its care and manipulation. The balance, which is inclosed in a glass case and kept free from dust, is first leveled in order that the supporting pillar should be vertical. If the pointer of the balance is not at the middle point, or zero (many physicists prefer to renumber the scale so that the numbers run consecutively from the left to the right, instead of the usual arrangement where the divisions are numbered to right and left from the centre mark) i.e., the zero or point of rest of the balance does not coincide with the zero of the scale, the true zero must be determined by taking the mean of an even number of swings on one side, and an odd number on the other, and then their mean. The body is placed in one of the pans while both pans and beam are supported. In the other are placed the weights, the usual practice being to begin with the larger weights and work toward the

smaller. The weights are of brass, platinum, or aluminium, the smaller weights being in the form of pieces of sheet metal and "riders" of fine wire. The pans and beams should always be supported while the weights are changed. After the approximate weight of the body is ascertained, so that the addition of a centigram will cause the pointer to come to rest on the opposite side of the scale, the "rider" is brought into play and adjusted at such a position that the pointer comes to a rest at zero. A more rapid and usual method is that known as "weighing by swings," where points of rest when the weights differ by a certain small unit are obtained as described above. The amount to be added to the smaller amount of the weights will be such a fraction of the small units as will be obtained by taking as the denominator the number of scale divisions between the two rest points, and as the numerator the distance of the true zero from the first point. It is often convenient with such a balance to have a table of sensitiveness, from which one can tell at a glance the number of milligrams corresponding to a scale division for any given load. The experimenter can also find the ratio of the two arms of the balance and use it as a correction factor, as well as determine the errors of the set of weights in order to refine his measurement. He should, in addition, take into consideration the amount of air displaced by weights and the body being weighed, particularly if their densities differ considerably. An analytical or assay balance will have a sensitiveness of 1-50 or even 1-400 of a milligram, and is used in chemical analyses for the exact determination of the mass of various substances, though a sensitiveness of one-half milligram suffices for many ordinary analytical purposes. In the use of the balance there are many methods, complex and exact, which are used by the physicist, and which will be found described in the more advanced treatises on experimental physics.

Probably the most accurate use of the balance is at the International Bureau of Weights and Measures at Sèvres, near Paris, where the standard kilograms constructed by the bureau are preserved and compared. Here the balances are of great sensitiveness, and are operated by an observer in an adjoining room, who uses a telescope to observe the deflections. There is automatic apparatus to change the weights from one pan to another, and the temperature is maintained constant.

Balances are constructed in many forms for various purposes where it is not at all necessary to employ such refinements as have been described. Those of the apothecary or grocer are familiar examples, while the balance for weighing bullion combines large capacity with considerable sensitiveness. In small balances use is sometimes made of the bent lever, especially in balances for weighing letters, chemicals, and other small objects. Here a constant weight is placed on the short or bent arm, and the body of unknown mass on the long arm. A pointer on a graduated scale indicates the weight of the body. The graduations are not even, as the angular displacement from a position of equilibrium does not increase proportionately with the increase of weight.

Bibliography. For a description of ancient balances, consult Gerland and Trau Müller, *Geschichte der physikalischen Experimentirkunst*; and Sokeland, "Ancient Desemers or Steelyards,"

in the *Smithsonian Annual Report for 1900* (Washington, 1901), translated from the *Verhandlungen der Berliner Gesellschaft für Ethnologie* (Berlin, 1900). For a description of the manipulation of a balance in fine measurements, the reader should consult Kohlrausch, *Lehrbuch der praktischen Physik* (Leipzig, 1905), or his more elementary *Kleiner Leitfaden der praktischen Physik* (Leipzig, 1900). An excellent systematic treatise is Felgentraeger, *Theorie, Konstruktion und Gebrauch der feineren Hebelwaage* (Leipzig and Berlin, 1907), as is also Braver, *Die Construction der Waage*, 3d ed. by Lawaczek (Leipzig, 1906); Stewart and Gee, *Lessons on Elementary Practical Physics*, vol. i (London, 1889), and Glazebrook and Shaw, *Practical Physics* (London and New York, 1893), give excellent descriptions of the theory and manipulation of balances, which also will be found discussed at considerable length in the larger treatises on practical physics. The publications of the International Bureau of Weights and Measures describe the method of testing standard kilograms and the balances used by the bureau.

BALANCE, and **BALANCE SPRING**. The balance of a watch is a wheel finely poised on its axis; the pivot holes in which it turns being frequently—in chronometers and clocks, as well as in watches—jeweled, or made of small rubies, diamonds, etc., for the sake of durability. The natural effect of an impulse given to such a wheel would be a complete rotation on its axis. This, however, is convertible, by the escapement (q.v.) and by the balance spring, into a vibratory motion. The balance spring is held to be a crowning invention in the mechanism of the watch; and the honor of its first suggestion has been claimed for no less than three very eminent men—Hooke, an Englishman; Abbé Hautefeuille, a Frenchman; and Huygens, the Dutch astronomer. The honor, however, is thought to belong to Hooke, who applied for a patent for the invention in 1658 or 1660.

The balance spring consists of a coil of fine steel wire which determines the time of vibration of the balance. One of its extremities is fastened to a point independent of the balance, while the other is attached near its axis. When the balance is at rest, the spring is not under tension, its position being called the point of rest; but when an impulse is given to the balance by the crown wheel of the escapement, the balance moves around just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse given, the balance stops for a moment, and then is driven back by the elastic recoil of the spring, and continues thus to vibrate so long as the impulse is repeated or the watch is in motion. The subject of balances and balance springs and their adjustment is treated at considerable length in Britten, *Watch and Clockmakers' Handbook* (London, 1896). For a general description of watchmaking and for illustration of the balance wheel, see **CLOCK** and **WATCH**.

BALANCE OF POWER. An expression used in diplomacy, with reference especially to the European Powers, to denote a condition of affairs in which no one state is permitted to have such a preponderance as to endanger the independence of the others. This idea is not confined to modern times. The Greek states acted upon it by a kind of instinct of self-

preservation, though it was not directly formulated. It has, however, been more distinctly avowed as a motive of political conduct, and more systematically acted upon since the time of Charles V, whose ambitious designs awakened the European Powers to the danger of such overwhelming preponderance in one dynasty. The motive of preserving the balance of power came first distinctly into the foreground in those alliances which England, Holland, and Austria repeatedly formed against the schemes of Louis XIV. It was the same cause that broke up the most powerful of these coalitions; for in the War of the Spanish Succession, when the Hapsburg candidate for the Spanish throne became, by the death of Joseph I, sovereign of Austria and Holy Roman Emperor, and the power which, in the hands of Charles V, had menaced the equilibrium of Europe, seemed likely again to be wielded by one man, England withdrew from the coalition and saved Louis from a decided overthrow. The kaleidoscopic changes in political alliances that characterized European history from the Treaty of Utrecht to the end of the Seven Years' War were the result of a frantic attempt on the part of continental statesmen to preserve the balance of power. The aggressions of Napoleon called all the powers of Europe to arms against him in the name of the balance of power; and in readjusting the map of Europe the balance of power was often invoked to cover the jealousy which resisted claims to restitution of territory. For some time the balance of power in Europe has been embodied, as it were, in a hexarchy or permanent congress of the six Great Powers—Great Britain, France, Germany, Austria, Russia, and Italy. Mutual jealousy among the leading Powers, on the score of extension of boundaries, is looked to as the great safeguard of the smaller states. After this manner the Crimean War arose out of Russia's renewed attempt to extend her dominion over Turkey. It was in the name of the balance of power that the nations, in 1878, at the Congress of Berlin, deprived Russia of many of the advantages she had gained by the Treaty of San Stefano. Within the last 30 years, however, the balance of power has encountered an opposing principle in the rising spirit of nationalism. It is now generally recognized that countries may no longer be carved arbitrarily into morsels for the sake of preserving a political equilibrium, but that physical and social conditions must be taken into consideration as forces playing a part in the formation of states. United Italy, United Germany, and the Pan-Slavic spirit in Russia exemplify the growth of this political idea. On the other hand, a new phase of the old problem has been presented by the spread of European colonization and commerce in Asia and Africa. The balance of power has been in a measure extended over the whole world, and France, Germany, and Italy are everywhere seeking colonies and "spheres of influence" to balance the colonial empires of England and of Russia.

As a result of the Balkan War in 1912-13, the sudden rise to power of the Slav races at one time seriously threatened the political equilibrium of Europe and startled the courts of the Great Powers, but owing to rival ambitions and racial jealousies all fears of a Slavic preponderance were quickly dissipated and vanished when the Balkan states turned their arms against those of their own race.

BALANCE OF TRADE. A term applied to the difference between the value of the exports and imports of a country. This difference was formerly measured roughly, by the outflow or inflow of the precious metals in the settlement of accounts. When the exports exceeded the imports, causing an inflow of the precious metals, the balance was deemed favorable; in the contrary case, unfavorable. All of these expressions, which are still familiar, had their origin in the conception of political economy dominant in the so-called mercantile period. (See *POLITICAL ECONOMY*.) It was one of the fundamental errors of that system to confound the wealth of nations with their stocks of precious metals, and the economic policy of the period zealously favored anything which seemed to increase the stock of the precious metals, and as sweepingly condemned whatever had an opposite tendency. It will be readily understood how upon such principles the attainment of a favorable balance of trade became the chief end of commercial policy. Various measures were adopted to secure this end and led to the manifold restrictions upon commerce which characterize peculiarly the eighteenth century.

With the spread of the notions of economic freedom and the gradual adoption of a more liberal if not an absolutely free-trade policy in commercial affairs, the "balance of trade" lost its commanding place in economic doctrine. But it remained for a long time, and is to-day, a frequent popular criterion of national prosperity. Apart from the importance thus ascribed to the balance of trade, there is doubtless the feeling that a nation which imports more than it exports must pay the excess from its accumulations and thus gradually become impoverished. But if it be true that a people living upon its accumulations is on the road to impoverishment, it is by no means true that an excess of imports over exports is evidence of such a fact.

Whatever its bearing upon the national welfare, there could be no doubt that under the simpler conditions of a century ago an excess of merchandise exports over imports was an adequate explanation of an inflow of the precious metals. This would still be true if current sales and purchases were the only economic relations that bound peoples together. But this is far from being the case. In addition to movements of goods we have movements of debts (bonds, stocks, etc.), and movements of services (freights for transportation), between the nations. Any inequality in the movement of goods may be compensated, not only by payments of gold and silver, but by transfers of indebtedness or the performance of services. Indeed, the last two factors may be of such importance as to determine a movement of gold exactly contrary to what the merchandise movement might lead us to expect. Thus the United States, in the fiscal year 1912, with an excess of merchandise exports over imports of \$551,057,475, had exports of gold exceeding imports by \$8,391,848. In the United States an excess of merchandise exports, and in Great Britain an excess of imports, may be said to be normal conditions of trade. Since it thus appears that the balance of merchandise exported and imported no longer explains the phenomena of international payments, the scope of the phrase "balance of trade" has sometimes been extended to include the balance of international settlements. But in so doing the phrase once clear and distinct becomes

involved and uncertain. It seems better to confine it to its original meaning to indicate one factor of modern commercial relations, and not the substance of them all.

It should be added that the practical determination of the balance of trade is beset with difficulties. Methods of determining the value of both exports and imports are necessarily crude, and it is not to be doubted that many of the false conclusions that have arisen in the discussion of trade balances have had their origin in the defects of commercial statistics. No analysis of trade returns can truthfully do more than indicate broad general tendencies without an examination into the methods by which such returns are prepared.

BALANGA, bā-lan'gā. The capital of the province of Bataan (436 square miles; pop., 45,166), on the island of Luzon, Philippines (Map: Luzon, D 5). It is on the west coast of Manila Bay, 34 miles northwest of Manila. It is a telegraph station, and its location on a shore road makes it an important point. It is well built and has a government house, a city hall, and a prison. Irrigation from the river Talisay is carried on to a considerable extent. Pop., 1903, 7347.

BAL'ANOGLOSSUS (Gk. *βάλανος*, *balanos*, acorn, gland + *γλῶσσα*, *glōssa*, tongue). A remarkable worm-like invertebrate animal, now generally regarded as in some way related to the probable ancestral form of the vertebrates. Two or three genera form the sole family of the order Enteropneusta and the class Hemichorda (or Adelochorda). The body is long and slender and, some distance in front of the middle, is banded by an elevated ring, called the collar, from the front of which springs the somewhat tongue-shaped proboscis. (See illustration on Plate of ASCIDIANS, ETC.) Back of the collar, on each side of the body, are series of vertical slits opening through both the body wall and the wall of the alimentary canal. Water taken into the mouth passes out through these openings and aerates the blood. The slits therefore function as gill slits; and they are supported by "chitinous" rods, like the gill arches of *Amphioxus*. Projecting forward from the anterior upper side of the esophagus is a short cartilaginous rod, which helps support the proboscis. This apparently corresponds to the notochord of the embryo of the higher vertebrates, and, because of its incomplete condition in *Balanoglossus*, the name "Hemichorda" is given to the class.

The species of *Balanoglossus* (and allied genera) are found buried in the sand of the seashore in shallow water in various parts of the world. They have been taken on both coasts of America, on the Pacific coast, north to Alaska, on the European side of the Mediterranean, in the East Indies, in the Bahamas, and on the south shore of Jamaica. Most of the known species are small and dull-colored, but some of the West Indian species are over a foot in length and half an inch in diameter, and are brightly colored with red and yellow. There are generally little heaps of excrement about the entrance to the holes in which *Balanoglossus* lives. All the species have a musky odor, which is strong enough to indicate their presence to any one familiar with the smell. Sometimes it is so strong as to be highly disagreeable. Many of the species have a complicated metamorphosis in their development, the pelagic bell-shaped

larva being known as a tornaria. It resembles superficially the larval form of some of the echinoderms, and for that reason some zoölogists have sought for evidence of relationship between that group and the Hemichorda. It is generally believed now, however, that the nearest living relatives of the Hemichorda are to be looked for among the Ascidians. Compare AMPHIOXUS; CHORDATA. For illustrations, see ASCIDIANS.

BALAO, bá-lá'ó (Sp. to leap or dance). The name in the West Indies for the fishes of the family Hemiramphidae, allied to the gars. See HALF-BEAK.

BALAOAN, bá'lou-án'. A town of Luzon, Philippines, in the province of La Unión, situated 26 miles north of San Fernando. Pop., 1903, 10,008.

BALARD, bá'lär', ANTOINE JÉRÔME (1802-76). A French chemist. He was born at Montpellier and died in Paris. He began his career as a pharmacist, but was subsequently appointed professor of chemistry at the Sorbonne and at the Collège de France, Paris. In 1868 he was made inspector-general of superior instruction. Balard carried out a number of interesting investigations both in pure and applied chemistry, but is best known as the discoverer of the element bromine, which he found in the mother liquors remaining after the extraction of common salt from sea water.

BAL'AS (Ar. *balakhsh*, a ruby from *Badakhshan*, *Balashan*, near Samarkand). The rose-red variety of ruby spinel (q.v.), called also rubicelle.

BALASHOV, bá'lá-shóv'. The chief town of a district, in the government of Saratov, Russia, on the left bank of the Khoper, a tributary of the Don, about 125 miles west of the city of Saratov (Map: Russia, IF 4). Balashov has a considerable export trade in grain. Pop., 1885, 10,100; 1897, 12,200.

BALASORE, bá'lá-sör' (Turk. and Ar. *bala*, high + *sorc*, dwelling). The capital of the district of the same name in the Orissa division, Bengal, British India, near the Burabalang, which enters the sea to the west of the Hugli or Calcutta River, 118 miles southwest of Calcutta (Map: India, E 4). It has dry docks and, in spite of an obstructed harbor, maintains a coasting trade, which consists principally of exports of rice and salt, and imports of oil, metal, and cloth. Before the deepening of the Hugli it was a transshipping place for Calcutta sea trade. The town has been the seat, successively, of Portuguese, Dutch, and Danish factories. In 1846 the Danes sold their interest in the place to the English. Pop., 1901, 20,880; 1911, 21,362.

BALATE, bá-lá'tá. The name in the Philippines for a local holothurian (*Holothuria atra*), which is a favorite sort of trepang. Consult Jordana y Morera, *Bosquejo geográfico e histórico-natural del archipelago Filipino* (Madrid, 1885). See TREPANG.

BALATON, bó'ló-tón, LAKE (Hung. for Ger. Plattensee). The largest lake in Hungary, about 55 miles southwest of Budapest (Map: Hungary, E 3). Its extreme length is 48 miles, with a breadth of from 3 to 10 miles, and an estimated area, including its frequently submerged marshes, of 420 square miles. Its depth is stated to exceed 100 feet near Tihany, although the average rarely goes beyond 25 feet. It is fed by numerous streams and springs and discharges its superfluous waters through the Sió, the Kapos River, and the Kapos Canal

into the Danube. The southern bank is low, while the northern is bounded by vine-clad hills. The lake abounds in fish, notably in "fogas," a variety of perch which is considered a great delicacy in Germany and Austria-Hungary.

BALAUSTION'S ADVENTURE. A dramatic monologue by Robert Browning. The author's own fondness for Euripides is reflected in Balaustion's enthusiastic devotion to the humanest of the Greek tragedians. The Rhodian girl is one of the loveliest creations in English poetry. The poem was published in 1871 and was afterward continued in *Aristophanes' Apology*. See BROWNING, ROBERT.

BALAWAT, bá'lá-wát'. A ruined city of Turkey in Asia, 10 miles northwest of Nimrud. Its Arabic designation is Jaqut Balábâdh. It is the site of the ancient Imgur Bel, a fortified place built by Asurnazirpal II (885-860 B.C.) and his son, Shalmaneser III (860-825 B.C.). Asurnazirpal II began the construction of a fine palace which was completed by his successor. Among the most interesting relics recovered from the ruins are splendid bronze gates that opened into the vestibule. They are now in the British Museum. Consult Birch, *The Bronze Ornaments of the Palace Gates of Balawat* (London, 1880-81).

BALAYAN, bá'lá-yân'. A seaport town of Luzon, Philippines, in the province of Batangas (Map: Luzon, D 11). It is situated at the northwest end of the Gulf of Balayan, 30 miles northwest of Batangas, has a good harbor, and vessels have made the town a base of supplies. The inhabitants are engaged in fishing, cattle-raising, agriculture, and coast trade. Pop. (1903) of town, 8493; of municipality, about 25,000.

BALBEC. See BAALBEK.

BALBI, bál'bít, ADRIANO (1782-1848). An Italian geographer, born at Venice, who became successively professor of geography at Murano, professor of physics at Ferino, and a customs official in his native city. He published numerous works on geography and on statistics, most of which have been translated into the principal European languages. Among his works are: *Prospetto politico-geografico dello stato attuale del globo* (1808), *Atlas ethnographique du globe on classification des peuples anciens et modernes d'après leurs langues* (1826), and *Abrégé de géographie* (1838).

BALBI, GASPARO. A Venetian merchant of the sixteenth century, the first traveler who left an account of India beyond the Ganges. He made a 10-years visit to India. After his return he published, in 1590, the results of his travels in a volume entitled *Viaggio all' Indie orientali*. A Latin translation was printed in De Bry's *Collection of Voyages and Travels to the East Indies*, published at Frankfurt in 1590-94. Balbi appears to have set down without exaggeration all that he himself saw and is particularly minute and exact concerning commercial matters, but there is scarcely any limit to his credulity with regard to what he heard from others. Having visited Goa and Cochín and other Portuguese settlements, he sailed for Pegu, then an independent empire, where he remained two years. His account of this last country is the most interesting of his narratives.

BALBINUS, DECIMUS CÆLIUS. One of the two emperors of Rome whom the Senate elected, on hearing of the death in Africa of the elder Gordianus and his son, in opposition to Maxi-

minus, who had the support of the legions in Germany. He was celebrated as an orator and a poet and was a man of mild disposition. His coadjutor, Marcus Clodius Pupienus Maximus (see PUPNIENUS), was a bold and resolute soldier, who had risen from the people. They had reigned only a few months, during which time Maximinus had been killed by his own soldiers, who afterward submitted to Maximus, when they were both killed in 238 A.D. by the Pretorians, who at that time were animated by bitter hostility toward civilians and extended it to the rulers who had been elected by them.

BALBO, bäl'bó, CESARE, COUNT (1789-1853). An Italian statesman and historian, born at Turin. At the age of 18 he was appointed by Napoleon auditor of the Council of State at Paris; in the following year he became secretary to the commission sent to organize the province of Tuscany and continued for several years in similar service until the downfall of Napoleon. Thereafter he cast in his fortunes with the house of Savoy and entered upon a military career; but this also was soon interrupted by his being unjustly implicated in the Revolution of 1821. After three years of exile in France he returned home and gave himself up to historical studies. In 1843 appeared his *Delle speranze d'Italia*, whose chief contention was that national independence must precede the enjoyment of constitutional liberty. After freedom of the press was secured in 1847, he founded the *Risorgimento* in conjunction with Cavour. In 1848 he became president of the first constitutional ministry of Piedmont and from that time until his death, in 1853, retained a seat in the Chamber as one of the representatives of Turin. A conservative by temperament and training, his ideal was Italian unity and independence, so far as was consistent with the maintenance of the papal power, and this idea dominates all his writings. The more important of these include: *Storia d'Italia sotto ai Barbari* (1830); *Vita di Dante* (1839); *Meditazioni Storiche* (1842); and the posthumous works, *Della monarchia rappresentativa in Italia* (1857); *Sommario della Storia d'Italia* (1862). His historical novels (now ed., Leipzig, 1864) were popular in their day. The best *Life of Balbo* is by Ricotti (Florence, 1856). Consult also A. Vismara, *Bibliografia di C. B.* (Como, 1882), and G. Mazzoni, *L'Ottocento* (Milano). Selected works, edited by F. Nicolini, are now appearing at Bari (1913-). *The Life of Dante* was translated by Bunbury (London, 1852).

BALBOA, bäl-bó'a, VASCO NUÑEZ DE (1475-1517). A Spanish explorer, the first European to see the Pacific Ocean from American shores. He was born of a noble but reduced family at Jerez de los Caballeros. After leading a rather dissolute life in his youth he took part in the great mercantile expedition of Rodrigo de Bastidas to the New World. He established himself in Santo Domingo and began to cultivate the soil; but fortune proved adverse, and in order to escape from his creditors he had himself smuggled in a cask on board a ship and joined the expedition to Darien in 1510, commanded by Martín Fernández de Enciso. An insurrection which took place obtained for Balboa the supreme command in the new colony. Confused accounts which reached him of a great western ocean impelled him, in 1513, to set out in quest of it. On September 25 of that year he obtained the first sight of the Pacific Ocean from a mountain top in the Isthmus of Panama. On the 29th

he reached the water at the point which is still known by the name he gave to it, the Gulf of San Miguel, and took formal possession for Spain, naming the ocean the *Mar del Sur*, or South Sea, the coast at this point trending nearly east and west. His natural enthusiasm at this great discovery was shared by all the educated men of his time, and the descriptions of it by contemporary authors may still be read with much interest.

The governorship of the territories conquered by Balboa, and known as Darien, was obtained in 1514 by Pedro Arias (Pedrarias) Dávila, by means of his intrigues at the Spanish Court. Balboa resigned the command into the hands of the Governor, a narrow-minded and cruel man, and in a subordinate situation undertook many successful expeditions; but these, and all his other merits, only served to increase the hatred of Pedrarias Dávila toward him. The King recompensed Vasco Núñez for his discoveries by appointing him *Adelantado del Mar del Sur* (the Pacific), and Governor of Panama, Coyba, and the lands he had discovered in the Pacific. The government of the mother country sought in vain to mediate between them, and Balboa even arranged to marry the daughter of Pedrarias. But on the first occasion of dispute which arose, Balboa, having been induced by Pedrarias to deliver himself up, was accused of a design to rebel, and upon evidence furnished by Garabito, the supposed friend to whom Balboa had intrusted his affairs, he was convicted and beheaded at Acla in 1517.

BALBRIGGAN (Gael. Brecon's town, from *baile*, *balley*, place, town, fort). A seaport town of county Dublin, Ireland, 22 miles north of Dublin (Map: Ireland, E 3). Its principal manufactures are embroidered muslins, cotton, calico, and hosiery. The name "Balbriggan" has been used to describe varieties of cotton-knit goods prepared elsewhere. There is a little coast trade in grain and fish. Balbriggan is a favorite watering place. After the battle of the Boyne William III encamped here. Pop., 1901, 2236; 1911, 2273.

BALBUS, LUCIUS CORNELIUS. 1. MAJOR. A native of Gades (Cadiz), in Spain. After serving in the war against Sertorius he came to Rome and received the citizenship from Pompey. He was on terms of intimate friendship with both Pompey and Cæsar, especially with Cæsar. He helped to form the First Triumvirate, and, as a skillful financier, was chosen to look after Cæsar's property and interests during the latter's Gallic campaigns. In 56 B.C. his enemies and those of the triumvirs prosecuted him on a charge of illegally exercising the rights of Roman citizenship. He was defended by Cicero, in a speech still extant, and acquitted. Under Octavianus he was made Consul (40 B.C.)—the first time this honor had ever been conferred on one not born a Roman citizen. 2. MINOR. A nephew of the above. He, too, won Roman citizenship through Pompey. He served under Cæsar in Spain and in Africa, and was rewarded with the position of Pontifex. As Questor in Spain in 43 B.C., under Asinius Pollio, he used his office for fraud and oppression. Years later (21 B.C.) we find him as Governor in Africa, where he defeated the Garamantes (19 B.C.) and obtained a Roman triumph—a new honor for one not born a Roman citizen.

BALCH, bälch, EMILY GREENE (1867-). An American economist and writer. She was born in Jamaica Plain, Mass., and received her col-

legiate education at Bryn Mawr. The year following her graduation in 1888 she spent in Paris in the study of political economy, and later she took special work at the University of Chicago (1895) and in Berlin (1895-96). In the latter city she was engaged in seminary work with professors Schmoller and Wagner. For a time she was connected with Denison House, a college settlement in Boston, and there also she was prominent in child welfare work. After being connected with the department of economics at Wellesley College for several years she was in 1903 made associate professor of economics and sociology. In 1908-09 she was a member of the Massachusetts State Commission of Industrial Education. Her writings include *Public Assistance of the Poor in France* (1893) and *Our Slave Fellow-Citizens* (1910).

BALCH, GEORGE BEALL (1821-1908). An American naval officer, born in Tennessee. He entered the navy in 1837, studied at the naval school in Philadelphia in 1841-43, and participated in most of the naval operations of the Mexican War. In 1862 he was promoted to be commander, and subsequently, in command successively of the *Pocahontas* and the *Pawnee*, of the South Atlantic blockading squadron, distinguished himself by his operations on the Black and Stone rivers (Tenn.) and Togoda Creek (S. C.). He was commissioned captain in 1866, commodore in 1872, and rear admiral in 1878; was superintendent of the United States Naval Academy from 1879 to 1881 and was retired in 1883.

BALCH, THOMAS WILLING. An American lawyer and author, who graduated from Harvard College in 1890 and from the law school of the University of Pennsylvania in 1895. He took up the practice of law in Philadelphia. The following works on international law are by him: *Some Facts about Alsace and Lorraine* (1895); *The Alabama Arbitration* (1900); *The Alaska Frontier* (1903); *L'évolution de l'arbitrage internationale* (1908); *La question de pêcheries de l'Atlantique* (1909); *The Arctic and Antarctic Regions and the Law of Nations* (1910); *La baie d'Hudson, est-elle une mer libre ou une mer fermée?* (1911; Eng. ed., under the title *Is Hudson Bay a Closed or Open Sea?* (1912)).

BALCONY, bāl'kō-nī (It. *balcone*, from *balco*, scaffold; Ger. *Balken*, beam). 1. A projecting platform in front of a window or of several windows on the outside of a private or public building, inclosed by a balustrade or parapet, and supported either by consoles and brackets or by supports rising from the ground. The balcony was occasionally used in Græco-Roman architecture, as is shown by several houses in Pompeii, by a temple at Baia, by ancient frescoes and reliefs, and by literary descriptions of the *maritima* of Roman houses, but it did not become popular until the Middle Ages in the Orient and southern Europe.

Early wooden examples have perished; the finest remaining ones are the stone balconies in Italy, both in the communal palaces, where they served for public speeches and announcements (often called *ringhiera*), and in private palaces, such as those of Venice and Rome. In Italy they were usually uncovered, but sometimes, especially in France, they were surmounted by canopies, supported either on brackets or on columns rising from the balcony. Renaissance architects made an important feature of the balcony. In northern Europe, especially Switzer-

land and Germany, the structure was usually of wood and became a most picturesque part of houses and chalets. 2. The term is also ap-

A VENETIAN BALCONY.

plied to the gallery or stern walk outside of the stern of a large ship, and in theatres to the part between the dress circle and the gallery.

BALDACHIN, bāl'dā-kin (It. *baldacchino*, a canopy, from *baldacco*, the Italian name of *Bagdad*, where the fabrics were manufactured). A term borrowed from the East and originally used of rich silks or brocades in the form of a canopy or tent-like or umbrella-like covering, such as were used in the East, either to place or carry over the heads of dignitaries or to pitch as tents. They formed an indispensable part of the court and traveling equipment of Byzantine and Mohammedan rulers and magnates, and were among the most sumptuous presents interchanged (e.g., that sent by Harun-el-Raschid to Charlemagne). Baldachins became well known in Europe, through the Italian trade with Constantinople and the Mohammedan East, and also through the Crusades. Supported on four poles, they were carried over the heads of civil and religious dignitaries in all processions, coronations, marriages, religious rites, etc., and this custom is still continued in the processions of the Catholic and Greek churches. Fixed baldachins were used in royal and feudal throne rooms, in papal and episcopal halls, and over state tribunals: the term is also used for the canopies over state bedsteads. During the Renaissance, when the more purely architectural forms of the canopies over high altars, side altars, tombs, etc., were superseded by others of more pictorial type, the term "baldachin" was applied to these permanent structures of marble or metal, such as Bernini's famous bronze baldachin over the high altar of St. Peter's in Rome. In this sense the baldachin becomes practically identical with the *ciborium* (q.v.) over the tomb altar in early mediæval churches; but the word should probably be restricted to such examples as imitate the draped canopies above described.

BALD COOT, BALD EAGLE, ETC. See COOT; EAGLE; ETC.

BALD CYPRESS. See CYPRESS.

BALDE, bāl'dā, JAKOB (1604-68). A Latinist and poet, native of Alsace, who wrote in Latin. He was a Jesuit and for a time professor of rhetoric at Innsbruck (1628), and then at Ingolstadt (1635), and court preacher at Munich (1638-50) and at Neuberg (1650-68). He excelled as a lyric poet and was especially success-

ful as an imitator of Horace. Of his poems the following deserve mention: *Lyricorum Libri IV*, *Epodon Liber I* (1643); *Sylvæ Lyricæ* (1643); *Urania Victrix* (1663)—an allegory. Consult G. Eitner, *Jacob Balde's Leben und Charakter* (Breslau, 1863), and J. Bach, *Jakob Balde* (Freiburg, 1904).

BALDER, bāl'dēr. A narrative poem by Sydney Dobell, written at Amberley Hill in 1853 and published in 1854. Its plot is singularly painful, and it abounds in monotonous descriptions. It evinces, however, a lofty imagination and a fine appreciation of nature.

BALDER, bāl'dēr (Old Norse *baldr*, AS. *bealdor*, OHG. *balder*, prince, lord; cf. OHG. *bold*, bold, Old Norse *ballr*, bold, impudent). In Scandnavian mythology, the son of Odin and Frigg, symbol of summer, light, beauty, amiability, persuasive eloquence, and gracious wisdom. According to the *Gylfegunning* (see EDNA) he lived at Brejdablik. The *Voluspa* tells a story of his death suggesting the myths of Adonis and Persephone. Here Balder is killed by the evil god, Loki, aiming for the blind god, Hödur, an arrow of mistletoe (symbol of mid-winter). He was the first of the Æsir to die. Hel, the goddess of the underworld, promised to release Balder, if heaven and earth unanimously asked it. Loki, as Thökt, refused, and escaped vengeance. But Balder will return after Ragnarök, the Twilight of the Gods, and usher in a golden age. Use has been made of this myth by Richard Wagner in his *Nibelungen tetralogy*. See AESIR; SCANDINAVIAN AND TEUTONIC MYTHOLOGY.

BALDER DEAD. 1. A dramatic poem by the Danish writer, Johannes Ewald, published in 1773. 2. A stately and pathetic narrative poem by Matthew Arnold, founded on the death and funeral of the Norse god and his journey to the underworld, where he was held in honor. See BALDER.

BALDERSTONE, bāl'dēr-stōn', CALER. A faithful old butler in the family of the Master of Ravenswood, in Scott's *Bride of Lammermoor*.

BALDI, bāl'dē, BERNARDINO (1553-1617). An Italian savant and poet. He is said to have been master of a dozen languages and to have written upward of 100 different works. He became tutor to Ferdinando Gonzaga, through whom he was made Abbot of Guastalla, an office which he held for 25 years. He was famous as a theologian, mathematician, geographer, antiquarian, historian, and didactic poet. He devoted 12 years to the work of which the *Cronica dei matematici* is an abridgment and also wrote *La Nautica* (a finely toned poem on navigation), an Arabic grammar and dictionary, and a translation of the *Targum* of Onkelos. Consult G. Zaccagnini, *La vita e le opere di B. Baldi* (Modena, 1903).

BALD'NESS, ALOPECIA; CALVITES. Absence or deficiency of hair upon the scalp. Alopecia is the scientific term. Pincus is authority for the statement that the life of a hair is from two to six years, at the end of which time it falls and is replaced by new growth. According to this calculation, from 50 to 60 hairs are shed each day. During vigorous health and until the prime of life has been passed, enough new hairs grow to replace the dead ones, and baldness does not occur. Congenital baldness occurs in some individuals and is sometimes called *hypotrichosis congenita*. Senile alopecia is observed in the aged as a part of the general atrophy incident

to this condition; there is a gradual thinning of the hair upon the top, front, and sides of the head, steadily advancing as age increases. Premature alopecia occurs in individuals from 20 to 35, either with or without manifestations of disease. A frequent cause of baldness in the young is seborrhæic eczema of the scalp, which is characterized by increased formation of dandruff and is of bacterial origin. It occurs as early as the eighteenth year. Other local causes are ringworm of the scalp, psoriasis, eczema, erysipelas, and lupus. Syphilis and favus (q.v.) are common causes. Anæmia, wasting diseases, such as fevers, childbearing, and debility due to dissipation, are all ascribed as causes of baldness. It is also hereditary in certain families and in such cases appears to be due to failure in the nutrition of the scalp. Women are less liable to baldness than men—a fact probably due to the circumstance that they take better care of the hair, and less frequently exhaust the natural oil of the sebaceous glands of the scalp by the use of strong alkaline shampoos. Shaving the head, when the hair falls in great quantity, as after long-continued fevers, is generally practiced; but the wearing of a wig impedes the growth of hair upon a shaven scalp. Chloral, ointment of mercury, cantharides, sulphur, tar, and resorcin are used with success in checking baldness in some cases.

ALOPECIA AREATA is a disease of the hair follicles of neurotic origin, which produces, quite suddenly, circumscribed patches of baldness of the scalp, sometimes of the eyebrows or beard, and in rare instances of the whole body. The disease often follows mental shocks, psychic disturbances, or injuries to the nerves. Consult Jackson and McMurty, *A Treatise on Diseases of the Hair* (Philadelphia, 1912); and Joseph, *Lehrbuch der haarkrankheiten* (Leipzig, 1910).

BALDO, bāl'dō, MONTE (It. bold mountain). A mountain group, 26 miles long and 7½ miles wide, on the boundary between south Tirol and the province of Verona, Italy, and bordering Lake Garda on the east. Its highest peaks are Cima di Val Dritta or Monte Maggiore (7277 feet) and Altissimo (6821 feet). Fine views are obtained from these summits, and the quarries yield choice marble.

BALDOVINETTI, bāl'dō-vē-nēt'tē, ALESSIO (1425-99). A Florentine painter and decorative designer of the early Renaissance. His master in painting is unknown, but we do know from documents that he was associated with Andrea del Castagna and with Domenico Veneziano, of whom, according to Berenson, he was a pupil. He belonged to that group of realists whose chief mission lay in solving the technical problems of painting. According to Vasari, Baldovinetti used oils before their introduction into Italy by Antonello da Messina; he made especial progress in rendering landscape. Nearly all his paintings are in Florence. The earliest ascribed to him are three small panels belonging to the cycle painted by Fra Angelico (q.v.) for the sacristy doors of Sant' Annunziata and now in the Uffizi. His earliest attested painting is a fresco of the "Nativity" in the same church. Of his decorations for the Portuguese chapel in San Miniato (1466) only an "Annunciation" and several figures of the ceiling survive. His greatest and most ambitious achievement was a series of frescoes for Santa Trinita (completed in 1497), upon which he labored 16 years, receiving a compensation of 1000 gold florins. Of the many portraits they

contained, but a single head, a likeness of the painter himself, survives in the Galleria Morelli Bergamo; there also he is represented by a group of prophets on the ceiling. In the lunettes of the chapel at Bergamo are several subjects by him, but his fine altar-piece, "The Trinity," surrounded by saints and angels (1472), is now in the Academy of Florence. Among other noteworthy works are a charming "Annunciation" and a "Madonna with Saints" in the Uffizi; and Madonnas in the Louvre and the collection of Madame André, Paris.

Baldovinetti was perhaps more important as a decorative artist than as a painter. He designed some of the intarsias, executed by Giuliano da Majano, in the sacristy of the cathedral of Florence and painted many objects of applied art, such as the fronts of cassoni (chests), caskets, shields, coats of arms, etc. Of his stained glasses a good window survives in the Pazzi Chapel. Contemporaries considered him the foremost designer of mosaics in his day, and he wrote a practical manual upon the subject. He restored the mosaics of the façade and of the choir chapel of San Miniato, and both the interior and exterior of the baptistery. Consult. Pretti, *Ricordi di Alessio Baldovinetti* (Lucca, 1868); Lodi, *Alessio Baldovinetti* (Florence, 1907); Berenson, *The Study and Criticism of Italian Art* (2d series, London, 1902).

BALDPATE, or BALDHEAD. 1. An American white-headed duck. (See WIDGEON.) 2. A kind of domestic pigeon. 3. In the West Indies, a dove (*Columba leucocephala*). 4. A fruit crow (q.v.).

BALDRIC, bəl'drik, or BAUBRICK (Fr. *baudrier*, from MGH. *balderich*, girdle). A band or sash worn partly as a military and partly as a heraldic symbol. It passes round the waist as a girdle, or passes over the left shoulder and is brought down obliquely under the right arm, or is suspended from the right shoulder in such a way as to sustain a sword. Many of the effigies of knights contain representations of the baldric, worn more frequently as a belt than as a shoulder sash.

BALDUNG, bäl'dung, HANS, usually called GRIEN (GRÜN), from his favorite color (c.1480-1545). A German painter and engraver, one of the principal artists of the High Renaissance. He was born at Weiersheim, near Strassburg, of a patrician family originally from Gmund in Swabia, the son of a jurist in the service of the Bishop of Strassburg. He probably studied in Nuremberg with Albrecht Dürer, whose influence is very perceptible in his early works, both paintings and engravings. In 1509 he became a citizen of Strassburg; in c.1512-16 he was employed upon the great altar and other decorative works in the minster at Freiburg, and from 1517 until his death he resided at Strassburg as court painter to the bishop and as a member of the city council. A good example of the painting of his earliest period is the "Adoration of the Kings" in the Berlin Museum. His masterpiece is the great altar of Freiburg Minster, the central panel of which represents the Coronation of the Virgin; the wings, four scenes from her life. The masterly treatment of light and shade in this painting shows his indebtedness to Grünewald (q.v.). To the same period belong two "Crucifixions" at Berlin and Basel and two other paintings in the cathedral of Freiburg. The most notable of his remaining pictures are the "Bewailing of the Body of Christ" in the Na-

tional Gallery, London; two representations of "Death Seizing a Young Woman" (1517) in the Museum of Basel, and the "Birth of Christ" (1520) in the Museum of Aschafenburg. Other examples of his work are in the collections of Sigmaringen and Strassburg. His style was not especially adapted to portraiture, but of all his work of this kind the masterpiece is the votive picture in which the Margrave Cristoph of Baden, his wife, 10 sons, and 5 daughters are represented as kneeling before the Madonna and St. Elizabeth. Baldung's chief strength lay in his draughtsmanship; no other painter of the German Renaissance, except Dürer and Holbein, has left as many drawings as he. He excelled especially in his designs for woodcuts, which allowed a freer scope to the imagination than painting (for a list of his woodcuts, see the article "Baldung" in Meyer's *Kunstler Lexicon*). No less famous as a designer of stained glasses, he produced pieces which may now be seen in the Freiburg Minster and the museums of Berlin, Nuremberg, Karlsruhe, Basel, and Freiberg. As a painter he was one of the very best of his day, in color excelling Dürer and most of his other contemporaries. Consult the monograph by Von Téreys (Strassburg, 1896), and Baumgarten, *Der Freiburger Hochaltar*, vol. xlix (Strassburg).

BALDWIN, BALDOVIN, or BALDUIN. The name of several members of the house of Flanders, who reigned as Kings of Jerusalem during the period of the Crusades.—BALDWIN I (1058-1118) was King of Jerusalem after 1100. He was the youngest brother of Godfrey de Bouillon (q.v.), Duke of Lower Lorraine, or Brabant. He took part in the First Crusade, quarreled with Tancred, retired to Edessa at the request of the Christian inhabitants of the place, and was soon after created Count of Edessa. After the death of his brother Godfrey, in 1100, he became Protector of the Holy Sepulchre and Baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He was defeated by an invading force from Egypt in 1102. He made some conquests, including Cæsarea, Acre, and Sidon. He died in Egypt. Unlike his brother, Godfrey, Baldwin was worldly and ambitious.—BALDWIN II (Baldwin du Bourg), cousin of Baldwin I, succeeded the latter as Count of Edessa, and in 1118 as King of Jerusalem, reigning until 1131. During his reign Tyre was taken, in 1124, with the assistance of a Venetian fleet, and the Order of the Templars was instituted. He was held in captivity by the Turks for six months. He died Aug. 21, 1131, leaving four daughters. Shortly before his death he resigned the crown in favor of his son-in-law, Fulk of Anjou, who reigned till 1142.—BALDWIN III (1129-62), the son and successor of Fulk of Anjou, was King of Jerusalem after 1143. He has come down to us in tradition as a model of crusading chivalry. The Christians lost Edessa during his reign. He several times defeated Nureddin, Sultan of Aleppo. He endeavored to improve the external and internal defenses of his kingdom. Saracens are said to have served under him, so much was he respected. He married Theodora, the daughter of the Greek Emperor Manuel, and died, it is believed, of poison, at Tripolis, in Syria, Feb. 10, 1162. His reign marked the height of power of the Latin Kingdom of Jerusalem. He was succeeded in the government by his brother Amalric, or Amaury, who died in 1173.—BALD-

WIN IV, the son and successor of Amalric, surnamed the Leper, reigned till 1183.—BALDWIN V, a child of five, the son of Sibylla, sister of Baldwin IV, was then called to the throne. He died in 1186, a year before Jerusalem was retaken by Saladin. Consult Gibbon, *Decline and Fall of the Roman Empire*, and Cox, *History of the Crusades* (New York, 1889); also references under CRUSADES.

BALDWIN I (1171–c.1206). The first Latin Emperor of Constantinople. He was born at Valenciennes, the son of Baldwin VIII, Count of Flanders and Hainaut. In 1195 he succeeded his father as Count of Flanders. In 1200 he appointed his brother Philip to the regency of Hainaut and Flanders and joined the Fourth Crusade. Part of the Crusaders—Baldwin I among others—were induced to assist the Venetians in reconquering Zara, in Dalmatia, from the King of Hungary. While at Zara the young Alexius, son of Isaac II, Emperor of Constantinople, asked the assistance of the Crusaders against his uncle, Alexius Angelus, who had deposed and blinded Isaac II and had usurped the throne. In return for their aid he promised to pay the Crusaders a liberal sum of money, to help them recover Palestine, and to effect the union of the Greek church with the Roman. The Crusaders agreed, defeated the usurper's forces, and restored the rightful emperor; but when Alexius was unable or unwilling to carry out his promises, they turned their arms against him. A revolution broke out in the city at the same time. Alexius the Younger was murdered, and his father died soon after. Alexius Ducas Murzuffos then usurped the throne, but was defeated by the Crusaders, and Constantinople was sacked, the Latins and the Venetians sharing the booty. Baldwin was chosen Emperor, and crowned on May 9, 1204; but he received only about a fourth part of the Empire—Constantinople and Thrace—the Venetians obtaining "a quarter and a half of a quarter of the Empire." A part also fell to the French adventurers who accompanied the expedition, and several provinces remained in the hands of Greek princes. The capacities of Baldwin I were not able to cope with the evils necessarily attending so anomalous a position. The Greeks were discontented and, backed by Calo-John, King of Bulgaria, took advantage of the absence of Baldwin I's brother with the flower of his troops in Asia and rose and massacred the Latins scattered throughout the towns of Thrace and made themselves masters of Adrianople. Baldwin laid siege to the town with the forces he had at his disposal, but was defeated and taken prisoner, April 14, 1205, by the Bulgarian King, and probably died about a year after (1206) in captivity. The facts about his death were never known. In 1225 a usurper attempted to pass himself off for Baldwin and thus obtain Flanders. Baldwin I was succeeded by his brother Henry. Consult Pears, *Fall of Constantinople* (London, 1885), and Gerland, *Geschichte des lateinischen Kaiserreiches*, Teil i (Hamburg, 1905).

BALDWIN II (1217–73). The last Latin Emperor of Constantinople, from 1239 to 1261. He was the son of Peter II (de Courtenay) and the nephew of Baldwin I. When his brother Robert died, in 1228, Baldwin was too young to rule, and an agreement was made with John of Brienne, who had been King of Jerusalem, by which Baldwin was to marry John's second daughter, and John was to be Emperor until his

death. John died, March 23, 1237, but as Baldwin was in western Europe he was not crowned Emperor until December, 1239. His reign was disastrous. He spent much of the time in the West, seeking aid in the defense of his capital. In order to obtain money he sold to St. Louis of France some of the most sacred relics at Constantinople, to hold which Louis built the Sainte Chapelle at Paris. On the night of July 25 or 26, 1261, his capital was taken by one of the generals of Michael Palæologus, ruler of Nicæa, and Baldwin fled to Italy. With him terminated the Latin Empire in the East. Consult Gibbon, *Decline and Fall of the Roman Empire*, vol. vi (new ed., London, 1898).

BALDWIN, ABRAHAM (1754–1807). An American statesman. He was born at Guilford, Conn., and graduated at Yale in 1772. In 1777 he entered the army as chaplain, and served until the close of the Revolutionary War, when he removed to Savannah, Ga. In 1784 he was sent to the State Legislature, and from 1786 to 1788 was a delegate to the Continental Congress. He was a prominent member of the Constitutional Convention of 1787, and as such cast an important vote, leading to a compromise, the result of which was the creation of the United States Senate. He was a member of Congress from 1789 to 1799, and was United States Senator from 1799 until his death, serving in 1801 and 1802 as President pro tem. In 1802 he was one of the three Georgia commissioners who negotiated the cession to the Federal government of a large part of the State's western lands. He conceived the plan of the University of Georgia, obtained a charter for it, and from 1786 to 1801 served as its first president.

BALDWIN, CHARLES II. (1822–88). An American naval officer, born in New York City. He entered the navy in 1839, served as midshipman during the Mexican War, and became a lieutenant in 1853. He resigned in the following year, but reentered the service in 1861 and in 1862 commanded the *Clifton*, of the mortar flotilla under Farragut, at Forts Jackson and St. Philip. In 1869 he was appointed captain, and in 1883 was promoted to be rear admiral, commanding the Mediterranean Squadron. He was retired in 1884.

BALDWIN, CHARLES SEARS (1867–). An American college professor and author, born in New York City, and educated at Columbia University, where he received the degrees of A.B., A.M., and Ph.D. In 1891 he was appointed instructor in English in that university and, in 1895, instructor in rhetoric. He then became a member of the faculty of Yale University, but returned to Columbia in 1911 as professor of rhetoric and English composition. His writings include: *The Inflections and Syntax of the "Morte d'Arthur"* of Sir Thomas Malory (1894); *Specimens of Prose Description* (1895); *De Quincey's Revolt of the Tartars* (1896); *The Expository Paragraph and Sentence* (1897); *A College Manual of Rhetoric* (1902); *American Short Stories* (1904; Ger. ed., 1911); *How to Write: A Handbook Based on the English Bible* (1905); *Bunyan's Pilgrim's Progress* (1906); *De Quincey's Joan of Arc and English Mail Coach* (1906); *Essays out of Hours* (1907); *Writing and Speaking* (1909); *Composition, Oral and Written* (1909).

BALDWIN, EVELYN BRIGGS (1862–). An American Arctic explorer, born at Springfield, Mo. He studied at Northwestern College (Naper-

ville, Ill.), and taught in the public schools of Kansas in 1887-91. In 1892 he was appointed observer in the United States Weather Bureau. Subsequently he became an inspector-at-large in the United States Signal Corps. In 1893-94 he was meteorologist of the Peary Expedition to North Greenland, and in a similar capacity accompanied in 1898-99 the Walter Wellman Expedition to Franz-Josef Land. He discovered and explored Graham Bell Land in May, 1899. In 1901 he organized the Baldwin-Ziegler Expedition, sailing under his command for the discovery of the North Pole by way of Franz-Josef Land. The expedition returned in 1902, having deposited several caches of provisions in Franz-Josef Land. Baldwin wrote for periodicals several articles dealing with Arctic life.

BALDWIN, JAMES (1841-). An American author and compiler, born in Hamilton Co., Ind. In 1887-90 he was connected with the educational department of Harper and Bros., New York, and from 1890 to 1893 was assistant editor of *Harper's Magazine*. He then became a school-book editor for the American Book Company. His publications include: *Six Centuries of English Poetry* (1892); *The Famous Allegories* (1893); *Old Greek Stories* (1895); *The Horse Fair* (1895); *Four Great Americans* (1896); *Hero Tales Told in School* (1904); *Abraham Lincoln, a True Life* (1904); *Thirty More Famous Stories* (1905); *The Golden Fleece* (1906); *Stories of the King* (1909); *Fifty Famous People, a Book of Short Stories* (1912).

BALDWIN, JAMES MARK (1861-). An American psychologist, born at Columbia, S. C. He graduated from Princeton in 1884 and received A.M. and Ph.D. degrees from that university in 1887 and 1889, respectively. He studied at Leipzig, Berlin, and Tübingen in 1884-85. In 1886-87 he was instructor in German and French at Princeton; from 1887 to 1889 he held the chair of philosophy at Lake Forest University (Ill.); and thereafter, up to 1909, he was successively professor of logic and metaphysics at the University of Toronto (Canada), Stuart professor of psychology at Princeton, and professor of philosophy and psychology at Johns Hopkins University. In 1909 he became honorary professor at the National University of Mexico. He was given the first honorary D.Sc. conferred by the University of Oxford and also received LL.D. degrees from the universities of Glasgow and of South Carolina. Perhaps best known in the fields of child and social psychology and of genetic logic, he also gained recognition in experimental psychology as an advocate of the fundamental importance of "motor" elements in consciousness, as the founder at Toronto of the first psychological laboratory to be established in the British Empire, and as the founder also of the psychological laboratory at Princeton. With J. McK. Cattell in 1894 he founded the *Psychological Review*. Besides various articles in philosophical, psychological, and popular journals, he is the author of the following works: *German Psychology of To-Day* (trans., 1886); *A Handbook of Psychology* (2 vols.: i, 1889; ii, 1891; i, 2d ed., 1890); *Elements of Psychology* (1893); *Mental Development in the Child and Race* (1895, 3d ed., 1906); *Social and Ethical Interpretations in Mental Development* (1897; 4th ed., 1906); *The Story of the Mind* (1898); *Fragments in Philosophy and Science* (1902); *Development and Evolution* (1902); *Thought and Things, or Genetic Logic* (3 vols., 1906-11); *Darwin and the*

Humanities (1909); *The Individual and Society* (1910); *History of Psychology* (1912). Editor: *Dictionary of Philosophy and Psychology* (3 vols., 1901-05); *The Psychological Review* (1894-1909); "Philosophy," in *Johnson's Universal Encyclopedia*; *Library of Historical Psychology* (1903-); *Princeton Contributions to Psychology* (1897-1903).

BALDWIN, JOHN DENISON (1809-83). An American journalist, born at North Stonington, Conn. He was self-educated, studied law and theology, and for several years after 1833 was pastor of a church at North Bradford, Conn. He was editor successively of the *Charter Oak*, a Hartford newspaper, the *Boston Commonwealth*, and the *Worcester Spy*; was three times chosen member of Congress, and wrote extensively for the magazines on archaeological and kindred subjects. He published *Raymond Hill*, a volume of poems (1847), *Prehistoric Nations* (1869), and *Ancient America* (1874).

BALDWIN, JOSEPH G. (1815-64). An American humorist. He was born in Alabama, where he was successful in law, politics, and literature. In 1854 he went to California and was a justice of the Supreme Court of that State (1858-62) and chief justice (1863-64). His best-known early publications are his racy *Flush Times in Alabama and Mississippi* (1853) and *Party Leaders* (1855). The latter contains judicial estimates of Southern statesmen. He died in San Francisco. Consult Mallery, in *The Sewanee Review* (April, 1901).

BALDWIN, ROBERT (1804-58). A Canadian statesman. He was born at York (now Toronto), received a grammar-school education, and was called to the bar in 1825. He soon became interested in politics. At that time the administration of affairs in Upper and Lower Canada (now respectively the provinces of Ontario and Quebec) was controlled by an oligarchy which monopolized the public offices. In both provinces there was much popular discontent and a demand for an executive council accountable to the legislature. (See *POLITICAL PARTIES, Canada*; also *CANADA, History*.) This demand affirmed the principle of responsible government, which early engaged the support of Baldwin and dominated the remainder of his public life. In 1829 he was elected to the Assembly of Upper Canada, but in 1830 lost his seat on a technicality and for six years thereafter untiringly labored in behalf of the popular cause. In 1836 he was made a member of the executive council by the reactionary Lieutenant Governor, Sir Francis Bond Head, but, hampered by political opponents in the council, found that he could not be useful and resigned. The radical reformers, led by William Lyon MacKenzie, broke out in rebellion in 1837-38, but Baldwin condemned their course, maintaining that a responsible executive was amply sufficient to restore public confidence. The Radicals of Lower Canada had also revolted (1837-38); and until the arrival of the Earl of Durham as Governor General and High Commissioner in 1838 there were few signs of English interference to allay the increasing discontent. The famous report of that nobleman in 1839 influenced the British Parliament to favor responsible government and brought about the passage in 1841 of an act which united the two provinces. Baldwin became a member of the executive council under the new régime; but, dissatisfied with the attitude of the Governor General, Lord Sydenham, he soon resigned. In the meantime friendly

coöperation between the leaders in Upper and Lower Canada, which had been promoted by the union, led to a successful popular party under dual leadership. In harmony with this movement Baldwin and Louis Hippolyte LaFontaine became in 1842 the leading members of the first Canadian administration to accept responsible government. That principle was, however, not yet firmly established; and Sir Charles (afterward Baron) Metcalfe, who opposed it, adopted a course which compelled Baldwin to resign in 1843. Five years of heated controversy followed, and in 1848 Baldwin and LaFontaine were again returned to power. Their administration (1848-51) marked the final and complete establishment of responsible government. Among the important reforms passed under Baldwin's leadership were the revision of the judicial system of Upper Canada, the foundation of Toronto University on a non-sectarian basis, and the organization of municipal government in that province. Under this administration also the railway system of Canada began to be vigorously developed. The disaffected in Lower Canada were appeased by amnesty and by a bill reimbursing those who had suffered from destruction of property in the rebellion of 1837-38. Baldwin resigned in 1851, mainly from lack of sympathy with the advanced wing of his party, of whose radical tendencies he strongly disapproved. His purity of personal character and his political integrity were never questioned. Consult Dent, *Canadian Portrait Gallery* (Toronto, 1880); Leacock, "Baldwin, Lafontaine, Hincks" (Toronto, 1907), in *The Makers of Canada Series*.

BALDWIN, SIMEON EBEN (1840-). An American jurist and educator, born at New Haven, Conn. He graduated in 1861 at Yale, was admitted to the bar in 1863, and in 1869 was appointed an instructor in the Yale Law School. He became professor of constitutional and private international law in 1872 and in 1893 associate judge of the State Supreme Court of Errors. From 1907 to 1910 he was chief justice of that court, then becoming Governor of Connecticut. At various times he was president of the American Bar Association, the American Social Science Association, the International Law Association, the American Historical Association, and the American Political Science Association. He was a member of the commission appointed in 1872 by the State to revise laws on education and of that appointed in 1873 to revise the General Statutes. His publications include: *Digest of the Decisions in the Connecticut Law Reports* (2 vols., 1872, 1882); *Modern Political Institutions* (1898); *American Railroad Law* (1904); *The American Judiciary* (1905); *The Relation of Education to Citizenship* (1912).

BALDWIN, WILLIAM HENRY, JR. (1863-1905). An American railway official, born in Boston, Mass. He graduated at Harvard College in 1885, and four years later was made president of the Montana Union Railroad. He soon became associated with the development of the Union Pacific Railway, of which system he became assistant vice president in 1890-91. He was general manager of the Flint and Pere Marquette Railroad (1891), third vice president (1894-95) and second vice president (1895-96) of the Southern Railway. In 1896 he became president of the Long Island Railroad, which position he held at the time of his death. In 1903 he was also made president of the Pennsylvania and Long Island Railroad Company, organized to

extend tunnels under the North River, Manhattan Island, and the East River, to connect with the Long Island Company's system. Mr. Baldwin took an active and effective interest in various reform movements in New York and also in educational work in the South. He was at one time chairman of the General Board of Education. Consult J. G. Brooks, *An American Citizen* (Boston and New York, 1910), and *Memorial* by People's Institute (New York, 1905).

BALDWIN CITY. A town in Douglas Co., Kan., 15 miles south of Lawrence, on the Atchison, Topeka, and Santa Fe Railroad (Map: Kansas, G 5). It is the seat of Baker University (M. E.), founded in 1858. Near the town is the battlefield of Black Jack, the scene of the first bloodshed in the slavery strife preliminary to the Civil War. Baldwin City was settled in 1853 and was incorporated about 1858. It has a mayor, elected annually, and a city council. The water works and electric light plant are owned by the municipality. Pop., 1900, 1017; 1910, 1386; 1913 (est. exclusive of 800 students), 1450.

BALDWINSVILLE. A village in Onondaga Co., N. Y., 12 miles northwest of Syracuse, on the Delaware, Lackawanna, and Western Railroad, and on the Barge Canal and Seneca River and Syracuse Lakeshore and Northern Electric Road. Supplied with natural gas and excellent electric power plant for both power and lighting (Map: New York, D 4). The industries of the village include machine, spring, and knife works, and paper mills. Baldwinsville is in a highly productive agricultural region, producing grain, corn, hay, tobacco, and dairy products. The village has a splendid high school and owns its water works. Pop., 1890, 3040; 1900, 2992; 1910, 3099.

BÄLE, bäl. See **BASEL**.

BALE, JOHN (1495-1563). Bishop of Ossory, in Ireland, born in the village of Cove, Suffolk, England, Nov. 21, 1495. He was educated as a Carmelite monk at Cambridge, but afterward turned Protestant, became rector at Thornden, in Suffolk, and, being persecuted by the Roman Catholics, fled to Flanders (1540), where he remained eight years, during which he wrote numerous works. He was recalled by Edward VI and successively presented to the living of Bishopstoke, in Hampshire, and the bishopric of Ossory (1552). In this latter sphere he made himself so obnoxious to the Roman Catholics by his zeal in the Protestant cause that on news of the death of Edward (1553) his house was attacked and five of his servants killed. He himself escaped out of the country, after great difficulty and heavy loss, and came finally to Basel. On the accession of Elizabeth (1559) he returned to England and was made a prebendary in the cathedral of Canterbury, where he died in November, 1563. His chief work was first published in 1548 under the title of *Illustrium Majoris Britanniae Scriptorum Catalogus hoc est Angliæ, Cambriæ et Scotiæ Summarium*, a history of English literature. His *Select Works* were published by the Parker Society, with a biography (Cambridge, 1849). He wrote many treatises and several scriptural plays.

BALEARIC (bäl'ê-är'ík) **CRANE.** See **CRANE**.

BALEARIC ISLANDS. A group of four large islands—Mallorca (Majorca), Menorca (Minorca), Ibiza (Iviza), and Formentera—and 11 islets (Cabrera the largest), which constitute a province of Spain. They lie off the coast of

Valencia, in the Mediterranean, in lat. 38° 4' to 40° 5' N., and long. 1° to 5° E. (Map: Spain, G 3). They have a total area of 1936 square miles and a population (Dec. 31, 1910) of 326,023. The climate is healthful and temperate. The soil generally is good. Vines, olives, and other fruit trees are cultivated abundantly. The coasts are precipitous, with some excellent harbors—that of Mahón, in Minorca, being one of the finest in Europe. The Balearic Islands were taken possession of by the Carthaginians at an early date, and after the destruction of Carthage they fell into the hands of the Romans. They were taken by the Saracens in 798 and became a separate Moorish kingdom in 1009. In 1232 the Moors were expelled from the islands by King James I of Aragon, and from 1276 the islands formed the independent kingdom of Mallorca until they were annexed to Aragon in 1349. The capital is Palma, on Mallorca. Consult Vuillier, *The Forgotten Isles* (New York, 1896), and Harrasowsky, "Les Baléares," in the *Revue de Géographie*, vol. xlv (Paris, 1899).

BALEEN' (Fr. *baleine*, Lat. *balea*, whale). Whalebone in its original state in the mouth of a baleen whale. See WHALE.

BALEN, bāl'ēn, HENDRIK VAN (1575-1632). A Flemish painter. He was born at Antwerp and was the pupil of Adam van Noort, the teacher of Rubens. He finished his studies in Italy and became instructor of Van Dyck and Snijders. Later he was influenced by Rubens and even by Van Dyck, as may be seen in the excellent paintings, including portraits of the painter and his wife, over their tomb in St. Jacob's, Antwerp. He excelled in small figures, especially mythological subjects. Good examples of his work are in the cathedral and museum of Antwerp and other important galleries of Belgium, and in Holland, Germany, and the Louvre.

BALER, bālār'. The capital of the sub-province of Principe, in the island of Luzon, Philippines, on the Baler River, about 90 miles from Manila, with which it carries on trade by land and water. United States troops took possession of this town in April, 1900. Pop., about 2500.

BALESTIER, bāl'ēs-tēr', WOLCOTT (1861-91). An American journalist, publisher, and author, born at Rochester, N. Y. He studied at Cornell University and the University of Virginia, and in New York City was editor of *Tid-Bits*, a humorous weekly, whose name was afterward changed to *Time*. In 1889 he became junior member of the publishing house of Heinemann & Balestier, of London and Leipzig. His publications include: *A Patent Philtre* (1884); *A Fair Device* (1884); a campaign life of James G. Blaine (1884); *A Victorious Defeat* (1886); *A Common Story* (1891); with Rudyard Kipling (his brother-in-law), *The Naulahka*, of which Balestier wrote the early (American) chapters (1892, 1900); and "Benefits Forgotten," in the *Century Magazine* (1892).

BALFE, balf, MICHAEL WILLIAM (1808-70). A popular English composer of operas. He was born, May 15, 1808, in Dublin. When only seven years old, he played in public one of Viotti's concertos for the violin. At 16 he made his début in London as a violinist, in the Drury Lane orchestra. In 1825 he went to Italy, where he studied counterpoint under Federici at Rome, and singing under Filippo Galli at Milan, and began his successful career as a composer, with music for the ballet *La Pérouse*, performed at

La Scala, in Milan. In 1827 he sang in the Italian Opera at Paris with Malibran and Sontag. He, however, returned to Italy and devoted himself to composition, producing in rapid succession some 30 operas, of which the most popular are *The Bohemian Girl* (1843), *The Rose of Castile* (1857), *Satanella* (1858), and the posthumous *Il Talismano* (1874), his most serious effort. Balfe lacks depth and individuality; but his gift of simple melody, his strong comic vein, and his facility of writing have won for him a prominent place among English composers. Consult C. L. Kenney, *Memoir* (London, 1875), and W. A. Barrett, *Balfe: His Life and Work* (London, 1882).

BALFOUR, bāl'fōor or bāl'fēr, ARTHUR JAMES (1848-). An English statesman. He was born July 25, 1848, and studied at Eton and Cambridge. From 1878 to 1880 he acted as private secretary to his uncle, the Marquis of Salisbury, Secretary of State for Foreign Affairs. He represented Hertford in the House of Commons in 1874-85 and Manchester from 1886 to 1905, acting, during his early parliamentary career, with the famous "Fourth Party" led by Lord Randolph Churchill. He was President of the Local Government Board in 1885, became Secretary of State for Scotland in 1886, and Chief Secretary for Ireland in 1887. This last appointment was severely criticised, since Balfour's reputation had been that of an easy-going philosopher; but in office Balfour seemed a different man. He administered his office with a combination of strictness and good sense such as had been shown by few of his predecessors. As a result, in 1891 he was made First Lord of the Treasury and government leader in the House of Commons, offices which he resumed in 1895 after acting as leader of the Opposition during the intervening period of Liberal ascendancy (1892-95). On the retirement of Lord Salisbury in July, 1902, he succeeded to the premiership. His tenure of office was chiefly remarkable as witnessing the decline and partial disintegration of the powerful Unionist party. The chief cause contributing to its downfall was the attitude of the government on the question of tariff reform, which was brought to the forefront by Joseph Chamberlain (q.v.) in 1903. Without embracing Mr. Chamberlain's protectionist views, the premier made himself the advocate of a professedly half-way policy which the supporters of free trade characterized as identical with Mr. Chamberlain's proposals. In 1903 the Cabinet was reconstructed as a result of the resignation of several members who were opposed to protection. In the Commons a number of Unionists seceded to the Liberal party, while another section was active in combating protectionist principles within the party. The sessions of 1904 and 1905 were given over largely to debates on the fiscal question, in which the opposition sought to elicit from the premier a definite statement as to the relation of his views to those of Mr. Chamberlain, and failed before his remarkable adroitness. On July 20, 1905, the government was defeated in the House of Commons in the course of an Irish debate, but the premier declined to resign on the ground that the vote was in the nature of a trick. Dissensions within the party, however, finally led to the resignation of the ministry in December. In the general election of January, 1906, the Unionists suffered a crushing defeat, Mr. Balfour himself failing of reelection in Manchester.

He entered Parliament, however, as representative for the City of London and continued, as leader of the Conservative Opposition, to play a leading rôle in the proceedings of the House of Commons. In the struggle between the Lords and Commons that immediately preceded the enactment of the Parliament Act, Balfour counseled submission, at the same time making public to the Conservative leaders a letter from the Prime Minister which told of the King's promise to create new peers, if such an action should prove necessary to pass the measure. For this timely advice to his party Balfour was severely criticised. Many Unionists demanded a new leader, and Balfour, to prevent the disruption of his party, found it necessary to resign (Nov. 8, 1912). He was succeeded, after a spirited contest between Walter Long and Austen Chamberlain, by Bonar Law. In Mr. Balfour's philosophic writings the naturally skeptical bent of his mind is clearly displayed; he is one to whom disbelief, or a contemptuous suspension of judgment, comes more easily than faith. As a writer, his highest merits are subtlety and originality, though Spencer and others whose conclusions he impugns have accused his dialectic of sophistry. His works are: *A Defense of Philosophic Doubt* (1879); *Essays and Addresses* (1893); *The Foundations of Belief* (1895; new ed., 1900); *The Fiscal Reform* (1906); *Arthur James Balfour as a Philosopher and Thinker*, extracts from non-political writings, speeches, and addresses (London, 1912).

BALFOUR, ANDREW (1873-). A Scottish bacteriologist and author, born in Edinburgh. His earlier education was obtained in his native city—at George Watson's College and at the university. Later he took advanced studies at Cambridge, but it was from the University of Edinburgh that he received the degree of M.D. in 1898. In 1900-01 he served as civil surgeon in the South African War, and from 1902 to 1910 was director of the Wellcome Research Laboratories at Khartoum. He was also appointed sanitary adviser to the Sudan medical department, and medical officer of health for Khartoum. He wrote several novels: *By Stroke of Sword* (new ed., 1901); *To Arms!* (new ed., 1902); *Cashiered, and Other War Tales* (1902); *Vengeance is Mine* (new ed., 1905); and the following medical works: *Public Health and Preventive Medicine*, with C. J. Lewis (1902); the first, second, third (1909), and fourth (1912) *Reports of the Wellcome Research Laboratories*; *Review of the More Recent Advances in Tropical Medicine*, with R. G. Archibald (1909); *Second Review* (of the same) (1911).

BALFOUR, FRANCIS MAITLAND (1851-82). A Scottish embryologist, born at Edinburgh; brother of the Rt. Hon. A. J. Balfour. He graduated in 1873 at Trinity College, Cambridge. In 1876 he was appointed lecturer on, and (1882) professor of, animal morphology. His publications are: *The Development of Plasmobranch Fishes* (1878), made up largely of the results of original research conducted at Cambridge and at the Stazione Zoologica of Naples; and *A Text-book of Comparative Embryology* (2 vols., 1880-81), in great part an original work, distinguished alike for profound learning and clear statement. He was killed, with his guide, on July 19, 1882, during either the ascent or descent of the Aiguille Blanche de Penteret, Switzerland.

BALFOUR, GERALD WILLIAM (1853-). An English politician born at Edinburgh. He studied at Eton and received the degree of M.A. from Trinity College, Cambridge. In 1855-86 he served as member of the Commission on Labor, and was private secretary to his brother, the Rt. Hon. A. J. Balfour, then President of the Local Government Board. He became a member of Parliament in 1885; from 1895 to 1900 was Chief Secretary for Ireland and introduced the Local Government Bill; in 1900 was appointed President of the Board of Trade, and in 1905 President of the Local Government Board. He failed of reelection to Parliament in the general election of 1906.

BALFOUR, ISAAC BAXLEY, M.D., LL.D. (1853-). A Scottish botanist, born in Edinburgh. He graduated at the University of Edinburgh, studied at Strassburg and Würzburg, and from 1879 to 1884 was professor of botany in the University of Glasgow. In 1884-88 he was professor of botany at Oxford and in the latter year accepted a similar chair at the University of Edinburgh. He also became King's botanist in Scotland, and keeper of the Royal Botanic Garden at Edinburgh. In 1880 he explored the island of Socotra, Indian Ocean, on behalf of the British Association and of the Royal Society, Edinburgh, in whose *Transactions*, vol. xxxi (1888), appeared the results of the journey. He became, in 1887, an editor of the *Annals of Botany*. A *Botany of Rodriguez* he published in 1878, and a *Botany of Socotra* 10 years later.

BALFOUR, SIR JAMES (?-1584). A Scottish judge and politician. He was educated for the priesthood, but devoted himself to ecclesiastical law. He was implicated in the plot for the assassination of Cardinal Beaton, and after the surrender of the castle of St. Andrews (June, 1547) was imprisoned in the French galleys. He regained his freedom by changing his creed and returned to Scotland. He conspired with Bothwell for the murder of Darnley and received the governorship of Edinburgh Castle, which he later surrendered to Murray, in return for a pardon for his share in Darnley's death and other favors. He was Lord President of the Court of Session during Murray's regency, but, suspected of intriguing with the adherents of the Queen, he was deprived of his office in 1568. After Murray's death Balfour contrived to gain the favor of the new regent, Morton, and received a commission to make a general digest of the law. This is the earliest text-book on Scottish law and is called *Balfour's Practicks*. In 1573 he again fell into disfavor and fled to France, but returned about 1580 and was instrumental in bringing about the fall of Morton. He died before Jan. 24, 1584. Balfour is one of the most contemptible figures of the period—"the most corrupt man of his age," as Robertson rightly describes him, though the scorn of Knox for "Blasphemous Balfour" may perhaps be partially explained by his abandonment of Protestantism in the galleys.

BALFOUR, JOHN. A Covenanter who appears in Scott's *Old Mortality* as "Balfour of Burley." The real John Balfour, the Covenanter, was historically of Kinlock and not of Burley or Burleigh. John Balfour of Burleigh participated in the assassination of Archbishop Sharp in 1679 and was outlawed.

BALFRUSH, bál-fróosh', or **BARFRUSH** (Pers. landing place, market). An important

commercial town in the Persian province of Mazanderan, situated on the river Bahbul, about 12 miles from its mouth in the Caspian Sea (Map: Persia, E 3). It is a clean and well-built town with fine bazaars and the ruins of an old pleasure palace of Shah Abbas. It is connected by a well-shaded road with Meshed-i-Ser, its port, through which it carries on a considerable trade in cotton, dried fruit, sugar cane, flax, hemp, and metals, chiefly with Russia. The town is also connected by road with Teheran and carries on extensive commerce with the interior. The population was once estimated at 200,000, but it has since been greatly reduced by epidemics, so that at present it is less than 50,000.

BALG, bālg, GERHARD HUBERT (1852-). An American philologist, born at Effren, near Cologne, Germany, and educated partly in that country and partly at the University of Wisconsin, where he graduated in 1881. He received the degree of Ph.D. at Heidelberg, in 1883, and taught at the University of Wisconsin and at private and public schools in the United States. He published several valuable philological works, notably *A Comparative Glossary of the Gothic Language, with Especial Reference to English and German* (1887-89); *The First Germanic Bible, and the Other Remains of the Gothic Language* (1891), and an English edition of Wilhelm Braune's *Gothic Grammar* (1883-95). He also supplied Germanic etymologies for the *Standard Dictionary*.

BALGOWNIE, bāl-gou'né, **BRIG OF**. A bridge of a single arch, over the Don at Aberdeen, Scotland, built in 1320.

BALI, bā'lé. One of the Dutch East India islands, situated east of Java, from which it is separated by the narrow Bali Strait (Map: East Indies, E 6). It forms, with the island of Lombok, the Dutch outpost residency of Bali and Lombok, having an area of 4063 square miles and a population of 524,000. The island covers an area of over 2168 square miles. Its surface in general closely resembles that of Java. It is mountainous and volcanic and reaches in its highest summit (the volcano Gunung-Agung) an altitude of 10,497 feet. In the lower portions of the island the common products of the East Indies, such as rice, cotton, sugar, coffee, tobacco, and indigo, are raised in large quantities. Politically the island is divided into the two districts of Buleleng and Jembrana (Dutch) and the autonomous states of Klung Lung, Bangli, Mengui, Badung, and Tabanan. The capital is Buleleng.

The natives, anthropologically, are one of the most interesting peoples of Malaysia. Physically and linguistically they are close to the Malayan or proto-Malayan Javanese and share the capacities of these for culture. In metal work and sculpture they are markedly successful. The Balinese and the natives of the adjacent island of Lombok, alone in Malaysia, retain as their religion Brahmanism in a form older than that now found in Hindustan, and other traces of Hindu influence also occur. The participation of the women in trade and industry indicates a power to resist the doctrines of Islam. Of more recent literature since Laut's *Het eiland Bali en de Baliëzen* (Amsterdam, 1848) may be mentioned Van Vlijmen's *Bali* (Amsterdam, 1875). See **INDONESIANS**; **MALAYS**.

BALIKESRI, bā-lé-kés-ri, or **BALIKISRI**. A town of Asiatic Turkey, in the vilayet of

Brusa, about 75 miles southwest of the city of Brusa (Map: Turkey in Asia, B 3). It contains a number of mosques and is the seat of an annual fair, visited by over 30,000 people. There is commerce in grain, opium, silk, and the region abounds in minerals. Its population is nearly 25,000, of which about three-fourths are Mohammedans.

BALINESE, bā'lé-nēz'. See **BALI**.

BALINGHEM, ba'lān'gān'. The historic site of the "Field of the Cloth of Gold," a small town near Calais, in the department of Pas-de-Calais, France. See **FIELD OF THE CLOTH OF GOLD**.

BALIOL, bā'li-ol or bāl'yol, EDWARD DE (?-1367). The son of John Baliol. He was received as the vassal King of Scotland at the English court and made himself conspicuous, in 1332, by his daring and successful invasion of Scotland, then under the regency of Randolph, Earl of Moray. Accompanied by some English noblemen, bent on recovering their forfeited estates in Scotland, he landed with a few hundred followers at Kinghorn, in Fifeshire; defeated the Earl of Fife; pushed boldly into the country and, on Dupplin Moor, in Perthshire, routed with immense slaughter an army more numerous than his own. On September 24 he was crowned King of Scotland at Scone. He acknowledged English suzerainty and promised to give up Berwick. He had enjoyed the kingly dignity for about three months, when he was surprised in his camp at Annan by a party of Scottish nobles and nearly lost his life as well as the crown. After the capture of Berwick, in 1333, he regained the throne. He was used as a tool by Edward III until 1356, when he surrendered to the latter the whole kingdom of Scotland. He died at Wheatley near Doncaster in 1367, and with him ended the house of Baliol. Consult Longman, *History of the Life and Times of Edward III* (London, 1869).

BALIOL, JOHN DE (1249-1315). Lord of Galloway, and King of Scotland from 1292 to 1296. On the death of Princess Margaret, in 1290, he became a competitor for the crown of Scotland. As the grandson of the eldest daughter of David, Earl of Huntingdon, brother of William the Lion, and grandson of David I, his claim was pronounced superior to that of his principal competitor, Robert Bruce, Lord of Annandale, son of a second daughter. The arbiter on the occasion was Edward I, of England, who found this a fit opportunity for asserting his claim as Lord-paramount of Scotland. This claim was acknowledged by the Scottish Estates in submitting the contest to his decision; and, consistently with this submission, Baliol, before and after receiving the crown (Nov. 30, 1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and the indignities which he experienced roused him to an assertion of his rights as king. With the advice of his nobles, he concluded an alliance in 1295, with France, then at war with England—an act of revolt followed by speedy chastisement. Edward invaded Scotland with a large force, defeated the Scottish troops, took Baliol prisoner, and compelled him formally to surrender his crown, July 10, 1296. Baliol was held as a prisoner for three years, enjoying, however, a limited freedom and something of royal state. At the end of that time he was permitted to retire to his patrimonial estates in France, where he died

in 1315. The estimate by his subjects of this prince was significantly indicated by the surname of Toom Tabard or 'Empty Jacket.' Consult Burton, *History of Scotland*, vol. ii (Edinburgh, 1905), and Lang, *History of Scotland*, vol. i (Edinburgh, 1904).

BALIOL, Mrs. MARTHA BETHUNE. The imaginary narrator of some of Scott's *Chronicles of the Canongate*.

BALIOL COLLEGE. See BALLIOL COLLEGE.

BALISARDA, bā'lē-sār'dā. A magic and all-penetrating sword, mentioned in Ariosto's *Orlando Furioso*. It was made by a witch, Falerna, to kill Orlando.

BALISAUR, bāl'i-sā'ūr. An East Indian badger. See BADGER.

BAL/ISTRA'RIA (LL, *balistra*, Lat. *ballista*, crossbow). One of the names given to those narrow apertures so common in the walls of old castles through which the crossbowmen discharged their bolts. Their lower terminations are generally circular, but sometimes in the form of a shovel. They do not seem to have come into use till the thirteenth century. See ARTILLERY; LOOPHOLES.

BALIUAG, bā-lē'wūg. A town of Luzon, Philippines, in the province of Bulacan (Map: Luzon, E 7) 13 miles north of Bulacan. It is the market for a rich agricultural region and is noted for a fine grade of bamboo hats which are manufactured in the town. In 1899 was established here the first municipal government in the Philippines under American occupation. The people of Baliuag are thrifty, progressive, and industrious. Pop., 1903, 15,936.

BALIZE, bā-lēz'. See BRITISH HONDURAS; BELIZE.

BALKAN (bāl-kān' or bāl'kan) **MOUN'TAINS** (Turk. high ridge; the ancient *Hæmus*). A mountain range in southeastern Europe, in the Balkan Peninsula, forming a continuation of the Carpathian system. As such they may be considered to begin at the western extremity of the Transylvanian Alps, at the gorge known as the Iron Gates of the Danube, where the boundaries of Hungary, Rumania, and Servia meet. Thence they extend due south through Servia and along the borders of Servia and Bulgaria, then bend abruptly to the east, and continue in that direction as far as Cape Emineh, on the Black Sea (Map: Balkan Peninsula, E 3). Their western boundary attains the Morava-Vardar basins. The first section of the Balkans—that extending north and south—is formed by rounded hills and ridges, which attain an extreme elevation of about 7000 feet. The main range consists of several sections arranged successively along an east and west axis. They constitute the divide between the Danube and the Maritza watersheds and the boundary between Bulgaria and eastern Rumelia. In this main division, comprising the central Balkans, are the highest summits of the range, several of which exceed 7000 feet (Yümrüktehal, 7789; Kadimlia, 7410; Ambarica, 7052). The eastern Balkans, from the vicinity of Shiven to the Black Sea, consist of numerous ridges, usually less than 3000 feet high, and of more broken character than the mountains in the western and central sections. From the Balkans various ranges extend southward toward the Ægean, the principal being the Rhodope (Despoto-Dagh), whose summits overtop those of the Balkans. The islands of the Ægean form its southern prolongation. Among the passes of

the Balkans may be mentioned the Trojan, Rosalita, and Shipka passes, which are at elevations of 4000 to 5000 feet. The Rilo Dag is the most elevated peak in the Rhodope range. Its highest point is about 9900 feet. The Balkan range is composed largely of folded sedimentary strata; but in the west crystalline schists, containing deposits of copper, lead, and iron ore, are prominent.

BALKAN PENIN'SULA. A name commonly applied to the easternmost of the three great southern peninsulas of Europe, bounded by the Adriatic Sea on the west and the Black and Ægean seas on the east. Its northern boundary is generally considered to be the Danube, the Save and its tributary, the Kulpa. Thus defined, the peninsula comprises, within an area of about 175,000 square miles, the following countries: European Turkey, Bulgaria, Servia, Bosnia, and Herzegovina, part of Croatia, Dalmatia, Montenegro, Albania, and Greece.

The eastern coast of the peninsula, overlooking the Black Sea, is generally low and marshy and almost unbroken, except for the Gulf of Burgas. Through the Bosphorus, a narrow channel about 20 miles long, the Black Sea communicates with the Sea of Marmora, which adjoins the peninsula on the southeast. The shores of the latter sea differ but little from those of the Black Sea in their general appearance. The Sea of Marmora communicates with the Ægean Sea through the Dardanelles channel. The coasts of the Ægean Sea form numerous gulfs and safe harbors of great commercial importance. The coasts of the Greek Peninsula are greatly indented and surrounded by numerous islands. The western coast of the Balkan Peninsula, above the Gulf of Arta, is generally mountainous. The greater part of the peninsula is covered with numerous mountain chains, the chief of which is the Balkan (q.v.), to which the peninsula owes its name.

Owing to the mountainous character of the country, the rivers which traverse the peninsula are mostly short, and very few of them navigable. The most important of them are the Maritza, Vardar, Morava, and Drin. There are also several lakes, the most important of which is that of Scutari. The climate is colder than in the other Mediterranean regions in the same latitude, and the snowfall during the winter is considerable.

The leading races of the peninsula are the Serbo-Croatians (Servians, Bosnians, Croatians, and Montenegrins) and Bulgarians, forming the southern branch of the Slav family, the Albanians, descendants of the ancient Illyrians, the Greeks, and the Turks. Since 1913 Turkish suzerainty has ceased in the peninsula, Bosnia and Herzegovina having been annexed by Austria-Hungary in 1908 and the remaining tributary territory having become independent as a result of the Balkan War of 1912-13. The Turks first obtained a foothold in the Balkan Peninsula in the middle of the fourteenth century, conquered Constantinople in 1453, putting an end to the Byzantine or Greek Empire, and soon after were masters of the whole peninsula. The Turkish Empire in Europe fell to pieces in the course of the nineteenth century, and at the present time Turkish rule extends over only about one-eighteenth of the region. The strife of nationalities is intense in the Balkan Peninsula and threatens at any moment to disturb the existing order. Consult: T. Fischer, "Die südosteuropäische Halbinsel" in *Länderkunde von*

Europe, vol. ii, part 2, 1890); Miller, *Travels and Politics in the Near East* (London, 1898); D. G. Hogarth, *The Nearer East* (New York, 1902); and Tuma, *Die östliche Balkan-Halbinsel* (Vienna, 1886).

BALKAN WAR. The causes of the armed conflicts which occurred in the Balkans during the years 1912-13 were traceable to long-continued disorders in Macedonia and Albania, to a temporary union of all the Christian states of the Balkans, except Rumania, and to the weakening of the Ottoman Empire consequent upon the internal dissensions following the Turkish Revolution of 1908 and the military reverses suffered in the Turco-Italian War (q.v.).

Macedonia had been ceded by Turkey to Bulgaria in 1878 pursuant to the Treaty of San Stefano, but the Congress of Berlin in the same year revised this treaty and through the insistence of Great Britain and Austria-Hungary restored the district to Turkey. By Article XXIII of the Treaty of Berlin, however, the signatory powers bound themselves to establish an organic law providing for good government in Macedonia and to see that it was applied. For 34 years this promise was unfulfilled, despite the repeated protests of the Christian inhabitants—Bulgars, Greeks, and Serbs. Gradually as the small Christian states of the Balkans grew stronger they interested themselves increasingly in the welfare of their respective nationalities in Macedonia. A serious revolt of Macedonian Bulgars almost precipitated war between Bulgaria and Turkey in 1903; only the intense rivalry among the various Balkan states and their inability to agree upon any common division of European Turkey postponed an appeal to arms. Nevertheless the misgovernment and atrocities in Macedonia at once attracted general attention, and from 1903 to 1908 the European Powers, led at first by Austria-Hungary and Russia, endeavored to secure reforms in the Turkish administration. Austro-Hungarian and Russian civil agents obtained some supervision in the three vilayets of Saloniki, Monastir, and Kossovo; Italian officers undertook to reorganize the *gendarmérie*; and the Concert of Europe assumed direction of financial matters. Unfortunately the system was far from complete, and there was slight harmony among the Powers. Germany wished to meddle as little as possible with the administration of a Turkish province. Great Britain, on the other hand, supported by Russia, wished to go much farther. Accordingly in 1907 the British ministry proposed a new plan, including the reorganization of justice under the direction of European agents, and King Edward VII and the Czar met at Reval with their respective foreign ministers and agreed on a thorough programme of reforms.

At this juncture came the Turkish revolution of 1908 (see **TURKEY**), by which the progressive and radical Young Turk party overthrew the autocracy of the Sultan, set up a constitutional government, and loudly heralded the principles of equality and liberty. The European Powers believed in the good faith of the Young Turks and in their ability to remove the Macedonian abuses, and this confidence was shared by the subject races of Macedonia themselves. The foreign advisers were therefore speedily recalled from Macedonia, and the international programmes of reform fell into abeyance. It soon became evident, however, that the Turkish Revo-

lution was directed not only against the Sultan's tyranny but against his feeble foreign policy which permitted the Powers to interfere in the internal affairs of the Empire. The revolution aimed at nationalization and centralization quite as much as at liberalism. In their desire to build up a strong, unified nation, the Young Turks introduced compulsory military service for Christians as well as for Moslems, but the realization of reforms promised by the Treaty of Berlin seemed more remote than ever. The special privileges long accorded to the subject races were curtailed; public meetings were prohibited; constitutional and national clubs were suppressed. This policy of Ottomanizing Macedonia had the effect of driving the people into more or less open rebellion. Lawless bands infested the country. Political assassinations were common. The repressive measures of the Turks served only to bring new recruits to the outlaws.

A very significant effect of the mistaken policy of the Young Turks was to draw the Christian nationalities together in common hatred of the Turks. From 1903 to 1908 the Serb, Greek, and Bulgar bands were as likely to massacre one another as to massacre Turks. Now they laid aside their rivalries. By the close of 1910 the Bulgars and Greeks in Macedonia who had long been the bitterest and most active in their hostility became fully reconciled, and this was followed by close and friendly relations between the governments of Greece and Bulgaria.

Another important result of the Ottomanizing policy of the new Turkish régime was disorder and insurrection in Albania. The turbulent chieftains and tribesmen of that province had been singularly loyal to the Ottoman Empire so long as their local customs and practices were respected, but as soon as the Young Turks undertook to abridge their privileges and to deprive them of arms, they rose in revolt. Every year from 1909 to 1912 was marked by desperate fighting in the mountains of Albania, each Turkish campaign becoming more expensive and less successful than the preceding one. In August, 1912, the Albanians submitted to the Turkish government a number of demands which included provision for a distinct judicial system—the restriction of Albanian military service in time of peace to the European vilayets, the use of the national language in civil administration, the establishment of schools, the undertaking of public works, the restitution of arms, and a general amnesty. The government was delaying its reply to these demands when the Balkan War broke out. With the Albanian situation both Montenegro and Serbia were directly concerned, and Serb irregulars were to be found fighting shoulder to shoulder with Albanians in the insurrections of 1911 and 1912.

The same determined policy of the Young Turks which led to disorders in Macedonia and Albania brought on the Turco-Italian War of 1911-12, and the Italian occupation of Tripoli and Cyrenaica and seizure of twelve islands in the Sporades humiliated the Turkish government and fed the ambition of the Christian states of the Balkans. A definite understanding was reached in March, 1912, by the governments of Bulgaria, Serbia, Greece, and Montenegro. Owing largely to the statesmanship of M. Venezelos, the Greek premier, jealousies and conflicting interests were not permitted to divide the states or keep them from their

central purpose. The alliance was formed to free the men of their religion and race from Turkish rule and to overthrow and dismember the Ottoman Empire in Europe.

Greece, Serbia, and Bulgaria naturally sympathized with the people of their own nationality in Macedonia. Montenegro likewise sympathized with the Albanian rebels, and the Turks complained of frequent attacks by Montenegrins on the border. In Bulgaria public opinion was greatly agitated by a massacre at Kotehana in August, 1912. As to Serbia, one of the many incidents that angered the people was a massacre of Serb Christians at Senitz in Novibazar in July. The emotions of the Greeks were stirred by reports of Turkish atrocities in Thessaly and by the clamorous appeals of the Cretans for annexation to the Greek kingdom, which had been increasing ever since the Græco-Turkish War of 1897 (q.v.).

These threatening conditions led the Porte in July, 1912, to announce its intention of introducing judicial, economic, educational, and administrative reforms in Albania. The rather vague assurance was extended to Macedonia in September, and in October the Turkish government revived the vilayets law of 1880, which constituted local autonomous councils, half of whose members, however, were to be appointed by the governor. Such tardy concessions could not stay the crisis, for the Balkan allies were by this time unitedly insisting upon a far more radical programme—national autonomy for Macedonia, Christian governors of the European vilayets, local militia, and the withdrawal of Turkish troops. Announcement that Turkey would hold army manœuvres near Adrianople was followed by orders for the mobilization of Bulgarian, Servian, Greek, and Montenegrin forces. By Oct. 8, 1912, nearly half a million men threatened the Ottoman Empire from the north, while over 100,000 Greeks were massed on the Thessalian frontier. The Turks retaliated by confiscating munitions of war intended for the allies and by holding up about 100 Greek merchant vessels.

Meanwhile the Great Powers had been attempting to prevent war. A conference on September 8 of the German Chancellor with Count Berchtold, Foreign Minister of Austria-Hungary, resulted in an expressed determination of the two governments to maintain the territorial *status quo* in the Balkans and to avert hostilities by encouraging the Porte in its "policy of decentralization"; and Austria-Hungary speedily mobilized an army with the avowed intention of protecting her interests in the sanjak of Novibazar. A proposal of the French foreign minister, M. Poincaré, for concerted diplomatic action, tardily assented to by Great Britain, led to representations by the ministers of Russia and Austria-Hungary, acting as mandatories of the Powers, at the Balkan capitals, on October 8, to the effect that (1) the Powers would reprove any belligerent action; (2) they would assist in securing, under Article XXIII of the Treaty of Berlin, reforms in the administration of European Turkey that would not infringe upon the sovereignty of the Sultan or the territorial integrity of the Ottoman Empire; (3) in case of war, they "would not permit at the end of the conflict any modification of the territorial *status quo* in European Turkey." On the very same day Montenegro severed relations with the Porte and declared war.

On October 13 Bulgaria, Serbia, and Greece dispatched an identical note to Turkey requiring the establishment of complete Macedonian autonomy under Christian governors within six months. Upon receipt of the note Turkey immediately recalled her representatives from their respective capitals. Formal declarations of war against Turkey were issued on Oct. 17, 1912, by Greece, Serbia, and Bulgaria.

The military plans of the four Balkan powers were well coördinated and directed to a common purpose. The chief objective of the Montenegrin campaign was Scutari. The Servians aimed at defeating the Turkish forces in Macedonia in coöperation with the Montenegrins in the west and the Greeks in the south and then to dispatch troops to seize the port of Durazzo on the Adriatic. The Greek attack was directed to the capture of Saloniki. The Bulgarians, whose forces were the strongest, were to perform the chief task of overwhelming the Turks in Thrace and pushing them back to Constantinople. Thus the Turks were attacked at the same time in four separate regions and were unable to concentrate and act on the offensive. Their commander-in-chief was Nazim Pasha, who was appointed on October 3. It was soon perceived that in the face of the vigorous and rapid assault of the Balkan armies the Turkish military organization had fallen into a deplorable state of inefficiency and unreadiness.

On the northeast Bulgarian forces, aggregating over 300,000 men, commanded by General Savoff (q.v.), occupied Mustapha Pasha on October 19 and Kirk-Kilisseh on the 24th. By the 27th Adrianople was invested, the garrison of 60,000 men henceforth making vigorous but unsuccessful sorties. On the 27th the Bulgarians captured Eski-Baba; and two days later began the sanguinary battle of Lule Burgas, the chief battle of the war, extending along a front of about 22 miles. Three attacks on the Turkish centre were repulsed, and the position was finally carried only after a hand-to-hand encounter. The Bulgarian generals did not restrain the ardor of their troops, and movements, especially infantry charges, involving heavy sacrifices of life, were carried out with remarkable heroism. The losses on each side were very heavy. The Turks were ill-supplied with food and ammunition and suffered also from defective leadership. The well-directed Bulgarian artillery fire wrought havoc among them. At last they began to retreat, but without panic, and fighting did not actually cease until November 2. The strength of the Turkish army engaged at Lule Burgas was placed at 150,000. Their loss in killed and wounded was about 35,000 and in prisoners about 3000. The Bulgarian loss was estimated at 15,000.

The Turks now fell back on Tchorlu and a little later withdrew behind the strong Tchatalja forts, the last line in defense of Constantinople. On November 12 the Bulgarians began their attack, but the Turks successfully stood their ground. To carry the defenses involved heavy loss, and it was hoped that the cholera, which had broken out among the Turks, would lead them to surrender. The Turks opened negotiations for an armistice on November 13, and operations were suspended, but when the allies presented their terms on November 20, they were at once rejected. On November 25, however, a meeting was arranged between General Savoff of the Bulgarians and Nazim Pasha, the Turkish

commander-in-chief and Minister of War, and three days later the negotiations were definitely resumed at Tchatalja. Finally, on December 3, a protocol was signed for an armistice which was to last until the end of the peace negotiations.

Meanwhile, in the western field of war, Servian forces took Prishtina on October 22, Novibazar on the 23d, and Senitza on the 26th. On the same day Uskub was occupied. Many of the Turks scattered in panic, but the main body withdrew toward Monastir. On October 27 the Servians, after driving the Turks back with heavy losses from Kotehana and Ishtib, captured Kuprulu. The Turks came to a stand in a narrow defile of the mountains between Kuprulu and Perlepe, whence the Servians tried to dislodge them on November 3. This was accomplished, but only after a long battle, in which the Servians suffered heavily. Meanwhile one portion of their army had been dispatched in the direction of Scutari to cooperate with the Montenegrins, another toward the coast at Durazzo, and a third to join the Greeks in the neighborhood of Saloniki. But the main body advanced to Monastir, which, after two days of desperate fighting, was captured on November 18. The last important success of the Servians was the occupation of Durazzo on November 28. The victorious advent of Servia on the Adriatic coast gave rise to international complications noted below.

The Greeks, under Crown Prince Constantine, invading Macedonia from the Thessalian frontier, had already occupied Ellassona, won successes near Mount Olympus, in the Melina Pass, and at Damsei, gained an important victory at Saranporo Pass on October 23, and on the following day captured the town of Servia. By the 31st they had occupied Verria on the Saloniki-Monastir Railway and had routed a Turkish detachment at Kailar. On November 3 their main column occupied the "holy town" of Yenidje and advanced thence on Saloniki, in conjunction with a detachment which had been landed at Stavros and with a Bulgarian force from Kuruk. The condition of the Turks in the defense of Saloniki was deplorable, and they were unable to offer effective resistance. After a two days' investment the town was surrendered on November 8. The number of the Greeks was placed at about 60,000 and of the Turks at about 25,000. A Bulgarian division and a Servian regiment entered Saloniki on November 9, and there were henceforth many evidences of jealousy among the allies. A Greek expedition against Janina had not attained its object when the armistice of Tchatalja was signed on December 3; Greece therefore declined to agree to the armistice and continued operations on land and sea. During the autumn and winter Greek warships managed to capture all the Ægean islands not already occupied by Italy.

The Montenegrins began their advance on Scutari on October 8. On the 12th they invested Tarabosch and on the 14th captured Tuzi. Esad Pasha, the Turkish commander, contested their advance at each mountain stronghold, but was at length obliged to take refuge within the fortress of Scutari. In the west Berane was taken on October 16, and toward the east Prizrend and Ipek on the 31st. South of Scutari another army of Montenegrins and Servians occupied Alessio and San Giovanni di Medua on November 5.

Ever since the outbreak of war the European Powers had continued their efforts in behalf of peace. M. Poincaré, the French premier, proposed early in November that the Powers should pledge themselves to "territorial disinterestedness," but this did not meet with favor among the members of the Triple Alliance, of whom Austria-Hungary occasioned the chief apprehension. She was known to be hostile to any movement that would bring Servia to the Adriatic or, by imposing a barrier of Slav states, cut Austria-Hungary off from the road to Saloniki. Toward the end of November Sir Edward Grey, the British Foreign Secretary, proposed that representatives of the Powers should be especially authorized to confer on the Balkan question at one of the European capitals. This was accepted, and London was designated as the place for the conference. Soon after the appearance of the Bulgarians before the Tchatalja lines, Turkey asked the Powers to mediate and received the reply that no terms unacceptable to all the belligerents would be forced upon them.

By the armistice signed at Tchatalja on Dec. 3, 1912, Bulgaria, Servia, Montenegro, and Turkey agreed to send delegates to a peace conference at London. During the armistice the armies were to retain their positions, and the besieged fortresses of Adrianople and Scutari were not to be reprovisioned. Greece, as has been seen, refused to accede to this agreement, while Janina remained in Turkish hands and continued her attacks on that city. Nevertheless, at the first session of the peace conference in London on December 16, the Greeks insisted on a share in the deliberations. The Turks, after some delay and efforts to obtain a counter-concession, yielded on this point. The territorial demands which the allies submitted December 23, comprising the cession of all territory west of a line from Rodosto to Cape Malatra, of the Ægean islands and of Crete, were refused by the Turkish diplomats, and the conference was suspended by the allies on Jan. 6, 1913. On the 16th the Porte was advised by the Powers to yield on the question of the surrender and cession of Adrianople. After receiving the assent of a Council of Notables on January 22, the Turkish government proposed to compromise on the division of Adrianople and the autonomy of the Ægean Islands.

These concessions were insufficient to satisfy the allies, and on Feb. 3, 1913, there was a general resumption of hostilities. The Bulgarians with Servian help pressed the attack on Adrianople; two forts were taken on March 9; and on the 26th the whole eastern line of defenses was carried and the Turkish commander, Shukri Pasha, was compelled to surrender with some 30,000 men. A vigorous attack was then made on the Tchatalja line; the town of Tchatalja was taken, and Bulgarian detachments occupied Delapes, Injes, Subachu, and Serbele. Meanwhile the Greeks had captured Janina, March 6; the siege of Scutari had been urgently prosecuted by Montenegrin and Servian troops; and Greek ships in the Adriatic were cooperating with the allied forces in northern Albania.

Further mediation of the Powers was impeded by their clashing interests. The moral support which Russian sentiment gave to the Greek-Christian Slavic Balkan states brought Russia into sharp conflict with the Austro-Hungarian "expansion to Saloniki" policy. After the resumption of hostilities between the

Turks and the allies, the attention of the Powers was directed to the settlement of conflicting claims to Albania. In deference to the strenuous representations of Austria-Hungary, they agreed to incorporate Scutari in an autonomous Albanian state and to forbid the acquisition by Servia of an Adriatic port, although Servia was to be given commercial access to the Adriatic over a neutral railway. In return, the Triple Entente secured for Servia and Montenegro the debatable territories of Ipek, Prizrend, Dibra, and Djakova. The northern and eastern frontiers of the new principality of Albania were accordingly agreed upon by the Powers on March 26, 1913. The immediate result of this agreement was the relaxation of Austro-Russian tension and the simultaneous withdrawal of Russian and Austro-Hungarian troops from the Galician frontier. With the consent of the Porte, the Powers renewed on March 1 their offer of general mediation in the struggle. Two weeks later the allies were willing to accept the good offices of the Powers on condition that the western boundary of Turkey should be the Rodosto-Malatra line, that Crete and the Ægean islands should be ceded, and that an indemnity should be paid by Turkey. The Powers, unwilling to give Bulgaria a foothold on the Dardanelles, insisted on a line from Enos to Midia by way of the Maritza and Ergene rivers; and as both Italian and German interests opposed the union of the Ægean islands with Greece, the Powers offered to determine later the status of those islands. On April 1 the Porte was ready to accept a direct line from Enos to Midia, and the allies were finally induced to agree to mediation, reserving the right to discuss with the Powers the claim for \$300,000,000 indemnity, the disposition of the Turkish national debt, the status of the Ægean islands, and the delimitation of the boundaries in Thrace and in Albania.

On April 19, 1913, a second armistice was signed at Bulair by all the belligerents except Montenegro. The announced decision of the Powers to incorporate Scutari in Albania only incited King Nicholas to redouble his efforts to capture that city. An international fleet under the command of the British Admiral Burney attempted to punish this defiance by blockading the coast from Antivari to San Giovanni di Medua on April 10. Unintimidated, the Montenegrins continued the siege, captured Scutari on April 23, and then at once acceded to the armistice of Bulair. For a while it was feared that negotiations looking toward a definite peace would be complicated by serious differences among the Powers concerning the fate of Scutari. Although the European Concert had already declared that Scutari should be incorporated in an autonomous Albania, the unexpected triumph of the Montenegrins aroused a storm of pan-Slavist sentiment in Russia. It was only the determined attitude of Austria-Hungary and the loyal support of her allies that forced King Nicholas to evacuate Scutari. On May 14, 1913, the city was occupied by an international military force in the name of the new principality of Albania.

As soon as Montenegro had grudgingly submitted to the Powers, delegates of the Balkan allies and of Turkey opened the second London Conference for the discussion of the terms of a general peace. Warned by Sir Edward Grey that the Powers would not tolerate protracted

deliberation, such as had wrecked the first London Conference, the Balkan diplomats came to an agreement late in May. By this Treaty of London, signed on May 30, 1913, it was stipulated that Turkey should surrender to the allies Crete and all territory on the European mainland west of the Enos-Midia line; that the delimitation of the Albanian frontiers and the disposition of the Ægean islands should be left to the adjudication of the Powers; and that financial questions incident to the readjustments should be submitted for decision to an International Commission at Paris.

Thus, within eight months, the Ottoman Empire had been shorn of all her European possessions except Constantinople and a small tract of adjacent land east of the Maritza River. But the surprising rapidity and ease with which this result had been achieved only whetted the ambition of each of the Balkan states to secure the bulk of the spoils. On one hand, Bulgaria claimed the greater part of Macedonia, including Saloniki and Monastir. On the other hand, Servia demanded a greater share of Macedonia than had been allotted to her in the Serbo-Bulgarian treaty of March, 1912, and Greece was insistent upon retaining both Saloniki and Kavala, which her troops had occupied. Rumania, too, had long been clamoring for a "strategic frontier" and for compensation from Bulgaria in return for her own neutrality during the Balkan War. In this emergency the Czar offered his services as mediator, but was petulantly refused. Inspired with a false confidence in the prowess of their army and possibly encouraged by Austro-Hungarian machinations, the Bulgarian government drifted rapidly into a second war, this time with their former allies and with Rumania and Turkey as well. Bulgarian troops took the offensive against the Greeks in the Panghaion district and engaged the Servians in a three days' battle at Slatovo. The new war, thus begun on June 30, was not formally recognized until July 5-6, when Bulgaria completed the diplomatic rupture with Greece and Servia, and Montenegro declared war against Bulgaria. On the 10th Rumania proclaimed hostilities, and almost simultaneously the Turks took advantage of the discord among their enemies and the withdrawal of the Bulgarian army from Tchatalja to advance in force toward Adrianople. Against such overwhelming odds the Bulgarian armies contended in vain. On the north the Rumanians quickly occupied Turtukai and Balchik and dispatched a column to threaten Sofia. On the south Adrianople was retaken with ease by the Turks on July 22. The advance of the Greeks from the southwest was more stubbornly resisted, but by the end of the month the armies of King Constantine had possessed themselves of all the important towns along the railway between Doiran and Dedeagatch and were advancing up the Struma River toward the Bulgarian boundary and the city of Sofia. Meanwhile on the west the Servians with Montenegrin aid had repulsed Bulgarian attacks and closed in upon Kotchana and were preparing to descend through the Osogovska Pass upon the Bulgarian town of Kustendil and thence converge with their other allies upon Sofia. Anxious to avoid further calamities, King Ferdinand sued for peace.

After a week's conference at the Rumanian capital of the representatives of all the Balkan

states, except Turkey, the Treaty of Bucharest was signed on August 6. Rumania of course secured an extension of her southeastern frontier as far as the Turtukai-Baltchik line. Bulgaria was obliged to abandon Kotchana and Radovisht to Servia, and Saloniki, Doiran, Demir-Iissar, Seres, Drama, and Kavala to Greece. In making this cession Bulgaria retained the town of Strumnitza in Macedonia and some 60 miles of seacoast on the Aegean between the mouths of the Mesta and Maritza. The Serbo-Greek boundary was so determined by the Treaty of Bucharest that Monastir became Servian and Voden and Florina fell to Greece. Subsequently Montenegro received from Servia, as compensation for assistance in the two wars, approximately a half of the sanjak of Novibazar, including Plevlye, Byelopolye, Ipek, and Djakova. For a brief period it was believed that the Treaty of Bucharest, concluded without much regard to the nationalities of the peoples in the distributed territories, would be revised by Russia or by Austria-Hungary. The new arrangement, however, was upheld by France and Germany, and the Dual Monarchy could hardly demand a change after the German Emperor had congratulated Rumania and Greece upon the settlement.

It still remained for Bulgaria once more to settle with the Turks the status of Adrianople. Bulgaria had counted upon the Powers to enforce the provisions of the Treaty of London, but now, unfriended and isolated, she was obliged to send General Savoff to negotiate a new treaty with the Porte. The Turks were not content even with the Maritza River as the boundary, but, making the most of their enemy's weakness, they compelled the Bulgarian envoy to renounce his claim to Kirk-Kilisseh and Demotika. By the Treaty of Constantinople, signed Sept. 29, 1913, the Turco-Bulgarian line would follow the Maritza from its mouth to a point near Mandra and thence, passing west of Demotika, would leave both that town and Adrianople to Turkey; near Adrianople the line would bend eastward and, passing north of Kirk-Kilisseh and south of Malko Tirnov, would terminate on the Black Sea at Sveti Stefan. Bulgaria emerged from the conflict discredited and deprived not only of Adrianople but also of the control of railway connections with Dedeagatch, her single new port on the Aegean.

While the Second Balkan War was in progress, the Ambassadors' Conference of the Powers at London was fixing the southern frontier of Albania. On August 11 announcement was made that it would run from a point south of Cape Stylos to Lake Ochrida, incorporating the district of Koritza in Albania, much to the vexation of the Greeks. With the government of Albania as well as with the boundaries of the new state, the Powers were concerned. About October 1 they set up at Valona an International Commission of Control, consisting of six members, representing Austria-Hungary, Italy, Russia, Germany, France, and Great Britain. Late in October it was announced that the Powers had agreed to nominate as first prince of autonomous Albania Prince William Frederick of Wied, a German subject and a relation of Queen Elizabeth (Carmen Sylva) of Rumania. Consult: Lane, *Peace Theories and the Balkan War* (London, 1912); H. Callan, "Lands and Peoples of the Balkans," in *Scottish Geographi-*

cal Magazine (Edinburgh, 1898); Lyde, *A Military Geography of the Balkan Peninsula* (London, 1905); E. Ashmead-Bartlett, *With the Turks in Thrace* (London, 1913); H. Wagner, *With the Victorious Bulgarians* (London, 1913); *The Balkan War Drama*, by a special correspondent (London, 1913); Pierre Loti, *Turquie agoniste* (Paris, 1913).

BALKES, bäl'kēs (more correctly BILKIS). The name "Arabian legend" gives to the Queen of Sheba, who married Solomon and bore him a son. She is alluded to in the 27th surah of the Koran and in Beekford's *Vathek* (q.v.).

BALKH, bälk. A district of Afghan Turkestan, corresponding to ancient Bactria. It is bounded on the north by the river Amu, on the east by Badakhshan, and on the west by the desert. Offsets of the Hindu-Kush traverse it in a northwestern direction, and slope down to the low steppes of Bokhara. Its area is approximately 5000 square miles. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation. The climate shows great variation. The commercial importance of the district greatly diminished with the discovery of the sea route around the Cape of Good Hope. The inhabitants, whose number cannot be ascertained, are Usbeg Tatars and range in character and occupation from plunderers of caravans to tillers of the soil and artisans.

BALKH, bälk (Turk. high town; anciently, *Bactra*). The chief city of a district of the same name, in Afghan Turkestan, situated where the Balkh River separates in numerous canals, about 23 miles south of the Amu-Darya, or Oxus River (Map: Asia, Central, K 3). It is surrounded by a mud wall; but though bearing the imposing title of Amul-Balad ('mother of cities'), little survives of the grandeur of ancient Bactra, on the site of which it is built, and Mazar-i-Sherif has usurped most of its importance since an outbreak of cholera in 1872. It contains a mosque, a citadel, and several half-ruined schools. It was twice destroyed by Genghis Khan and Timur, and in 1825 it was plundered by the powerful ruler of Kunduz, Mir-Murad-Bey. Balkh is reputed to have been at one time the centre of the Zoroastrian religion. There is a new town of the same name a short distance to the north of Balkh. The population is estimated at from 8000 to 15,000.

BALKHASH, bäl-käsh' (probably the *Fouru-Kasha* of the Avesta; *fouru*, great + *kasha*, lake). The fourth lake in size on the Eurasian continent, near the eastern borders of Russian Central Asia, in lat. 45° and 48° N., and long. 75° and 79° E. (Map: Asia, G 4). It was formerly connected with the smaller lakes lying beyond its eastern end, but it is now dwindling gradually in size. It has an area of 8600 square miles, and stretches from southwest to northeast over a distance of 330 miles; its breadth varies from 6 miles in the eastern part to 54 miles in the western. With the exception of its northern coast, the shores of Balkhash are so low that it is often difficult to locate their outline. The lake is shallow, navigation irregular, and the fisheries unimportant. It is frozen from November to April. Its waters are usually extremely saline except at the mouth of the rivers which empty in it. It has several feeders from the southeast, the principal of which is the navigable river Ili. The largest of several islands is Utch-Aral, near its western shore.

BALL (OHG. *balla*, Ger. *Ball*, Fr. *balle*; cf. Eng. *bale*, a round pack). The ball was to the primitive man not an implement of sport, but an absolute necessity of existence. The first were stones rounded by the action of tide or current, and man used them with a sling to crush in the forehead of the beasts upon whom he fed. Specimens of the *Bos primigenius* so slain have been exhumed from ancient bogs. The slaying of Goliath by David will immediately come to mind as an instance in which the stone ball from the brook was used as a weapon of offense. Hannibal's Balearic slingers, in the second Punic War, demoralized the Roman infantry by the terrible execution they did while yet at a distance and out of sight. The sling remained a part of the equipment of the English army until the fifteenth century. The South Americans had a modification of the sling in their *volas*. They attached a ball to each end of a thong, with another in the centre to hold by and get the necessary impetus. These were thrown and twirled round the legs of a distant and fleeing animal, bringing it to earth.

As an aid to outdoor activities and sports the ball claims a venerable antiquity. Thus, one of the most beautiful episodes in the *Odyssey* is the description of Nausicaa and her maidens in which, as rendered by Pope,—

"O'er the green mead the sportive virgins play,
Their shining veils unbound—along the skies,
To'st and retost the ball alternate flies."

The ball games of the Greeks came to be much valued as a means of giving grace and elasticity to the figure, and in the special rooms provided for them in the gymnasiums they were played almost daily by persons of all ages and ranks. A teacher (*philorepus*) was in attendance, and certain rules and gradations of the exercise were observed, according to the physical condition of the player. The Romans also practiced ball playing in connection with their baths, but it never assumed the importance attached to it by the Greeks. Of the various kinds of balls used by them, the commonest were the *pila*, a handball stuffed with hair, and the *foliis*, a large inflated skin, like a football. There were several recognized games, vaguely resembling handball and football; and in the Byzantine period a game distinctly similar to the modern polo was played on horseback by the nobles.

Ball playing seems to have been of great antiquity in the west of Europe also. In the sixteenth century it was in great favor in the courts of princes, especially in Italy and France. Houses were built for playing in all weathers, and in gardens long alleys were laid out for the purpose, the names of which still adhere to many localities. Thus, one of the most famous streets in London takes its name from the Italian *palla*, 'a ball,' and *maglia*, 'a mallet'—the game thus denoted being described in Blount's *Glossographia* (1656): "Pale Maille: a game wherein a round bowle is with a mallet struck through a high arch of iron (standing at either end of an alley), which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley, near St. James's, and vulgarly called Pell-Mell."

From the *jeu-de-paume* of the Middle Ages came the modern tennis, racquets, and lawn tennis. The origin of football is equally remote. It has been discovered in regions as far apart as the Faroe Islands in the north, New Zealand in

the south, and the Philippines in the tropics. A peculiar kind of game with an inflated ball was played by the Indians of the Amazon; they threw it in the air, and shot at it from opposite directions with blunt arrows. The game of lacrosse originated with the North American Indians, and evidently could have had no connection with the Oriental games, though it is not unlike them in several respects. But in all these questions of origins the historical data are so meagre and the modifying influences of various games upon one another have been so general that the true history of few games can be completely told. Besides the many famous games of universal acceptance in which the ball is the prime factor, there are many less-known sports, popular in certain localities, which are in the same way dependent upon it. The Frenchmen play the game of the hammer, hitting a ball along the highways; the Italians play *pallone* by striking the ball with a rubber casing worn over the hand. The Spaniards are devoted to their *fronton*, which is akin to handball. Even the Eskimos have their ball game to while away the tedium of the long winter; and marbles are too universal to be restricted to any locality or period. See BASEBALL; FOOTBALL, TENNIS; BASKETBALL.

BALL. Ammunition for firearms or ordnance. Before the era of hollow or elongated shells and bullets, all projectiles were solid and spherical. The term "ball ammunition" or "ball cartridge," however, is still used as a distinction from "blank ammunition." In military pyrotechny, "balls" in many varieties are used, either to give light, produce dense smoke, or diffuse suffocating odors. In these latter respects, however, they are, under modern conditions, rarely if ever used. See AMMUNITION; ORDNANCE; PROJECTILES.

BALL, ELMER DARWIN (1870–). An American entomologist, born at Athens, Vt. He was educated at Iowa State College and Ohio State University. From 1902 to 1907 he was professor of zoölogy and entomology in the Utah Agricultural College, at the end of this period becoming director of the Utah Experiment Station. In 1909 he was appointed director of the School of Agriculture in the Utah Agricultural College, and a year later held the presidency of the Utah Academy of Science. His writings include systematic studies of the life histories of the Cercopidæ Jassidæ and the Fulgoridæ, and also contributions on the economic effects of grasshoppers, codling moths (1907), and sugar-beet leaf hoppers (1907 and 1909).

BALL, JOHN (?–1381). An English preacher, well known for his connection with the Wat Tyler Insurrection in 1381. It was Ball who preached from the famous text:

"When Adam dalf, and Eve span,
Who was thanne a gentelman?"

He was executed at St. Albans on July 15, 1381. See TYLER'S REBELLION.

BALL, SIR ROBERT STAWELL, LL.D. (1840–1913). An English astronomer, born at Dublin, Ireland. He was educated at Trinity College, Dublin, and became, successively, professor of applied mathematics and mechanism at the Royal College of Science for Ireland; professor of astronomy in the University of Dublin; professor of geometry and astronomy at the University of Cambridge. He wrote *Elements of*

Astronomy (1880; 1900); *The Story of the Heavens* (1885; 1905); *The Story of the Sun* (1894); *Great Astronomers* (1895; new ed., 1906); *The Earth's Beginning* (1901; new ed., 1909); *Popular Guide to the Heavens* (1905; 3d ed., 1913); *Natural Sources of Power* (1908); *A Treatise on Spherical Astronomy* (1908); *A Primer of Astronomy* was reissued in 1911; besides many magazine articles, essays, lectures, and reviews. He was elected a Fellow of the Royal Society in 1873, was astronomer-royal of Ireland (1874-92), and in 1892 was made director of the Cambridge Observatory. At various times he was president of the Royal Astronomical Society, of the Mathematical Association, and of the Royal Zoological Society of Ireland. He was knighted in 1886. In 1902 he visited the United States and addressed several public or semi-public meetings.

BALL, THOMAS (1819-1911). An American sculptor, the most important of the early middle period. He was born at Charlestown, Mass., March 6, 1819, the son of a house and sign painter, and on the early death of his father undertook the support of the family. His employment as a boy-of-all-work in the old New England Museum, Boston, turned his attention to art and led him to the study and practice of portrait painting. His first attempt in sculpture was a small bust of Jenny Lind, and this was followed by other cabinet busts of musicians of his acquaintance—for Ball was an amateur musician of great ability, being the first in America to sing the basso of Elijah. A life-size bust of Daniel Webster brought great success and assisted his departure for Florence in 1854. After two years' study he returned to Boston and was in 1860-64 engaged in modeling his celebrated "Washington" (unveiled 1869), the first equestrian statue in New England and by far the best of any type so far produced. In 1865 he returned to Florence, where he spent most of his later life. Among the more important of his later works are: Edwin Forrest as "Coriolanus" (1867), now in the Actors' Home, Philadelphia; "Eve stepping into Life," considered by the sculptor as his most important work; "La Petite Pensée," a well-known ideal head; "St. John the Evangelist" in Forest Hills Cemetery, Boston. In 1875 his celebrated "Emancipation Group" in Washington (replica in Boston) was unveiled—a bronze representation of Lincoln freeing a kneeling slave and a work of real inspiration; in 1876 was completed the colossal bronze figure of Daniel Webster in Central Park, New York; and in 1878, the statue of Josiah Quincy before the City Hall, Boston. At 70 years of age Ball began his most ambitious and probably his greatest achievement, the Washington monument at Methuen, Mass. It consists of a great block of Carrara marble, surmounted by a colossal bronze figure of Washington; at the base are four seated figures representing Oppression, Revolution, Victory, and Cincinnati, and above these the busts of Washington's four principal generals. The sculptor's last years were spent in Montclair, N. J.

Ball is one of the most important figures in the development of American sculpture, for which he set a new standard both in craftsmanship and in ideals. To an observer accustomed to the subtleties of present-day modeling, the surfaces and textures of his statues seem oddly smooth; but the figures are always truly sculptural and are serious and dignified in

conception. He published an autobiography entitled *My Threescore Years and Ten* (1891) and a number of lyrics and other poems. Consult Taft, *History of American Sculpture* (New York, 1903).

BALL, WALTER WILLIAM ROUSE (1850-). An English mathematician. He was educated at University College, London, and at Trinity College, Cambridge. In 1878 he was appointed lecturer at the latter college, in 1891 director of mathematical studies, and in 1898 senior tutor and chairman of the college educational committee. He became auditor of the Cambridge University accounts (1907) and in addition to his other duties served frequently as examiner and as member of boards and syndicates. His writings, besides many papers contributed to mathematical journals, include: *The Genesis and History of Newton's Principia* (1893); *The Student's Guide to the Bar* (7th ed., 1904); *History of Trinity College, Cambridge* (1906); *A History of the First Trinity Boat Club* (1908); *Short Account of the History of Mathematics* (5th ed., 1912); *Mathematical Recreations and Essays* (5th ed., 1912).

BALLAD (OE. and OF. *balade*, Fr. *ballade*, dancing song, from Late Lat. and It. *ballare*, to dance, from Gk. *βαλλίζειν*, *ballizein*, to dance; cf. *ball*, *ballet*). A versified narrative, in a simple, popular, and often rude style, of some valorous exploit or some tragic or touching incident. Indeed, so far as subject is concerned, the ballad is a species of minor epic yet with a strong lyric element. It is comparatively short, the story being circumscribed, and not embracing a combination of events, as does the plan of the grand epic. There can be little doubt that the ballad has been the earliest form of poetry among all nations, and that the earlier epics or heroic poems of the higher kind, such as the *Cid* or the *Nibelungenlied*, and, for that matter, the *Iliad* and *Odyssey* of Homer grew out of such simple beginnings. The old ballads were handed down orally and thus underwent constant changes. Accordingly, unlike modern poems, the popular ballad has no individual author, and the treatment of the theme, whether war, crime, love, or enchantment, was thus always objective, there being no poet to thrust forward his own emotions. These ballads make their appeal directly to the common feelings of love, hate, fear, shame, and grief, by means of a great variety of incident. Some of them are humorous, being merely *fabliaux* in ballad measure; some are versions of current romances, but the best of them spring from native tradition. It was long ago observed that the ballads of various nations are frequently based upon the same or similar incidents; and the tracing of the development of these primitive *Märchen*, whether they were carried from people to people by wandering minstrels or are the common inheritance of the Indo-European races, is of more interest and value to the student of folklore than is the study of their form to the historian of poetry. See Gummere, *The Beginnings of Poetry* (New York, 1901).

All the British ballads, in the present form, are of comparatively recent date; the oldest manuscript now existing is assigned to the first quarter of the fifteenth century. But there are allusions to Robin Hood, by Langland, 50 or more years earlier; and, according to Child, this story undoubtedly began to assume a ballad form as early as the thirteenth century. There is no reason, in any case, to doubt that the Anglo-

Saxons had their narrative songs; indeed, Tacitus speaks of certain *carmina* among the Germanic peoples, though none of these have survived independently, being fused in such connected works as *Beowulf* and the *Nibelungenlied*. Of British ballads, those in the Scotch dialect are the best, being much more spirited than those composed in England. This may be accounted for partly by the fact that in the north their traditional form was long preserved, while in the south they got into print early and were thus subjected to a kind of revision which amounted to mutilation. It is difficult to make a selection, owing to the abundance of material, but among the best known are the "Geste of Robin Hood," a series of ballads forming a miniature epic; "The Hunting of the Cheviot," "Sir Patrick Spens," "Mary Hamilton," "The Wife of Usher's Well," "The Twa Corbies," "Clerk Saunders," and "Fair Helen of Kirkconnel Lea." All these old ballads were intended for a musical setting. If short, they were sung; if of considerable length, they were chanted, often by professional minstrels, to the accompaniment of some instrument, as the harp or fiddle. The typical stanza (though subject to variations) consists of two rhyming verses, each having seven accents, divided into lines of four and three accents. Ballads were always popular in England, although after the invention of printing they were not so commonly sung. In the eighteenth century a great revival of interest in the older ballad literature took place, stimulated largely by the publication, in 1765, of Percy's *Reliques of Ancient English Poetry*, derived mainly from a seventeenth century manuscript. Other famous collections followed: Scott's *Border Minstrelsy* (1802-03) and Motherwell's *Minstrelsy, Ancient and Modern* (1827). The influence of Percy's book was very great in both England and Germany. It led to a whole class of imitative ballad literature, of which may be mentioned Bürger's "Lenore," Tennyson's "Revenge," and Rossetti's "King's Tragedy." Such imitators, however, have taken suggestions from rather than held close to the older ballad form and have especially departed from their models in the intrusion of the subjective note of characteristic modern poetry. In fact, the paramount interest of the revival of balladry lies in the fact that it broke up the exclusive domination of the heroic couplet and led to freer versification. American ballads are not wanting; some of them may be found in the collection *Cowboy Songs* (New York, 1911), made by John A. Lomax; important as genuine ballads in the proper sense, and illustrative of the literary laws at work in the production of the ballads of the past the world over. Crude and artless as they are, they justify strict classification as ballads by the impersonality of their authorship, their primitive and robust humanity, and the blend of lyrical and narrative elements.

The oldest extant German ballad of the kind described under this title is the famous *Hildebrandslied* (q.v.), which can be traced to the eighth century and is the only survivor of its period and class. By the middle of the twelfth century the development of German poetry, despite all Romance influences, had definitely won its greatest triumphs in the field of native ballad literature. By 1300 the courtly minnesinger had begun to give place to the *bourgeois* meistersinger; and the latter for two centuries summed up the poetical life of the nation in their ballads. The sixteenth century was a period of rapid de-

cline, as in England; and it was not, as already indicated, until Percy's influence on Herder and Bürger had caused a revival of interest that the ballad again came to the front, and was during the nineteenth century a subject of wide literary interest.

Among the Latin nations the Spaniards possess the richest ballad literature. Here the fact that the ballad preceded the romance is easy of demonstration. The simple emotions of the people are vividly depicted in the *coplas*, *seguidillas*, and *muñiciras* which sprang up in great numbers. The octosyllabic line was the commonest metre, and assonance (q.v.) was used instead of rhyme.

The ballads (*pjesmc*) and hero songs (*yunak*) of Servia, while comparatively little known, deserve an important place in any general treatment of the subject. Their history is at least as long as that of the western ballads; and the researches of recent scholars, especially Vuk Stephanovich (1787-1864), and Ljudovik Gaj (1809-72), have succeeded in accumulating in permanent form a vast mass of them which possess the same general characteristics in subject as the other ballads, while as to form the older ones are generally composed in 15 and 16 syllable lines, the modern in decasyllabic metre. As a nation comparatively untouched by modern unifying civilization, the Servians are still producing, or maintaining in popular use, ballads which look upon life from a primitive point of view, which has long been lost in the west.

Bibliography. For English and Scottish ballads, Percy, *Folio Manuscript* (3 vols., ed. Hales and Furnivall, London, 1867-68); good preparatory books are Gummere, *Old English Ballads* (Boston, 1894), and *The Popular Ballad* (New York, 1907); the best general work, Child, *English and Scottish Popular Ballads* (5 vols., Boston, 1883-98); the last volume contains an almost exhaustive bibliography. See ENGLISH LITERATURE with the appended bibliography.

For the German. Uhland, *Alte hoch- und niederdeutsche Volkslieder* (4 vols., 3d ed., Leipzig, 1892); Scherer, *Die schönsten deutschen Volkslieder* (Leipzig, 1868); Smrook, *Lieder der Minnesinger* (Elberfeld, 1857); Robertson, *A History of German Literature* (Edinburgh, 1902); Vogt and Koch, *Geschichte der deutschen Literatur* (2 vols., Leipzig, 1904); and see GERMAN LITERATURE with an appended bibliography.

For the Spanish, Marín, *Cantos populares españoles* (5 vols., Madrid, 1882-83); *Biblioteca de las tradiciones populares* (11 vols., Seville, 1883); Böhl von Faber, *Flóresta de rimas antiguas castellanas* (3 vols., Hamburg, 1821-25); Balaguer, *Historia de los Trovadores* (Madrid, 1888); Menéndez y Pelayo, *Estudios de Crítica Literaria* (Madrid, 1895); Ticknor, *History of Spanish Literature* (4th ed., New York, 1871); Lockhart, *Ancient Spanish Ballads* (London, 1823); and Fitzmaurice Kelly, *A History of Spanish Literature* (New York, 1898).

For the Servian, Bowring, *Servian Popular Poetry* (London, 1827); Kapper, *Volkslieder der Serben* (Leipzig, 1853), and Krauss, *Sagen und Märchen der Sudslaven* (Leipzig, 1884). See also SERBIAN LITERATURE.

For the ballad in general, see Gummere, *The Popular Ballad* (New York, 1907); and id., *Democracy and Poetry* (1911).

BALLAD. In music the term designated at different periods widely divergent musical forms. The oldest ballads were chiefly literary productions which were recited by minstrels with impro-

vised accompaniment on the harp. This is particularly true of the oldest ballads of England, Scotland, Scandinavia, and Spain, while in Italy the ballad (*ballata*) was a real dance song before the development of instrumental music. Riemann considers it highly probable that in Germany and France during the twelfth and thirteenth centuries these simple dance songs were gradually transformed into more artistic forms. At any rate, during the fifteenth century we find the ballad together with the rondeau (q.v.) the most popular form of artistic song with instrumental accompaniment, especially in Spain. By far the greater number of the 459 compositions contained in the *Cancionero musical de los siglos XV y XVI* are such ballads. In England ballads not only enjoyed the greatest popularity during the sixteenth century, but ballad writing became even a fashionable amusement. After the sixteenth century the form of the ballad became more and more simple, gradually returning to the plain strophic folk song. Its decline was particularly rapid in England, where about 1800 the term denoted a cheap, trivial song whistled in the streets.

The modern ballad is not a revival of the older form. Zumsteeg (q.v.) was the first to furnish a musical setting for the splendid literary ballads of Goethe, Schiller, and Bürger, and naturally the musical form (scarcely more than the same strophic melody for all stanzas) was very primitive and inadequate. Löwe (q.v.), whose fame rests entirely upon his ballads, strove for characteristic expression of each stanza and secured artistic unity by means of a few pregnant motives, which appear constantly in thematic development. Schubert, Schumann, and Brahms, adopting Löwe's principle, have furnished unsurpassed examples of the modern vocal ballad. Schumann also set several of Uhland's ballads for soli, chorus, and orchestra. Senta's ballad from *The Flying Dutchman* is perhaps the most widely known example of this form. In modern music, especially since Chopin wrote his superb *Ballades*, the term appears frequently as a title of purely instrumental works for piano or orchestra. Such works have the same thematic structure as the vocal ballad, but their fundamental mood is usually that of the more sinister emotions. For the older ballads consult H. Riemann, *Handbuch der Musikgeschichte*, vol. ii, part i (Leipzig, 1906).

BALLADE, bál'lad' (Fr.; see BALLAD). A poem which consists of three stanzas of eight lines, followed by one of four lines (known as the "envoy"), or three of 10 lines with envoy of five, each of the stanzas and the envoy closing with the same refrain. In the ballade of eight lines there are but three rhymes, in this order: A, B, A, B, B, C, B, C; the envoy repeats the last four. The envoy is a special feature of the ballade and chant royal; it was usually a form of dedication to a noble patron, so that even in modern ballades it generally begins with a vocative, as "Prince!" "Princess!" or the like. The chant royal is merely an enlarged ballade, with five stanzas of 11 lines and envoy of five. While poems of undecided structure, called rondeaux, and ballades began to make their appearance at the end of the twelfth century, the ballade, as a strict metrical form, is really due to François Villon (q.v.) and Charles of Orléans. Théodore de Banville (q.v.) revived this and other early French forms about 1860, and they have since been successfully imitated in English by Swinburne, Andrew Lang,

Austin Dobson, Edmund Gosse, W. E. Henley, Frank Dempster Sherman, and others.

BALLADINO, bál'lá-dē'nō, ANTONIO. A versifier in Ben Jonson's *The Case is Altered*, whose motto is: "Tut, give me the penny; I care not for the gentlemen, I." Munday, a contemporary dramatist, is satirized.

BALLAD-OPERA. A kind of operetta which was the rage in England during the eighteenth century. Instead of writing music to the words, the process was reversed. A number of well-known popular airs were strung together and new words were written to the music. These airs were interspersed in spoken dialogue. The first and most popular of these ballad operas was John Gay's (q.v.) *Beggar's Opera*, produced in London in 1727. It was followed in the next year by six similar works by different authors. In 1750 the *Beggar's Opera* made its appearance in New York, and for three-quarters of a century works of this kind were the only operatic fare offered to the American public. Consult G. Sarrazin, *John Gay's Singspiele* (Weimar, 1898).

BALLAGI, bál'ló-gé, Mór (MORITZ), originally **BLOCH**, blók (1815-91). A Hungarian philologist and theological author, born at Inóc, of Jewish parentage. After completing his studies at Budapest and Paris he undertook a translation of the Bible into Hungarian, for the purpose of Magyarizing the Jews. Of this work, only the Pentateuch and the Book of Joshua were published (Budapest, 1840-43). In 1840 he was made a member of the Hungarian Academy. He became a Protestant in 1843 and thereafter studied theology at Tübingen. From 1855 to 1878 he was professor of theology at Budapest. His philological works include: *Ausführliche theoretisch-praktische Grammatik der ungarischen Sprache* (1843; 8th ed., 1881); *Vollständiges Wörterbuch der ungarischen und deutschen Sprache* (2 vols., 1854-57; 6th ed., 1890); *Magyar példabeszédek közmondások* ('Collection of Hungarian Proverbs') (2 vols., 1850; 2d ed., 1855).

BALLANCHE, bál'länsh', PIERRE SIMON (1776-1847). A French writer on social theories. Among his works may be mentioned: *Antigone* (1814); *Essai sur les institutions sociales dans leurs rapports avec les idées nouvelles* (1818); *Le vieillard et le jeune homme* (1819); *L'homme sans nom*—a novel (1820); *Palingénésie sociale* (never completed), and *La vision d'Hébal* (1832). The *Palingénésie*, which he did not finish, was to be an exposition of the workings of God in history and is considered his greatest work. His system, termed "Ballanchism," attracted much attention. Ballanche was a member of the circle gathered around Châteaubriand and Madame Récamier, his platonic affection for the latter forming part of the literary history of his period.

BALLANTYNE, JAMES (1772-1833). A Scottish printer, born at Kelso. He studied at Edinburgh University and in 1796 became proprietor and editor of the *Kelso Mail*. He published Sir Walter Scott's *Minstrelsy of the Scottish Border*, and in 1802, at Scott's advice, set up a printing establishment at Edinburgh. In 1808 he also became a member of the firm of John Ballantyne & Co., booksellers, and from 1817 he edited the *Weekly Journal*. Not only did he read the proofs of Scott's works for technical details, but oftentimes he proffered criticisms which, as Lockhart testifies, led Sir Walter to introduce important changes into the

treatment of a subject. Although not himself responsible for the financial difficulties of Scott, he was involved in the failure of Constable & Co. and subsequently was retained by the trustees of the creditors to conduct the literary affairs of the printing establishment and to edit the *Weekly Journal*.

BALLANTYNE, JAMES ROBERT (1813-64). A British Orientalist, born at Kelso, Scotland, and educated at Haileybury College, Herts, England. He was at first instructor at the Scottish Naval and Military Academy, but was sent to India in 1845 to take charge of the Government Sanskrit College at Benares, with which institution, after 1856, he was also connected as professor of moral philosophy. Upon his return to Europe he was appointed librarian of the East India Office. His primary aim, as embodied in his works, was the elucidation of Oriental ideas in such a way as to show their relation to European science. His works include: *The Practical Oriental Interpreter* (1843); *Catechism of Sanskrit Grammar* (2d ed., 1845); *A Synopsis of Science in Sanskrit and English Reconciled with the Truths to be Found in the Nyaya Philosophy* (1856)—a work of genuine scientific merit; *Christianity Contrasted with Hindu Philosophy* (1859).

BALLANTYNE, ROBERT MICHAEL (1825-94). A Scottish author, born at Edinburgh, a nephew of James Ballantyne. In 1841-47 he was in the service of the Hudson's Bay Fur Company in Rupert Land and in 1848 published an account of his experiences as, *Hudson's Bay; or, Life in the Wilds of North America*. From 1856, in his own words, he "lived by making story-books for young folks." Of these he wrote with much success more than 80, including *Young Fur Traders* (1856), *Coral Island* (1857), *The Gorilla Hunters* (1862), *Black Ivory* (1873).

BAL'ARAT'. The most important commercial centre, next to Melbourne, in Victoria, Australia (Map: Victoria, C 5). It consists of the two municipalities of Ballarat West and Ballarat East, situated in one of the richest of Australian gold fields, on the west and east banks of the Yarrow River. It is 74 miles northwest of Melbourne and is the centre for six branch railroads. Its chief industries are those of the gold mines, iron foundries, woolen and flour mills, breweries, and distilleries. It is the see of Anglican and Catholic bishops, has many handsome buildings, churches, hospitals, monuments, Botanical Gardens, an excellent School of Mines, etc. Its establishment and rise date from the discovery of gold in 1851. The largest gold nuggets ever unearthed were discovered here. Ballarat East and Ballarat West have been distinct municipalities since 1855, and in 1870 the latter was proclaimed a city. Pop., 1911, 42,403.

BALLARD. Formerly a city in King Co., Wash. It has a good harbor and is one of the most important lumber manufacturing centres in the United States. Other leading industries are the manufacture of foundry and machine-shop products and shipbuilding. Ballard was settled in 1882 and was incorporated in 1890. In 1907 the towns of Ballard, Columbia, and portions of other precincts were joined to Seattle and now form a part of that city.

BALLARI. See BELLARY.

BAL'LAST (first part of uncertain origin; perhaps Eng. *barc*, mere + *last*, burden, weight). Weight carried by a ship or boat to secure proper stability, both to avoid risk of capsizing

and to secure the greatest effectiveness of the propelling power. Modern steamers have tanks fitted for water ballast and rarely carry any other kind. The tanks are located forward, aft, and amidships, in order that the vessel may not only be immersed to a safe extent, to avoid danger of capsizing, but also so that the trim, or inclination of the keel to the surface of the water, may be adjusted. When light (i.e., with little or no cargo), steamers require *trimming* by the stern (i.e., to have the stern more deeply immersed than usual), in order to submerge the screw or screws. Sailing vessels require greater stiffness (i.e., power to resist capsizing) than steamers, in order to stand up under the force of wind against their sails as well as to resist the motion imparted by the waves. The amount of ballast needed depends not only upon the depth of immersion, but upon the shape of the hull, some forms of which require more ballast than others. In ballasting or stowing cargo, the ballast and cargo are considered together, the quantity and distribution of the former being dependent on the latter. The combined effect of both should not place the centre of gravity too low or too high. If too low, the ship will be unduly *stiff* and will roll violently and jerkily, though perhaps not deeply; and she will sail sluggishly, except in a comparatively smooth sea. If the centre of gravity is too high, the vessel will be *crank*, and will be dangerous from lack of power to right herself when heeled over by the wind pressing on her sails or by the action of the waves; she may roll deeply, but her rolls will be slow; crankness interferes with speed under sail, because it reduces the amount of sail which can be safely carried; furthermore, the lack of righting power, or stability, which causes crankness, prevents the vessel from responding quickly to the action of the waves. A vessel is said to be *in ballast* when she has ballast only on board.

The term is applied to bags of sand used to steady or lighten a balloon. Civil engineers use the term "ballast" to signify the sand or gravelly material which is laid as a foundation for roads, concrete floors, etc., or as packing between railway sleepers, in order to give them solidity. No modern railway is considered to be complete or safe for transit until it is dressed and finished by ballasting. The possibility of procuring ballast at a cheap rate considerably affects the course of railway undertakings.

BALLAST PLANTS. Plants growing on or distributed from the ballast of ships, from seeds which were contained in the ballast when loaded on the vessel, or which have fallen on it in transit. Various kinds of plants have thus been transported from one region to another. Botanists have made a special study of ballast plants in relation to the general subject of the transportation of plants by different agencies.

BALLASTER. See BALUSTER.

BAL'LATER (Gael. *baile*, town + *leiter*, slope of a hill). A village and police burgh of Aberdeenshire, Scotland, on the Dee, 43 miles by rail west-southwest of Aberdeen (Map: Scotland, E 2). It is frequented on account of the medicinal springs in the neighborhood. Pop., 1911, 1240.

BALL BEARING. See BEARING.

BALL CLAY. See CLAY.

BALLENDEEN, JOHN. See BELLENDEN.

BALLENSTEDT, *häll'en-stët*. A town in the German duchy of Anhalt, situated in the Harz

Mountains, about 7 miles by rail from Quedlinburg. It is celebrated chiefly for its castle, the summer residence of the dukes of Anhalt-Bernburg. From the tenth to the sixteenth century this castle was a Benedictine monastery. It is the seat of a district court, has a fine park, an extensive library, and a number of valuable collections. Pop., 1900, 5423; 1910, 6100.

BALLENTYNE, JOHN. See BELLENDEN.

BALLENY (bál-lá'né) **ISLANDS**. A group of islands in the Antarctic Ocean in lat. 67° S., and long. 163° E., 280 miles north of Victoria Land (Map: Antarctic Region, F 6). It consists of three large and two small islands, of volcanic origin, and covered with glaciers. Freeman's Peak, on Young Island, is about 12,000 feet high. The group was discovered by John Balleny in 1839, and at the time two of the volcanoes were in eruption.

BALLESTEROS, bá'lyá-stā'rós, DON FRANCISCO (1770-1832). A Spanish general and statesman, born at Saragossa. He entered the army and served with distinction against the French. When the Duke of Wellington was appointed to the chief command of the allied armies, Ballesteros resigned, refusing to serve under a foreigner, in consequence of which he was banished to Ceuta. Upon the restoration of Ferdinand VII Ballesteros received the command of an army corps and became Minister of War in 1815. Appointed Vice President of the Provisional Government by Ferdinand VII, he opened the prisons of the Inquisition, returned to the municipality of Madrid the rights granted by the Cortes in 1812, and at the head of the national militia dispersed the enemies of the constitution. In the war against France (1823) he was compelled to retreat and to agree to terms of peace so humiliating, and in the eyes of the Spaniards so disgraceful and unwarranted, that he has always been considered a traitor. Excluded from the general amnesty, he was forced, upon the downfall of the constitutional government, to flee to Paris (1824), where he lived in retirement until his death.

BALLESTREM, bá'l'les-strám, FRANZ XAVER, COUNT VON (1834-1910). A German statesman. He was born on the family estate of Plawniowitz in upper Silesia, entered the Prussian army, served in the campaigns of 1866 and 1870-71 and at the close of the latter retired with the rank of captain. He was elected to the Reichstag in 1872 and took a prominent position in the Centre Party, being appointed a papal chamberlain by Pius IX for his vigorous services in the Kulturkampf. He was First Vice President of the Reichstag in 1890-93 and President from 1898 to 1906. In 1903 he became a member of the Prussian House of Lords.

BALLET, bál'lá' or bál'lét (Fr. dimin. of *bal*, dance, It. *ballo*, ball, dance, from Late Lat. and It. *ballare*, to dance; cognate with "ballad.") A species of dance in which a company of trained performers, either singly or in groups, interpret music by means of the choreographic art. Owing to its resemblance to the chorus of the classic Greek tragedy, attempts have been made to trace its history back to the pantomimic, sacrificial dances of antiquity. The earliest ballet performance of which we have record was in Milan, at the wedding of the Duke of Milan to Isabel of Aragon in 1489. The home of our modern ballet was undoubtedly Italy, where it was first employed as a court spectacle. In its infancy song and recitation

were introduced with the music and dancing which we know at present.

From Italy the ballet was carried to the French court in the time of Catherine d' Medici. In 1581 Baltasarini (called Beau Joyeux), Catherine's director of music, presented the famous *Ballet Comique de la Reine*, and the new entertainment soon proved so popular that royalty itself took part in the performances. With the growth of court luxury under Louis XIII and Louis XIV, the *ballets-de-cour* were more elaborately staged and became a favorite diversion. Both monarchs are said to have taken part in them when young. One of the most famous court ballets at this time was the *Triomphe d'Amour*, produced by Quinault, Benserade, and Lulli in 1681. It was in this same year that women first took parts, the entire cast having previously been of men. During the reign of Louis XIV the ballet was first placed on the popular stage.

In 1758 appeared the publication of Jean Noverre's *Lettres sur le danse et les ballets*, which revolutionized its form. Noverre contended that the ballet was a blending of the arts and was to be used primarily for the interpretation of a story and not for the display of virtuosity. He attempted to abolish words from the ballet and substitute pantomime; from his time dates the *ballet d'action* and the abolishment of pure formalism in the dance. He was appointed dancing master of the ballet at the Paris Opera by Marie Antoinette and continued his activity until the French Revolution.

During the period of the upheaval in France there is no record of the ballet, but in the first half of the nineteenth century we have the heyday of the French and Italian schools. Gaetan Vestris and his son Auguste appeared about 1810; the former was reputed to be the most graceful male dancer that ever trod the stage. In 1822 Marie Taghioni set Paris aflame by her *La Sylphide*; shortly afterward her rival, Fanny Ellsler, eclipsed her fame in *Le Diable Boiteux*; Carlotta Grisi, the ethereal, gained her reputation in *Giselle*, a ballet composed specially for her by the author, Théophile Gautier; Fanny Cerito, and Lucile Grahn also belong to this period. The high-water mark of this type of ballet came in 1845, when four of the greatest danseuses—Taghioni, Grisi, Cerito, and Grahn—appeared in London in the famous ballet *Pas de Quatre*. This was regarded as an international event of first importance. Within six years of that date this entire school had disappeared, and but one name stands out in the third quarter of the century, Rosati, who was decidedly second-rate compared to her predecessors.

The ballet as a separate performance then disappeared in favor of skirt dancing and high kicking, save when given as an interlude to the opera (cf. FAUST). In the last quarter of the century, however, the school of the Russian ballet began to appear as the successor of the French and Italian.

The first movement in Russia toward the formation of a ballet was when Czar Alexius in 1672 ordered Johan Gregory to collect performers of the dance. In the reign of Czarina Anne (1730-1740) C. Friedrich Wellman was ordered to secure recruits for the public entertainments, and twelve ballet masters were appointed. This was the beginning of the school

of St. Petersburg. Following sovereigns encouraged its growth until the beginning of the nineteenth century, when Didelot, the great ballet master, appeared to do the same thing for the Russian ballet that Noverre had done in France. He formulated principles and exact methods of instruction and induced all the great dancers, such as Taglioni and Ellsler, to appear in St. Petersburg. When in 1850 French and Italian dancers no longer shone on the stages of western Europe, the Russians continued quietly and inconspicuously to preserve the traditions in their own country, and gradually, under Petipas and Fokine, the present Russian school evolved. It is unlike any previous school, uniting with the formal romanticism of the old-time ballet fairy lore an intensely modern realism. For the first time in the history of the ballet, under M. Backst, the Russian painter, is emphasised the importance of proper blending of color and mass in the entire *mise-en-scène*. This school produced Anna Pavlova, pronounced the equal of Taglioni and Ellsler.

Pougin, *Dictionnaire historique du théâtre* (Paris, 1885); Flicht, *Modern Dancers and Dancing* (London, 1912).

BALL-FLOWER. A detail of ornament in English Gothic architecture, so named from its resemblance to a ball within a flower, usually with three, sometimes with four, petals. The ball-flower is supposed by some to be an imitation of a pomegranate.

BALLIN, Hugo (1879-). An American figure and decorative painter. He was born in New York City; studied at the Art Students' League, where he won a scholarship, and later (1900-03) in Italy. During this time he had the advantage of studying mural decorations in Lombardy and Umbria with Robert Blum. He returned to this country to reside and practice in New York. Among his chief paintings are "Susanna's Bath"; the "Lute Player"; "Three Women Dancing about Cupid," which won the Shaw Prize in 1905 (the year in which he became an Associate of the National Academy); "Mother and Child" (Clarke Prize, 1906); "The Portative Organ," an excellent example of his style. Because of his notable ability in the field of decorative painting, Ballin became known as one of the most promising of the younger American artists. He excels especially in color, which is always soft and in a low key, and his work is elusive in line and excellent in composition. His art, more than that of any other contemporary American painter, recalls the harmonies of the masters of the Italian Renaissance.

BALLINA, bāl'ī-nā' (shortened from Gael. *Bel-an-atha-an-feadha*, the ford south of the wood, from *bel*, estuary + *ath*, ford). A seaport in the counties of Mayo and Sligo, Ireland, on the Moy, 7 miles south of its entrance into Killala Bay (Map: Ireland, B 2). The Moy runs through the town, is crossed by two bridges, and separates the two counties. Ballina proper is on the Mayo side, the Sligo portion being called Ardnaree. The river is navigable from the sea to a mile and a half below the town. Ballina has a brisk trade in agricultural produce, in salmon, and in cured provisions.

Flour, beer, coarse linens, and snuff are manufactured. The river Moy and Lough Conn are favorite angling resorts. Killala Bay was the rendezvous of the French invaders in 1798. They landed and took Ballina, but three weeks afterward were defeated at Killala. Pop., 1901, 4505; 1911, 4662.

BALLINGER, bāl'in-jēr. A city and the county-seat of Runnels Co., Tex., 225 miles west of Fort Worth, on the Colorado River, and on the Abilene and Southern and the Gulf, Colorado, and Santa Fe railroads (Map: Texas, C 4). The city contains a Carnegie library, two theatres, three parks, and a lake, and owns its water works. It is situated in a rich agricultural region, producing corn, cotton, wheat, peanuts, fruit, etc., and has a flour and a cottonseed-oil mill. An enormous irrigating plant on the Colorado River is in the course of construction. Pop., 1900, 1128; 1910, 3536.

BALLINGER, RICHARD ACHILLES (1858-). An American lawyer and public official. He was born in Boonesboro, Iowa, graduated from Williams College in 1884 and was admitted to the bar two years later. Until 1897 he practiced, successively, in Kankakee, Ill., New Decatur, Ala., and Port Townsend, Wash. In 1890-92 he was a United States court commissioner and in 1894-97 a judge of the Superior Court of Jefferson Co., Wash. Immediately after this he took up the practice of law in Seattle, of which city he was mayor from 1904 to 1906. Following two years as commissioner of the General Land Office, he was chosen by President Taft Secretary of the Interior (1909). His opposition to a radical programme for the conservation of public resources brought him into bitter conflict with Gifford Pinchot, the chief forester. Finally a congressional inquiry was made into the methods employed by Mr. Ballinger in administering certain Alaska coal lands belonging to the government. (See ALASKA, *Public Lands*; and UNITED STATES, *History*.) Upheld throughout by the President, the Secretary was not permitted to resign until he had been exonerated by the investigating committee. Early in 1911 he returned to the private practice of law in Seattle. His published writings include *Ballinger on Community Property* (1895) and *Ballinger's Annotated Codes and Statutes of Washington* (1897).

BALLIOL (bāl'yol) COLLEGE. One of the largest and most important colleges in the University of Oxford. Its original foundation is attributed to Sir John de Baliol of Barnard Castle, Durham (father of the Baliol who contested the crown of Scotland with Bruce), as an act of penance for injuries done to the churches of his neighborhood. Its first scholars were in residence between 1260 and 1266 in a hired house; but while Balliol may claim, on the ground of the longest occupation of the same site and of priority in the benefaction to which it owes its inception, to be the oldest of the Oxford colleges, it was not, until 20 years later, a college in the modern sense of the word; it was originally, like the colleges of Paris at the same time, simply an association of students presided over by a principal of their own election, and did not become an endowed corporation with a permanent home until, in 1282, Devorguilla, wife of John de Baliol, completed the scheme and gave the college its first statutes. It was long comparatively unimportant. Although Wiclif became its master about 1360,

it was for a while the home of the champions of the scholastic philosophy. In the fifteenth century it became "the nursing mother of the early English humanists," such men as Humphrey, Duke of Gloucester, and John Tiptoft, Earl of Worcester, being numbered among its scholars. After this period of brilliance Balliol was little heard of until the nineteenth century, when it came once more to the front. It was blessed with a succession of able masters, of whom the most famous was Benjamin Jowett; it received many notable benefactions, particularly the Snell Exhibitions, which have attracted many brilliant Scotchmen, among them Adam Smith, Sir William Hamilton, and J. G. Lockhart; and, at the same time that it set the example (with Oriel) of opening its scholarships to general competition, it established a rigid standard of ability for its members, by requiring from them an additional entrance examination and obliging them to read for honors in the schools. The college consists of a master, 26 fellows and honorary fellows, about 50 scholars and exhibitioners, and in 1912 had 262 undergraduates. Its buildings date from the library, part of which is as old as 1430, to the present hall, completed in 1877. It has a long list of distinguished graduates, particularly in the nineteenth century. Among poets and men of letters it can boast of Southey, Matthew Arnold, Swinburne, Clough, Andrew Lang, and Calverley, besides having associated to itself Robert Browning as an honorary fellow. To the Oxford Movement it contributed Cardinal Manning and William George Ward; and to the English Church two of its primates, Tait and Temple. And more than one of the intellectual and social movements specially characteristic of the end of the nineteenth century owe their inspiration to T. H. Green, fellow of Balliol from 1860 and afterward professor of moral philosophy, while many of the leading politicians of the present time are graduates of Balliol. Consult H. W. C. Davis, *Balliol College* (London, 1899).

BALLIS'TA. See ARTILLERY.

BALLIS'TIC PEN'DULUM. See BALLISTICS.

BALLIS'TICS (*Ballista*, an engine for hurling missiles—Lat. from Gk. *βάλλειν*, *ballein*, to throw). The science which treats of the motion of heavy bodies projected into space. Its usual meaning is, however, restricted to the motion of projectiles of regular form, fired from cannon or small arms.

The motion of a projectile, from the instant it starts from its seat at the bottom of the bore of a gun until it strikes the object aimed at and comes to rest, passes through three distinct and discontinuous phases which necessarily give rise to as many different branches of the science of ballistics. These are called, respectively, *interior ballistics*, which treats of the motion and cause of motion of a projectile while in the gun; *exterior ballistics*, which considers the motion of the projectile from the time it emerges from the gun with a known velocity of translation and of rotation until it strikes the object aimed at; and *ballistics of penetration*, which has reference to the effect of the projectile upon the target. This is not the order in which the three phases of the subject are usually presented to the artilleryist, but the reverse. He desires to penetrate or destroy a certain object, say the side of an

armored ship. Ballistics of penetration enables him to determine the velocity his projectile must have on impact and the proper striking angle to accomplish the desired result. Exterior ballistics would then carry the data thus obtained to the gun and determine the necessary muzzle velocity and angle of projection. Lastly, interior ballistics would ascertain the proper charge, kind of powder, size, shape and density of the grains to give the projectile the muzzle velocity demanded without unduly straining the gun.

These three divisions will be considered separately in the order first named.

INTERIOR BALLISTICS

Interior ballistics treats of the temperature, volume, and pressure of the gases into which the powder charge in the chamber of a gun is converted by combustion, and the work performed by the expansion of these gases upon the gun, carriage, and projectile. It determines among other things the proper relation of weight of charge to weight of projectile and length of bore, the best size, shape, and density of the powder grains for different guns and their effect upon the maximum and muzzle pressures. It deduces formulas for determining the pressures upon the surface of the bore for different charges, sizes, and shapes of grains, and thus shows how to build up the gun so as best to resist these pressures.

Early History. It is only within the last 50 years that the complicated phenomena which take place in the bore of a gun when the charge is fired have been clearly apprehended. The celebrated Benjamin Robins (1740) made many experiments relating to interior ballistics. His deductions from his experiments, in spite of the extremely erroneous and sometimes absurd opinions on the subject that were entertained in those days, justly entitle Robins to be called the "father of modern gunnery." Dr. Hutton's experiments verify most of Robins's deductions, differing principally in the estimate of maximum temperature and pressure. Count Rumford (1792) made the first attempt to measure directly the pressure of fired gunpowder. The account of his experiments was the most important contribution to interior ballistics which had been made up to that time.

Recent History. In the study of interior ballistics the gun may be regarded as a thermodynamic machine or heat engine, which does its work in one stroke, in contradistinction to the steam engine, which works through a series of strokes. And, just as with the steam engine, an indicator diagram may be drawn for the gun representing graphically by a curve the relation between the pressure of the powder gas and the distance traveled by the projectile, which distance measures the volume occupied by the gas. Thus in Fig. 1, if *OB* represents the axis of the bore, the pressures may be shown under different conditions by the indicator curves *Pab*, *OP'P''ab*, and *OP'P'''b*. If the exact form of either of these pressure curves were known, it would be easy to determine the velocity of the shot (very nearly) at any travel *OB* down the bore. For, as with all indicator diagrams, the area *OP'P'''bB*, bounded by the curve of pressures, the axis of *x* (axis of the bore of the gun), the ordinate *OP'* through the origin of motion, and any other ordinate *OP'''*

or Bb drawn through the base of the projectile at any travel OO'' or OB measures the work done by the expansion of the gas, which, if we omit

FIG 1.—PRESSURE CURVE.

OP , axis of pressures; OX , axis of bore of cannon; OP' , pressure if the charge burned instantaneously; $OP'P''$ a b z, curve of quick-burning powder; $OP'P'''$ b z, curve of slow-burning or cocoa powder.

a certain percentage for friction, recoil of the gun, loss of heat by conduction, etc., may be equated to the kinetic energy of the projectile. This gives the fundamental equation of work:

$$\text{Work of expansion} = \frac{wv^2}{2g} \left(1 + \frac{1}{2} \left(\frac{\pi}{n} \right)^2 \right)$$

in which w is the weight of the projectile, g the acceleration of gravity, v its velocity, and n , which measures the twist of rifling, is the number of calibres the projectile advances while making one revolution about its axis. In our army guns, which have an increasing twist, n varies continuously from 50 at the beginning of rifling to 25 near the muzzle. The numerical value of the term containing n , which represents the projectile's energy of rotation at the muzzle where it is greatest, is 0.008; and as this is small in comparison with unity, which represents the projectile's energy of translation, it is usual also to omit this in establishing the equations of interior ballistics and to regard the entire work of expansion as measured by the energy of translation of the shot. We therefore have approximately,

$$\text{Work of expansion} = \frac{wv^2}{2g}. \quad (1)$$

This of course is not a true equation, since the first term is greater than the second on account of the energies omitted; but it can be made true by suitably increasing the weight of the projectile in the second member, or better still, by diminishing the value of a factor, called the "force of the powder," which enters into the first member. And this last is what is actually done in deducing equations for velocity and pressure from the above fundamental equation of work.

Formerly, before the laws of thermodynamics were known, the law of pressures was sought by measuring the velocity of the shot at various travels in the bore and drawing a space-velocity curve to suitable scales, taking the measured velocities for ordinates and the corresponding travels of the projectile for abscissas. By means of this curve a pressure, or indicator curve, may be drawn, and from this an em-

pirical law of pressures deduced. If the velocities could be measured with great accuracy and at numerous points in the bore, especially in the neighborhood of greatest pressure or acceleration, pressure curves could be laid down with great precision, as will be shown later. But the pressure curve thus determined cannot be relied upon beyond the experimental limits upon which it was based.

The first experimenter who made use of this method was the Chevalier D'Arcy, in 1760, who measured the velocity of a bullet at the muzzle of a musket with a ballistic pendulum, after the barrel had been successively shortened by cutting off a portion. This method has been repeated in modern times and the muzzle velocities measured much more accurately than was possible in D'Arcy's time. In 1891 Laurence V. Benét, director of the Hotchkiss Ordnance Company, Paris, experimented with a Hotchkiss 57 mm. rapid-firing gun by "cutting off successive lengths from the chase and observing the velocities of a series of rounds fired, with each resulting travel of projectile." In 1903 similar experiments were made at the Springfield Armory with a rifle the barrel of which was successively shortened 20 times by cutting off one inch at a time. About the same time experiments were made in France with a 16 cm. rifle specially prepared so that the chase "could be increased in length by the addition of either one or two tubes at pleasure so as to give three measured muzzle velocities corresponding to three different travels of projectile." (Consult *Mémorial de l'Artillerie de la Marine*, vols. xxi, xxii, and *Journal of the United States Artillery*, vols. xx, xxvi.) In 1845 General Cavalli experimented with a 16 cm. gun by drilling small holes perpendicular to the axis at different distances from the base, into which were screwed wrought-iron barrels from which bullets were propelled by the charge of the gun, while at the same time giving motion to the projectile. The velocities of these bullets were measured, from which the corresponding pressures were inferred. These pressures were much too great on account of the energy with which the products of combustion impinged against the bullets. In 1854 a Prussian Artillery Committee, whose president was General Neumann, experimented with a gun of small calibre by drilling a hole into the powder chamber in which was fitted a small barrel. If cylindrical projectiles of the same length and made of the same material were placed in the gun and in the small barrel, then, on the supposition that the pressure in the powder chamber was uniform, the two cylinders would describe equal spaces in equal times, since the pressures on the bases divided by the respective weights of the projectiles give the same quotient. Therefore, if the velocity of the cylinder were measured when it emerged from the small barrel, the velocity of the projectile when it had moved the same distance down the bore would be known. These experiments were much more satisfactory than those of General Cavalli, and the conclusions of the committee were subsequently confirmed by the Russian General Mayenski in 1867, who measured the velocity of a projectile at different positions in the bore by a method of his own invention. "He used a projectile to the base of which was attached a rod passing through the breech of the gun and arranged so as to rupture electric currents

placed at varying distances along the path of this rod."

Between the years 1857 and 1859 Maj. T. J. Rodman of the United States Ordnance Department carried out an extensive series of experiments with smoothbore guns of 7-inch, 9-inch, and 11-inch calibres for the purpose of measuring directly the pressure of the powder gas at various points along the bore. His method was to bore at these points channels to the interior of the gun, into which he inserted a very ingenious apparatus for measuring the pressure of the gas invented by himself, and which he called the "indenting" or "cutter gauge." A modification of this apparatus designed to remove certain difficulties inherent in the cutter gauge is now used by all nations and is known as the "crusher" or "pressure" gauge. This

FIG. 2.—NOBLE PRESSURE GAUGE. *P*, piston; *H*, housing; *S*, spring; *C*, cylinder; *J*, closing plug.

part of an inch; and from this measured compression the pressure per square inch that produced it is taken from an experimental table of compressions called a "tarage table." Major Rodman's estimates of the pressure of the powder gas are too great on account of the necessity of placing the gauge on the exterior of the gun. Major Rodman was the first to demonstrate by actual experiment that the maximum pressure can be greatly diminished by increasing the size of the powder grain. He also invented a perforated grain which burns with an increasing surface of combustion and thereby tends to equalize the pressure in the bore. The principle involved in this invention is of very great importance in gunnery and has been extensively utilized.

About 1862 Capt. Andrew Noble, formerly of the Royal Artillery, but then connected with the Elswick works at Newcastle-on-Tyne, invented a chronoscope for measuring exceedingly small intervals of time, which he soon after applied to the "measurement of the times at which a projectile passed certain points in the bore of

a gun." From these measured times he deduced the velocity of the shot from its seat to the muzzle, and then determined in the usual way by calculation the corresponding pressures. (Consult *Phil. Trans.*, 1875, part i, pp. 107-108.) "The mechanical part of the instrument consists of as many thin disks, 36 inches in circumference, as there are points where velocities are to be measured, all keyed on to a single shaft and made to rotate at a very high and uniform velocity through a train of wheels by means of a very heavy descending weight. A stop-clock connected with an intermediate shaft gives the precise speed of the circumference of the disks which is usually arranged at about 1250 inches per second.

"The recording arrangement is as follows: Each disk is furnished with an induction coil, the primary wire from which is conveyed to a plug inserted in the gun at a point where we may wish to record the instant at which the shot passes. There is at each point a special contrivance by which the shot in passing severs the primary wire, thereby causing a discharge from the secondary, which is connected with a discharger near the edge of the disk. The spark records itself on the disk by means of paper specially prepared to receive it. The instrument is capable of recording the millionth part of a second, and when in good working order the probable error of a single observation should not exceed 4 or 5 one-millionths of a second." This latter statement may be a little oversanguine; but it is admitted by a competent judge to be "practically correct to a hundred-thousandth of a second."

The data employed by Noble and Abel in their discussion of the phenomena attending the combustion of gunpowder in cannon were derived chiefly from the experiments carried on by the Committee of Explosives whose president was Colonel Younghusband, F.R.S., using the Noble chronoscope above described (*Phil. Trans.* for 1875). Experiments were made by the committee with the 10-inch, muzzle-loading, 18-ton rifle, loaded with 70 pounds of pebble powder (gunpowder) and a 300-pound projectile. See under *Exterior Ballistics*.

Theoretical Determination of Velocity.—The work done by the adiabatic expansion of y pounds of powder gas at the initial temperature of combustion, in the bore of a gun, is given by the equation

$$\text{Work of expansion} = fny \left\{ 1 - \frac{1}{(1+x)^n} \right\} \quad (2)$$

in which n is a simple function of the specific heats of the gas, f is the pressure of unit weight of the gas at temperature of combustion, per unit of surface, and x is a number which varies directly with the travel of the projectile and represents, approximately, the number of volumes of expansion of the gas. If we assume that the work of expansion is measured by the energy of translation of the projectile, we get from equations (1) and (2) the following expression for the square of the velocity:

$$v^2 = \frac{2afny}{w} X_2, \quad (3)$$

in which X_2 stands for the quantity within the braces of (2). If the charge of powder in the chamber of a gun were converted into gas be-

fore the projectile had time to move, (3) would give the velocity of the shot at any travel with great accuracy. This was practically the case with the old-time fine-grained powder, which was consumed almost instantaneously. But for the modern large-grained powders, which require an appreciable time for burning, the equation does not apply, at least not while the grains are burning. The dimensions of modern powder grains vary with the calibres of the guns for which they are designed. For example, the grains for our 8-inch rifle (called multi-perforated grains) are cylinders about half an inch in diameter and an inch long, with seven small longitudinal perforations, one of which coincides with the axis of the cylinder, while the others are symmetrically disposed about the axis. These perforations in the grain under consideration are about one-twentieth of an inch in diameter. For the 14-inch rifle these dimensions are increased about 70 per cent. It will readily be seen that it requires a large part of the entire time the projectile remains in the gun after firing for these grains to burn up. Indeed it frequently happens that they are not all consumed until after the projectile leaves the bore.

It is impossible, in an article like this, to furnish all the details of the deduction of a formula for giving the velocity of a projectile in the bore of a gun while the powder is burning. The problem is a very complicated one and has not yet been rigidly solved. Many assumptions have to be made which are not strictly true, and formulas require to be tested at every point by comparing computed with measured results. It has been established by experiments due chiefly to M. Vieille that grains of modern powder burn in parallel layers, and that the velocity of combustion under the constant pressure of the atmosphere is uniform. It is also known that the velocity of combustion, and therefore the disengagement of gas, increases with the pressure, so that in attempting to deduce a formula for the velocity of a projectile in a gun where the pressure is constantly changing, and greatly exceeds the atmospheric pressure, the law which governs the velocity of combustion becomes of the first importance. It is believed that the law of the square root of the pressure, propounded by Sarrau, is very near the truth. At any rate the formula for velocity based upon this law gives results agreeing very well with observation, as will be shown later.

The first important step in deducing a formula for velocity while the powder is burning was made by Ensign (later Captain) J. H. Glennon, United States navy, who in 1888 published a paper in *Proceedings of the United States Naval Institute* entitled *Velocities and Pressures in Guns*, in which he gave an original expression for the weight of powder burned in a gun at any time as a function of the distance traveled by the projectile. Colonel Ingalls following up Glennon's idea deduced the following general equations for velocity and pressure while the powder is burning and which apply to all forms of grain:

$$v^2 = MX_1 \{1 + NX_0 + N'X_0'\}$$

$$p = M'X_2 \{1 + NX_4 + N'X_4'\}$$

In these equations M , M' , N , and N' are functions of the gun and powder constants,

while X_0 , X_1 , X_2 , X_4 , and X_4' are functions of x and n , that is, of the number of volumes of expansion, approximately, and the ratio of the specific heats of the powder gas.

Noble and Abel determined the ratio of specific heats of the gases of fired *gunpowder* at temperature of explosion to be $1\frac{1}{2}$ and therefore $n = 3$. With this value of n Ingalls has computed and published an extensive table of the X functions by means of which their values, or rather their logarithms, can be taken out for any value of x , or—what is the same thing—for any travel of the projectile, by simple interpolation.

For certain forms of grain N and N' may be regarded as zero and the expressions for v' and p are reduced to the first term of the second member. This simplification occurs with very thin flat grains of large surface; and with long cylindrical grains with an axial perforation. With other forms of grain,—long slender strips or cylinders,—the third term may be omitted but not the second. While with spherical, cubical, and multi-perforated grains all the terms must be retained theoretically; though in many cases the third term is so small that it may safely be neglected.

The constants M , M' , N , and N' may be determined in various ways. The following data must be known: *Gun Constants*. Calibre; travel of projectile in bore from seat to muzzle; volume of powder chamber. *Powder Constants*. Size, form, and density of grains; force of the powder and velocity of burning under atmospheric pressure. *Elements of Loading*. Weight of powder charge and of projectile. With these data the constants can all be readily computed by suitable formulas. If the force of the powder and velocity of burning in open air are not known, the constants can then be found by means of a measured muzzle velocity and the maximum pressure, which last is assumed to be the pressure given by a crusher gauge placed, usually, in the cartridge bag or in some part of the powder chamber. Or, the constants may be determined more accurately by means of two measured velocities in the bore when these are available.

Comparison of Theory with Observation.—"The solution of the problems of interior ballistics requires the adoption of several hypotheses and simplifications that are only approximately true, and the practical value of the formulas deduced can be established only by a comparison of predicted results with experiment, which is the final test of all physical formulas." For a first comparison take the velocities measured in the 10-inch rifle with the Noble chronoscope, already mentioned. In this case the constants M , M' , and N were determined by the two measured velocities 1027 f.s. and 1464 f.s. corresponding, respectively, to travels of the projectile of 2.26 and 8.26 feet. From these data the following equations for velocity and pressure were deduced:

$$v^2 = 889860 X_1 \{1 - 0.05364 X_0\}$$

$$p = 57834 X_2 \{1 - 0.05364 X_4\}.$$

(For the details of the calculations, consult Ingalls's *Interior Ballistics*, 2d ed., Fort Monroe, 1894.) The formula for pressure has the same degree of accuracy as the velocity formula since the former was derived from the latter by differentiation, according to the principles of mechanics.

Table I, which is sufficiently explained by its caption, gives the measured and computed velocities for the distances traveled by the projectile found in the first column. The differences in the fourth column show a wonderful agreement between theory and observation. They are all, except the first, less than 1 per cent of the measured velocity and are practically nil. If the agreement of the computed velocities with those measured with the Noble chronograph is a proof of the correctness of the velocity formula, so, conversely, is this agreement an illustration of the precision and accuracy with which this chronograph measures extremely small intervals of time.

TABLE I

TABLE OF MEASURED AND COMPUTED VELOCITIES OF A 300-POUND PROJECTILE IN THE BORE OF A 10-INCH RIFLE, FIRED WITH A CHARGE OF 70 POUNDS OF PEBBLE GUNPOWDER. ALSO COMPUTED PRESSURES

Travel of projectile in feet, from start	Measured velocity in feet per second	Computed velocity	Measured minus computed	Pressure on bore of projectile in pounds per square inch	Remarks
0.41	436.0	450.8	-14.8	34,752	Maximum pressure
0.50	501.7	505.0	-3.3	34,557	
0.82	657.0	661.0	-4.0	32,005	
1.06	750.0	748.2	1.8	29,648	
1.65	911.0	908.0	3.0	24,400	
2.06	992.8	992.5	0.3	21,403	
2.26	1027.0	1027.0	0.0	19,302	
2.74	1097.0	1098.0	-1.0	17,580	
3.06	1137.0	1139.0	-2.0	16,121	
7.06	1412.0	1420.0	-8.0	7,022	
8.26	1464.0	1464.0	0.0	5,476	Muzzle
10.15	1527.0	1516.0	11.0	4,269	

Other and even more striking examples of the agreement between the measured and computed velocities of a projectile in a gun may be found in the *Journal of the United States Artillery*, vols. 25, 26, and 39, and in Ingalls, *Interior Ballistics*, pp. 107, 129, 130, 133, 161, and 165.

Multiperforated Grains. These grains, which have already been described and which are exclusively used in the larger guns of both the army and the navy, are the only grains which burn with an increasing surface of combustion; but they do not retain their original form until completely consumed—as do all other forms of grain in use—but break up when the least dimension, called the web thickness, is burned through, into 12 slender rods, or “slivers,” as they are technically called, which burn according to a law different from that by which the entire grain burned. Thus two independent sets of formulas for velocity and pressure become necessary to represent what actually takes place in the gun. This may be illustrated by an example pertaining to the 14-inch seacoast rifle. This piece was fired Jan. 23, 1911, with a charge of 328 pounds of nitro-cellulose powder plus an “igniter” of 9 pounds of rifle, or saluting, powder, and a projectile weighing 1664 pounds. The muzzle velocity, measured in the usual way with a Boulengé chronograph (see section on *Exterior Ballistics*), was 2252 f.s. and the maximum pressure, shown by a crusher gauge, was 43,640 pounds per square inch, or a pressure on the entire base of the shot, of 3359 tons of 2000 pounds. From these data were obtained the following equations for the velocity and pressure on the base of the projectile.

From the origin to a travel of 210.75 inches:

$$v^2 = 1197100 X_1 \{1 + 0.03542 X_0 - 0.00061 X_0^2\}$$

$$p = 53102 X_2 \{1 + 0.03542 X_4 - 0.00061 X_4^2\}.$$

From a travel of 210.75 inches to the muzzle:

$$x^2 = 2051700 X_1 \{1 - 0.05180 X_0\}$$

$$p = 91013 X_2 \{1 - 0.05180 X_4\}.$$

(For the details of this example, consult Ingalls, *Interior Ballistics*, pp. 162 et seq.)

To use these formulas for any travel of projectile the first operation would be to divide the travel expressed in inches by 45.465, which is the reduced length of the initial air space in the powder chamber, in inches. That is, it is the length of a cylinder of the diameter of the bore whose volume is the same as the air space (space not occupied by the powder charge) in

the chamber. With this quotient, which is designated by α , and is the argument of the table of the X functions, take out from the proper columns the values of such of the functions as are required. As an example, what would the pressure be when the projectile has traveled 36.372 inches? By division, as above indicated, we find $\alpha = 0.8$, and then from the table, $X_2 = 0.7249$, $X_4 = 4.03$, and $X_6 = 14.91$. Substituting these values of X_2 , X_4 , and X_6 in the first of the above expressions for the pressure, it comes out 43,640 pounds per square inch. In a similar manner the velocity at this travel would be found to be 991.4 feet per second. At the muzzle, where the travel of projectile is 413.85 inches, the second set of formulas gives $v = 2252$ f.s. and $p = 9485$ pounds per square inch. This large muzzle pressure is of course wasted, and could only be utilized by increasing the length of the gun. It may be shown that the velocity in this case could never exceed 3150 f.s. whatever may be the length of the gun.

Muzzle Energy.—The muzzle energy of a projectile, designated by Em , is given by the equation:

$$Em = \frac{wv^2}{4000g} \text{ foot-tons,}$$

which becomes for the 14-inch gun we have been considering

$$Em = \frac{1664 (2252)^2}{4000 \times 32.16} = 65600 \text{ foot-tons;}$$

and this enormous energy is produced in about $\frac{1}{15}$ of a second. A horse power is defined “as the rate at which work is done when 33,000 pounds (16.5 tons) are raised one foot in one minute.” According to this definition the muzzle energy of this shot represents nearly three million horse power.

Theoretical Value of the Force of the Powder.—The theoretical value of this factor (designated by f) is

$$f = \frac{p_0 v_0 T}{273},$$

where p_0 is the normal atmospheric pressure; v_0 the volume of unit weight of the powder gas at temperature of combustion and under normal atmospheric pressure; and T the absolute temperature of combustion. By means of this formula and the best procurable values of v_0 and T for nitro-cellulose powder the value of f comes out 2076.7. The value of this factor computed on the supposition that (1) is a true equation, with the data already used for the 14-inch gun, is 1759.7. According to these calculations about 15 per cent of the total work done by the expansion of the gases of combustion was expended in doing other work than that of giving energy of translation to the projectile. See EXPLOSIVES.

EXTERIOR BALLISTICS

In exterior ballistics we determine the path of a projectile from the instant it leaves the gun until it strikes the target, or, in the case of shrapnel, bursts in the air at any desired point, knowing its shape, calibre, weight, its initial velocity of translation and rotation, the resistance it meets from the air, and the action of gravity.

History. The theories relative to the motion of projectiles were originally of the crudest kind. Up to the middle of the sixteenth century bullets were supposed to move in right lines from the gun to the target, and shells fired from mortars were thought to describe a path made up of two right lines joined by an arc of a circle. The trajectory was divided into three parts: First, *violent*, which was thought to be a right line; second, *middle* or *mixed*, which was an arc of a circle; and third, the *natural*, which was a right line. In a work on gunnery, published by Niccolò Tartaglia, a Venetian, in 1537, he proved that no part of the path of a projectile could be a right line, and that the greater the velocity of the projectile the flatter is its path. Tartaglia also invented the gunner's quadrant (q.v.) for giving elevation. Galileo demonstrated the parabolic form of the trajectory in vacuo in his *Dialogues on Motion*. Newton's discovery of the law of gravitation made plain the cause of the curvilinear motion of projectiles. By the use of the calculus, his own invention, he determined the momentum transferred from the projectile to the particles of air at rest, which is the method followed at the present day, and which leads to the law of the square of velocity. So far as a rigorous solution of the trajectory in air is concerned, the problem remains to-day about where Newton and Jean Bernoulli left it.

Ballistic Machines. There are two ways in which the velocity of a projectile after leaving the gun may be determined experimentally—by measuring the projectile's momentum, and by measuring the time required for the projectile to pass over a given space. The first method is the older; and many years ago, when guns and projectiles were small, velocities low, and ranges short, the results were sufficiently accurate for most practical purposes. Modern gunnery is much indebted to the now discarded *ballistic pendulum* and *gun pendulum*, which have long

since been supplanted by the cheaper and more accurate machines using the second method.

The *Ballistic Pendulum* was invented about 1743 by Benjamin Robins, who was the first to make a systematic and intelligent series of experiments to determine the velocity of projectiles. The principle of the ballistic pendulum, as well as of Count Rumford's gun pendulum, is the transformation of the elements of the projectile's momentum from a small mass and high velocity to a large mass and low velocity, more easily measured by the methods then known. The ballistic pendulum consisted of a plate of iron to which was bolted a block of wood to receive the impact of the ball, the whole suspended from a horizontal axis about which it was free to revolve. The block when struck by the ball recoiled through a certain arc which was measured by the length of tape wound from a reel. The arc of oscillation being measured, the velocity of the ball can be found by calculation. This light pendulum could stand the impact of musket balls only, but with it Robins began the science of gunnery by determining the relations which should exist between the calibre, length of barrel, and charge of powder. Dr. Hutton (1775-91), Dr. Gregory (1814), and Major (later Colonel) Mordecai, of the United States Ordnance Department (1842-45), made many experiments with improved ballistic pendulums.

By the second method a projectile's velocity is determined by measuring the time required to pass over a known space in its path. We will not take time to describe any of the numerous machines invented for this purpose prior to 1840, when Wheatstone, the celebrated English electrician, suggested the use of electricity for measuring small intervals of time. Some of them were very ingenious, but they were all lacking in precision even for the low velocities then obtainable. A simple calculation will illustrate this. Suppose the known space to be 150 feet and the observed time of describing it $\frac{1}{10}$ of a second. Then the velocity, which is equal to the space divided by the time, would be 1500 feet per second; and to make this true within one foot, the time must not be in error more than $\frac{1}{15000}$ of a second. It is only by the use of electricity that such precision is possible. The general method of using electro-ballistic machines is as follows: Two vertical target frames or screens are placed perpendicular to the plane of fire; the first as near the gun as possible without being sensibly affected by the blast, and the second a measured distance further from the gun, say 150 feet (s). A copper wire passes several times across each screen forming a grating through which the projectile cannot pass without breaking the wire. From the screens the wires go to the chronograph which may be in any convenient place. The passing of the projectile through each screen is instantly recorded by the chronograph so as to give the interval of time (t) between these occurrences. We then have

$$v = \frac{s}{t},$$

where v is the mean velocity at the middle point between the screens, which can be reduced to muzzle velocity by a suitable formula.

The electro-ballistic machines most in use at the present day are the Boulengé chronograph and the Bashforth chronograph—the former used

principally on the continent of Europe and in this country and the latter in England.

The Boulengé chronograph, invented by Captain Le Boulengé of the Belgian Artillery, was greatly improved by Captain Bréger of the French Marine Artillery. The following is a description of the modified instrument, taken substantially from *Ordnance Notes*, No. 193. It

FIG. 3.—THE BOULENGÉ CHRONOGRAPH.

a and *b*, suspended rods; *E* and *E'*, electro-magnets; *B* and *S*, stand with leveling screws; *O*, marking knife.

consists of a vertical column, *B* (Fig. 3) to which are affixed two electro-magnets; the right-hand one, *E*, is actuated by the current of the first screen, and supports an armature called the *chronometer rod*, *a*. The left-hand magnet, *E'*, is actuated by the current of the second screen and supports an armature called the *registrar*, *b*. The chronometer, *a*, is a long cylindrical brass tube terminating at its upper extremity in a piece of soft iron and bearing at its lower end a heavy steel bob which causes it to fall vertically when released. It is covered by a closely fitting zinc cylinder called the recorder. The registrar is of the same weight as the chronometer. When the projectile passes through the first screen the chronometer is liberated and falls vertically, continuing close to the marking knife, *O*. The second screen being pierced, the registrar falls upon a horizontal plate, *b* (Fig. 4), which turns upon an axis and releases the spring, *s*. The spring is furnished with a square knife, *m*, which, when released, strikes the zinc recorder and leaves an indentation upon it. The position of this indentation, which is a sharp, well-defined cut, on the recorder shows the distance the chronometer had fallen while the projectile was passing over the distance between the screens plus the time required for the machine

to operate. A simple application of the law of falling bodies gives the time.

The Boulengé chronograph, from its simplicity of construction and the ease with which it can be manipulated, is well adapted for measuring muzzle velocities and will probably continue to be used for that purpose. But in studying the laws which govern the resistance of the air to the motion of projectiles, it is necessary to know the velocity of the same projectile at several equidistant points of its path and thus to determine its loss of velocity, or what is technically known as the retardation. This might be done by employing several Boulengé chronographs—one for each pair of screens; and theoretically there can be no objection to their use. But the practical objections to the multiplication of instruments and observers are obvious. In 1864 the Rev. F. Bashforth, B.D., then professor of mathematics at the Artillery College, Woolwich, invented a chronograph which is capable of measuring with great accuracy the time occupied by a projectile passing over any number of successive spaces between equidistant screens connected electrically with the chronograph. Bashforth made a great many experiments with his chronograph, principally at Shoeburyness, between the years 1865 and 1879, and laid the foundation of our knowledge of the resistance of the air, as affecting the motion of a projectile.

It has been demonstrated by experiment that the resistance of the air to the motion of similar projectiles moving with the same velocity, is proportional to the surface exposed, that is, to the square of the projectile's diameter (d^2), and to some function of the velocity. If r is the retardation, and C a factor depending upon the weight, diameter, length, and form

t, trigger; *s*, spring; *m*, marking knife; *b*, pan for catching short rod; *s'*, spring.

of head of the projectile, its steadiness of flight and the density of the air it encounters, we may write the following equation:

$$Cr = kf(v),$$

where k is a coefficient to be determined by experimental firing.

It is impossible with our present knowledge to determine the exact form of $f(v)$ for all velocities, from first principles. As has been already stated, Newton found

$$f(v) = kv^3;$$

but experiments have abundantly shown that this form of $f(v)$ is true for only a limited range of velocities. It is certain that its form changes several times between the extreme limits of velocities employed in gunnery. Colonel Siacci of the Italian Artillery deduced a complicated empirical expression for Cr in terms of the velocity, which gives retardations agreeing very closely with experiment from $v = 100$ to $v = 3000$ f.s. It possesses, however, no practical advantages over the customary method of expressing the retardation by suitable powers of the velocity so chosen as to represent the mean retardations over certain ranges of velocity ascertained by experiment. We therefore have on this hypothesis

$$Cr = kv^n$$

The values of k and n for oblong projectiles deduced by General Mayevski were based upon a discussion of the Krupp firings made at Meppen in 1881, for velocities up to 700 m.s.; and were subsequently extended by Colonel Zaboudski to include velocities up to 1100 m.s. The numbers as published were in kilogram-meter units, and were reduced by Colonel Ingalls to foot-pound units and made the basis of his extensive ballistic tables published by the United States government in 1900. They are continued in Table II.

TABLE II

Range of velocities	Value of exponent n	$\log k$
3600 f.s.		
2624.2	1.55	7.6090480-10
1804.9	1.70	7.0961978-10
1375.2	2	6.1192596-10
1228.9	3	2.9809023-10
967.80	5	6.8018712-20
787.86	3	2.7734430-10
0	2	5.6698914-10

As an illustration of the meaning of these numbers we have, for example, for velocities between 2624.2 f.s. and 1804.9 f.s., the expression

$$Cr = 0.0012479 v^{-1.55};$$

and for velocities between 1804.9 f.s. and 1375.2 f.s.,

$$Cr = 0.00013160 v^{-2},$$

and so for the other velocities. The coefficients, k , are so determined that the value of Cr computed by both these equations is the same for $v = 1804.9$ f.s. So that, although there is a sudden change in the law of retardation at this point, there is no apparent break in the ballistic table, which depends upon these laws. See Table III.

Horizontal Trajectory. The horizontal trajectory is that part of a complete trajectory lying above the level of the gun—that is, when the point of fall is at the height of the gun. In vacuo a projectile would describe an arc of a parabola whose axis is vertical; and as a parabola is symmetrical with respect to its axis

the descending branch of the trajectory would be the same as the ascending. The angle of fall would be the same as the angle of elevation and the striking velocity the same as the muzzle velocity. But in the actual trajectory, owing to the resistance of the air, this symmetry disappears. The descending branch is steeper than the ascending branch, the angle of fall is greater than the angle of departure, and the range and striking velocity are less than in vacuo. For very flat trajectories, that is to say, when the angular elevation given to the piece is not more than 4 or 5 degrees of arc, the curvature of the horizontal trajectory may be omitted and the motion considered rectilinear. In this case, by means of the expressions for Cr given in Table II, equations may easily be found giving the horizontal range (X) and time of flight (T) in terms of certain functions of the muzzle and striking velocities (V and v). These equations are the following:

$$X = C \{S(v) - S(V)\}$$

and

$$T = C \{T(v) - T(V)\}.$$

The factor C , called the ballistic coefficient, is made up of several factors when complete. But for type projectiles and for normal conditions of the atmosphere its value for flat trajectories is

$$C = \frac{w}{d^2},$$

in which w is the weight of the projectile and d its diameter in inches. It will be seen that C measures the ability of a projectile to overcome the resistance of the air; or, as we may say, it is the measure of the ballistic efficiency of a projectile. The S and T functions, called, respectively, the space and time functions, are tabulated with other functions given later with the velocity (v or V) for the argument. They were computed by means of formulas derived from the tabulated values of Cr given above.

As an example of the use of the above equations for range and time of flight, take the following data pertaining to the 14-inch rifle: $d = 14$ in.; $w = 1664$ lbs.; $V = 2252$ f.s. With these data compute the striking, or remaining, velocity (v), for a horizontal range of 3 miles, or 15,840 feet, and the time of flight.

The expression for the range gives, by transposition,

$$S(v) = \frac{X}{C} + S(V);$$

or, giving to X , C , and V their values,

$$\begin{aligned} S(v) &= \frac{196 \times 15840}{1664} + S(2252) \\ &= 1865.8 + 4159.4 = 6025.2. \end{aligned}$$

The space function of the muzzle velocity is interpolated from the ballistic table (see Table III); as is also the remaining velocity (v) from its computed space function. From the table we find $v = 1774.98$ f.s. For the time of flight we have

$$T = \frac{1664}{196} (2.398 - 1.463) = 7.938 \text{ seconds.}$$

It may be interesting to consider for a moment the enormous effect exerted by the air upon a swiftly moving body, as shown by this example. The loss of energy of the projectile in its pas-

sage of three miles through the air is given by the equation

$$\text{Loss of energy} = \frac{w(V^2 - v^2)}{2g} = \frac{w(V+v)(V-v)}{2g}.$$

Applying the numbers given above, taking $g = 32.16$ f.s., and dividing by 2000 to reduce the result to foot-tons, we find the loss of energy to be 24,848 foot-tons—and this in about 8 seconds.

At the firing ground of the Krupp works, Essen, remaining velocities have been repeatedly measured for even greater ranges than three miles, and the computed velocities completely verified, and also the computed times of flight.

When the angle of elevation exceeds 5° or 6° , the error resulting from disregarding the curvature of the trajectory begins to be felt. But Siacci has shown that this error is practically compensated by substituting for the striking velocity (v) what he called the *pseudo velocity* and designated by the letter u . The relation between the real and pseudo velocities is expressed by the equation

$$u = v \frac{\cos \theta}{\cos \phi},$$

in which ϕ is the angle of departure, or initial inclination of the trajectory to the horizontal plane, and θ the inclination of any other point of the trajectory. At the far end of the horizontal range the inclination (θ) is called the angle of fall and is designated by ω . At the summit of the trajectory θ is zero. The pseudo velocity is employed in all ballistic formulas in place of the real velocity (v); but at the muzzle, where $\theta = \phi$, u becomes the muzzle velocity (V), as is shown by the above equation. The value of u at the point of fall will be distinguished by u' .

Fundamental Formulas. The following equations, due to Colonel Siacci (consult *Giornale d' Artiglieria e Genio*, Rome, April, 1880), have been adopted by artilleryists the world over for the solution of the principal problems of exterior ballistics:

$$x = C \{S(u) - S(V)\}$$

$$\frac{y}{x} = \tan \phi - \frac{C}{2 \cos^2 \phi} \left\{ \frac{A(u) - A(V)}{S(u) - S(V)} - I(V) \right\}$$

$$\tan \theta = \tan \phi - \frac{C}{2 \cos^2 \phi} \{I(u) - I(V)\}$$

$$t = \frac{C}{\cos \phi} \{T(u) - T(V)\}.$$

In these equations x and y are the rectangular coördinates of any point of the trajectory, the origin being at the muzzle of the gun, and the axis of x horizontal; and t the time of flight to the point x, y . $A(u)$ and $A(V)$ are certain functions of the velocity—muzzle or pseudo—and are called altitude functions. $I(u)$ and $I(V)$ relate to the inclination of the trajectory and are called inclination functions. The other symbols have already been defined.

At the summit of the trajectory $\tan \theta$ becomes zero and the third of the above equations reduces to

$$\sin 2\phi = C \{I(u_0) - I(V)\},$$

in which u_0 is the pseudo velocity at the summit. By means of this formula and the ballistic table, u_0 can be calculated when C, V , and ϕ are known.

For the horizontal trajectory the above equations reduce to

$$x = C \{S(u') - S(V)\}$$

$$\tan \omega = \frac{C}{2 \cos^2 \phi} \{I(u') - I(u_0)\}$$

$$T = \frac{C}{\cos \phi} \{T(u') - T(V)\}$$

$$I(u_0) = \frac{A(u') - A(V)}{S(u') - S(V)}.$$

We will now complete the calculations pertaining to the 14-inch gun by computing the angle of elevation (ϕ) and angle of fall (ω). The striking velocity, which for this particular trajectory is sensibly the same as the pseudo velocity, has been found to be 1774.98 f.s. By interpolation from the abridged ballistic table the following additional numbers are obtained:

$$A(V) = 189.79$$

$$A(u') = 337.18$$

$$I(V) = 0.06510$$

$$I(u') = 0.09532$$

By means of these numbers and the value of $S(u') - S(V)$ already computed, we find

$$I(u_0) = 0.07900 \quad \therefore u_0 = 1994.375$$

$$\phi = 3^\circ 23'$$

$$\omega = 3^\circ 59'.$$

When the angle of elevation is considerable, the projectile passes through air in the middle of its course less dense than at either end of its trajectory, and the less resistance offered to the projectile increases the range and must be accounted for in the ballistic formulas. A mean resistance is usually assumed due to a height of two-thirds the greatest altitude of the projectile, and a correction applied to the ballistic coefficient in the shape of a factor greater than unity taken from a table of factors having the height of projectile for argument. By a combination of the fundamental formulas given above we get the following general expression for y :

$$y = \frac{C^2}{2 \cos^2 \phi} \{z I(u_0) + A(V) - A(u)\},$$

in which $z = \frac{x}{C}.$

By means of this formula the height of a projectile at any distance (x) from the gun can be computed. For the summit or maximum ordinate this equation becomes

$$y_0 = \frac{C^2}{2 \cos^2 \phi} \{z_0 I(u_0) + A(V) - A(u_0)\},$$

in which $z_0 = S(u_0) - S(V).$

For the trajectory already considered, we have found $u_0 = 1994.375$, and from the ballistic table we find

$$S(u_0) = 5128.15$$

$$\text{and} \quad A(u_0) = 259.31,$$

$$\text{and then} \quad z_0 = 968.75$$

$$\text{and} \quad y_0 = 253.6 \text{ ft.}$$

This value of the maximum ordinate affords a good idea of the flatness of the trajectory of a high-power gun for a range of three miles, and

suggests that a considerable portion of the trajectory at either end would be danger space for a war ship.

One of the principal objects in view in the deduction of ballistic formulas and the preparation of tables for their use is the computation of range tables for the different guns in service. "A range table should be so constructed as to afford all the data necessary to enable the gun for which it was prepared to be properly and promptly laid in such a manner that its projectiles may hit an object whose distance from the gun is known, and also to predict the effects of the shot upon the object. The constants upon which a range table is based are the calibre

or inclined to the horizon, within certain limits." But these limits are ample for nearly all practical purposes. According to this principle if ϕ' is the range-table angle of elevation for a certain horizontal range, then the angle of elevation required to hit an object at the same distance but at an angular elevation (ϵ) above the gun will be $\phi + \epsilon$; and this addition to ϕ is made by simply pointing the gun at the object. It has been shown by calculation that a ship in the offing firing at the Signal Station battery at Gibraltar, which is 1270 feet high, with a high-power gun could safely employ the range-table angle of elevation. And this is probably an extreme case.

TABLE III
ABRIDGED BALLISTIC TABLE

and weight of the projectile and the shape of its head, from which data is deduced the ballistic coefficient for a standard density of the air; also the muzzle velocity and the jump of the gun—that is, the elevation or depression of the muzzle due to the shock of the discharge. These should be determined with all the precision possible before beginning the construction of the table. With these data are computed for a series of horizontal ranges, forming the argument of the table, and which occupy the first column, the angle of departure, angle of fall, striking velocity, and time of flight. These are the fundamental elements required in a range table; but it should also give the variations of the angle of departure due to variations of the muzzle velocity and of the density of the air; the drift of the projectile due to rifling; slope of fall; danger space; penetration of different kinds of armor; probable rectangle of hits, etc., all of which must be taken into account for effective work."

Rigidity of the Trajectory.—A range table gives the angle of elevation necessary to hit an object on the same level as the gun. But it happens in practice that the object fired at is almost always above or below this level; and here comes in the principle of the *rigidity of the trajectory* which asserts that "the relations existing between the elements of a trajectory and the chord representing the range, are sensibly the same whether the latter be horizontal

If we imagine a projectile whose diameter and weight are so adjusted as to make the ballistic coefficient unity—like the projectile used with the obsolete 3-inch wrought-iron field gun—for such a projectile the differences of the space functions in the upper part of this table show the distances the projectile would travel, moving with the velocity in the first column, while its velocity was reduced by the resistance of the air, 10 f.s. For example, the projectile starting with a velocity of 1810 f.s. would travel 42.1 feet while its velocity was reduced to 1800 f.s. The lower part of the abridged table shows that the projectile would travel the same distance while the velocity was reduced from 510 f.s. to 509 f.s.

A projectile whose ballistic coefficient is 7, which is nearly that of a 12-inch shot, would range seven times as far, or 294.7 feet, before losing 10 foot-seconds of its velocity.

The most important of the problems of exterior ballistics can be solved by means of the formulas here given in connection with the general ballistic table. But the solution of many of them is greatly facilitated by the use of certain auxiliary formulas and tables, for a description of which the reader is referred to the works mentioned at the close of this article.

The formulas and tables of exterior ballistics like those of interior ballistics are more or less empirical and must be tested by actual experiment before they can be fully accepted. A few ex-

amples of the agreement between computation and observation in high-angle firing, where the errors of theory should be the greatest, are here given:

1. "A shot was fired April 28, 1892, on Krupp's practice ground at Meppen, in presence of the Emperor, from a 24 cm. coast gun, with an angle of elevation of 44°. The weight of the projectile was 215 kilos=474 lbs., and the muzzle velocity 640 m.s.=2100 f.s. The range was measured and found to be 20,226 m.=22,120 yds." The data of this example were taken from the *Exhibition Catalogue of the Cast-Steel Works of Fried. Krupp*, p. 31 (Chicago, 1893). It is worked out in full in the introduction to Ingalls's *Ballistic Tables* (page v), and the results only will be given here. The computed range was 22,138 yards. The computed time of flight was 71.2 sec. Observed time, 70.2 sec. The projectile reached a height—computed as explained above—of 21,431 feet, and the correction for tenuity was made for two-thirds this altitude, or 14,287 feet.

2. The "jubilee shots," so called, were fired at Shoeburyness, England, in the spring of 1888 with a 9.2-inch wire-wound gun. Weight of projectile, 380 lbs.; muzzle velocity, 2360 f.s. There were three series of shots fired at 30°, 35°, and 40° elevation, respectively. The ranges were all measured and the times of flight observed. Table IV gives the mean measured ranges and times of flight, and those computed:

TABLE IV

Angle of elevation	Mean measured range (yards)	Computed range (yards)	Difference	Mean observed time of flight, seconds	Computed time of flight, seconds	Difference
30°	17922	17881	41	50.25	50.53	-0.28
35°	19175	19435	-260	57.11	58.02	-0.91
40°	20876	20922	-46	63.45	64.30	-0.85

Many other striking examples of the agreement between computed and observed ranges and times of flight, with guns of all calibres, and with angles of observation from zero to 45°, are given in Ingalls's *Handbook of Problems in Exterior Ballistics*.

BALLISTICS OF PENETRATION

The laws which govern the penetration of projectiles into different kinds of armor are very obscure, and little has been done up to the present time save the determination of empirical formulas, which satisfy with more or less exactness the measured penetrations upon which they were based. From among the numerous formulas which have been published the following three are selected as typical and are probably as correct as any:

1. Wrought-iron plates (Tresidder).

$$\tau = [5.5795 - 10] \frac{w^{1/2} v^2}{d^4}.$$

2. Krupp cemented plates, by capped armor-piercing shot.

$$\tau = [5.2685 - 10] \frac{w^{1/2} v^2}{d^4}.$$

3. For hard-faced plates, by uncapped projectiles.

$$\tau = [6.8234 - 10] \frac{w^{1/2} v^2}{d^4}.$$

τ is the penetration in inches.

As an example, take the 14-inch shot already considered. Its striking velocity at a range of three miles was found to be 1775 f.s., and this substituted in the above formulas gives 30.96, 15.48, and 12.88 inches penetration, respectively. This supposes the shot to strike normally. When the shot strikes at an angle with the normal it is customary to multiply the normal penetration by the cosine of this angle to get the true penetration. But this is only a rough approximation.

BALLISTITE. A form of gunpowder of which the chief constituent is nitroglycerine. See GUNPOWDER; EXPLOSIVES.

BALLOT (Fr. *ballotte*, It. *ballotta*, dim. of *balla*, a ball). Primarily, a little ball, used in the practice of secret voting. Secret voting is thence called "voting by ballot," whether it be a ball, a ticket, or a mechanical device that is used for the purpose. Wherever the practice of deciding questions by vote has obtained, some form of secret voting has always been found necessary in order to insure untrammelled action by the voter. The dicasts in Greece voted secretly by means of balls, stones, or shells with marks. From this use of marked shells (Gk. *ostrakon*, a shell) in popular voting came the so-called *ostracism*, or secret vote of the people, by which they drove into exile those who became obnoxious to them. *Tabellæ*, or tickets, were chiefly used by the Romans. If the vote concerned a change in the law, the tickets were marked V. R., the initial letters of the words "Uti Rogas," expressing assent to the proposer's proposition; and A for "Antiquo," expressing adherence to the old law. If the vote concerned the election of candidates to a public office, then the tickets bore the names of the candidates. The system of secret voting in Rome was fixed by various laws, of which the Lex Gabinia, 139 B.C., was the first; but the popular assemblies voted by ballot as well as by acclamation long before the passing of these laws. These ancient forms of secret voting continued into the Middle Ages, and especially the method of voting by colored balls, from which the usage takes its name. Balls may be used in voting in various ways: e.g., the voter may deposit a ball in either

of two boxes, so conjoined that no one shall be able to say into which he drops it; or he may be presented with two balls—a white and a black—and so drop one of them into a box that it shall be unknown which he used. This original form of balloting is still commonly employed in voting on the question of the admission or rejection of members of private clubs and in other cases of a similar nature.

In modern times, however, the most common form of ballot has been the written or printed ticket. In the New England Colonies the practice of voting "by papers" was in vogue from the very first, and there is some reason to suppose that some of the Puritans had become familiar with that usage in Holland or elsewhere on the Continent. The ballot has been occasionally employed in legislative assemblies. It was used in the Venetian Senate; and in Great Britain it was first called for, not for the purpose of elections, but of protecting the independence of members of Parliament in their votes on proposed legislation. After the Restoration, in 1660, it was used for purposes of ostracism in the Scottish Parliament. In 1710 a proposal for secret voting was carried in the English House of Commons, but rejected by the Lords. From 1840 to 1845 the ballot was in use in the French Chamber of Deputies. But the idea of secret voting in deliberative and legislative assemblies responsible to the people is now universally abandoned as inconsistent with the fundamental principles of popular government, of which publicity and the free criticism rendered possible by publicity are the great safeguards.

Toward the end of the eighteenth century vote by ballot for elections to the British Parliament was advocated by some of the Whigs; and it was one of the first things demanded by English Reformers at the beginning of the nineteenth century, the followers of Bentham being specially earnest in advocating it. It stood in the original draft of the Reform Bill of 1832. It was first proposed in the British Parliament in 1833 by the historian Grote, who renewed the motion every year till 1839. It was one of the six points in the reform demanded by the Chartists. In 1851 the proposal of vote by ballot was carried in the Commons against the opposition of Lord John Russell and the Liberal Government of that time by a majority of 51. The report of a select committee of the House of Commons in 1869 greatly contributed to decide public opinion in favor of the ballot as a necessary safeguard against corruption, intimidation, disorder, and all sorts of undue influence at elections. The result was Mr. Forster's Ballot Act of 1872, which introduced secret voting at all parliamentary and municipal elections except parliamentary elections for universities. It had already been adopted for school board elections in 1870. With the introduction of the ballot at parliamentary elections, the public election at the hustings, which had been so often associated with rioting and violence, disappeared.

Voting by printed ballot is now the method generally employed in elections in countries where constitutional government exists. The ballots may be furnished by the candidate for office, the political party engaged in promoting his election, or by the government. The first or the second of these plans has usually been adopted in local and general elections in the United States. But the fact that several officers—whose names may conveniently appear on a

single ballot—are usually to be voted for at the same election, the great cost of printing and distributing the ballots to multitudes of voters, and the organization of party "workers" requisite for this work of distribution, have combined to render it impracticable, usually, for the individual candidate to supply the voters with ballots bearing his name, and to throw that burden upon the political party. Hence the "party ballot," which has done so much to build up the great party organizations in this country, and which has been a prolific source of corruption, fraud, and intimidation of the individual voter.

These defects of the "party ballot" in the last few years of the nineteenth century produced a widespread public sentiment in favor of a ballot reform, which in many of the United States resulted in the adoption of the third plan above referred to—namely, the printing and distribution of the ballots by the State. With some modifications, due to local conditions or to the efforts of party managers to derive a partisan advantage from the system, the form commonly employed is the "official" or "Australian ballot," so called from the fact that it was the first employed with success in some of the Australian states. Its most distinguishing feature is the arrangement of the names of all the candidates for a given office, whether nominated by party organizations or by independent effort, in order on the ballot, the voter indicating his choice by some mark written by him opposite the name of his chosen candidate. The usual and preferable form of the official ballot is the "blanket ballot," in which the names of all the candidates for an office are arranged in alphabetical order, irrespective of party affiliations. In a few of the States, however, the practice of arranging the candidates in party columns, each column headed by an emblem—as an eagle or a star—has been adopted. This device is justified as a concession to the necessities of the illiterate voter, who may, by placing his mark at the head of a party column, cast a vote for all the candidates of that party, instead of choosing, out of an alphabetical list, the names of the individual candidates favored by him. This form of ballot is greatly favored by the political organizations for the reason—which constitutes the chief indictment of the method—that it tends to promote "straight" party voting and to discourage the practice of independent voting. Certain novel mechanical devices for insuring secret voting and for obviating the more serious objections to the use of the printed ballot will be described under the head of VOTING MACHINE.

The length and complexity of the official ballot, containing the names of all candidates for all the offices to be filled at a given election, has introduced a new element of confusion. To obviate this, and thus to promote more intelligent voting, a movement aiming to reduce the number of offices to be filled by election at a given time has recently gained great headway in this country. Two methods for accomplishing this purpose have found favor—the separation of national from state and of local from state and national elections by holding them at different times, and the use of the "short ballot." The latter, which involves the election of only the principal officers of the state or city, leaving the others to be appointed, involves important changes in the fundamental

law of the several states as well as the reform of the system of voting by ballot.

For a description of the process by which the state has assumed the regulation of elections, and for an exposition of the laws which have been enacted for securing the purity of the ballot, see ELECTION; ELECTORAL REFORM; CORRUPT PRACTICES; PRIMARY ELECTIONS; VOTE; VOTER; SUFFRAGE.

BALLOT, SHORT. See ELECTORAL REFORM.

BALLOU, bā-lō', HOSEA (1771-1852). An American clergyman and one of the founders of the Universalist denomination in this country. He was born at Richmond, N. H.; after scant schooling he began to preach in 1793, and became a pastor at Dana, Mass., in 1794, and at Barnard, Vt., in 1803. From 1807 to 1815 he was minister of the Universalist congregation at Portsmouth, N. H., and from 1817 until his death was in charge of the Second Universalist Society of Boston, Mass. In 1819 he established the *Universalist Magazine* (later called *The Trumpet*), and in 1831 the *Universalist Expositor* (later called the *Universalist Quarterly Review*). He took a most active part in formally organizing the denomination, in extending its work, and in adding to its literature. He was also known as an eloquent pulpit orator and was much in demand for special celebrations. From John Murray, the first preacher of Universalism in the United States, he differed in the entire rejection of the so-called Calvinistic theology. Chief among his publications are *Notes on the Parables* (1805), *Treatise on the Atonement* (1807), and *The Doctrine of Future Retribution* (1834). For an account of his life and doctrines consult biographies by T. Whittemore (4 vols., Boston, 1854-55), and O. F. Safford (ib., 1889). Consult also J. C. Adams, *Hosea Ballou and the Gospel Renaissance of the Nineteenth Century* (Boston and Chicago, 1903).

BALLOU, HOSEA (1796-1861). An American clergyman, the grand-nephew of Hosea Ballou, of Boston. He was born in Vermont; was pastor in Connecticut and Massachusetts, and in 1853 became first president of Tufts College. He was one of the editors of the *Universalist Magazine*, later published under the name of *The Trumpet*. He was the author of *Ancient History of Universalism*, and edited a translation of Sismondi's *History of the Crusades* (Boston, 1833). A *Biography of the Rev. Hosea Ballou* was written by M. M. Ballou, his son.

BALLOU, MATURIN MURRAY (1820-95). An American journalist, born in Boston, Mass. He founded *Gleason's Pictorial*, the first American illustrated weekly; and was successively editor of *Ballou's Pictorial*, *The Flag of Our Union*, *Ballou's Magazine*, and the *Boston Globe*, of which he was one of the founders. He published *Due West*; *Due South*; *History of Cuba* (Boston, 1854); and a *Biography of the Rev. Hosea Ballou*, his father.

BALLOU, WILLIAM HOSEA (1857-). An American author, born in Hannibal, N. Y. He studied at Northwestern University and at the University of Pennsylvania, and was subsequently a member of several United States scientific surveys (1875-78). After some time spent in reform work and journalism he devoted himself to scientific and public interests and to business pursuits. Fort Worth University conferred on him the degree of Sc.D. in 1911. Besides having written many scientific articles for American magazines and foreign weeklies,

he is the author of some 300 poems and also of the following novels: *A Ride on a Cyclone* (1889); *The Upper Ten* (1890); *An Automatic Wife* (1891); *Spectacular Romances* (1892); *Love on a Log and Other Stories* (1895).

BALL'S BLUFF. A locality on the Potomac, 33 miles northwest of Washington. Here, on Oct. 21, 1861, during the Civil War, 1900 Federal soldiers of McClellan's army, under Col. E. D. Baker, were overwhelmingly defeated by about 3000 Confederates under General Evans, the latter fighting from the shelter of a thickly wooded grove. The Federals lost about 1000 in killed, wounded, and prisoners, Colonel Baker falling during the engagement; while the Confederates lost only 150. The disaster was due to the blundering generalship of McClellan and his division commander, Stone. The latter was arrested by order of the Secretary of War and imprisoned for six months in Fort Lafayette. This arrest seems to have been unwarranted, as no charges were ever preferred against him and he was later reinstated in command. Consult Johnson and Buel (ed.), *The Battles and Leaders of the Civil War*, vol. ii (New York, 1884).

BALLSTON SPA, bāl'stōn spā. A village, the county-seat of Saratoga Co., N. Y., 7 miles southwest of Saratoga Springs, on the Delaware and Hudson Railroad and on the Kayaderosseras River (Map: New York, G 4). It has some reputation as a summer and health resort and is widely known through its mineral springs. The water flows from a depth of 650 feet through a tube bored into the solid rock, and is highly effervescent. The village has a county courthouse, fair grounds and track, the Saratoga county almshouse and hospital, and the Spa sanitarium. The industries include a large tannery, foundries and machine shops, a shirt waist and textile factory, and pulp and paper mills. Settled in 1787, Ballston Spa was incorporated in 1807. Town meetings are held every two years and charter elections annually. The board of education, the village president, and the board of trustees are chosen by popular vote. The water works are owned and operated by the village. Pop., 1900, 3923; 1910, 4138.

BALLYMEENA (Gael. middle town). A town and important railway centre of county Antrim, Ireland, on the Braid, 33 miles northwest of Belfast (Map: Ireland, E 2). It lies in a densely populated and well-cultivated district, has agricultural and iron-mining industries, and manufactures linen, especially brown linen. Pop., 1901, 10,886; 1911, 11,381.

BALLY TREE. See BLACK BULLY.

BALM, bām (for derivation, see BALSAM). *Melissa officinalis*. An erect, branching, perennial, herbaceous plant, 1 to 2 feet high, of the family Labiatae, a native of the south of Europe, naturalized in England, and escaped from gardens in the United States. It has ovate, crenate leaves and axillary one-sided whorls of white or pale yellow flowers. The whole plant has an agreeable, lemon-like smell, on account of which it is frequently cultivated in gardens. It is a valuable honey-producing plant and is sometimes grown for bee forage. Balm is employed for making an agreeable and somewhat exhilarating beverage called balm wine. The leaves and tops are used in medicine under the name of Melissa, or balm. For medicinal use the herb should be cut before the appearance of the flowers, which begin to expand in July. It is nearly inodorous when dry. The taste is some-

what austere and slightly aromatic. Balm has scarcely any therapeutic value. The quantity of oil contained in it is not more than sufficient to communicate a pleasant flavor to the infusion, which forms an excellent drink in febrile complaints, and when taken warm tends to promote the operation of diaphoretic medicines. A variety of the common catmint (*Nepeta cataria*), with a smell like that of balm, is often mistaken for it. Moldavian balm (*Dracocephalum moldavicum*) is a native of the country from which it derives its name, and of Siberia, etc.; an annual plant, having, when fresh, a smell like that of balm, but less pleasant. It is much used in Germany for flavoring. Bastard balm (*Melittis melissophyllum*), a native of the south of England and of many parts of Europe, is a very beautiful plant, which, when dried, has a delightful fragrance and retains it long. In the United States *Collinsonia canadensis* is called horse balm, and *Monarda didyma*, bee balm. All these are of the family Labiata.

BALMACEDA, bäl'mä-sä'nä, JOSÉ MANUEL (1838-91). A Chilean statesman. He was born at Santiago, studied there at the Seminario Conciliat, became a leader in the Liberal Club de la Reforma, and in Congress rose to be parliamentary chief of the Progressive party. In 1882 he was appointed Minister of the Interior, and in 1885 Minister of Foreign Affairs. He was elected President in 1886, and forthwith inaugurated an era of public improvement, during which laws were liberalized, railroads were built, and the system of public education was widely extended. Nevertheless this policy eventually alienated from him all save those directly interested in office. In 1890 he was suspected of scheming to effect the election as his successor of Señor San Fuentos, a politician generally distasteful to all parties, and occasion was thus afforded for open dissatisfaction. When he had thereupon proceeded to appoint an unpopular ministry and dissolve Congress, a revolutionary junta was formed and civil war began (Jan. 7, 1891). After the utter defeat of the government troops near Valparaíso (August 7), Balmaceda sought refuge in the Argentine Legation, Santiago, where, on September 18, he committed suicide. Consult Pedro Montt, *Exposition of the Illegal Acts of ex-President Balmaceda, which Caused the Civil War in Chile* (Washington, 1891). See CHILE, *History*.

BALMAIN'. A suburb of Sydney, Australia. See SYDNEY.

BÁLME (bálm), COL DE (OF. neck or gorge of balsam). A mountain pass in the Alps between Mont Blanc and the group of the Dent du Midi, 7221 feet high. Through it passes the bridle path from Chamonix to Martigny. It is noted for its fine views.

BALMES, bäl'mēs, sometimes written **BALMEZ**, JAIME LUCIANO (1810-48). A Spanish ecclesiastic, philosopher, and publicist, born at Vich, Catalonia. After studying at the University of Cervera he became a priest (1833), and passed his life in teaching, travel, and study. His fame rests upon his *El Protestantismo comparado con el Catolicismo en sus relaciones con la civilización europea* (6th ed., Madrid, 1875; orig. Barcelona, 2d ed., 1844-45; Eng. trans. from the French, Paris, 1842-44, London, 1849; 10th ed., Baltimore, 1868), which is a very able defense of the Roman church in reply to Guizot's *Civilization in Europe*. Other writings of his (in English translation) are *The Foundations*

of Religion Explained (London, 1858) and *Letters to a Skeptic on Religious Matters* (Dublin, 1875). For his biography, consult Blanche-Raffin, *J. Balmez, sa vie et ses ouvrages* (Paris, 1849).

BALM OF GILEAD. See BALSAM.

BALMORAL (bäl-mör'al) **CASTLE** (Gael. *bailc*, dwelling, town + *morail*, majestic). A royal residence situated on the river Dee, about a mile west of Crathie in West Aberdeenshire, Scotland (Map: Scotland, E 2). The estate, purchased in 1848 by the Prince Consort and subsequently extended, now comprises 40,000 acres. In 1853-55 the old building was replaced by a handsome granite castle built in the Scottish baronial style and furnished and decorated in accordance with Highland tastes. The castle consists of two separate blocks of buildings united by wings and a massive tower; it has a straggling rather than an imposing appearance, but commands a magnificent prospect. It was the autumnal residence of Queen Victoria. The castle can be visited by special order when the royal family is not in residence.

BALMUNG, bäl'mung. The name of Siegfried's sword in the *Nibelungenlied*. Originally the ancestral blade of the Nibelungs, it was presented to him by the generous Shilbung and Nibelung, whom straightway he thanklessly slew.

BALNAVES, bäl-näv'es, HENRY (1512-79), of Halhill, a Scottish reformer. He was born at Kirkcaldy in Fifeshire, and educated at St. Andrews and at Cologne, where he was imbued with the teachings of Lutheranism. On his return to Scotland he studied law. James V made him a senator of the College of Justice in 1538, and when Arran took up the regency he was made Deputy Keeper of the Privy Seal (1542). In the following year he was imprisoned for a time on account of his Protestantism, which became all the more active by these attempts at repression. Suspected of complicity in Cardinal Beaton's murder, he was declared a traitor and excommunicated. He fled to the castle of St. Andrews, and when it was captured by the French was sent to France with Knox and others as a prisoner of war. Here he wrote a treatise on justification, which was published after his death by Knox, with a laudatory preface, under the title of *The Confession of Faith* (Edinburgh, 1584; reprinted, London, 1831). When Mary of Guise assumed the regency in 1556, Balnaves' forfeiture was rescinded. He returned to Scotland and took an active part in public affairs, as a commissioner to settle the Treaty of Berwick (1559-60) and to revise the Book of Discipline (1563), and as an assessor with the regent Murray to inquire into the charges against Mary in connection with Darnley's murder (1568). He died in 1579. For his biography, consult Rogers, *Three Scottish Reformers* (London, 1874).

BAL'NIBAR'BI. One of the countries mentioned by Swift in his *Gulliver's Travels*.

BALNEOLOGY. See HYDROTHERAPY.

BALSA, bäl'sä (Sp. Port. from Peruv. *balza*, a light wood, of which rafts are made). A raft or float, used originally for carrying passengers across a river or for landing in the surf. It consists of two floats—commonly made of logs from the balsa tree, the wood of which is almost as light as cork—separated a short distance from each other and held in that position by a framework. It has been used in South America for centuries; it sometimes consists, as

on the coast of Brazil, of several sharpened logs held together by slats, and, used by fishermen, is often met far out at sea. On the western coast of South America balsams are made of bullock hides sewn together over a framework to form a body of nearly circular section, pointed and turned up at the ends; two of them are joined together by a framework to which they are lashed. The balsam must be regarded as a development of the raft principle, and is analogous to the pirogue, proa, banca, catamaran, and other outrigger boats of Asia and the Pacific islands. The balsams used in the navy are composed of two floats joined by a framework, over which are laid slats about an inch apart. Each float is about 10 feet long, of oval section, but somewhat flattened on top and tapering slightly from the centre towards the ends, built up of staves and banded like a barrel. The width of naval balsams is about two-thirds the length. Larger sizes have been issued, but they are not now supplied. The "india-rubber balsam" has been used on shipboard more or less since 1837, but since the advent of collapsible boats its use has decreased. It is composed of two or more cylindrical, air-tight bags, with apparatus for inflating them, and a framework and raft body to hold them together and afford a platform for passengers or freight. It is comparatively light and portable, but takes up much deck room, and the rubber deteriorates rapidly.

BALSAM, bāl'sam (Lat. *balsamum*, Gk. βάλσαμον, *balsamon*, resin of the balsam tree, the tree itself). A name formerly comprehending many resinous substances and oils, to which important medicinal virtues were ascribed, as well as of medicines compounded of resins and oils. When the term "balsam" is now used without addition, the balsams of Peru and Tolu are generally intended. These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *Myroxylon* or *Toluifera*, of the family Leguminosæ, natives of the tropical parts of America. *Myroxylon balsamum pereiræ*, which is called the quinquino, a beautiful tree, common from Peru to Mexico, is generally regarded as the species which produces the balsam of Peru; and *Myroxylon balsamum genuinum*, a very similar species, found in the forests of Tolu, the banks of the Magdalena, etc., as that which produces the balsam of Tolu; but it is doubtful if the difference is not at least as much owing to the modes of procuring and preserving the balsam; and other species of the same genus are supposed also to yield it. Both balsams have a very fragrant odor. They are used in confectionery to impart a flavor like that of vanilla; also in perfumery, and for pastilles, etc. In medicine they are administered as gentle stimulants and tonics and particularly in chronic bronchial affections. Tolu lozenges are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers. They contain cinnamic acid, a peculiar oily substance which has been called *cinnamein*, also known as oil of balsam of Peru, resins, benzoic acid, toluene, etc. The name "white balsam of Peru" is sometimes given to a balsamic substance which flows from the *Liquidambar styraciflua*. See LIQUID-AMBAR.

The name "balm of Gilead" is generally applied to a liquid resinous substance which has long enjoyed a very high reputation in the East, being prized not only for its fragrance, but also

for the medicinal virtues which it is supposed to possess. It is the subject of several allusions in the Old Testament, which strongly indicate the prevalent opinion of its preciousness; and is celebrated by Strabo, Pliny, Diodorus Siculus, and other ancient writers as a cure for almost every disease. It is generally believed to be produced by a species of *Commiphora*—a small tree growing in Arabia and Abyssinia, and known as *Commiphora opobalsamum* or *Balsamea meccanensis*. The finest balsam, called opobalsam, or balm of Mecca, is obtained by incisions; at first turbid and white, it finally becomes of a golden-yellow color and of a consistence like honey. Inferior kinds are obtained by boiling the fruit and the wood. Balm of Gilead is irritating when applied to the skin and is believed to resemble balsam of Copaiva in its effects upon the human system.

Other substances, sometimes designated balsams and possessing a somewhat similar fragrance, are produced by different species of Burseraceæ. Among them is one called South American balm of Gilead, the product of a tree called *Protium carana*. Balsamic substances are furnished also by a number of species of Clusiaceæ—balsam of Umiri, a fragrant yellow fluid, by *Humiria floribunda*, a South American tree. Canada balsam is a kind of turpentine obtained from the balm-of-Gilead fir (*Abies balsamea*); Hungarian balsam, from the mugho or mountain pine (*Pinus pumilio* or *mughus*); and Carpathian balsam, from the stone pine (*Pinus pinea*). (See FIR and PINE.) Balsam of Copaiva is the produce of different species of *Copaifera*. (See COPAIBA.) A variety of *Populus balsamifera* is known in the United States as the balm-of-Gilead tree. Balsam apple is a name applied to the fruits of two species of *Momordica*, natives of the East Indies, but rather common in the West Indies.

BALSAM (*Impatiens balsamina*). An erect, semi-succulent annual, native of India, and cultivated in flower gardens for more than 300 years. It is sometimes called "touch-me-not," because of the bursting tendency of the ripened seed pods, and also "lady's slipper," referring to the shape of the flower. Many varieties have arisen through cultivation and selection. The double sorts are known as camellia-flowered varieties. The plant grows from 1 to 2½ feet high and branches freely. The flowers are axillary and vary in color from white and yellow to dark-red. The plant is of easy culture. Seed may be sown in the open, or plants started in pots and planted out after danger of frost is past.

BALSAM APPLE. See MOMORDICA.

BALSAMO, bāl'sà-mō, JOSEPH. See CAGLI-OSTRO.

BALSAMODEN'DRON. See MYRRH.

BALTA, bāl'tà. A town in the government of Podolia, Russia, situated on an affluent of the Bug, about 210 miles southeast of Kamenetz-Podolski, the capital of the government (Map: Russia, C 5). It is poorly built and very filthy. It is connected by rail with Odessa. The chief articles of its commerce are grain, cattle, and the manufacture of beer, tiles, and soap are among the principal industries. It holds two annual fairs. Pop., 1897, 24,400, 75 per cent of which are Jews. Formerly a Turkish possession, it was ceded to Russia by the Treaty of Jassy in 1791.

BALTA, JOSÉ (1816-72). A Peruvian soldier and statesman, President of Peru in 1868-72,

BALSAM, ETC.

1. BAMBOO (*Bambusa vulgaris*); a, Tip of a female flowering stalk.
2. BARBERRY (*Berberis vulgaris*).

3. BEECH (*Fagus sylvatica*).
4. BALSAM (*Impatiens balsamina*).
5. SMART WEED or KNOT WEED (*Polygonum aviculare*).
6. BANYAN (*Ficus benghalensis*).

born at Lima. In sundry revolutions he won military distinction, and in 1855 he withdrew from the army with the rank of colonel. In 1867 he was one of the leaders of the insurrection which drove into exile (January, 1868) the dictator Prado. In 1872 he was shot by order of the Minister of War, General Gutierrez, who had instituted a military mutiny. The populace were swift in their revenge upon both Gutierrez and his brother, who had played the assassin.

BALTARD, bál'tär', LOUIS PIERRE (1764-1846). A prominent French architect and engraver. He studied in Rome (1788-91). He was professor of architecture at the Ecole Polytechnique in 1796, was architect of the Panthéon under the Empire, and supervisor of prisons and markets, 1815-18. He held, after 1818, a professorship at the Ecole des Beaux-Arts and was, after 1837, general inspector of Paris monuments. Among the buildings designed by him were the prison and arsenal at Lyons. He published several works, and was engraver for the great work on Egypt issued by order of Napoleon.

BALTARD, VICTOR (1805-74). Son of the above, pupil of his father in painting and architecture at the Ecole des Beaux-Arts; won Grand Prix de Rome in 1833. He is noted especially as the architect of the Halles Centrales (general market) of Paris, built between 1852 and 1859. This immense edifice of iron and glass, covering several acres and intersected by a main avenue and two cross streets, was the pioneer of all modern iron-and-glass buildings, and after 60 years of use still serves admirably its original function. Baltard was made architect of the Hôtel de Ville in Paris in 1853. In the reorganization of the corps of architects of the city of Paris in 1860 by Baron Haussmann, he was appointed director, with special charge of the Halles Centrales. He published several monumental books.

BALTCHIK, bäl-chäk' (probably ancient *Melissa*). A seaport of Rumania, situated on the Black Sea, about 24 miles northeast of Varna (Map: Balkan Peninsula, G 3). It has a well-protected harbor and is the seat of a considerable trade in agricultural products. Pop., 1900, 5869; 1905, 6588; consisting chiefly of Turks, and for the rest, Bulgarians, Tatars, and Greeks. This town was bombarded by the Turks in October, 1912, and ceded by Bulgaria to Rumania in accordance with the Treaty of Bucharest of Aug. 10, 1913.

BALTHAZAR, bäl-thä'zär. 1. A character in Eichberg's opera of *The Doctor of Alcantara*. 2. Belshazzar, "which that highte Balthasar," in Chaucer's *Monk's Tale*. 3. One of the Wise Men of the East. 4. The name of several minor characters in plays of Shakespeare.

BALTIC (bäl'tik), BATTLE OF THE. See COPENHAGEN.

BALTIC PROVINCES. A term comprehending three Russian governments bordering on the Baltic, viz., Courland, Livonia, and Esthonia (Map: Russia, D 3). Area, 35,614 square miles. Pop., 1911, 2,687,400. The great bulk of the population consists of Letts and Esths—the former akin to the Lithuanians, the latter a Finnish race. The higher classes, nobility and burghers, are Germans, who constitute about 7½ per cent of the total population of the three governments. The number of Russians is still insignificant. The Teutonic Knights and Sword bearers subjugated the Letts in the thirteenth century, introducing German civilization

and Christianity by fire and sword. The inhabitants are nearly all Protestants. Although the soil is not very fertile, agriculture is in a flourishing condition, owing to the improved methods of cultivation and a generally higher intelligence of the people. Commerce and manufactures are also highly developed, favored by the proximity of the Baltic. For further details, see articles on the separate governments.

The Baltic provinces once belonged to Sweden, except Courland, which was a dependency of Poland. The Swedish provinces came into the possession of Russia in the beginning of the eighteenth century through the conquests of Peter the Great, and Courland was acquired in 1795. Peter the Great conceded to the provinces their own administration and guaranteed the inhabitants freedom of conscience. These rights were confirmed anew in 1856, but in spite of this a systematic attempt was made by the Russian government, especially since 1880, to assimilate the provinces with the rest of the Empire. The Greek church endeavored to proselytize the people, the Russian language was substituted for the German in the schools and courts, and the press was subjected to censorship. These measures aroused great discontent in the Baltic provinces, especially among the German nobility, who, constituting but a small fraction of the population, exercise great power over the peasantry. The fall of 1905 witnessed the outbreak of a formidable revolutionary movement among the Lettish and Esthonian peasantry, directed against both the German landowners and the Russian government and partaking largely of the nature of a Jacquerie. See RUSSIA.

BALTIC SEA. The inclosed sea in northern Europe, bounded by Germany, Denmark, Sweden, and Russia, and communicating with the North Sea through a series of winding channels known as The Sound, Great Belt, Little Belt, Kattegat, and Skagerrak. From the peninsula of Denmark, which may be regarded as its western limit, the Baltic extends eastward to the frontier between Germany and Russia and thence northward to about lat. 66°. The greatest length of the Baltic from Lübeck in Germany to Haparanda in Sweden is about 930 miles, while its breadth varies from an extreme of 425 miles (Stockholm to St. Petersburg) to less than 50 miles at the southern extremity. It covers an area of about 160,000 square miles. The northern extension includes three large bays or gulfs, the gulfs of Riga and Finland, indenting the coast of Russia, and the Gulf of Bothnia between Russia and Sweden. On the coast of Germany are smaller indentations, including the bays of Pomerania, Lübeck, and Kiel, and the Gulf of Danzig. The principal islands are Rügen, Bornholm, Oland, Gotland, Ösel, Dagö, and the Åland and Danish groups. The depression occupied by the Baltic is generally shallow; on the Stolpe Bank, off Stolpmünde in Germany, the depth is less than 40 feet, and over considerable areas it does not exceed 120 feet. Like the North Sea, the greatest depths are found in the northern part, the extreme being 1542 feet (south of Stockholm). The Baltic receives the drainage of a large part of northern Europe, including western Russia, northeastern Germany, and nearly the whole of Sweden. Owing to this drainage and to the restricted channel to the North Sea, the surface water of the Baltic contains only a third as great a percentage of salt as the Atlantic, and the saltiness shows a ten-

dency to decrease towards the west and north. Tidal action is apparent only on the southern coasts, but there are surface currents of a low degree of salinity which flow constantly from the Baltic to the North Sea, while deeper currents, whose waters contain a larger content of salt, flow in the opposite direction. Storms are frequent and often cause severe losses to shipping. Easterly winds are particularly dangerous, as they drive the water before them in the form of huge tidal waves. Navigation in the northern part is suspended by ice during the winter season and early spring. The Baltic is of great commercial importance to northern Europe; the most important ports are Copenhagen, in Denmark; Kiel, Lübeck, Stettin, Danzig, and Königsberg, in Germany; Riga, Reval, St. Petersburg, Cronstadt, Helsingfors, and Åbo, in Russia; and Stockholm, Karlskrona, and Malmö, in Sweden. The Baltic is connected with the North Sea by an artificial waterway, the Kaiser Wilhelm Canal, 61.3 miles in length, which was completed in 1895. The canal contains no locks and is of sufficient depth to permit the passage of deep-sea ships. More than 40,000 vessels with a tonnage of 7,000,000 pass over its waters annually.

BALTIMORE, bal'ti-môr. The metropolis of Maryland, and the seventh city in point of population in the United States. It is situated on the Patapsco River, at the head of tide water and navigation, about 14 miles from Chesapeake Bay (Map: Maryland, L 3). The city extends about $6\frac{1}{4}$ miles from east to west, and between $4\frac{1}{2}$ to $5\frac{1}{2}$ miles from north to south, covering an area of $31\frac{1}{2}$ square miles, or 20,254 acres.

Physical Characteristics. Baltimore is situated, in common with other great centres of the Atlantic border, at the junction of the plateau of old crystalline rocks and the overlying beds of younger and still unconsolidated formations, which stretch out towards the east. The hills within the city are composed of younger sands and gravels, which are cut through by such streams as Herring's Run, Jones's and Gwynn's Falls, and the Patapsco River. The climate of the city is temperate and bracing, removed alike from the bitter cold and enervating heat of more extreme localities.

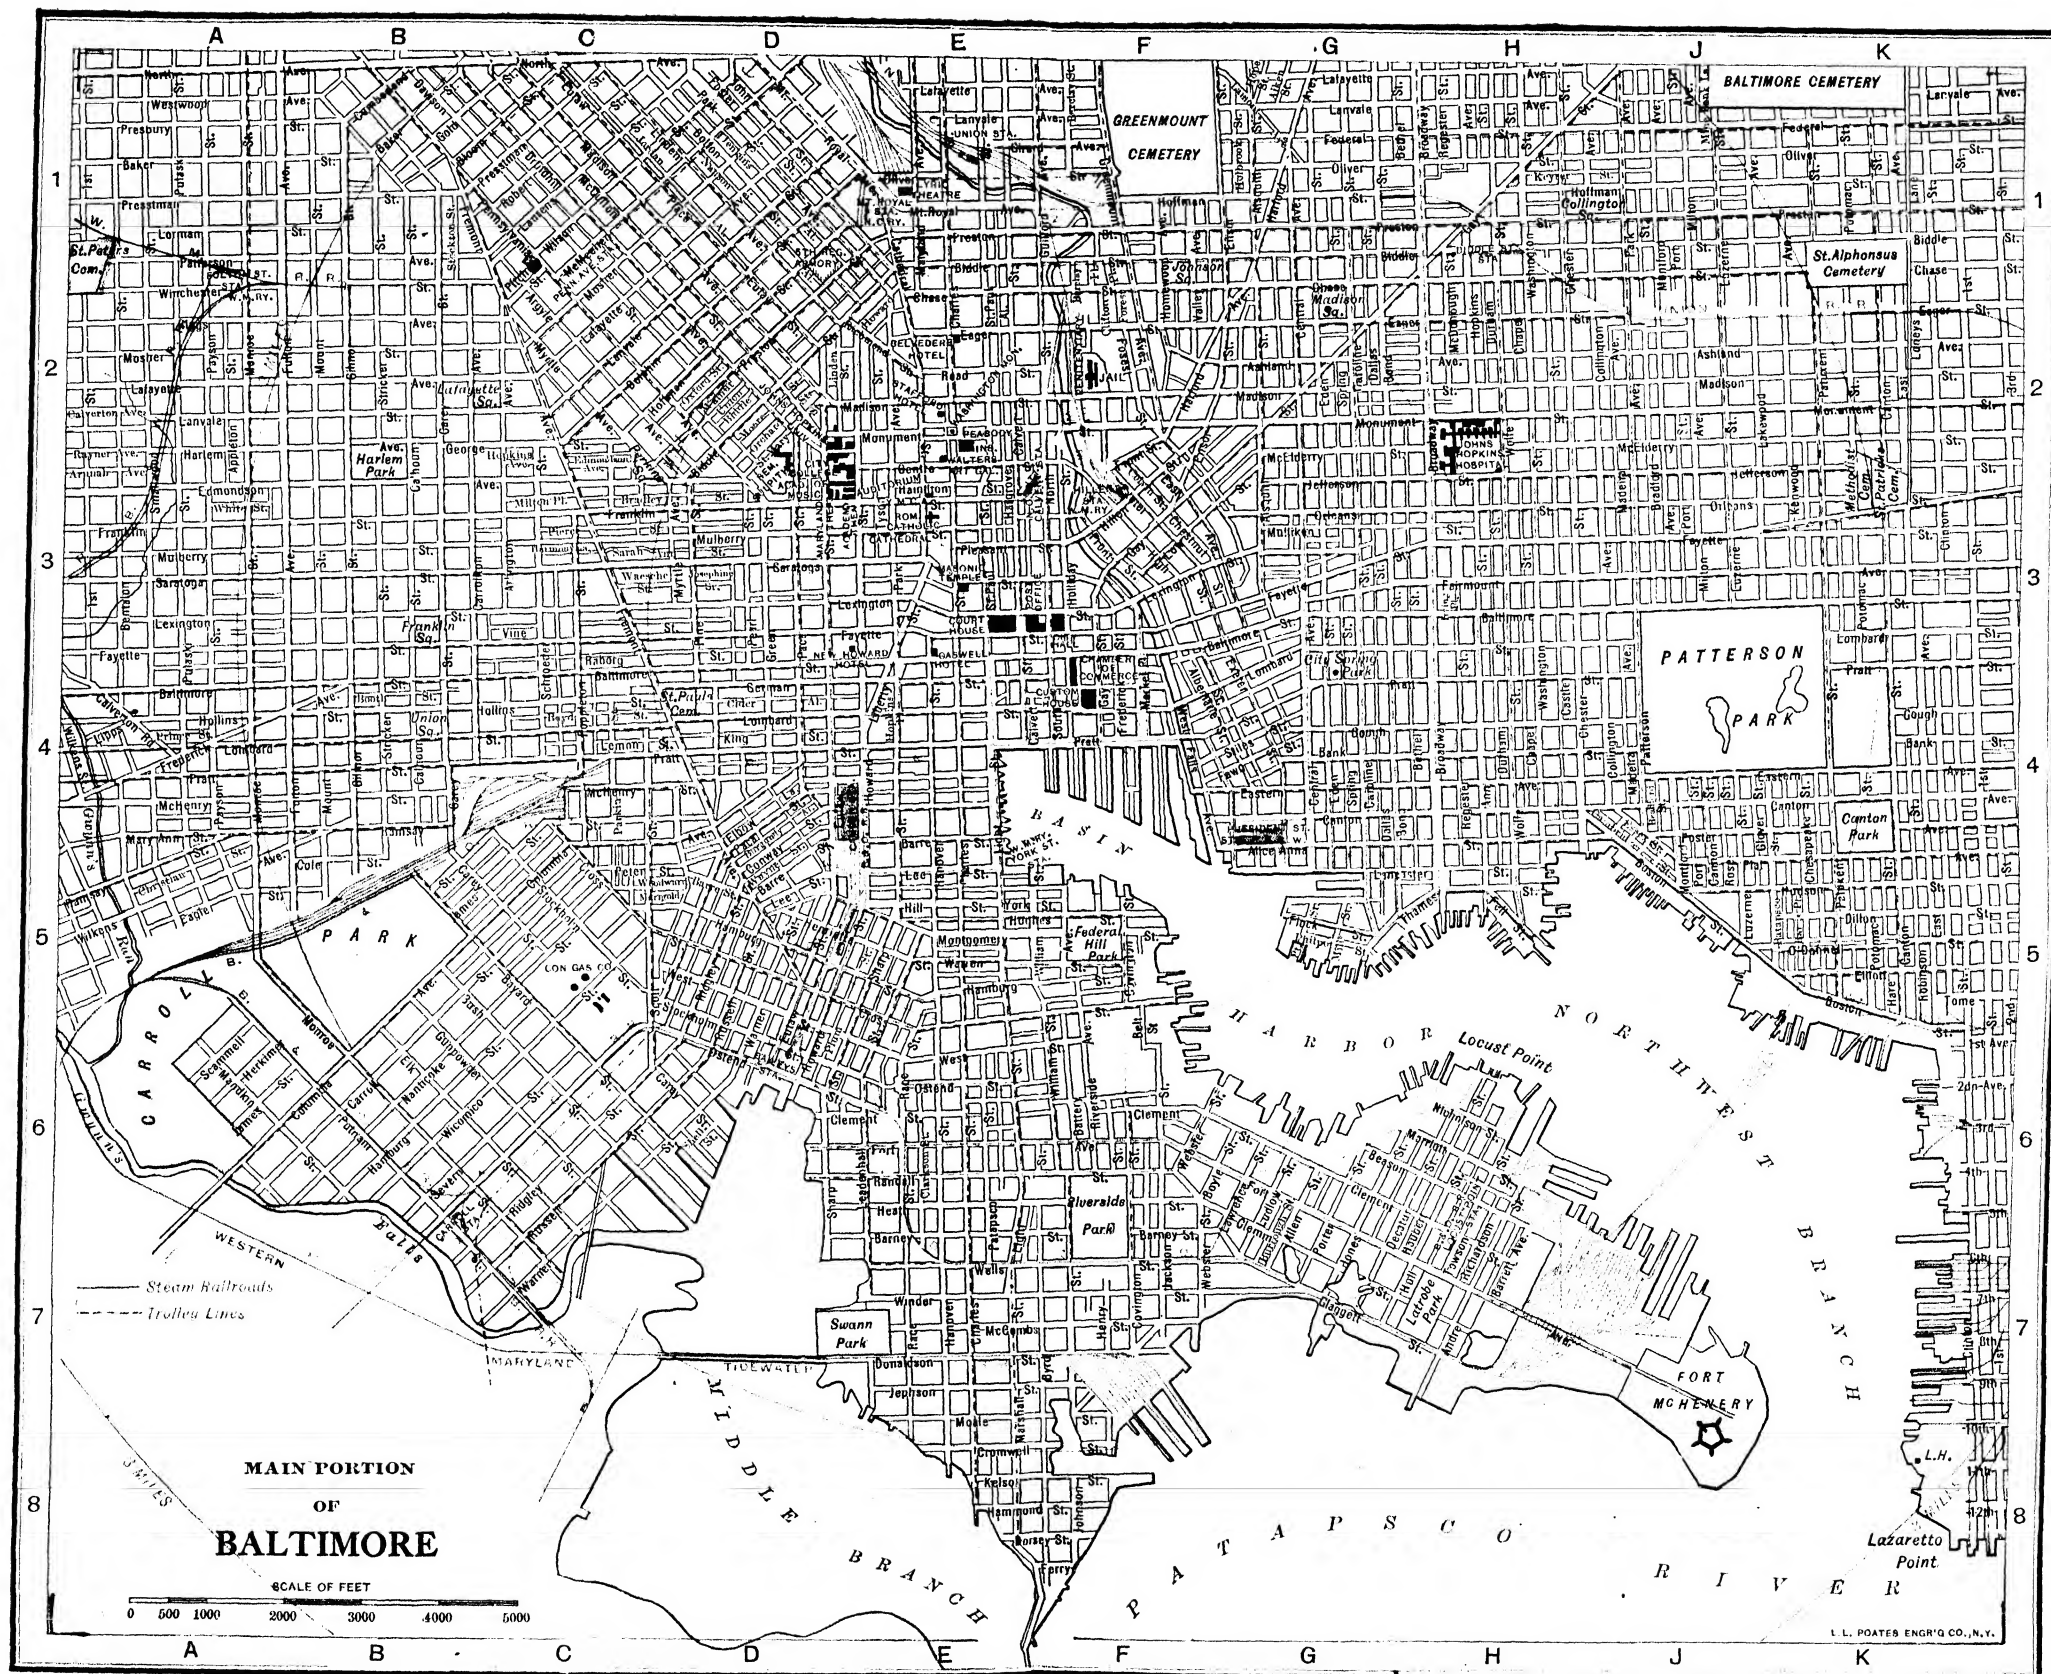

Baltimore is roughly divided into two nearly equal parts by a small stream—Jones's Falls—which rises 20 miles to the north and flows through the city. The area of this stream is being converted into a highway, to be known as the Fallsway, of a minimum width of 75 feet, running diagonally across the city from the docks to the railroad terminals. The stream flows through the sewer pipes, above which there has been constructed a system of concrete arches, which are in turn covered by a pavement of stone blocks. The portion of the city northeast of the stream, of which Fells's Point and Canton, with wharves, factories, and canneries lining the water's edge, are respectively the south and southeast ends, is still denominated "Old Town." The southeastern section is occupied largely by immigrants and presents the ordinary characteristics of a seaboard city. To the north, east, and northeast stretches the residential quarter of the city's breadwinners. Of the section southwest of the Falls, Locust Point is an irregular strip extending to the southeast, with numerous wharves, railroad terminals, and grain elevators, and tipped at the very extremity by Fort McHenry. The southwestern corner is

Spring Garden. The wholesale business section extends north from Pratt Street, the extreme northern limit of the harbor, and is bounded by Paca, Baltimore, and Light streets. A little beyond is Baltimore Street, the chief latitudinal thoroughfare. Farther on, widening out to the west, lies the retail shopping district, while beyond, extending halfway to the northern limits, is the fashionable residential quarter. The northern and northwestern sections are substantial-dwelling districts, fringing out to modest but comfortable artisans' homes. Houses are numbered in the decimal plan, running north and south from Baltimore Street, and east and west from Charles Street.

Monuments and Buildings. Baltimore is called the Monumental City, a title derived less from the number of its stone memorials than from the early date at which Washington Monument, in Mount Vernon Place—a noble marble shaft rising 164 feet, surmounted by a heroic figure of Washington—and Battle Monument, in Monument Square, were erected. Mount Vernon Place contains several bronzes by Barye and one by Dubois, the Rhinehart monument of Chief Justice Taney, and the Story replica of the George Peabody monument. Other monuments of interest are the Wells and McComas, the Armistead, the William Wallace, the Wildey, the Howard, the Confederate, the Ridgely, the Francis Scott Key, and the Soldiers' and Sailors' monuments.

The characteristic of Baltimore architecture is solidity and convenience. The public buildings of special interest are the city hall, the post office, the custom house, the city jail, the Peabody Institute, the Johns Hopkins Hospital, the Enoch Pratt Free Library, the Masonic Temple, and, most beautiful of all, the courthouse, of white marble, in classic Renaissance style, with interesting mural paintings by Blashfield and Turner, and a bust of Severn Teackle Wallis, the distinguished Maryland jurist and man of letters. The city boasts many large and beautiful apartment houses, such as the Marlborough, Washington, Esplanade, Homewood, and Algonquin. The Continental, Equitable, American, Baltimore and Ohio, and Fidelity buildings are imposing office structures. The important clubs of the city are the Maryland, occupying a beautiful Romanesque edifice of white marble; Baltimore, Athenæum, University, Phoenix, and Country (Roland Park). The Stafford, Rennert, Howard, Caswell, Eutaw, Emerson, Kernan, and Belvedere are the principal hotels. A United States Subtreasury is located here.

Parks and Squares. The public parks and squares of Baltimore are beautiful and well distributed. The more important are Druid Hill (674 acres), Gwynn's Falls (375 acres), Clifton (267 acres), Wyman (198 acres), Carroll (177 acres), Patterson (128 acres), Herring Run (154 acres), Riverside (17 acres), Latrobe (14 acres), Swann (11 acres), and Federal Hill (8 acres). Druid Hill may be reasonably described as one of the finest parks in the United States. It abounds in natural beauties which have been carefully preserved and emphasized. Druid Lake, an artificial basin, is part of the municipal water-works system. Carroll Park contains the historic Carroll mansion. Clifton Park was purchased from the Johns Hopkins University. Wyman Park, and a tract which will probably be called University Park, situated adjacent to

Homewood (the suburban site of the Johns Hopkins University), on Charles Street, bid fair to rank among the most attractive parks of the city. Under an adopted plan prepared by Frederick Law Olmsted, the city has undertaken a definite extension of its systems of parks and squares.

Suburbs. Baltimore's suburban growth has been very rapid. Suburbs extend north and northwest of the city proper for about 10 miles and are made accessible by electric car lines. It is estimated that these suburbs have (in 1913) a population of 100,000. Among the more important are Arlington, Mount Washington, Roland Park, Walbrook, Forest Park, and Catonsville.

Cemeteries. Greenmount Cemetery (containing the graves of many illustrious men, including those of John McDonogh, Johns Hopkins, and Sidney Lanier), Loudon Park, and the National Cemetery are the most important burial places. Westminster, one of the oldest and smallest churchyards in the city, contains the grave of Edgar Allan Poe.

Educational Institutions. Baltimore ranks as one of the foremost educational influences of the country. A graded system of public schools provides free instruction in kindergarten, primary, secondary, collegiate, and normal studies, and in manual training. The system comprises 161 schools, employing 1850 teachers, with a total enrollment of 79,000 pupils and an average attendance of 62,000; including both elementary and secondary schools. Baltimore is the seat of the Johns Hopkins University (q.v.), opened for instruction in 1876. Other institutions of learning are St. Mary's Seminary of St. Sulpice, Loyola College, Goucher College, Morgan College (colored), and St. Joseph's Seminary (colored). Among the professional schools are the law and medical departments of the University of Maryland, College of Physicians and Surgeons, Maryland College of Pharmacy, and Baltimore College of Dental Surgery. The last named, founded in 1839, is the oldest dental college in the world. Other schools and academies are McDonogh School, Bryn Mawr School, Calvert Institute, Academy of the Visitation, Notre Dame of Maryland, and Mount de Sales Academy.

The Peabody Institute, endowed by George Peabody, who laid the foundation of his great fortune in Baltimore and entertained a strong friendship for its people, contains a valuable library of 180,000 books, 28,000 pamphlets, and 1400 maps, an interesting art gallery, and a well-organized conservatory of music. The art galleries of Mr. Henry Walters contain one of the choicest private collections in the United States, and are opened to the public at certain seasons for the benefit of a local charity. The Maryland Historical Society has a valuable collection of books, pamphlets, and manuscripts, and an art gallery. The Maryland Academy of Sciences possesses interesting natural-history collections. The Maryland Institute includes a school of art and design and a library.

The libraries of the city, in addition to those connected with the several institutions enumerated above, are the Enoch Pratt Free Library, containing more than 306,000 volumes, with branch libraries in various parts of the city; the Baltimore Bar Library, the Maryland Diocesan Library, the Medical and Chirurgical Faculty Library, and the New Mercantile Library.

Charitable Institutions. Among the im-

portant charitable institutions of the city, supported by endowment, private contribution, or public aid, are the Johns Hopkins Hospital, in construction and equipment one of the finest in the world; Sheppard-Pratt Insane Asylum, Maryland University Hospital, Union Protestant Infirmary, City Hospital, Maryland General Hospital, St. Joseph's Hospital, Church Home and Infirmary, Hospital for the Women of Maryland, Jewish Home for Consumptives, Eudowood Tuberculosis Sanitarium, Hebrew Hospital and Asylum, Baltimore Orphan Asylum, Thomas Wilson Sanitarium, St. Vincent's Infant Asylum, Nursery and Child's Hospital, Hebrew Orphan Asylum, Bay View Asylum (the city almshouse), House of Refuge, Maryland Hospital for Insane, Mount Hope Retreat. Numerous other sectarian and non-sectarian institutions provide for the relief of the sick, needy, and the infirm. A Pasteur Institute (city) is in successful operation.

Churches. The first Methodist Episcopal church in the United States was founded in Baltimore. The city is also the seat of a Protestant Episcopal bishop and of a Roman Catholic archbishop (Cardinal Gibbons), whose diocese is the first in the United States. Important Roman Catholic church assemblages have been held here from time to time, one of the most interesting being the Third Plenary Council in 1885.

The city abounds in noteworthy ecclesiastical structures. The Roman Catholic Cathedral, built in the early part of the nineteenth century, is remarkable for the chaste simplicity of its design and proportion of its parts. Of more recent construction are Grace Episcopal Church, First Methodist Episcopal Church, First Independent Christ's Church, First Presbyterian Church, First Baptist Church, Associate Reformed Church, Vernon Place Methodist Episcopal Church, and the Eutaw Place, Madison Avenue, and Bolton Street synagogues.

Trade and Industry. Natural geographical situation, favorable trade connections, and unusual harbor facilities constitute Baltimore's chief commercial advantages. At the entrance to the harbor the Patapsco River divides into the northwest, southwest, and middle branches. The northwest pierces $2\frac{1}{2}$ miles into the very heart of the business portion of the city. The southwest and middle branches envelop the southern and southwestern sections, giving a long expanse of water front in close proximity to the lines of the Baltimore and Ohio and the Wabash railroads. The main harbor, or that on the northwestern branch, has a water front, measured on the pier head line, of $6\frac{1}{2}$ miles, an area of 630 acres, and while leaving ample fairways for the movement of vessels, furnishes 96 acres of anchorage grounds, on which the least depth of water is 19 feet. The whole of the lower portion of the harbor, covering the elevators and steamship piers, has a depth of 27 feet at mean low water. The harbor along the southwest and middle branches has, within the city limits, and measured on the pier-head line, a water front of $5\frac{1}{2}$ miles, and nearly as much more on the opposite banks in the county. It covers an area of 1300 acres, and has channels of 24 feet depth at mean low water. The municipal pier system has been adopted. This favorable geographical situation has been emphasized and developed by the establishment of direct lines of communication. The Baltimore and Ohio Railroad reaches in one direction to Philadelphia, thence by direct connection to New

York, and on the other hand penetrates to the west, southwest, and northwest to the waters of the Mississippi. The Northern Central Railroad serves to connect Baltimore with the great Pennsylvania system, and affords a direct outlet to the north. Two associated branches of the Pennsylvania system are the Baltimore and Potomac to Washington, and the Philadelphia, Wilmington and Baltimore to Philadelphia and the north and east. The Western Maryland Railroad, constructed largely through municipal aid, and extending in one direction through the fertile valley of the Shenandoah and in another into the rich Cumberland Valley, has been acquired by the extensive Wabash system; and in July, 1912, a new trunk line connecting Baltimore and the Atlantic seaboard with Pittsburgh and the West was inaugurated by way of the new Western Maryland extension.

Regular communication between Baltimore and foreign ports is afforded by the North German Lloyd to Bremen, the Neptune line to Rotterdam, the Atlantic Transport line to London, and a number of other lines offering frequent service. The city is the largest corn-exporting port in the United States. Other important articles of local export are wheat, flour, cotton, tobacco, copper, and coal. Importing activity centres about iron ore, bananas, pineapples, coconuts, sugar, and general merchandise. In 1910 Baltimore ranked fourth among all the seaports of the United States in the value of exports and sixth in the value of imports.

The manufacturing enterprises of Baltimore are most varied, scarcely a single important industry being unrepresented. It is the largest manufacturing centre in the United States for fertilizers, straw goods, cotton duck, fruit canning, and oyster packing. It has the largest copper-refining plant in America. In the total value of its manufactured products Baltimore stood in 1909 thirteenth among the cities of the United States. The shipbuilding industry has recently undergone marked development. Sparrow's Point, with its great steel plant, Curtis Bay, Locust Point, and Woodberry are busy industrial centres.

The closer proximity of Baltimore, by several hundred miles, to the great cotton belt of the South, to the grain-growing sections of the West, and to the wood, coal, and iron wealth of the interior, affords cheap and easy access to the raw materials of industry. It is believed that Baltimore's location in the middle of the Atlantic coast and its facilities for collecting and distributing from and to the inland will throw to the port a large proportion of the trade that will pass through the Panama Canal. The proximity of a rich and productive country, the low cost of water transportation, and the economy of domestic distribution through municipal markets render the cost of living in Baltimore much less than in many smaller cities.

Municipal Government. The original municipal charter, granted in 1796 and repeatedly amended and modified, was replaced in 1898 by a modern reform instrument of government. Under its provisions the government of the city is vested in a mayor, who holds office for four years, a bicameral city council, and various administrative departments, boards, and commissions. The municipal officials, with the exception of the city register and printer (elected by the city council), and the comptroller, surveyor, and president of the second branch of the city

council (elected by popular vote), are appointed by the mayor, with the consent of the higher branch of the city council. The mayor, comptroller, city engineer, city solicitor, and president of the higher branch of the city council constitute a board of estimates, exercising essential control of municipal finances. The board of awards is of similar composition, with the register substituted for the city engineer. The mayor, comptroller, register, and two other persons appointed by the mayor serve as commissioners of finance in the administration of the municipal debt.

Baltimore spends annually, in maintenance and operation, about \$22,000,000, the principal items of expense being: police department, \$1,270,000; charity and corrections, \$530,000; street lighting, \$391,000; fire department, \$1,100,000; parks and squares, \$522,000; schools, \$2,500,000; sewers and sewerage disposal, \$2,500,000; interest on debt, \$2,450,000. The water works, representing a total construction expenditure of nearly \$20,000,000, are owned and operated by the city. The entire system now includes some 732 miles of mains, two standpipes, eight storage reservoirs and two impounding reservoirs. The city has a gross bonded debt of about \$75,000,000, and the assessed valuation of property, real, personal, and corporate, is \$782,000,000. The city parks are maintained by a franchise tax upon the receipts of the street railways.

Population. The thirteenth census (1910) of the United States gave the total population of Baltimore as 558,485, divided into 118,851 families, occupying 101,905 dwellings. Of this number 268,195 were males and 290,290 were females; 481,442 were native born and 77,043 were foreign born. The total number of whites was 473,387 and of colored 85,098. Of the native whites 261,474 had native parents and 134,870 had foreign parents. The total illiterate population 10 years old and over was 20,325, of whom 10,887 were white and 9438 were colored.

History. The foundation of Baltimore is associated with the emergence of the proprietary government of Maryland from an era of troublous times towards the close of the first quarter of the eighteenth century. With the expansion of commerce and the increase of population, it was not long before the need of a port near the head of Chesapeake Bay began to be felt. Attention was directed to a remarkable site on the north side of the Patapsco River, 14 miles from the waters of the bay, offering easy access and safe harbor to vessels of large size. On July 14, 1729, a petition was presented to the Provincial Assembly praying for the erection of a town at this point, and three weeks later a bill to this effect was passed.

Baltimore slowly but surely forged ahead of older towns in trade. The history of the city immediately before and during the Revolutionary War forms a familiar chapter in our national history. From Baltimore largely came the zeal and energy with which Maryland entered into the War of Independence. The events of the war interrupted foreign commerce and cut off all continental supplies; but it stimulated local manufactures and shipping thereafter. Local merchants engaged extensively in the world's carrying trade, and "Baltimore clippers" became famous. During the War of 1812 the city was attacked by land and water, but successfully defended in each case. During the bombardment

of Fort McHenry, Francis Scott Key, while detained on board a British vessel, composed the national anthem, "The Star-Spangled Banner." The introduction of new industrial methods succeeded the reactionary depression following the War of 1812. The Chesapeake and Ohio Canal and the Baltimore and Ohio Railroad were projected and carried forward by local enterprise. The first telegraph line in the United States was constructed between Washington and Baltimore. Industry, trade, and commerce suffered heavily from the events of the Civil War. Communication with the South was completely cut off, and western trade diverted to other channels. A mob attack upon a Massachusetts regiment in its passage through the city, on April 19, 1861, inflamed the country and led to the Federal occupation of the city. But the causes of prosperity were suspended, not destroyed, and as the prostrate industrial life of the tributary territory revived, the city emerged into new importance as an industrial centre. In 1888 a large area or "belt" of suburban territory was annexed to the corporate limits. On Feb. 7, 1904, a conflagration wiped out the business centre of the city. The fire burned 30 hours and spread over the territory bounded by Fayette, Charles, Baltimore, Liberty, and Lombard streets, the water front, and Jones' Falls. The loss was estimated at \$125,000,000. Within three years the burnt area was completely rehabilitated. The fire has since been considered a blessing in disguise because of the spirit of progress which it awakened. The diversification of manufactures, the growth of commerce, extension of trade, increase of population, the influx of foreign elements, the rise of economic standards, the development of civic consciousness have been the essential elements in the later history of Baltimore.

BALTIMORE, BARONS OF, or LORDS BALTIMORE. The title of the Calvert family in the Irish peerage. SIR GEORGE CALVERT, first Lord (c.1580-1632). A British statesman. He was born at Kipling, Yorkshire, and graduated at Oxford in 1597. He then became secretary to Sir Robert Cecil and won the esteem of James I, who knighted him in 1617 and made him Secretary of State in 1619. In 1621 and again in 1624 he sat in the House of Commons; but becoming a Catholic shortly afterward, he resigned, only to be raised to the Irish peerage by the favor of the King as Baron of Baltimore. He early became interested in the colonization of the New World and in 1621 dispatched a ship to Newfoundland to establish a settlement. In 1623 he obtained a charter to found a colony there under the name of the Province of Avalon. He crossed the ocean himself in 1627 and again in 1629, taking his family with him, but encountered many difficulties from the hostility of the French and the severity of the climate and soon applied for a grant of land in a more genial region. Although the King had tried to dissuade him from his project, he finally obtained (in 1632) a grant of the territory which was called "Mary-

land" by Charles I in honor of the Queen. Before the charter was issued, Sir George died, and the grant devolved upon his son Cecil, who thus became the real founder of Maryland, although he never visited the Colony. He sent settlers, however, under his younger brother, Leonard (see CALVERT, LEONARD), who was the first Governor of Maryland (1634-47). The successive Barons of Baltimore, or Lords Baltimore, were: GEORGE (first), CECIL (second), CHARLES (third), BENEDICT (fourth), CHARLES (fifth), and FREDERICK (sixth). The house became extinct with the last, who died without leaving legitimate issue. All of them were prominently identified with the history of Maryland.

Wilhelm, *Life of George Calvert* (1884); one of the Maryland Historical Society's monographs; J. P. Kennedy, *Discourse on the Life and Character of George Calvert, Lord Baltimore* (Baltimore, 1845); C. H. Firth, article in *Dict. of Nat. Biog.*, and references there cited; C. C. Hall, *The Lords Baltimore and the Maryland Palatinate* (Baltimore, 1905).

BALTIMORE ORIOLE. See ORIOLE.

BALTINGS, bäl'tingz. The royal family from which the Visigoths chose their kings.

BALTISTAN, bäl'të-stän' (Pers. *stan*, district, region; of the Baltis), or LITTLE TIBET. A province of Kashmir, a native state, India, on the south of the Mustagh and north of the Kashmir province (Map: India, C 1). It is situated in the midst of enormous mountain ranges with peaks of 25,000 and 26,000 feet, and one over 28,000 feet, and glaciers which are the largest known out of polar regions. The area is estimated at about 13,000 square miles, and the population at about 60,000. The people are essentially Mongolian and in large part profess Mohammedanism. Their language is a Tibetan dialect. Cultivation of the soil is dependent on irrigation, and life presents many hardships. The cold is often intense, and the country is almost without forests. Independent rule in Baltistan, by the rajas or gyalpos, came to an end in 1840. Years of oppression followed, but the country, now under the administration of the Wazir Wazarat of Ladakh and the protection of the government of India, may look for better days.

BALTZER, bälts'ër, JOHANN BAPTISTA (1803-71). A German theologian. He was born at Andernach, studied at Bonn, and after his ordination to the priesthood in 1829, was made professor of theology at Breslau in the following year. He was at first an enthusiastic follower of Georg Hermes in his attempt to reconcile the newer German philosophy with the Roman Catholic teaching, but definitely broke with his school in 1839 and associated himself with the speculations of Anton Günther. After the papal condemnation of the latter's teachings Baltzer submitted indeed, but his independent spirit led him into further difficulties, and he was suspended in 1862. As in natural sequence he was a strenuous opponent of the definition of papal infallibility and was a promoter of the Old-Catholic movement in Silesia. He published *Die biblische Schöpfungsgeschichte* (2 vols., 1867-73), and *Ueber die Anfänge der Organismen* (4th ed., 1869). For his life, consult: Friedberg (Leipzig, 1873), and Melzer (Bonn, 1877), both favoring Baltzer's attitude, and Franz (Berlin, 1873), representing the other side.

BALTZER, WILHELM EDUARD (1814-87). A German theologian and leader of the movement known as the *Freie Gemeinden*, or free religious communities which have sprung up since the middle of the nineteenth century in opposition to dogmatic and traditional theology. He was born at Hohenleine, studied at Leipzig and Halle, and entered the Lutheran ministry, but on account of the liberal views which, following Delitzsch, he had adopted, was not looked upon with favor. Consequently, in 1847, he founded a "free church" of his own and presided over a convention of similar organization at Nordhausen in the same year. Until 1881 he continued to be a representative leader among them, but lived in retirement at Grotzingen for the last few years of his life, partly occupied in the promotion of vegetarianism, for which he founded an association and an annual publication. His writings were mainly devoted to the propagation of his views; among them are *Alte und neue Weltanschauung* (4 vols., 1850-59); *Gott, Welt und Mensch* (1869); *Vegetarisches Kochbuch* (14th ed., 1900).

BALU, bá'lōō (native name). A variegated wild cat of Sumatra, probably a variety of *Felis aurata*.

BA-LUBA, bá-lōō'bà. A Negroid people of the middle Kasai Basin, Belgian Congo. They are intelligent, adaptive, industrious, and skilled in the arts; travelers praise the good qualities of this powerful people.
